The George O. Towle Manufacturing Company, Lancaster, Pa.—to manufacture electrical machinery. Capital

stock, \$5,000. Directors: G. O. Towle, J. E. Hubley and R. Blickenderfer, Lancaster; G. A. Towle, Lowell, Mass., and J. P. Williams, New York.

The Canon City Ice, Light & Power Company, Canon City, Col. Capital stock, \$100,000. Incorporators: H. H. Shepard, M. M. Shattuck and H. H. Lee.

The Capital Electric Construction & Power Company, Washington, D. C. Trustees: George P. Phillips, William W. Walker, Robert P. Murphy and Hal P. Hill.

The South Milwaukee Electric Light Company, Milwaukee, Wis. Capital stock, \$15,000. Incorporators: William P. Cook, F. S. Pamperin and William Wiotte.

The American Electrical Novelty & Manufacturing Company, New York. Capital stock, \$25,000. Directors: Conrad Hubert, Maurice Hartman and Joseph Hurwich.

The Rockford Railway, Light & Power Company, Rockford, Ill.—to construct and operate street railways. Capital stock, \$250,000. Incorporators: F. A. Poor, N. B. Poor and R. S. Clements.

The Northern Electric Company, Auburn, Me.—to carry on electric light and power business. Capital stock, \$120,000. President, George C. Wing; treasurer, Herbert I. Goss.

The Chester Valley Electric Light, Heat & Power Company, Downingtown, Pa. Capital stock, \$25,000. Directors: Joseph R. Downing, John T. Fox, Guyon Miller, T. E. Parke, C. W. Walker, Edward Kerr and Joseph H. Johnson, of Downingtown.

The Indiana Heat, Light & Power Company, Mishawaka, Ind.—to manufacture gas and electricity. Capital stock, \$50,000. Trustees: Hugh H. Hoisford, John Tromp, J. M. Chillas, Archibald G. Graham and Edward A. Jernegan.

The Flushing & South Shore Railroad Company, Jamaica, N. Y.—to build and operate a standard gauge road, steam or electric, fifteen miles long, from Flushing to a point on the Long Island Railroad between Freshport and Woodburgh. Capital stock, \$50,000. Directors: William F. Brown, William L. C. Allen, Edward J. Boyle, George A. Hamilton, William J. Hawson, Matthew J. Kany and J. Holla Gibson of Brooklyn; Louis E. Freeman of Orange, N. J., and Francis L. White of Summit, N. J.

The East Greenwich Electric Lighting Company, East Greenwich, Conn.—to generate, conduct, sell, lease and use electricity for lighting, heating and mechanical purposes, and to manufacture, use and deal in all machinery, electrical instruments, conductors, lamps, apparatus and appliances pertaining to the use of electricity. Capital stock, not to exceed \$50,000. Incorporators: Charles G. Hill, Frank C. Cundall, Thomas H. Galvin, Samuel M. Knowles, Russell V. Sharpe, Joseph S. Thornley and others.

The Cumberland & Frostburg Electric Passenger Railway Company of Allegany County, Pa. Capital stock, \$50,000. Incorporators: John W. Burchinal and James E. Hooten of Mountville, W. Va., and Zachariah Lancy, Walter Powell and J. Henry Holzshu of Cumberland.—The Frostburg & Lonaconing Electric Passenger Railway Company, Frostburg—to build an electric road from Lonaconing to Frostburg. Capital stock, \$50,000. Incorporators: John W. Burchinal and James E. Hooten, of Mountville, W. Va.; Mark Wineland, Peter Lemmert and George H. Wittig of Frostburg.—The Lonaconing & Westport Electric Railway Company, Lonaconing—to build a road from Lonaconing to Westport. Capital stock, \$50,000. Incorporators: J. W. Burchinal, J. E. Hooten of Mountville, William Atkinson, Hugh Scott and George Terrett of Lonaconing. These three roads are to be connected. The reason that three separate companies were incorporated instead of one is that there is a state statute limiting the number of miles controlled by a turnpike company, plank road or passenger railway company to twelve, and the combined lines or any two of them will extend over that distance.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 15, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 630,527. Depressible-Rail System for Electric Railways. William Grunow, Jr., Bridgeport, Conn., assignor of one-half to Zalmon Goodsell, same place. Filed April 12, 1897.
- 600,554. Protective Appliance for Electric Railways. Louis E. Watkins, Springfield, Mass., assignor of one-half to Frank W. Dickinson, same place. Filed July 17, 1897.
- 603,633. Trolley. John Clayton, Cuyahoga Falls, Ohio. Filed Nov. 4, 1896.
- 630,515. Car Fender. George F. Radcliffe and John C. Slutz, Kansas City, Kan. Filed June 14, 1897.
- 600,601. Car Fender. William F. Young, Philadelphia, Pa., assignor of one-half to Henry S. Davis, same place. Filed Feb. 16, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 600,523. Quick-Break Electric Switch. Thomas E. Drogan, Chicago, Ill., assignor to the Siemens & Halske Electric Company of America, same place. Filed Nov. 13, 1897.
- 600,616. Alternating-Current Meter. George Hummel, Munich, Germany. Filed Oct. 30, 1897.
- 600,743. Automatic Safety Circuit-Closer and Cut-Out. Walter L. Pratt, Adams, N. Y. Filed May 13, 1896.

MISCELLANEOUS.

- 601,509. Controller for Electrically-Propelled Vehicles. Regina'd T. D. Brougham and Walter C. Bersey, London, England, assignors to the Electrical Vehicle Syndicate, Limited, same place. Filed Dec. 13, 1897.
- 600,607. Insulator-Support for Electrical Conductors. Fred Benedict, Niles, Mich. Filed Sept. 13, 1897.
- 600,693. Method of Making Soluble Metal Electrodes for Accumulators. Jules Julien, Brussels, Belgium. Filed Sept. 25, 1896.
- 630,719. Galvanic Battery. Emil Habermann, Michigan City, Ind. Filed Oct. 7, 1897.
- 603,765. Automatic Fire-Alarm. Robert J. Baker, Baltimore, Md., assignor of one-third to Joseph March, same place. Filed April 28, 1897.
- 600,819. Explosive-Engine. Alexander Winton, Cleveland, O. Filed June 26, 1896. Renewed Feb. 12, 1898.
- 600,850. Primary Battery. J. Ensign Fuller, New York City, assignor of one-third to George W. Munro, same place. Filed April 5, 1897.

TELEPHONE AND TELEGRAPH.

The Senate Finance Committee has decided to report a substitute for Senator Brush's bill reducing and regulating telephone rates throughout the State of New York. The substitute bill does away with the special commission to regulate telephone charges, etc., and places the matter under the supervision of the Railroad Commissioners and invests them with authority to investigate all complaints. The new bill provides that no telephone company shall make any charge for use or service of any telephone except the same be reasonable and just, or directly or indirectly charge, demand, collect or receive from any person or corporation a greater or less compensation for any use or service of any telephone than he or it charges or receives from any other person or corporation for a like and contemporaneous use or service under substantially similar circumstances and conditions, or refuse or neglect to furnish any reasonable telephone service to any person upon just and reasonable terms. Charges shall be deemed to be unreasonable and unjust if they are such as shall produce a net profit in excess of 10 per cent. on the cash capital actually paid in and property equivalent to cash computed on its actual value and invested surplus earnings, which cash capital, property and surplus earnings shall have been expended or employed in the business and be necessary to the efficient rendering of telephone services. The substitute bill was prepared by Senator E. R. Brown of Jefferson.

The minority report of the House Committee on Interstate and Foreign Commerce against the bill reported by that committee for the establishment of a Pacific cable has been completed. The original bill provides for a subsidy to the Pacific Cable Company at the rate of \$100,000 a year for twenty years, and provides for the completion of the cable to Honolulu by 1900, and to Japan and China by 1901. The substitute offered by the minority committee also provides for a subsidy not exceeding \$100,000, but it eliminates the name of the corporation, and has a provision for advertisement by the Postmaster-General and the co-operation of the Government of Japan.

The Committee on Department of Electricity in San Francisco has reported in favor of the establishment of a department of electricity in connection with the city government to have charge of the fire alarm, police telegraph and telephone systems, and to be under the control of a joint commission composed of the Fire and Police Commissioners. The joint commission shall appoint a chief of the department, who must be a skilled electrician, and also the necessary assistants.

It is stated that Gen. Miles has recommended the immediate connection of all the fortifications about New York with headquarters on Governor's Island by means of a submarine cable. Fifty miles of cable or more will be required as it will extend from Davids Island in the Sound to Sandy Hook, taking in en route Fort Schuyler, Willels Point, Governor's Island, Fort Wadsworth and Fort Hamilton. Both telegraph and telephone communications will be had through it.

Senator Lodge has introduced a bill as an amendment to the Naval Appropriation bill, calling for an appropriation of \$25,000 for the purpose of taking soundings between Honolulu, in the Hawaiian Islands, and the Empire of Japan and Australia, for the purpose of determining the practicability of the laying of a telegraph cable between the points named, and also authorizing the President to place a vessel of the United States for use in making such surveys.

The telephone war which has been raging in Columbia, Mo., for some months, has just closed in favor of J. A. Hudson, formerly editor of the *Macon Times*, and Thomas Gary of Macon, who owns several plants in North Missouri. They have purchased both of the Columbia systems and will consolidate the two and put in an entirely new plant. The line will be extended to Jefferson City, Fulton and other neighboring towns.

An effort is being made to establish a new telephone exchange in Watertown, N. Y. Frank A. Sherman has undertaken the management of the enterprise for the Shaver Telephone Company, and is endeavoring to secure the names of 150 patrons in order to secure its success.

The District Commissioners, in a letter to Senator McMillan, chairman of the Senate District Committee, have recommended adverse action on Senate bill 3,716, to authorize the Automatic Telephone Exchange Company (Limited) to construct, operate and maintain a telephone exchange in the District of Columbia.

The New State Telephone Company has been granted a 30-year franchise in Lapec, Mich., on condition that the city gets the use of two 'phones gratis for five years. The Bell 'phones will be thrown out.

A St. Joseph, Mo., dispatch states that the Missouri & Kansas Telephone Company is preparing to compete with

the Harrison Telephone Company by establishing connections in Northern Kansas and Southern Nebraska. All points on the Grand Island road will be covered by both companies.

The common council of Fond du Lac, Wis., has granted a franchise to the Eastern Wisconsin Telephone Company with the conditions that telephones for business houses be placed at a rental not to exceed \$2 per month, and for residences at not to exceed \$1 per month.

W. H. Kelley, of Newark, N. Y., has decided to establish a telephone exchange in the Horton block in that town as soon as the building is completed. Over forty persons have agreed to put in 'phones. The Newark Union says the service is bound to be first class with Mr. Kelley behind the project.

The Pennsylvania Telephone Company has perfected arrangements whereby its line will be extended from Chambersburg to Greencastle, Upton, Welsh-Run, Mercersburg, Penmar and Blue Mountain, thus connecting all the principal towns of the county with the county seat.

The Valley Telephone Company, Bay City, Mich., has ordered 1,500 telephones from the American Electric Telephone Company of Chicago for their Valley system. This order will be increased soon. The first 'phones will be placed in service in West Bay City in a few days.

A bill has been introduced in the Maryland Legislature for the reorganization of the Home Telephone & Telegraph Company of Baltimore, now in the hands of a receiver. The bill grants to the reorganized company all the rights and privileges held by the present company.

The Phoenix Telegraph & Telephone Company of Phoenixville, Pa., has made application for a new charter under the name of the Chester County Telegraph & Telephone Company. Its directors are Samuel W. Charles W. and Frank W. Gumbes, of Oaks, Montgomery county, and Thomas L. Hodges and William D. Bernard, of Philadelphia.

The longest telephone line will soon be in operation. It will extend from San Diego, Cal., to Nelson, B. C., nearly 2,225 miles. It will be twice as long as the longest line heretofore found practicable—that from Boston to Chicago by way of New York.

A company has been organized in Wallowa county, Oregon, to build a telephone line from Lostine to Paradise. The line will pass through Leap and Flora, and it is hoped to have it in operation within two months.

New Companies Incorporated.

The Tecumseh Telephone Company, Tecumseh, Mich. Capital stock, \$10,000.

The Juniata Telephone & Telegraph Company, Mifflintown, Pa. Capital stock, \$2,400.

The Union Telephone Company, Portland, Me.—Capital stock, \$10,000. Incorporators: G. A. Beaton and others.

The Inter-State Telephone Company, La Crosse, Wis. Capital stock, \$100,000. Incorporators: P. S. Elwell, George W. Bunge and Andrew Lees.

The Alvin & Angleton Telephone Company, Alvin, Tex. President, A. J. Birchfield; secretary and treasurer, O. S. Cummings; general manager, F. J. Bush.

The Lostine Telephone Company, Lostine, Ore.—Capital stock, \$1,500. Incorporators: E. W. Rumble, Guy E. McCully, W. S. Burleigh, A. E. Gray and H. C. Keefer, all of Lostine.

The Central Commercial Telephone Company, Bellefonte, Pa. Capital stock, \$25,000. The line will take in State College, Bellefonte, Lock Haven, Renova, Jersey Shore and Williamsport.

The Humboldt Telephone Company, Humboldt, Neb.—to put in a telephone exchange in Humboldt. Capital stock, \$1,000. Directors: Mayor A. H. Fellers, F. W. Samuelson, O. A. Cooper, E. A. Tucker and F. R. Butterfield.

The S. V. Interior Telephone Company, New York—to manufacture electric devices. Capital stock, \$30,000. Directors: R. G. Vassar, J. G. Smith, J. D. Anderson, W. B. Dall, C. C. Bean, G. Tait, C. A. Dall.

The Mutual Telephone Company, Ronceverte, W. Va.—to construct a telephone line from Marlinton to Monroe Academy, Pocahontas, Franklin, Lewisburg, Ronceverte and Greenbrier. Capital stock, \$10,000.

The American Typal Telegraph Company, Detroit, Mich.—to engage in the leasing, manufacture and sale of telegraph apparatus and the ownership and exploitation of rights in relation thereto. Capital stock, \$50,000, of which \$5,000 is paid in. Incorporators: James McMillan, Frank J. Hecker, Charles L. Freer and William F. Jarvis.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 12c.; casting, 11½c.

The underground trolley service is to be installed on the Eighth Avenue line, New York; the present week.

The Frankford & Southwark Passenger Railway Company, Philadelphia, has declared a dividend of \$3.50, payable April 1.

The capital stock of the Buffalo, Hamburg & Aurora (N. Y.) Electric Railway Company is to be increased from \$200,000 to \$400,000.

It is stated that stockholders of the Bell Telephone Company, at their annual meeting to be held March 29, will not be asked to authorize an increase in the capital stock.

In the New Jersey Legislature on the 21st inst. the Squire bill, authorizing the sale of trolley road franchises to the highest bidder, was passed in the House by a vote of 33 to 19.

There appears likely to be a default in the interest on the Louisville Railway common stock on April 1. The directory is divided on the matter but the leading members are said to be strongly in favor of it.

The American Bell Telephone Company has declared its regular quarterly dividend of \$3 per share, payable April 15. The transfer books close for the annual meeting on March 24 and reopen March 30. The books will be closed for dividend March 31 and reopened April 15.

The Cincinnati Street Railway Company has decided upon a further issue of new stock to the amount of \$650,000. After this new issue there will still remain of the authorized capital of \$1,800,000 to be issued \$944,000. At the meeting of the directors on the 15th the usual quarterly dividend of 1½ per cent. was declared.

The Edison Electric Illuminating Company of New York reports for February: Gross earnings, \$256,880; expenses and taxes, \$122,307; net earnings, \$134,573; surplus for dividends, \$89,998. For the same time in 1897 the gross earnings were \$212,803; expenses and taxes, \$94,796; net earnings, \$118,007; surplus for dividends, \$78,932.

The bill granting franchises to street railway corporations which has passed the New Jersey House limits the time for which corporations may use or occupy any public street or highway under any consent, permission or franchise hereafter granted. It limits franchises to 25 years. It is not certain that the bill will get through the Senate.

In a decision just reached by the Massachusetts Railroad Commissioners the Holyoke Street Railway Company is authorized to issue \$100,000 additional stock to capitalize the floating debt incurred by construction. This makes the total capital of the company \$500,000. The Commissioners have fixed the market value of the new issue at \$125 a share.

The announcement has been made that in case the Manhattan Railway Company declines to accept the terms offered by the Rapid Transit Commissioners as a means of increasing speedy transit facilities in New York City, two syndicates have offered to take the matter in hand under the modified terms of the bond, and go to work promptly on the underground or tunnel system.

The Louisville "Commercial" states that "the Louisville holders of the preferred and common stock of the New Orleans Traction Company are placing their stock in the pool very rapidly. There are 33,000 shares of the stock held in Louisville, and the stockholders' committee, composed of George W. Norton, John Russell and Col. St. John Boyle, will be satisfied if two-thirds of this amount comes into the agreement."

It is stated that a commercial company has been organized in New York under the name of the Russian-American Trading Company, with a capital of \$5,000,000; sample rooms are to be established in St. Petersburg, Moscow, Odessa, Riga, Warsaw, Astrakhan and various other parts of European and Siberian Russia. German trade papers are saying that it is the object of this company to secure the control of the Russian markets for machinery, and to secure concessions for the erection of electric light plants, etc.

A mortgage from the Rochester Gas & Electric Company to the Rochester Trust & Safe Deposit Company was recorded a few days ago in the county clerk's office at Rochester, N. Y. The amount of the mortgage is \$300,000, and it is given to fund the floating debt of the company and for other corporate purposes. The mortgage covers all franchises, real estate, gas and electric plants, machinery, apparatus, wires, poles and mains, as well as a number of shares of capital stock in the Brush Electric Light Company.

The annual report of the Electric Storage Battery Company of Philadelphia for the year ended December 31 last is most encouraging for stockholders. Net earnings after the payment of fixed charges amounted to nearly \$322,000. Sales in 1897 aggregated more than \$1,000,000, and were \$455,000 in excess of the sales in 1896, an increase of nearly 80 per cent. Net profits for the year amounted to \$340,000, an increase over 1896 of more than \$190,000, or about 130 per cent. After charging off for depreciation, etc., about \$65,000, the company shows a net surplus for the year 1897 of about \$258,000.

The Asbury Park & Belmar trolley road, sold by order of the U. S. Court, has been purchased by Col. B. M. Harvey of Asbury Park and Acton C. Hartshorne of Freehold, N. J., for \$53,000. The sale was the culmination of several years of litigation. It is generally understood that the sale was in the interest of the Atlantic Coast Company. It is probable that the Atlantic Company will operate a trolley road all the way to Belmar, making a continuous trolley road from Belford on the Bay Shore through Red Bank and all the Monmouth resorts except Spring Lake and Sea Girt.

The lease of the Second Avenue Railroad Company to the Metropolitan Street Railway Company, both of New York, was filed with the Secretary of State at Albany on the 19th inst. The terms of the lease are that the Metropolitan Street Railway Company shall control the lines of the Second Avenue Railroad Company during the unexpired term of the company's charter in consideration of the payment to it of an annual rental of 8 per cent. on the par value of its capital stock for the three years commencing March 1, 1898, and 9 per cent. thereon yearly for the remainder of the term of the lease.

The North & South street railway bill has been reintroduced in the municipal assembly at St. Louis, and is now backed by an organized company. The name of the new applicant for the sweeping street franchise is the Central Traction Company of St. Louis, capitalized at \$100,000. The incorporators are Finis E. Marshall, L. B. Tebbetts and John H. Blessing, of St. Louis; B. M. Snyder, of Kansas City; Jules S. Bache and H. Staples Potter, of Boston. The new bill differs in several respects from the old one which was vetoed by Mayor Ziegenheim after it passed both houses. Among the differences is an increase of the compensation the city is to receive from \$750,000 to \$1,000,000.

The Edison Jr. Incandescent Lamp Company has issued a circular calling for subscriptions to its stock. The company is incorporated under the laws of West Virginia, with a capital stock of \$1,500,000, with shares at the par value of \$100 each, of which \$500,000 is to be non-cumulative preferred stock. Of the preferred stock \$250,000 is to be retained in the company's treasury for future use, and \$250,000 is offered for subscription at par and a bonus of 20 per cent. in the common stock. The circular states that the business of the company secured during the last few months will pay good dividends on the stock now offered for subscription. The money raised by the sale of the stock is to be used as follows: \$50,000 for the expansion of business, and \$200,000 for construction, equipment and operation of factories.

EDITORIAL NOTES.

The Telectroscope. Shortly after the telephone made its appearance and was found to be a commercial necessity, numerous inventors turned their attention to devising some means, through the medium of electricity, whereby a scene or portrait could be reproduced at a distance. Several methods were from time to time suggested in which selenium invariably played an important part, owing to the peculiar quality which this substance possesses of varying its electrical resistance according to the intensity of light thrown upon it. In one rather ingenious but crude method suggested, the transmitting and receiving apparatus consisted of two selenium plates in circuit, divided up into minute squares, each of the latter being connected by a separate wire to the corresponding square upon the second plate. It was intended by such an arrangement to reproduce on the receiving plate by electricity, and through the medium of the connecting wires, any image which might be reflected or thrown on the transmitter. Although theoretically such an apparatus should accomplish what was expected of it, provided the squares were minute enough, as will readily be seen, it necessitated the use of an immense number of separate conductors, the difficulty and cost of sorting and distributing them being considered insurmountable.

Herr Szczepanik, an Austrian Pole, has recently devised an instrument which he calls a fernseher or telectroscope, and which is said to do away with many of the objectionable features previously mentioned. His apparatus, which allows of pictures being reproduced over almost any distance, although far less complicated than any system previously devised is necessarily more or less intricate. Herr Szczepanik makes use of four mirrors coated with an opaque substance, two located at the transmitting end of the line and two at the receiving end. On the coating of two of these mirrors numerous parallel lines are drawn by means of a knife or needle, all those on one of the mirrors being at right angles to those on the other, thus exposing a large number of narrow linear strips of reflecting surfaces. This is to allow of only a single line of the object under observation being exposed to the reflective influence of the mirror. The first mirror in which the object is reflected is pivoted and constantly made to oscillate by means of an electro-magnet. Thus the lines of the scene or picture which is being transmitted are continually changing. Each of these single line reflections is broken up into a series of points by means of the second oscillating mirror, which is located at an angle to the first. Thus, owing to the fact that two lines intersect each other in a point, only a single point of the reflecting line of the first

mirror will appear in the second, and therefore the ray corresponding to that point alone will be reflected from the second mirror.

This ray of light, which corresponds to a given point of the image which is being transmitted, is made to generate a more or less intense current through the medium of a selenium cell. A common form of cell consists of a number of brass disks mounted in a cylindrical column with intervening sheets of mica as an insulating material. The alternate brass disks are electrically connected to form one electrode, the remaining to form the other, the whole being securely clamped together and covered with selenium while hot. As previously stated, the peculiar property of selenium is that its ohmic resistance varies with the intensity of the light to which it is exposed, the resistance being usually about twice as great in the dark as in the daylight. Thus when a cell of the above nature is connected by means of suitable conductors to the receiver, the light rays are converted into electrical impulses of greater or less intensity, which are again reconverted into light rays at the receiving end by means of an electro-magnet. This is accomplished by the magnet moving a prism located in front of a strong white light, the latter naturally being broken up into the seven colors of the spectrum. As the prism is made to move through the medium of the electro-magnet, it will revolve just far enough to bring the required color into view. The color would now be reflected in one of the two mirrors, which are made to oscillate synchronously with those on the transmitter. In this way each point of the picture in its natural color is reproduced by the two receiving mirrors and reflected upon a screen. As the separate points follow one another with great rapidity, the observer, so it is claimed, will take in the impression of the entire picture.

By constantly reproducing the effect the picture may be made to last as long as desired. It is said to be no more difficult to reproduce a moving picture than a still one, for according to Herr Szczepanik it is the actual picture which is reproduced and not a mere record as in the case of the cinematograph. The inventor moreover claims that there is no limit to the distance at which the apparatus may be successfully operated.

It is claimed by those who have had an opportunity of examining Herr Szczepanik's apparatus, and watched the transmission of an image, that the colors in the reproduced picture are not always clear and the objects reproduced do not remain steady but are constantly vibrating as in the case of cinematographic images. This defect will, however, undoubtedly be remedied at some future day by the inventor, who is constantly seeking to improve and simplify his apparatus. If Herr Szczepanik has succeeded in accomplishing what is claimed, he has solved a problem upon which inventors have been at work for

years, and has given to the world an invaluable invention. The usages to which this apparatus could be applied are both numerous and interesting. In a commercial way it would enable of business being transacted as safely and conveniently at a distance as over a counter, owing to the possibility of identifying a person, or even if necessary watching him attach his signature to an important document. In the event of war such instruments could be located at various points along a coast, and would enable a person situated miles away to detect the advance of a hostile fleet. Battlefields during action, foreign scenes or an eclipse of the sun might be observed. In fact, there are hundreds of uses to which the teleoscope could be adapted if found to work properly. As we understand, Herr Szczepanik intends to exhibit his invention at the Paris Exhibition of 1900, so that in all probability any minor defects in the apparatus which may now be apparent will undoubtedly be remedied during the next two years.

* * *

Future Fields for Electricity.

Of late years there would seem to be a growing demand for electrical machinery among the countries of Central and South America. About eight years ago Mexico suddenly awakened to the fact that the large water powers in that country were going to waste when they could be advantageously utilized for generating electricity for various commercial purposes. An electric plant was accordingly installed and proved so successful that others immediately followed. Some idea can be formed of the rapid strides electricity has made since then in Mexico, when it is stated that during the last year the United States exported electrical machinery and apparatus to that country amounting to \$284,714, and during the present year will in all probability export several times that amount, if the rumor is true that the City of Mexico is shortly to have all its street railways operated by electricity at a cost of \$3,000,000. This advance has been steadily made since 1890 in spite of the peculiar character of the people, who have the reputation of ever making haste slowly. As Mexico abounds in sources of water power and is practically destitute of fuel, the development along this line was inevitable.

Argentina is also beginning to employ electricity for various purposes. Owing to the facilities that country possesses for procuring coal economically from England, steam is mostly utilized for generating electric power. Although electricity has been but recently adopted in that republic, the exports last year of electrical apparatus from the United States to Argentina amounted to \$157,561.

There also appears to be a growing demand for electrical machinery in Brazil, but that country, not being so well situated as Argentina in regard to the procuring of cheap fuel, the inhabitants are making some use of the limited water power available. Recently the Minas Railway Company was incorporated at Albany, N. Y., with a capital of \$500,000, to construct and operate an electric railroad in the city of Minas. Thus it will be seen that Brazil is awaking to the necessity of adopting modern methods. During the last year the United States sold Brazil \$110,460 worth of electrical apparatus, a considerable amount when it is recalled that but a very few years have elapsed since the first generator was started running in that tropical region.

Lima in Peru has recently installed an electric lighting plant, and Chili, Colombia and other South American countries are also beginning to appreciate the advantages of electricity, as can be seen from the fact that \$66,084 worth of machinery of the above nature entered the latter country during 1897.

The next new source of demand will unquestionably be Africa. Certain sections of that continent, notably Portuguese Africa and the Cape Colony, have made rapid strides of late in industrial enterprises, immense quantities of iron pipe and other

products being shipped there annually from this country.

Gold mining, which is carried on on an extensive scale in certain portions of South Africa, should in the near future create a considerably increased demand for electrical machinery now that several electro-metallurgical processes have proven successful in the recovery of that precious metal. It is therefore only reasonable to suppose that electricity will before long be extensively adopted owing to its economy as a motive power either for pumping water, propelling street cars or in gold mining.

* * *

The Holland Submarine Boat.

For probably the last quarter of a century serious efforts have been made by inventors, especially in England, France and in this country, to perfect a boat that could be operated successfully under water. One of the great difficulties which had to be overcome was in finding a motive power wherewith to operate the machinery while the vessel was submerged. In most of the early attempts this proved to be one of the main difficulties, and it was not until electricity came into general commercial use that the solution was found.

Mr. John P. Holland, who has been working on the submarine boat problem since 1877, has recently launched a craft of the above nature which, so far, if we except an occasional slight derangement of the machinery, seems to have proven eminently successful. This boat, which by the way is the sixth that the inventor has built, is cigar-shaped in form, 53 feet in length by 10 feet 3 inches in width. Her frame is of steel, to which plates of similar metal about one-half inch in thickness are securely riveted. A small conning tower, two feet in diameter, rises from the middle of what might be termed the deck, and it is through this opening that access is had to the interior of the vessel. When running only partly submerged, the pilot can from the conning tower obtain a view of the surroundings. Just before diving this opening is hermetically closed.

The boat may be submerged either by admitting water to a number of tanks, or when properly ballasted may be made to dive by manipulating the horizontal rudder with which she is provided. This horizontal rudder also enables the vessel to be kept at any desired depth below the surface. One of the inventor's aims in the construction of this craft was to allow of her being run either entirely on the surface of the water, in which condition she is expected to make 16 knots an hour, or partly submerged, with nothing but the conning tower visible, or again entirely submerged. In the latter case her speed would be materially reduced, probably not exceeding eight to nine knots an hour.

The necessary motive power for this submarine boat is obtained by means of a 50 HP. gasoline engine and storage batteries, the latter weighing 21 tons, located in the bottom of the vessel and serving as ballast. When running on the surface the gasoline engine is usually employed to drive the single screw, but when about to dive the engine is disconnected from the propeller shaft and the motor substituted. The boat is illuminated by means of electricity, and is also provided throughout with electric bells for communicating purposes. When the vessel has been running submerged, and it is desired to come to the surface, compressed air is admitted to the tanks containing the water, and the latter being expelled the boat rises to the surface. The crew are provided with fresh air from these same tanks, which contain sufficient to last them for nine or ten hours. In the event, however, through any mishap of the air living out, a float is provided which could be attached to an air tube and sent to the surface, and by this means air could be drawn into the interior of the vessel.

One of Mr. Holland's principal claims is that his submarine boat would prove invaluable in time of war and could destroy single-handed a whole fleet.

From the successful tests which have recently been made with this vessel in Staten Island Sound, it would seem as though Mr. Holland's claims were well founded. In the several trials this submarine boat underwent, it was proven beyond doubt that she could be made to dive or sink at will. The only trouble noticeable appeared to be with the machinery which, either owing to its complexity or delicacy, was frequently getting out of order. This no doubt was in part due to the fact of its being new and not in good working condition.

As a motive power for submarine boats electricity as derived from the storage battery would seem to be everything that could be desired, as it operates the motor without consuming oxygen, which is greatly to be desired where air is comparatively scarce.

Under the Searchlight.

Notes and Comments on Various Topics.

THE New York *Commercial* says: "Some General Electric stock has gone astray. It is in a freight car, and was lost somewhere between Schenectady and Worcester, where the General Electric Company is setting up new machinery for the Consolidated Street Railway Company. The stock is lost, car and all. If any one has seen it wandering through the country he will confer a favor on the General Electric Company by sending a postal card to the Edison building, Broad street, stating where it can be found." This is by no means the first batch of stock belonging to the General Electric Company that has gone astray.

* * *

THE Philadelphia *Record* states that a four-inch circular saw for the amputation of limbs is being installed at the Emergency Hospital at Boston. An electric motor will furnish the power to run the device. The saw will be mounted on a flexible shaft like that which a dentist uses, only larger. The bearings, in which runs the saw arbor, are attached to a handle by which the surgeon is able to direct the saw at any angle. Dr. Galvin and his assistants will be able to save considerable time by the use of this appliance. Not only does the saw cut much faster than a hand tool, but the heat of its rapid cutting sears the flesh and blood vessels and the healing processes of nature are advanced to a stage which by the old method is reached only after an hour or two.

* * *

Directors of the General Electric Company intimate that the matter of General Electric deferred preferred stock dividends and capital impairment is now under consideration, and they express the opinion that these matters will be settled before very long. A prominent director says: "The company is now doing exceedingly well and I think the stock is now a purchase."—*Boston News Bureau*.

It is just such stuff as this that has been appearing in various papers almost word for word during the past two years. The General Electric Company must certainly believe in the saying that there is a fool born every minute.

* * *

A UNIQUE lawsuit is about to be brought against the Nassau Electric Railroad of Brooklyn. It is claimed that the above company is directly responsible for \$500 worth of damage done to furniture and other household effects in a dwelling located along the line of the road. The complainant, who by the way is a woman, states that on the day named in the complaint one of the trolley wires broke and the motorman gathered it up and wound it around a lamp-post directly in front of her house. She claims that the electric current was communicated from the trolley wire to the lamp-post, thence to the gas-pipes which entered her house, and up through the walls until it met a lead water pipe. The current expended its full force on the lead pipe, melting it so badly that the water escaped in large

quantities. She says that the floors and ceilings and all the furniture in two rooms were practically destroyed by the flood of water thus let loose.

* * *

ACCORDING to the London *Electrical Engineer*, a new form of footwear is being extensively advertised in that city, known as the "Galvanic genuine electric boots and shoes." The company exploiting this new form of footwear has gotten out a pamphlet to which our English contemporary refers as follows: "The logic in this little book is worthy of notice. Thus, we learn that 'motion is philosophically regarded as the first attribute of life. An electric current is electricity in motion, and it is an established fact that continuous currents of electricity actuate the circulation of blood, and are, indeed, the very propelling power which stimulates it in its onward course: therefore 'the blood is the life,' but electricity is the life of the blood.' Coming down to the feet, we learn that 'the sole of the foot is one of the most delicate parts of the human system, owing to the quantity of sensitive nerves with which it is supplied: therefore, as the electric apparatus acts directly on these nerves, it cannot fail to have a comforting and beneficial effect. Undoubtedly voltaic electricity is the best means of exercising electric influence on the human system, no shocks being felt. The reparative action of 'continuous current' produces effects analogous to those of the natural currents in the body whilst the latter is in a state of rest, whereas the effect of the intermittent current (shocks) on the system is analogous to those produced by the discharges of animal electricity, owing to muscular exertion, and thus tends to exhaustion of vital force.' Coming to the construction of the boot, we find that one of the Pulvermacher Company's 'band chain' batteries is inserted in the felt inner sole. The cells consist of equal lengths of zinc and gilt copper wire wound on a flexible flat band and separated from each other by an insulated thread. The moisture from the feet does the rest, and the mild invigorating currents for which the Harness electropathic belts were noted are produced. The mechanical construction of this chain is not illustrated, but, like the Harness belt cells, if a current is produced and applied continuously, sores are also produced, which are not wanted on the soles of the feet. No connection between zinc and copper and good faith on the part of the wearer are the great desiderata to make these boots both harmless and useful, but the faith might be exercised on a pair of ordinary boots and the saving in first cost devoted to charity."

DEATH OF NELSON W. PERRY.

We are pained to have to announce the untimely death of Nelson W. Perry, which occurred at 7 o'clock on Sunday evening at his residence in Brooklyn. On Saturday night Mr. Perry, with his usual love for research, was experimenting in his laboratory. During the course of his work it was necessary to turn out the gas, leaving the room in total darkness. Mr. Perry becoming thirsty reached for a glass of water standing on a table, but by mistake picked up a glass containing bichloride of potassium which he drank. Immediately recognizing the peculiar taste of the poisonous fluid, he announced the fact to a member of his household, and several physicians were sent for who worked unremittingly over him for some hours. It was believed at one time that he was improving, but on Sunday he grew gradually worse and at the hour mentioned expired.

Mr. Perry was exceedingly well known among the electrical fraternity and was extremely popular. He was born in Columbus, Ohio, in 1853, his father being Judge of the Supreme Court in that State. He received his education at the Phillips Exeter Academy, Harvard University and the School of Mines, Columbia College. At the latter seat of learning he showed remarkable ability, graduating first in his

class in a number of subjects including an advanced course in physics. In 1880 he was appointed to the chair of metallurgy at the University of Cincinnati, and for a number of years thereafter practised his profession of mining engineering. During this period he did considerable research work in chemistry, and evolved a new method for making platinum assays. He also contributed several important papers to various scientific societies.

In 1887 Mr. Perry gave up mining engineering to go into electrical engineering, and for several years thereafter was connected with a number of leading electrical manufacturing companies. In 1891 he became connected with *ELECTRICITY*, first as associate editor, later as editor, holding the latter position until a few months ago. His excellent work in connection with this journal needs no comment. Mr. Perry's ability was well known. He was a member of the American Society of Mechanical Engineers, a member of the New York Electrical Society, a member of the Institute of Mining Engineers, a foreign member of the Deutsche Gesellschaft für Chemie of Berlin, and of the Societe Chimique of Paris. He was also a member of the American Institute of Electrical Engineers, in which society he took a leading part, frequently contributing valuable papers at its meetings.

Mr. Perry was married twice, and leaves a widow and three children to mourn his sad fate. The sudden death which terminates a career so full of promise is to be deeply deplored, and *ELECTRICITY* tenders its sympathy and condolence to the relatives of the dead man.

The remains were taken to Cincinnati for interment on Tuesday evening.

THE MODERN FINANCIER WANTS TO UNLOAD ON NEW ORLEANS NEXT.

A wave of municipal financiering seems to be sweeping over the country and the modern financier has new opportunities without number for "doing" the public and increasing the pile already in his coffers. Is it any wonder that a few people are growing richer every day and the public at large growing poorer?

In Philadelphia some of the modern financiers have recently leased the gas works and formed a company, with a large issue of stocks and bonds, for manipulating the deal. Municipal ownership there is of course not now the thing—at least not until all the money has been made that can be made by the insiders, and then, we suppose, the city will buy the leasing company out and another rake-off will be made by the insiders.

We publish below an interesting and unique document from New Orleans. This is a "peach" in its way, and needs no explanation any further than that all idea of the prices to be paid for various private plants to be purchased by the city is omitted, either intentionally or unintentionally.

In our issue of January 26, 1898, we called our readers' attention to the fact that a large part of the stock and bonds of what is known as the Edison Electric Company of New Orleans, which it is now proposed to unload on the city, was owned by the General Electric Company. According to their 5th Annual Report, issued on January 31, 1897, the above organization controls \$3,871,000 worth of these securities.

In view of the recent arrival at New Orleans of a private car loaded with cash and containing one of the slickest men in the business, we can but imagine that "sugar, if necessary," will be used to push forward the electric part of the scheme. If this sale to New Orleans of the lighting plants could only be accomplished before the annual report of the General Electric Company appears, we presume profits could again be made by marking up the prospective value of New Orleans lighting securities.

This is a funny world, surely, but it is funnier for

the modern financier than for the public. As electrical securities are dead slow on the New York Stock Exchange, it is but natural that a market should be found for them among the various municipalities.

Among the men whose names are suggested by the so-called Improvement Association for the first Board there are undoubtedly a large number who would justly refuse to have anything to do with such a scheme were the matter only placed before them in the proper light:

THE MUNICIPAL IMPROVEMENT ASSOCIATION

Of New Orleans (P. O. Box 1020).

Wm. B. Bloomfield, President.
J. L. Lyons, First Vice-President.
Geo. Lhoté, Second Vice-President.
Hugh McCloskey, Third Vice-President.
Lewis Johnson, Fourth Vice-President.
Herman Meader, Fifth Vice-President.
T. J. Woodward, Sixth Vice-President.
E. F. Kohnke, Seventh Vice-President.
R. B. Jones, Secretary.
Julius Weis, Treasurer.

ORDINANCE TO INSURE MUNICIPAL OWNERSHIP OF PUBLIC WORKS.

EQUAL PRIVILEGES TO ALL. SPECIAL PRIVILEGES TO NONE.

The Duty of the Convention to Grant New Orleans a Board of Public Works.

The Citizens of New Orleans should not Divide their Forces on Separate Bills, but should Concentrate upon One Ordinance to obtain Municipal Control of all Public Works.

NO WASTE AND EXPENDITURES FROM CHANGE OF ADMINISTRATION—TAX REQUIRED NOT TO EXCEED TWO AND ONE HALF MILLS—REDEMPTION OF ALL BONDS GUARANTEED BY 1950.

By this Ordinance the Public Schools of New Orleans will receive about \$75,000 additional to their present fund. Employment will be given to thousands of laborers. Every Citizen and Member of the Convention should oppose all bills that do not provide for the Municipal Acquisition of the Waterworks, Sewerage and Other Public Works.

To the People of the City of New Orleans:

It is an unpleasant fact to state that the city of New Orleans has been for the past twenty years one of the least progressive cities of the United States.

It has declined in population from sixth place to twelfth.

The city of New Orleans lacks that progressive character which attracts population and manufactures.

A mighty effort must be made to place our city in the front rank of American cities.

About a year ago "The Municipal Improvement Association, of New Orleans," was formed for the purpose of devising plans for the benefit of the city.

They have prepared an ordinance, to be brought before the Constitutional Convention, providing for a Board of Public Works.

It was published expressly for every citizen to read, so that it could be subjected to criticism.

The object of the ordinance is to enable the city to acquire and operate its own public works, which would be a benefit to the city itself, and, at the same time, give employment to thousands of men—its citizens—in building up the various systems of public works.

The proposed Board of Public Works is not a private corporation, formed to make a profit out of the city, but is a part of the city government itself.

Nothing is taken away from the city. Public works which should be owned by the municipality are now in the hands of private corporations.

If the ordinance becomes a law, the city government will perform about the same functions in the future as now, with this exception: instead of col-

lecting from the taxpayers more than two hundred thousand dollars for street lighting, and paying same to private corporations, the amount will be placed under control of the Board of Public Works, to be administered for account of the city, with the ultimate object of acquiring the lighting plant.

The same thing will be done as to other corporations. Between the two, is not the latter the better plan?

In regard to the organization of the Board, a membership of one hundred was suggested, with the view of dividing them into committees having charge of the various works and systems; all of these sub-committees, however, to be directly under the supervision and control of the entire one hundred members.

The first Board shall be composed of the following named persons:

Wm. B. Bloomfield, Hugh McCloskey, Lewis Johnson, George Lhote, J. C. Murphy, Peter S. Lawton, E. F. Kohnke, W. A. Gordon, S. F. Heaslip, Herman Meader, Jno. B. Myers, P. W. Mulqueeny, W. H. Dwyer, Jas. D. Hill, Maurice Stern, W. E. Lawrence, W. H. Byrnes, John A. Davilla, T. J. Stanton, Robt. B. Jones, Julius Weis, A. A. Maginnis, Chas. Godcheaux, J. W. Hearn, Geo. W. Young, R. W. Wilmot, Frank R. Johnson, J. B. Sinnott, John Everet, W. H. Douglas, Thomas White, S. Locke Breaux, F. Reusch, Jr., D. D. Colcock, Eugene May, Thomas Sloo, W. J. Montgomery, G. G. Norris, Frank Dameron, Geo. H. Dunbar, Thos. J. Woodward, Geo. Soule, Paul Gelpi, Jos. Garcia, Jno. D. Moulin, Walter A. Taylor, B. M. King, R. H. Lea, Wm. Atkinson, B. P. Sullivan, James H. Dillard, Paul Capdevielle, B. P. Moss, Peter Elizardi, P. McGrath, Ed. Cunningham, John Lynch, N. J. Long, D. B. Morey, Sam Geoghegan, Dennis Sheen, W. A. Kernaghan, H. Buddig, J. B. Collins, Jno. T. Gibbons, H. L. Franz, Jno. Houlgrave, M. J. Sanders, Jas. Thibaut, Hugh Flynn, Geo. K. Pratt, W. G. Vincent, Felix Couturie, John Henderson, J. F. Markey, Chas. Feahney, E. F. Dyer, A. R. Blakely, Chas. Dittman, Denis Lanau, J. Watts Kearney, Otto Thoman, Henry Carstens, Henry Thoele, Frank W. Young, Frank Barker, Thos. M. Gilmore, R. H. Keen, F. R. Cogswell, Gustave Pitot, A. Darcantel, Julius Koch, W. W. Carre, N. Burg, J. B. Cefalu, P. Powers, Wm. M. Baker, Eugene F. Buhler.

It would take the time and attention of a committee of ten or more members to administer the water works; as large a committee would be required by the drainage system, and so on with each separate and distinct work; but as all of these would co-operate under the supervision of the whole Board of Public Works, the present unseemly and injurious scramble of every Board for itself and a tendency to grab all for its special object, ignoring and combating other equally important and necessary adjuncts to the advancement of the city, would be checked and properly regulated by the whole Board with an eye single to the general good. A Board controlling millions of dollars of the people's money should have a large membership of our citizens.

This large membership lessens the chances of the Board being corrupted.

It is much easier to influence and corrupt a small number than it is to corrupt the majority of an hundred.

Political control of the Board is minimized, because no one holding an office of profit, either State, parish or municipal, can become or remain a member.

In proposing a Board of this character, invested, as it is, with such large powers, the Municipal Improvement Association was impressed with the great responsibility which it assumed.

The question determined was that the Board of Public Works should be run upon a business basis, and removed as far as possible from political influence.

It was, therefore, thought best to suggest the names of the one hundred members to compose the first Board of Public Works.

The members have been selected from every class—the merchant, the clerk and the laboring man having their representatives on this Board.

The Board is divided into three classes of thirty-four members each, their terms of service varying from four to twelve years.

Every four years one term expires, thereby retiring thirty-four members, whose places shall be filled by thirty-four men elected by vote of the people at the general election in this city, two from each of the seventeen wards. The bill prohibits the re-election of the thirty-four retiring members.

There are three methods provided in the Bill for removing members of the Board: by a two-thirds vote of members, by suit of twenty taxpayers or a creditor of the Board to the amount of twenty-five thousand dollars.

The ordinance affords no ground for the assertion that the Board is a self-perpetuating body, for, as above explained, thirty-four members are elected, by vote of the citizens, at the general election, every four years.

It has been said that the voice of the people should be heard in selecting the first Board. Theoretically, this is correct. But, practically, if the first Board were left for selection at a general election, the danger is that the ballot-box stuffer would elect the members.

The present Grand Jury has indicted a number of election officers for fraud; and this in spite of an "election system" that is supposed to exclude all possibility of fraudulent voting.

The Board of Public Works is given power to acquire and operate the following public works and systems of the city of New Orleans:

SEWERAGE.

A sewerage system is urgently needed to carry off daily all the fecal matters from 50,000 privy vaults of the city.

The city granted a sewerage franchise to a company, which is now in the hands of a receiver, and the city has instituted suit for the forfeiture of the franchise.

If this private company were to succeed, it is believed that in addition to the issue of bonds necessary to construct the system in the district specified, there would probably be a further issue of two millions of dollars of stock, upon which a dividend of, possibly, 6 per cent. would be declared, thus taxing the citizens one hundred and twenty thousand dollars per year over and above what they would be taxed if the system were owned by the city itself, in which case no profits would have to be paid to stockholders.

The sewerage system contemplated by this private company was to be located, for the present, only in the thickly settled part of the city, where the most income would be produced.

The other parts of the city would possibly remain unsewered for years to come.

WATER WORKS.

The water works, owned by a private corporation, was once owned by the city; but not being controlled by a permanent Board, it was made a political office, carrying with it the disorganizing feature of all political bodies—the dismissal of officers and employees after every election.

The constant change of management, for political reasons, could not but result disastrously.

There is a general complaint as to the quantity, quality and the price of water.

The New Orleans Water Works Company has a capital stock of two millions of dollars, and declares a dividend of one hundred thousand dollars yearly.

LIGHTING.

The city is paying more than two hundred thousand dollars per year for street lighting, about one-eighth of its entire alimony.

A private corporation must make its charges sufficient to declare dividends upon stock watered, possibly, in excess of its actual value.

The drainage plant, now being erected to furnish electric power to run the various pumps of the city can, with small comparative cost, be increased sufficiently to perform all of our street lighting.

If used for drainage purposes alone, the machinery would be idle most of the year.

GARBAGE AND STREET CLEANING.

Garbage and street cleaning should be placed under a Board of Public Works, in order to remove such an important function from the changing administration accompanying political control.

PAVING AND BANQUETTES.

A uniform system of paving and banquettes should be carried on until the entire city has been thoroughly paved. New Orleans has expended from its own treasury more than two million of dollars, within the last few years, for its share of street paving, besides three millions of dollars paid by private citizens as their assessment for streets and banquettes, and the largest part of this alleged "paving" is gravel. The city and the citizens have little to show for this expenditure, aggregating five millions of dollars.

TELEPHONES.

The streets of a city belong to the people, and their monopoly by a fortunate few, under a "telephone franchise," is not impartial government.

The present company charges ninety-six dollars per year for each telephone. The Board of Public Works could furnish a better service for thirty-five dollars.

This discrepancy shows how this corporation has been able to declare a profit of over one million dollars in twelve years. The difference between these two charges is about sixty dollars per year, which is equal to paying a tax of 1 per cent. on six thousand dollars, or a tax of two and one-half mills on twenty-four thousand dollars.

It is this exorbitant rate that denies the use of the telephone to the majority of our citizens.

BELT RAILROAD.

The future must be considered in connection with the matter of a belt railroad. The Mississippi Valley will soon have from fifty to one hundred million population. The increase of commerce therefrom will draw to the city scores of new railroads, all seeking the river front to connect with the shipping.

Should such an important factor in the city's prosperity as a belt system be placed under the control of one railroad, or should it be placed in charge of a Board of Public Works, whose policy will be to offer the same facilities to all roads alike? The first plan would remit the city's interests to a single railroad corporation, which would dictate terms to other roads, to selfishly further its own interests, while the Board of Public Works would advance the city's interests by granting the same rights to all, and special privileges to none. The policy of every railroad would be that of the T. & P., whose ordinance is now pending before the City Council, which provides that other railroads could use its belt system, "if the same did not discriminate against the Texas & Pacific." We may feel assured that all the belt facilities furnished by it would only be sufficient to meet the needs of its own traffic.

The Louisville & Nashville Railroad Company have an application before the Council for a similar grant along the river front below Canal street, which, if granted, would effectually exclude a belt system from that portion of the city.

The City Council should refuse to grant the application of these two roads. Public interests should be served in preference to private interests always.

A belt system under the control of the Board of Public Works would be enlarged to meet the growing needs of this port, and all existing or future roads would have free use of these facilities upon their paying their share of the actual expenses of the road. A different policy will build up other points, like Chalmette and Southport, to the detriment of our property holders and laborers alike; or

worse, cause the railroads which would prefer New Orleans as a terminal to seek instead Galveston, Sabine or Mobile, rather than be harassed by the dictation of a rival road in the use of city water front.

WHARVES.

Fortunes have been made out of the wharf leases, and these fortunes have been made at the expense of the commerce of the city. The wharves and landings should not be administered by private persons for private gain. All tonnage coming to this port should have like facilities at the lowest cost.

SYSTEMS SELF-SUPPORTING.

The systems above enumerated are required by the ordinance to be self-supporting. The charges for the privileges must be sufficient to meet the expenses, so that no system shall be a burden upon the taxpayer who is not using it.

PARKS, PUBLIC SQUARES AND PLACES.

In the hot climate of this latitude cities require breathing places for the people. There should be a large increase in the number of public parks and places in the city, and unless land is shortly acquired for the purpose it will cost millions to obtain these municipal lungs in the near future.

The city of Glasgow has added more than twenty-five squares and parks to its system within the last forty years.

DRAINAGE.

Drainage is so intimately linked with the other public works mentioned that it has been provided for in this ordinance in order to obtain a unified, central administration.

A practical illustration will emphasize the necessity for a central administration of public works.

Under a system of independent boards, suppose the Drainage Commission has finished its work in a certain section of the city and is followed by a Sewerage Commission. There would of course be an undoing of the Drainage Commission's work. Then, probably, the Waterworks Board would follow the Sewerage Commission, and there would necessarily be further destruction of previous work. And a conduit system (even now in course of adoption) might, perhaps, nullify the work of all preceding boards; or the paving of miles of streets might all be undone and the expense multiplied by the drainage and sewerage following immediately on its completion.

Under a Board of Public Works having a central, unified policy or plan, these different works would be economically systematized.

HOW THE PUBLIC WORKS CAN BE CONSTRUCTED AND ACQUIRED BY THE CITY.

It can scarcely be disputed that all of these systems and works should belong to the municipality, and this consummation is assured if this Board of Public Works be created under the constitution. Its chief purpose will be to acquire them, and by the powers given to it in the ordinance it will in time succeed.

It provides a two and one-half mill tax to be voted for by the property taxpayers in 1898, and it further provides for mortgaging and pledging the revenues of the various systems to insure their construction; and the right is given to make leases, which opens the way to contract for the building of every system needed. In each lease there could be embodied the right to purchase the system from the lessee who constructed it for a fixed sum, at a certain date, stipulating that all the rent paid during the term shall be taken as payment on account in the final transfer of the system. This insures municipal ownership in reasonable time.

The money expended now for a service, which goes to the stockholders of private corporations, would, under the proper management by a Board of Public Works, be paid, to create rights in the plant itself, which now remain the private property of the corporations performing the service. We propose to inaugurate under the Board of Public Works a home-stead system, where every dollar paid for a service shall finally inure to the benefit of the citizens paying it, by creating a right in the system itself fur-

nishing the service until the plant becomes the property of New Orleans.

The amounts now paid by the city to contractors and to departments of the city which will be assumed by the Board of Public Works are as follows:

Jefferson City Gas Light Co.....	\$30,105.00
Louisiana Electric Light Co. (estimated).....	180,000.00
New Orleans Waterworks Co.....	94,752.00
Algiers Waterworks & Electric Light Co.....	11,280.00
Great So. Telegraph & Telephone Co.....	8,000.00
Wharves and landings.....	10,000.00
Commissioner Public Works.....	130,311.75
Garbage.....	120,000.00
	\$379,448.75

For running the various drainage stations when completed, and for other purposes.....

60,000.00

\$639,448.75

The ordinance provides that the city of New Orleans shall pay over to the Board of Public Works two-fifths of its estimated revenue, which amounts to about \$640,000, as per above table; this, together with the sums that will be received from the permanent public improvement fund and the public improvement fund will in time enable the city of New Orleans to become the owner of the plants performing the services.

Besides, in the division of the public improvement funds, the ordinance provides an increase of the income to the public schools of over \$100,000 per annum, and no argument is needed to demonstrate the necessity of this addition to the cause of education.

No plan can be suggested to the Convention which undertakes to acquire and do so much for the people based on so small a burden of taxation and municipal expense.

Our city has now an assessed valuation of \$140,000,000. Should the assessment rolls increase, due to the building up and improvement of our city, \$3,500,000 yearly for the next ten years, we estimate that the revenues of the Board of Public Works for that period would approximate the following:

Proceeds from sale first issue of bonds.....	\$3,000,000
In ten years the assessment rolls are estimated to reach the sum of \$175,000,000, when the Board will be authorized to make a further issue of bonds of.....	2,000,000
The 20 per cent., known as the "Reserve" over and above "The Estimate of Revenues" of the city of New Orleans, now expended by the city for improvements, is to be turned over to the Board. The fund is now estimated to be.....	\$400,000
Assuming that of this amount there is collected only.....	300,000
One-fourth to the School Board, say.....	75,000
Leaves for the Board of Public Works.....	\$225,000

In ten years say a net revenue of.....	\$2,580,000
The estimated amount which the School Board would receive in these ten years from this source would be.....	\$853,500
After paying interest on the Board of Public Works bonds from the two and one-half mill tax there would be a surplus of \$682,500, one-half of which goes to the Board of Public Works, say.....	341,250
And one-half to the School Board, say.....	841,250

Total amount paid by Board of Public Works to school fund in ten years..	\$1,194,750
Total amount of cash at disposal of Board of Public Works in ten years.....	\$10,901,250

In addition to this estimated income of about eleven million dollars, there is a further sum turned over to Board of Public Works of two-fifths of estimated receipts of the city, as explained above, which on present assessment yields about six hundred and forty thousand dollars yearly.

All of the above revenue would be produced by a small tax of two and one-half mills. The principal resources of the Board of Public Works would not be alone the above amount, for the Board is authorized to mortgage and pledge the revenues of the various systems, so that each system would only require a small amount of cash to be commenced, and the balance required to finish the systems would arise from mortgaging and pledging the revenues.

The Permanent Public Improvement Fund, now amounting to two hundred thousand dollars per year, is applied to pay obligations of the Drainage Board, which Board calculates to issue bonds to the amount of one million five hundred thousand dollars. If the Board of Public Works takes up this amount of bonds of the Drainage Board, it will reduce the above amount, in which case the Permanent Public Improvement Fund is thereafter to be turned over to the Board of Public Works, which would replace within a few years the million and a half dollars used to redeem the bonds of the Drainage Commission.

The claim of every system referred to in the ordinance is considered by some certain class of citizens as paramount. This is the best argument to prove that each and every one demands immediate consideration and active inauguration. Any efforts to obtain only one or two of them is a serious blow to the general interests of the community. No drainage and paving systems alone should be permitted to monopolize all the public funds to the exclusion of sewerage and the control of the waterworks. Each and all are important, and should be undertaken by the Board of Public Works. The acquisition of all the systems finally is only a question of the Board's competency and management, as the above exhibit of income provides the means. Let the Board have the opportunity to acquire those things needed by the city to advance its health, comfort and prosperity.

Ordinances with but a single object are likely to be introduced by men with good intentions, and their projects will be supported by politicians, corporations, and such like, on the outside of the Convention, who will wish to divert all interests to one subject, while they hope to make money out of extravagant city contracts.

Every citizen and every member of the Convention is warned against all such schemes, whose final and direct object is to prevent municipal ownership.

Municipalities in America have sold franchises and rights, mortgaging future generations, which, if administered prudently to-day under municipal control, would yield revenues sufficient to defray the expenses of their government. Glasgow to-day is administered without taxation.

Indirect taxation paid to monopolies created by State law or city ordinance exceeds the direct taxation paid by the people.

It may be objected that the ordinance is too long, containing too much detail to be embodied in the constitution. This point is not well taken when it is considered that the matters herein dealt with are vital to a healthy municipal life; that the city of New Orleans comprises one-fourth of the entire State population; that in no country, save France, is a single municipality so linked with the destinies of the entire State as in Louisiana.

The plan we propose is necessary, and is entitled to all the space required in the constitution of the State to make it effectual; and this seems more reasonable, as the Board of Public Works should be free from political domination and political vicissitudes.

By reason of the "fever scare" of 1897, this city has become the focus of observation for all other parts of this State, for the Mississippi Valley, and for such parts of the United States as may be affected by the introduction of yellow fever, and their judgment as to how they shall deal with us is held in suspense as they watch how we are prepared to deal with ourselves. Self-preservation forbids the adoption of a policy of "drifting on the tide of time," and demands that we should resolve to save ourselves. "God helps them that help themselves," and the necessity for such works as the ordinance creating the Board of Public Works suggests, makes it the imperative duty of the present Convention to put this city in the way of procuring the same at the lowest cost, in the quickest time, and with security for their best administration.

THE MUNICIPAL IMPROVEMENT ASSOCIATION OF NEW ORLEANS, LA.

INSULATION AND CONDUCTION.*

BY REGINALD A. FESSENDEN.

A thing insulates because it is possessed of two distinct properties—first, the ability to stand the mechanical and electrical stresses due to the voltages used, and secondly, because it is such a poor conductor that but a negligibly small current can flow through it and leak away. In other words, it will neither allow the current to break through it, nor to steal through it. The first property is called by Maxwell the "dielectric strength" of the insulator, the other property is called the ohmic resistance. The two together form its insulating power.

In the two great branches of electrical work, the requirements for an insulator are widely different. For apparatus used for the transmission of intelligence as a rule low voltages are used, and so dielectric strength is of relatively small importance, but the currents used are small, the circuits long, and material of high ohmic resistance is needed. For apparatus designed for the generation and transmission of electric energy, on the other hand, where the voltages are high and the currents large, dielectric strength is the main thing desired, and the leakage of a small amount of current is not objectionable. Consequently the two branches of the profession have come to use the word "insulation" in quite different senses, the former and older as meaning something having high ohmic resistance, and the latter branch using it with reference chiefly to material having great dielectric strength.

Confusion sometimes occurs through this double meaning, and the writer himself has been taken to task by a European engineer for stating that pure water was approximately as good an insulator as rubber, the critic having reference, as was apparent, to its ohmic resistance, whilst the original note was principally concerned with its dielectric strength. It is therefore considered best to define the sense in which the word is used, in spite of the fact that attention has previously been called to the distinction to be made between these two properties, notably and very lucidly by Mr. Steinmetz in this Institute's Proceedings, Vol. IX, p. 815.

Before entering upon the discussion of the various purposes for which insulation is used, and of the substances best suited to each case, it may be as well to give a brief account of the manner in which the current passes through materials.

1. *By actual convection.*—That is, by particles of the insulator, or of foreign substances, taking a charge from one electrode and moving with it to the other terminal under the influence of the voltage. This action is similar to that of the moving pith ball between the two knobs of a Holtz machine.

This phenomenon is not known to take place in solids, but it is quite marked in gases, vapors and fluids.

Until recently it was a question of no practical importance in electrical engineering, but with the high voltages now in use or contemplated it may give serious trouble, and apparatus must be designed to check this form of leakage. It was not so long ago that Ferranti's 10,000 volts was looked upon as monstrous, but some experiments of the large companies, of which I have been informed, seem to show that 100,000 volts may be quite practicable, even in quite unfavorable climates. With overhead wire the leakage will merely mean a loss of energy, and the use of porcelain for all insulation, as any oxidizable material (used for instance to protect the primaries of transformer-), would be speedily destroyed by the ozone. Where, however, oil is used in the transformers, the leakage may cause quite serious trouble, owing to the large surfaces and their proximity. In addition, as Prof. Elihu Thomson pointed out some years ago, with high potentials, impurities in the oil are apt to group them-

selves along the lines of highest slope of potential like the iron filings around a magnet, and if, as is generally the case, the impurities have a higher specific inductive capacity than the oil, such a group is thus apt to form a bridge between two points of great difference in potential, hence causing an arc. In those convection currents it is not, I believe, the very small particles which cause the trouble, because small bodies, when charged from a comparatively

FIG. 1.

The ball *c* having touched *A* and got a + charge, is repelled and moves over to *B* where it gives up its charge, takes up a - charge and moves back to *A*.

large and smooth one are not repelled but attracted; consequently a small grain of dust after touching a highly charged flat conductor would remain close to it if there were no negatively charged particles near it to drag it away or no currents in the oil to wash it off.

The relation between the size of the particle, the voltage and the radius of the charged conductor when the particle after touching the conductor is neither attracted nor repelled, can be obtained by the method of images, but the formula so derived is rather long and complicated and I have not had time to work out the numerical results.

It is evident, however, from it, that for a convective current to take place the radius of the particles carrying the discharge must be a quite appreciable fraction of the radius of the charged conductor. Consequently this form of leakage is due to the motion of a portion of the oil as a whole and not of its individual particles, and if we can break up mechanically these currents we can to a great extent stop the leakage from this cause. This may be done in three ways:

1. By using oil of great viscosity, in which case, however, we lose the chief advantage of oil insulation, i. e., its ability to reinsulate quickly after a discharge.

2. By putting pure dry cellulose in some form or other between the charged surfaces loosely, so that the oil can filter through it easily and any air escape readily, but sufficiently close to prevent any rapid flow. Pure cellulose has the great advantage that when well boiled in the oil it has approxi-

FIG. 2.

mately the same specific conductive capacity as the oil. No varnish or shellac should be used in the oil for reasons given later.

3. By dissolving a solid, non-disassociating substance in the oil in such excess that it crystallizes out at ordinary temperatures, and forms with the oil a soft gelatinous mass, not fluid, but yet capable of allowing the oil to ooze through its substance. This has many of the disadvantages of 1, but it has one advantage, in that the substance chosen may be one like paraffin, having a large specific heat of liquefaction, and consequently an overload will not raise

the temperature of the oil above a fixed point till the paraffin is all melted.

The effect of points in promoting convective discharges in air is well known. It is usually attributed to the great surface density of electricity which a point must take in order to make the potential all over the conductor the same, and hence, since the repulsive force varies as the square of its surface density, it is evident that there will be a great tendency for discharge from a point from this cause. But there is another and very important one, i. e., the fact that, as mentioned above, a particle cannot take a charge and move away unless its radius is larger than a certain fraction of the radius of the curvature of the conductor at the point where it touches the latter; consequently when the charged surface is a plane only large aggregations of atoms can move away; these move slowly and carry small charges in proportion to their mass. But at points where the radius of curvature is very small, small particles can move away with great rapidity and with relatively large charges. Rounding off or flattening the charged surfaces thus acts in a double way, by reducing the surface density and by preventing all but large sized particles moving away.

2. *Conduction in Solids.*—It is not absolutely certain that all conduction is not by convection, but the terms are here used with their usual signification. In solids we do not know as yet exactly how the discharge is handed on, but I have noted a very remarkable fact, which is quite significant and suggestive, i. e., the conductivities of metals are proportional

to the quantity $\frac{\text{elasticity}}{\text{density}} \div \text{valency}$. The following table shows this:

TABLE OF CALCULATED AND OBSERVED RESISTIVITIES.

Metal.	Atom. Vol.	Atom. Wt.	Calc.	R. Calc.	R. Observed.
Silver.....	10.2	108	1	100	107
Copper.....	7.1	63.3	2	126	106
Gold.....	10.2	197	1	135	137
Aluminum.....	10.5	27	3	152	149
Magnesium.....	14	24.4	4	220	275
Zinc.....	9.4	65.5	4	203	332
Cadmium.....	13	112.2	4	456	470
Tin.....	16.2	118	8	1039	878
Thallium.....	17.3	201	6	100	1190
Lead.....	18.2	207	8	14.0	1305
Iron.....	7.2	56	4 or 8	480	646
Beryllium.....	2	9	Unknown.	50 or 100

This fact was discovered by the writer in 1892,* as the result of several years' tedious work in collecting physical data and combining them into formulae to see if any law could be found. Out of the hundreds of combinations tried, this and another one (really the same ultimately, but expressed in terms of other properties), were the only ones which seemed hopeful. It was stated in the article referred to that this formula could not be quite correct. This was for the following reason: Silver, gold and aluminum should, as will be seen from the formula given below, have resistances proportional to the square roots of their densities multiplied by their valencies, i. e., in the ratio of

$$\sqrt{10.6} : \sqrt{19.26} : \sqrt{2.65 \times 3};$$

$$\text{i. e.,} \quad 100 : 136 : 150.$$

Now at this time the best determinations of the resistance of aluminum with which I was acquainted gave it as 193 to silver 100. With such a wide discrepancy therefore between calculation and observation, i. e., 193 instead of 150, it did not seem probable that the high observed value could be modified by subsequent determinations so as to agree with the calculated one. It was, therefore, with considerable pleasure that I saw the recent determination of Messrs. Richards and Thomson (published last year in the *Journal of the Franklin Institute*). Their results for aluminum, 99.66 pure, were:

Aluminum : Silver :: 163 : 100,
and they expressed the opinion that the value for

* Science, July 22, 1892.

* Paper read before the 123d meeting of the American Institute of Electrical Engineers, New York, March 23, 1898.

pure aluminum, when hard-drawn, would be 66 per cent. of the conductivity of copper. This result is so close to the calculated result given in the paper referred to, i. e.,

$$17 : 27 = 100 : 159,$$

though such a high conductivity for aluminum was considered beyond the bounds of probability at that time, that I feel justified in considering that the formula given may be found fairly accurate when more exact determination shall have been made.

This formula throws a certain light on the nature of conductivity in solids, and why some solids are insulators. For the formula $\sqrt{\frac{\text{elasticity}}{\text{density}}}$ is the

same as that for the velocity of sound in a body. Now, in the convective discharge, the electricity was handed on with the same velocity as that with which the particles moved. In fluids, as we shall see, the electricity is handed on with the velocity with which the ions move. In both cases the electricity travels along on the particles of matter.

The idea that electrical flow in solid conductors might also be a simple handing on from one atom to another suggested itself nearly a decade ago to Prof. Lodge. That brilliant and careful reasoner and experimenter, who has cleared up so many patches of scientific jungle, gives a very clear description of the manner in which this would happen if such were the case. I cannot do better than quote him, as it will show how well this idea agrees with all the facts then known but one:

"But if we are not satisfied with this vague analogy, and wish to penetrate into the ultimate nature of heat and the mode in which it can be generated, then we can return to the consideration of a multitude of oscillating and colliding particles, moving with a certain average energy which determines what we call the temperature of the body. If now one or more of these bodies receives a knock, the energy of the blow is speedily shared among all the others, and they all begin to move rather more energetically than before: the body which the assemblage of particles constitutes is said to have 'risen in temperature.' This illustrates the production of heat by a blow or other mechanical means. But now, instead of striking one of the balls give it an electric charge; or, better still, put within its reach a constant reservoir of electricity from which it can receive a charge every time it strikes it, and at the same time put within the reach of some other of the assemblage of particles another reservoir of infinite capacity which shall be able to drain away all the electricity it may receive. In practice there is no need of infinite reservoirs: all that is wanted is to connect two finite reservoirs, or 'electrodes,' as one might now call them, with some constant means of propelling electricity from one to the other, i. e., with the poles of a voltaic battery or a Holtz machine.

"What will be the result of thus passing a series of electric charges through the assemblage of particles? Plainly the act of receiving a charge and passing it on will tend to increase the original motion of each particle; it will tend to raise the temperature of the body. In this way, therefore, it is possible to picture the mode in which an electric current generates heat.

"But although this process may be used as a possible analogy, it cannot be a true and complete statement of what occurs; for it is essentially the mode of propagation of sound. Sound travels at a definite and known velocity, being a mechanical disturbance handed on from particle to particle in the manner described. But heat, being some mode of motion, must also be handed on after some analogous fashion so that when heat is supplied to one point of a mass it spreads or diffuses through it. It is difficult to suppose the conduction of heat to be other than the handing on of molecular quiverings from one to another, and yet it takes place according to laws altogether different from those of the propagation of the gross disturbance called sound. The exact mode of conduction of heat is unknown, but, whatever it

is, it can hardly be doubted that the conduction of electricity through metals is not very unlike it, for the two processes are the same laws of propagation: they are both of the nature of a diffusion, they both obey Ohm's law, and a metal which conducts heat well conducts electricity well also."

I have said, "with all the facts then known but one." This because, as mentioned in the abstract given above, there seemed to be no good evidence for the view that there was any connection between the conduction of sound and of electricity. The reason for this lay in the fact that very few determinations had been made of the velocity of sound in the pure metals, though a considerable number had been made on alloys and commercial materials.*

Consequently no general law could be discovered, though it cannot be doubted but that had the formula for the relation between Young's modulus and atomic volume discovered by the writer† been known at that time, this evidence of a still more intimate connection between sound, heat and electricity would have been discovered by Dr. Lodge.

The formula referred to is:

$$\text{Young's modulus} = \frac{78 \times 10^{10}}{(\text{atom. vol.})^2}$$

Hence it is possible to predetermine the velocity of sound in wires by the formula:

$$\text{Velocity in cms. per sec.} = \frac{883 \times 10^4}{\text{atom. vol.} \times \sqrt{\text{density}}}$$

and the electric resistivity is given roughly by:

$$\text{Resistivity} = 45 \times 10^{-9} \times \text{atom. vol.} \times \sqrt{\text{density} \times \text{valency.}}$$

This formula possesses a general interest, inasmuch as it would seem that while the strain in the dielectric is propagated with the velocity of light, i. e., $\sqrt{k \mu}$, the actual electricity in the wire were handed on with the velocity of sound, and is proportional to $\sqrt{\frac{k}{\mu}}$. The significance of this will be treated of elsewhere.

Suppose a wheel, with elastic spokes and a heavy rim bound outside with a band of horsehair, the horsehair rubbing against a series of violin strings mounted parallel to the axis of the wheel, as shown in Fig. 2. Suppose each violin string has mounted upon it a small metallic bead charged with electricity so that when the strings vibrate the beads can touch. Then on grasping the wheel at B, after a time, depending upon the elasticity and mass of the wheel, a spark will be seen at A, but the actual velocity with which the electricity moves round the circuit of violin strings will depend upon the elasticity and mass of the strings. In passing, we may note several things:

1. That for this analogy to hold at all, the atoms must be charged even in a conductor not carrying current; which is significant when taken in connection with the fact pointed out by the writer in the papers above referred to, that if we calculate the tensile strength, rigidity and Young's modulus on the assumption that these effects are due to charges on the atoms, we get results agreeing very closely with experiment.

2. That in a circuit having many atoms in the cross-section the energy could be handed on without actual contact by electro-dynamic processes.

3. That if one part of the circuit were composed of violin strings tuned to a different note-period from

* I am here moved to again call attention to the fact that an immense amount of physical experimental work is misdirected. It is no doubt quite gratifying to ascertain, after several years' laborious work, that a particular piece of brass or steel of not very definitely known composition and in a quite indefinite physical state has a temperature coefficient of expansion expressed by five significant figures, but such information must be considered as pieces of philosophic virtu, intrinsically worthless, but possibly possessing a value by reason of their uniqueness and associations. I have pointed out elsewhere (*Jour. Frank. Inst.*) that at the present time, in spite of the fact that much has been done, notably by Matthiessen, Roberts-Austen and others, we have not at present any data in regard to 90 per cent. of the more important properties of the simpler metals used in the arts. The importance of having a standard state for solids; of a central bureau to furnish pure materials in a standard physical state to experimenters, and the exclusive use of such materials by experimenters, cannot be overestimated.

† *Elec. World*, Aug. 22, 1891; *Science*, July 22, 1892.

the other we would get effects similar to those of thermo-electricity.*

4. That the reversal of the point of greatest drop of potential in a circuit of air and carbon from the + to the - electrode as the pressure is reduced may be due to the fact that, as shown by the beautiful experiments of J. J. Thomson, the molecular conductivity of air at low pressures is extremely high, the electrode heated thus depending upon whether the solid conducts better than the gas, or vice versa.

5. That this same formula would also be applicable to a diffusion phenomenon, and indeed the presence of valency in the formula makes it exactly analogous to that for the diffusion of heat. Moreover, Roberts-Austen, in a series of striking experiments, has shown that diffusion can take place in solids at ordinary temperatures. If a current be however a diffusion, it may be shown that for fairly large current densities the atoms must move several cms. per second, and we might therefore expect interpenetration when brass and zinc terminals are joined. But this does not occur to any considerable extent. We may also take it as an electrolytic diffusion, as is suggested by J. J. Thomson in his "Dynamics Applied to Physics and Chemistry," but in this case, even assuming the theory suggested by him to account for some atoms preferring a plus to a negative charge. I find it difficult to imagine the manner in which the atoms could be charged and discharged at the surface of the conductor. It is to be noted that in gases the phenomenon of diffusion sound velocity and heat conductivity are all linked together.

It will be noticed that in the table given, while the metals follow each other in the order they should from calculation, yet the agreement is in some cases not so close as in others. This may arise from several causes:—1. The conductivities of but few of the metals are accurately known. 2. The elasticities of but few of the metals are accurately known, and the formula given for the Young's modulus only roughly takes temperature into account. 3. The temperature coefficients of the metals are not the same. For instance, that for copper is over .4 : .415, having been obtained by Swan and Rhodin, and .404 by Kennelly and the writer, whilst silver is only .38 and gold .36. Consequently the ratio will vary with the temperature, and at higher temperatures the ratio resistivity of copper : resistivity of silver will be less. This, it is interesting to note, holds true for the velocity of sound, for from Wertheim's results we have, velocity of sound in silver : velocity in copper = 1.35 at 20° C., and only 1.19 at 200° C., and hence, just as in the case of electrical conductivity, the sound conductivity of copper diminishes at a faster rate than that of silver.

The magnetic metals, as iron and platinum, are very difficult to obtain pure. Their true resistance is therefore at present doubtful.

What has been mentioned thus far concerning the resistance of solids has had no immediate bearing on the subject of insulation. It was necessary, however, in order to introduce the following considerations.

(To be continued.)

The International Ohm.

In view of the impending publication of the bill concerning electrical units of measurement, the *Elektrotechnische Zeitschrift* states that the German Imperial Post Office authorities have resolved to introduce the ohm in place of the Siemens unit. In future all new apparatus and measuring instruments will be standardized in ohms. Existing curved handled rheostats and resistances used in connection therewith will at once be rearranged, whilst other apparatus and instruments will be similarly dealt with on being sent to the work-shops for repairs as occasion may arise. Statements of resistances in official reports will in future always be expressed in ohms.

* Compare the analogous problem of two portions of gas of different densities in a closed ring tube and junctions heated. Neuman, "Jahrbücher f. Chem.," 1814, p. 15.

A NOVEL HIGH TENSION SERIES ENCLOSED ARC SYSTEM.

BY J. H. HALLBERG, E. E.

Articles have appeared in the pages of *ELECTRICITY* describing the enclosed arc lamps and calling attention to their many advantages, but the writer has not seen any particular attention called to the high tension series enclosed arc lamps, which have now been perfected and are manufactured by a few firms. Probably the reason of this silence is that the manufacturers have not met with such success in designing and operating lamps on this circuit as would warrant their recommendation for street and commercial lighting.

I will first take up a few questions as to the requirements of the enclosed arc lamp for high tension series street lighting and commercial circuits. The insulation should consist of mica, lava and porcelain; fiber should never be used in arc lamps except for switch handles. When testing insulation, it is best that you should not depend on the ringing of a magneto bell, but should take one wire from the magneto in operation and connect to the ground or to frame of dynamo or cover of lamp, then the other wire should be attached to a small handle and taken in one hand, while with the other you touch some connection or bare wire in sure contact with circuit; to be perfectly sure, wet your hands; it is understood that you must be insulated from the ground. I have found this method to be the surest where no special testing apparatus is at hand, as you will surely feel the current from the magneto if there is a leak. Never depend on ordinary insulation in high tension series lighting, as the extremely high pressure of the "kicks" caused by flashing of the dynamo or the breaking of a wire will break through any ordinary insulation and consequently ground lamps and apparatus. The lamp should be provided with a standard hanger, and so designed that it will fit in the majority of hoods with the hanger-boards now in use. The lamp should be provided with a cover that is easily removed for inspection. The lamp should be proof against snow or rain, and as nearly dust proof as possible, and at the same time ventilated.

All parts should be easily interchangeable, with the use of no other tools than a pair of pliers and a screwdriver. My experience has been that it is better to use binding-posts and connectors than solder, for various reasons, the main one being, a coil can be changed without the troublesome use of a soldering iron. The out-out should be positive in its action and have a sure adjustment, and its contact points should be easily interchangeable. It is preferable that the clutch works direct on the carbon, as the wear of the clutch is thus reduced on account of the softness of the carbon. The lamp should be equipped with some device to prevent the slipping of the carbons. In a differential lamp the slipping could only happen during its burning, as the carbons are together during the day, or when the lamp is not working. In a shunt-wound lamp the device should always be in action, as the carbons in a shunt lamp are always apart except at the moment that the arc is struck. This device may seem unnecessary, but experience has proven that the best of clutches will slip in stormy weather, especially on lamps placed on tall poles, or if they are suspended from poles which also carry one or more trolley wires.

The inner globe should be easily interchangeable, as when trimming a number of lamps it is demonstrated that it is best to exchange the dirty inner globes for clean ones, and bring the dirty globes and what is left of the upper carbon back to the station, where the former are cleaned and the carbons are cut to the right sizes for negative or lower carbons for the next trimming. The lamp could be so designed that it would maintain the same voltage at the terminals and arc, whether the amperes be 4 or 7, varying, or any constant between these two

numbers. A lamp designed for 4 amperes should operate on any amperage between 4 and 7. The arc in the lamp should continue the entire voltage as measured at hangers except one volt. This one volt is all that is necessary to hold the out-out open. When the lamp is out out by its automatic out-out not over 4 volts should be expended when the lamp coils are hot. The shunt coil and out-out should not consume over one-tenth ampere when lamp is hot. If possible, the lamp should be so designed that no dashpot or springs are required in its mechanism. This is very important, as all of our readers have probably experienced more or less trouble from dirty dashpots, feed and out-out springs. In many cases these lose their tension, which would either keep the lamp out entirely or destroy all adjustment, allowing the lamps to burn 30 to 70 volts instead of 45 to 50. The writer knows of some out-outs that would not shunt the lamp until the arc reached about 140 volts. This, of course, would burn the shunt coils in the lamp, as they were only designed to stand a maximum of 70 volts. I believe all will agree with me that a spring and a dashpot are the most frequent causes of trouble on a high tension street lamp which is subjected to internal heat and to dust and dampness. The lamp should be of light weight, say 25 lbs. complete with hood, hanger-board and globe, so as to allow the use of lighter construction and suspensions; a light lamp will also make the old balancing weights unnecessary, and on shipments of lamps the freight is about one-half of that paid for old-type long and heavy lamps. The lamps should be adapted for either inside or outside service without change; at the same time they should be so designed that if necessary the plain cover can be substituted for a fancy one without any changes on the lamp. The lamp should be as short as possible, say about 24 inches from top of hanger to bottom of globe, so as to allow the lamp to be used in low-studded buildings, basements and hallways. If it should be necessary to have a long lamp in order to suit some particular customer, it can be done by simply putting on a longer cover without changing the mechanism of the globes. The lamp should regulate so that its voltage would not vary over 5 volts at any time from normal. The lamp that is designed and built so as to come up to the above specifications should certainly meet with the approval of most station managers and electrical engineers. Since the invention and perfection of the enclosed arc lamp it is possible to build a lamp of the type above mentioned, and the writer after personally handling nearly 100 of them for street lighting purposes during the past ten months, has come to the conclusion that it is the most convenient street lamp and will surely occupy a prominent position among the enclosed arc lamps, as it possesses higher efficiency than any other type of enclosed arc lamp as yet advertised in this country.

The light from the high tension enclosed series arc lamp possesses all the advantages that are so noticeable in the low tension D. C. enclosed lamp, which are: a perfectly steady light, perfect diffusion and distribution, the tint of which can be governed by the use of different combinations of globes. It burns from 100 to 150 hours with one 12 by $\frac{1}{2}$ solid "imported" carbon. This not only saves labor in trimming and attention, but the lamp mechanism and clutch do not wear as the lamp feeds only a few times every 12 hours. It must also be remembered that the clutch works on the soft carbon, which prevents it from wearing, and as there are no carbon rods, the repairs on an enclosed arc lamp are only about 10 per cent. of that for the open arc system. If we now get a lamp as per above suggestions it would be perfectly proper to ask the following question, if you do not already realize the economy of a plant equipped with this type of lamp for street lighting: How do these lamps compare with the open arc system in regard to amperes, voltage and candle power? The old-type open arc lamp requires 10 amperes and 45 to 50 volts (equal to 500 watts) to

produce what is known as 2,000 nominal candle-power. The new enclosed arc lamp with clear globes requires 7 amperes and about 71½ volts (equal to 500 watts) to produce 2,000 nominal candle-power. From the above figures you can see that the wattage remains the same for both types of lamps, consequently your coal bill is not increased when you use the enclosed series lamps. The enclosed arc lamps require about 30 per cent. higher voltage, but the amperage may be reduced accordingly. I consider this a great advantage, especially if your circuits are very long, as the line loss would be cut down considerably. If you desire a 1,200 candle-power system your wattage consumption would be about 300 to 325 (equal to 4 amperes and 80 volts, or 5 amperes and from 68 to 70 volts). I mentioned in the early part of the article that a shunt wound high tension series enclosed arc lamp could be so designed that it would operate with the arc voltage even though the amperage varies about 40 per cent. You will undoubtedly see the advantage of this. To-day you will find that almost any manufacturer of arc dynamos will furnish regulators and controllers, by the adjustment of which you may change the amperage from, say, 4½ to 6½ amperes and the dynamos will hold their amperes very steadily at any point. This enables you to get a perfectly controllable arc circuit, which may be varied at will from the station.

On dark nights you may run your dynamo at 7 amperes. The next night may be moonlight; then you can cut your dynamo down to, say, 5 or 6 amperes; then, during winter, when snow is on the ground, you will not need over, say, 5½ amperes on the darkest nights. On moonlight nights with snow on the ground you could probably go as low as 4½ amperes on your circuit and still you would light your streets equally as well as you would on a very dark night with 7 amperes. This feature of this system will save a station or a town a good many dollars. Figures show the following:

200 lamps at 70 v. each = 14,000 v. \times 7 amp. = 98,000 watts.

200 lamps at 70 v. each = 14,000 v. \times 4½ amp. = 63,000 watts.

This shows a saving of 35,000 watts per hour. If your plant can produce one electrical H.P. per hour with four lbs. of coal, you would save during an 11 hour run on 4½ amperes instead of 7 amperes about one ton of coal, equal to, say, about \$2. By applying this system I am sure a great many plants which now shut down at 12 P.M. could persuade the town which they light to pay a little more and run on a very low amperage the rest of the night, and then it might be profitable to run an all-night incandescent circuit. I am sure lighting plants in small towns could get many new customers on their incandescent circuit if they could afford to run until daylight instead of shutting down at 12 P.M. These are only a few examples showing the many advantages that can be gained through the use of this system. There are many stations which have 4 to 7 ampere dynamos that are not in use, for, as the town grows, the requirements change, a larger light is wanted and a 10 ampere arc system has to be put in. Now, clean and fix up your old 4 to 7 ampere dynamos, write for prices and information to arc lamp manufacturers who make a high tension series enclosed arc lamp. Be sure that the manufacturers guarantee the lamp to burn on a varying amperage of, say, about 5 without change in the voltage at hangers, as your old-type dynamo may not regulate as well as the later designed and improved lamps. So you see, if the town board should vote to put in 15 or 20 new 2,000 C.P. arc lamps, and your present 10 ampere dynamos are loaded, you can, if you have an old 5½ ampere dynamo, by simply buying this type of lamp and putting up new circuit, turnish the town with this lamp and save the cost of a new dynamo. The foregoing explanations and suggestions might alone show station managers how they would profit by the use of an arc lamp of this type, but I will now call your attention to the most important

fact, and that is, that this lamp operates for 125 hours without any attention or trimming. At each trimming there is used only one $12 \times \frac{1}{2}$ " solid "imported" carbon. The cost of this quality of carbon is between \$27 and \$30 per 1,000, consequently a lamp of this kind, if operated 10 hours every night in the year, will consume 30 of these carbons per year, equal at highest carbon price to 90 cents. If your carbons for the old-type open arc lamp cost you \$15 per thousand pair, delivered (this is certainly the lowest cost figure), then a lamp of that type which consumes one pair of carbons each night of 10 hours requires 365 pair for one year, equal to \$5.47½, and making a saving of \$4.57½ each year per lamp in carbons alone.

As the enclosed arc only needs trimming once every ten or fifteen days, one or more trimmers may be dispensed with. The enclosed arc having an inner globe, a deduction of about \$1.00 per year for each lamp might be made from the above figures to allow for the additional chances of breakage.

American Institute of Electrical Engineers.

At the meeting of the Institute held at 12 West 31st street, New York, Wednesday evening, March 23, a paper was presented by Prof. Reginald A. Fessenden on "Insulation and Conduction." About 75 members and guests were present, with President Crocker in the chair.

In the absence of the author, the paper was read by Mr. R. W. Ryan and discussed by Prof. Franklin and Dr. Pupin.

The secretary announced that at the meeting of council in the afternoon the following nominees had been selected from the proposals submitted by the membership:

For President—Arthur E. Kennelly.

Vice - Presidents—Robert B. Owens, William Stanley, Cary T. Hutchinson.

Managers—Herbert Lloyd, Samuel Sheldon, George F. Sever, Chas. P. Steinmetz.

Treasurer—Geo. A. Hamilton.

Secretary—Ralph W. Pope.

The following officers continue their terms as provided in the constitution: Vice Presidents—A. E. Kennelly, Chas. S. Bradley, D. C. Jackson; Managers—J. W. Lieb, Jr., F. A. Pickernell, W. L. Puffer, L. B. Stillwell, Alexander MacFarlane, W. F. C. Haddon, Gano S. Dunn, Herbert Laws Webb.

The question of Standardization of Electrical Machinery was referred to a special committee composed of Elihu Thomson, Francis B. Crocker, A. E. Kennelly, C. P. Steinmetz, C. T. Hutchinson, J. W. Lieb, Jr., and L. B. Stillwell.

The following associate members were elected:

Albert G. Davis, acting manager patent department General Electric Company, Schenectady, N. Y.
Albert R. Gallatin, student of Columbia University, New York City.

Herbert Gaytes, electrical engineer Realty Syndicate Railways, Oakland, Cal.

Russell Agnew Griffin, purchasing agent American Telephone & Telegraph Company, New York City.

Francis Valentine T. Lee, engineer Pacific Coast department Stanley Electric Manufacturing Company, San Francisco, Cal.

Max Lowenthal, associate editor the *Electrical Engineer*, New York City.

Henry W. Pope, special agent American Telephone & Telegraph Company, New York City.

Fritz Reichmann, instructor of physics, University of Texas, Austin, Tex.

Theodore E. Theberath, Pacific Coast engineer Stanley Electric Manufacturing Company, San Francisco, Cal.

Robert Anton Fliess, student of electrical engineering, Columbia University, New York City.

The opening date of the General Meeting at Omaha was fixed for June 27, and its continuation for either three or four days has been left with the Committee on Papers and Meetings for decision.

THE WESTERN TELEPHONE CONSTRUCTION CO.

Officers Elected at the Annual Meeting—Increasing Its Manufacturing Facilities—New Types of Apparatus.

At the annual meeting of the stockholders and directors of the Western Telephone Construction Company in Chicago on the 14th of this month, the following officers were elected:

President and General Manager—James E. Keelyn.

Vice President—Judge D. A. Holmes.

Secretary—B. F. Stewart.

WESTERN TELEPHONE CONSTRUCTION COMPANY'S 2,000 LINE DISTRIBUTING BOARD.

Mr. Keelyn's name will be recognized as the former president of this company. He is already well known and popular with the electrical fraternity.

Judge Holmes is a well-known lawyer in Chicago, of the firm of Mason, Holmes & Mason, of which Senator W. E. Mason is the senior member.

Mr. B. F. Stewart will be recognized as an old-timer in the electrical business, he having formerly been manager of the Western Electric Company's factory and in later years well known throughout the country from his important connection with the Westinghouse Electric & Manufacturing Company.

The Western Telephone Construction Company reports that it has again been forced to make an increase in its manufacturing facilities. It is therefore making an addition to its factory which will give it half as much space again as it now occupies. New machinery is being purchased and preparations are being made in every direction for the most active season in the history of this company. The sales so far this season have eclipsed anything in the history of the company, and large orders are coming in so rapidly that they are handled with the greatest

difficulty. Several new types of apparatus have recently been put on the market by the company which deserve special mention.

The accompanying plate shows a 2,000 line distributing board, which has recently been built and installed in a number of exchanges equipped with the Western apparatus. This board is a combined lightning arrester, distributing and test board. The line cables after entering the exchange pass to the lightning arrester side of the board, where their respective wires are attached to the terminals provided on the lightning arrester clips. The circuit of each line is then continued through a fusible cut-out and static arrester, and thence by means of jumper wires to its proper position on the other side of the board, where the ends of the jumper wire are attached to the terminals provided on the test clips. From the other side of these test clips cables are again formed which run to the drops and jacks in the switchboard.

The arrangement is such that there is no confusion whatever in the jumper wires, which lie in parallel troughs or passages, and a tangle is thus made almost an impossibility. The arrangement for testing any line afforded by this board is very complete. A special test plug may be inserted under any of the test clips and the circuit tested in either direction—that is, towards the switchboard or towards the sub-

scriber. If desired the test telephone may be simply bridged across the circuit at that point of the line being tested without breaking the continuity of the line between the subscriber and the switchboard. This board is extremely compact, and the rapidity with which a change may be made in the distribution of the lines between the various terminals is surprising.

The instruments and apparatus manufactured by the Western Telephone Construction Company are continually growing in favor, and the demand for them keeps pace with the fast increasing popularity of telephonic communication in all sections of the

country where independent systems have got a foothold.

The New York Electrical Society.

The 186th meeting of this Society will be held at the College of the City of New York, Lexington avenue and 23d street, New York City, this (Wednesday) evening at 8 o'clock.

Mr. Frank E. Knight will read a paper on "The Influence of Electric Railroads on Population and Land Values in Cities."

After this paper, Mr. W. J. Clarke will give a practical demonstration of the Marconi system of wireless telegraphy by means of an improved apparatus. On behalf of Mr. John Denuis, Jr., the inventor of the fluorometer, Mr. Clarke will also describe the operation of that instrument as a surgical adjunct of the X-ray.

The General Electric Company owed on January 1, 1893, \$1,339,360 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Supreme Court of Wisconsin has rendered a decision to the effect that there can be no extension of street railway lines beyond city limits, even though a franchise has been granted, without the award of damages where property owners object. It also makes no difference whether or not the companies have the right to carry freight or express matter.

Judge O'Neill has filed an order consolidating the two actions in the suit concerning the receivership of the National Electric Manufacturing Company at Eau Claire, Wis., making H. H. Hayden and J. T. Barber defendants, and Morgan Brooks of St. Paul, Edward P. Allis Company, Milwaukee, the Eureka Tempered Copper Company and others plaintiffs. He also made T. F. Frawley, Fitch Gilbert, R. E. Rust, George T. Thompson, John S. Owen, D. R. Moon, A. J. Rust, Bank of Eau Claire, Chippewa Valley Bank and Westville Lumber Company defendants. He likewise vacated Judge Bailey's three orders of December 30, closing up the receivership. Judge O'Neill also removed Receiver R. E. Rust, but the judge spoke in complimentary terms of Mr. Rust's high standing and said his removal from the receivership was due only to the fact that his being a defendant made such action by the court a necessity.

In the suit brought by the Port Huron Electric Railway Company against the Guarantors' Liability & Indemnity Company, Judge Vance in the Circuit Court at Port Huron, Mich., on the 18th inst., took the case from the jury, directing a verdict for the street railway company for the amount of \$1,136. The suit was brought to recover the amount of a judgment awarded Conrad Lutz in the Circuit Court against the street railway company for injuries sustained a year ago last November in a collision between a street car on which Lutz was a passenger and a Grand Trunk engine. The street railway company was insured with the indemnity company against damages recovered by passengers for injuries sustained in accidents. The company, however, refused to pay the Lutz claim claiming exemption owing to alleged negligence on the part of the street railway company.

The American Range Finder Company, a West Virginia corporation engaged in manufacturing and selling range finders and other instruments, made an assignment on Wednesday last to Charles B. Van Nostrand, New York, who is understood to be the principal owner of the company. Edward A. Wickes, New York, is president of the company, and John Nisbet of Yonkers secretary. The company was incorporated in 1888 with a capital stock of \$500,000 to manufacture a range finder, invented by Lieutenant Fiske, to determine the distance and location of ships at sea. The concern had no factory, and its instruments were manufactured for it by the Western Electric Company, and sold on royalty.

A Patent Office Bill.

A bill has been introduced in the U. S. Senate by Mr. Platt of Connecticut, providing for an increase in the working force of the Patent Office, in order to facilitate the work of the office, which is greatly in arrears. The bill provides that for the purpose of determining with more readiness and accuracy the novelty of inventions for which applications for letters patent are or may be filed in the Patent Office, and to prevent the issuance of letters patent of the United States for inventions which are not new, the Commissioner of Patents is authorized and directed to revise and perfect the classification, by subject-matter, of all letters patent and printed publications in the United States Patent Office which constitute the field of search in the examination as to the novelty of invention for which applications for patents are or may be filed.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Albany, N. Y.—The bill introduced by Assemblyman Eldridge, which is believed to validate all the grants of the Union ("Huckleberry") road in New York City, was passed in the Senate by a vote of 29 to 10.

Atlantic City, N. J.—Surveys have been completed for a new electric railway to run direct from Camden to this city. The new line will leave Camden and cross Cooper's Creek near the head of Harleigh Cemetery, passing down through the outskirts of Haddonfield, then to Ellensburg, Gibbstown, also Pleasant Mills, Weekstown, Unionville and Port Republic, and thence down the shore road to Absecon and across the meadows to this city. The corporation is known as the New Jersey Electric Railway Company, and is incorporated for \$3,000,000, the projectors being Philadelphia and Atlantic City capitalists. The third-rail system will be employed, and the cost of the road is estimated at close to \$2,000,000. Ninety-pound rails will be used on the road, and the line will cross the meadows on an elevated steel structure.

Baldwinsville, N. Y.—The commissioner of highways has granted the Baldwinsville & Liverpool Railway Company a franchise to construct an electric road and lay tracks on the highways running from Liverpool to the limits of Baldwinsville.

Buxton, Me.—The building of the Saco River electric road now appears to be certain. Its promoters have issued \$300,000 twenty-year 5 per cent. gold bonds, and floated them with the Massachusetts Loan & Trust Company. The Railroad Commissioners have already approved the location of a route which passes through the villages of Bonny Eagle, Standish, West Buxton and Bar Mills to Saco. The gauge of the road is 4½ inches. The construction of the road will be rushed in order to have the line ready for travel by July 4. It is the theory of the projectors that the road will open the way for the utilization of the immense water power now dormant in the Saco river.

Chattanooga, Tenn.—The passenger lines of the Chattanooga Belt Railway have been formally transferred to the Chattanooga Rapid Transit Company, of which S. W. Divine is president. Mr. Divine says there will be no change in the operation of the road until he is ready to put in the electric system.

Danville, Ill.—The thirty year franchise ordinance of the Danville Gas, Electric Light & Street Railway Company was passed over the mayor's veto by a vote in the council of three to one.

Hartford, Conn.—The directors of the New England Railroad Company have decided to extend the third-rail system to Bristol. They expect to have the line in operation early in June.

Lafayette, Ind.—Col. William Sears of Chicago, one of the promoters of the electric railway projected to be built between Goshen, Ind., via Danville, Ill., to St. Louis, has called a meeting of the capitalists interested in its construction to be held at Plymouth, April 11. Two surveys have been made, each over a different route, and those interested in the enterprise are confident of having construction under way before May 1.

Lockport, N. Y.—The "Journal" has been authorized to state that "an electric railroad between Lockport and Buffalo is now a certainty and will be in operation within three months. The Ely Company has positively leased the Lockport Buffalo branch of the Erie and the work of putting in a third rail, erecting poles and trolley lines and all other necessary regulations will be under way in a short time. Surveyors and engineers are at work now along the line between here and Buffalo under the direction of Erie and Ely officials."

Marlboro, Mass.—Within a few weeks it will be possible for West Warren people to take a trolley ride into Boston, and from there, if so disposed, to Nashua, N. H., the whole trip being more than 100 miles. When the short connecting link near Marlboro is completed, the people along the line, in the Brookfields, Spencer, Worcester, Marlboro and South Framingham, will be on a continuous electric line, and can go to Boston by trolley. The connecting link necessary to make this possible lies between Marlboro and South Framingham, and it has been decided to make the connection with all possible dispatch.

Montpelier, Vt.—The board of trade are considering the plan of building an electric railway from Rochester through Hancock, Granville, Warren, Waitsfield, Moretown and Middlesex to this city. A committee consisting of Fred Blanchard, H. C. Gleason, L. Bart Cross, Collins Blakely and H. W. Kemp have been appointed to correspond with parties interested with a view to ascertaining the feasibility of such a project.

New York.—An immense power house is to be erected at Kingsbridge by the Third Avenue Railroad Company at a cost, including the plant, of at least \$5,000,000. The electric machinery is to have a capacity of 4,000 horse-power, the purpose of the company being to have the motive power for their whole system generated there, and to change all their lines into electric within three years.

New Kensington, Pa.—The borough council has granted the New Kensington Street Railway Company

a 99-year right of way to lay a single street car track over Fifth avenue the entire length of the borough from Parnassus to Arnold. T. A. Mellon, Jr., is president of the company and D. T. Marsh, Pittsburg, secretary.

New Haven, Conn.—The New York, New Haven & Hartford Railroad Company has decided to build an extension of its Nantasket Beach electric system between East Weymouth, the present terminus of the road, and Braintree. With the completion of this extension the company will have 15 miles equipped with electricity.

Norfolk, Va.—The Norfolk & Ocean View Railroad eight mile electric line, which has been in the hands of receivers for a year, has been sold by order of the United States Court to the Norfolk Street Railway Company, for \$329,000.

Penn Yan, N. Y.—All the preliminary work, including the survey, has been completed by the Penn Yan & Geneva Electric Railroad Company, and an application will at once be made to the State Railroad Commissioners for a charter. F. B. Hubbell of Baltimore, Md., the promoter of the road, states that the necessary capital is in sight and will be forthcoming unless war with Spain is proclaimed.

Pittsburg, Pa.—The Pittsburg "Times" says: "A big scheme, and it will not be of such very gradual accomplishment either, to gridiron the Monongahela and Youghiogheny valleys with electric lines, is in a formative condition just now. The sag ends of the scheme are already built, and it will only require the construction of a few miles up each of the valleys to connect Pittsburg by new lines with Braddock, McKeesport, Elizabeth, Monongahela City, Charleroi, Bellevue, California and Brownsville, and eventually Morgantown and Fairmont, in the Monongahela valley, and McKeesport, Versailles, West Newton, Smithton, Layton's, Dawson, Broadford, Connellsville and Uniontown up the Youghiogheny."

Republic, Wash.—E. R. Gray, I. M. Fisk and T. W. Butler, of Kettle Falls, are reported here to be organizing a company for the purpose of establishing an electric car line into this camp.

Reading, Pa.—The right of way along the entire route of the Reading & Royertown Electric Railway has now been secured, and the construction of the road is being pushed rapidly. This road will pass through a large number of villages and settlements, heretofore inaccessible by rail, for a distance of about twenty miles.

Saginaw, Mich.—The receivers of the Union Street Railway presented figures showing that they were losing money at the old rates of seven and nine for a quarter, and Judges Snow and Wilber have granted them permission to raise the rates.

Sistersville, W. Va.—Engineers are surveying the proposed route of the Sistersville & Salem Railway, to be built between this city and West Union. The right of way has been secured from this city to Middlebourne and as soon as the engineers establish the grade work will be commenced. It will be one of the longest electric lines in the country, the distance from here to West Union being about 50 miles.

Tiffin, O.—Samuel B. Sneath, builder and owner of the Tiffin & Postoria electric road, which is in operation as far as Bascom, has transferred the road to a company whose officers are: President, D. E. Kimberly, Cleveland; vice president, Mr. Gabriel, Cleveland; secretary, C. O. Everett, Cleveland; treasurer, S. B. Sneath, Tiffin, who, with B. G. Tremaine, Cleveland, compose the board of directors.

Westbrook, Me.—The directors of the Westbrook, Winham & Harrison Electric Railway Company have voted to accept the locations granted by the several towns through which the road is to pass. The work of construction will probably begin at an early date.

Wildwood Beach, N. J.—A party of Philadelphia capitalists, headed by Morris M. Neurath, have organized the Five-Mile Beach Railway Company, and they will shortly commence the building of an electric trolley road the entire length of Five-Mile Beach, connecting the resorts of Holly Beach, Wildwood and Anglesea.

LIGHTING PLANTS.

Bad Axe, Mich.—At an election held here on the 14th an informal vote was taken on the question of municipal purchase of the electric light plant, 190 voting in favor of buying the plant and 72 against. The franchise of the present owners gives the village the right to buy within a specified time at actual cost.

Brooklyn, N. Y.—The Edison Electric Light Company has begun stringing wires on the poles of the defunct Coney Island & Gravesend Electric Light Company, purchased by them from the Citizens' Company, which bought the franchise granted by the town. Lights will be introduced by the 15th of April.

Burlington, N. J.—The Monmouth Traction Company, which is applying for right of way through this city, has just completed a contract for lighting the city for \$4,000 a year for five years, conditional on getting a franchise to build and operate the trolley system.

Chillicothe, O.—The Juneman electric plant, which has been doing the city lighting, passed into the hands of the Chillicothe Street Railway Company on the 18th inst., the consideration being \$25,000. The railway company proposes to reduce the cost of the city lighting \$1,650 a year.

Cranford, N. J.—The township committee has granted a 99 year franchise to string wires for lighting in the township to the Cranford Light & Water Company.

Des Moines, Ia.—The so-called curative act permitting the carrying out of the McKaskey-Holcomb contract for the erection of a municipal electric lighting plant has passed both houses of the Legislature.

Milwaukee, Wis.—Bids will be received by the board of public works on Friday, April 15, for the gas and electric light fixtures for the Public Library and Museum building. It is expected that these fixtures will cost about \$16,000. Bidders will have to put up bonds to the amount of \$5,000 or \$2,500 in cash. In order to get the full benefit of competition the board of public works has mailed copies of the advertisement and the specifications to manufacturers of gas and electric light fixtures in New York, Philadelphia and Chicago.

New Albany, Ind.—The council is expected to take early action on the question of lighting the entire city with electric arc lights, doing away with the sun vapor lights.

Petoskey, Mich.—At the spring election next month the voters of this place will have a chance to express their opinions on a bonding proposition for \$6,000 for a municipal lighting plant.

Pomeroy, O.—George Pfarr, Henry C. Pownall and George Cowey, who compose the Mutual Electric Company, have been granted the right to maintain and operate a system of electrical distribution in this city for a term of twenty-five years.

Richmond, Mich.—The proposition to bond the village for \$9,000 to establish an electric light plant was carried at the late election by a vote of 204 to 69.

Rogers City, Mich.—Electric lights are spoken of as among the probabilities in the contemplated village improvements.

Rockville Center, L. I.—At the recent election here, the appropriation of \$2,000 for completing the electric light plant was carried by a vote of 101 to 32.

Sac City, Ia.—The Sac City Electric Company has accepted the provisions of the ordinance giving it a lighting franchise and will proceed to let contracts for the construction of an electric light plant.

Trenton, N. J.—A bill has been introduced in the House by Mr. Porter which gives the Board of Street and Water Commissioners in cities of the first class entire control and authority to provide for the public lighting of all streets, avenues, lanes, alleys, highways, docks, bridges, parks and public buildings of such city.

Watertown, S. D.—This city is soon to have a new electric light plant. Col. L. D. Lyon, representing the Watertown Water, Light & Power Company, has been canvassing the city and has secured a guarantee of 1,000 lights. The city will grant a franchise and take a number of lights for street lighting. For the past two years Watertown has been without electric lights, the old plant constructed by the General Electric Light Co. in 1888 is worn out, and the franchise has lapsed. The new plant will be of modern construction.

COMPANY MATTERS.

Albany, N. Y.—Senator Malby's bill, enabling the St. Lawrence Power Company of Massena, St. Lawrence county, to operate its canal for navigating purposes and to furnish a water supply, water power, or to generate electric power to be used by any city, town or village wishing to contract therefor, has passed the Senate.

Annapolis, Md.—A bill has been introduced in the House to incorporate the Electric Power & Light Company of Baltimore County. The company is authorized to lay wires in the county for the transmission of electricity for heating, lighting or motive purposes; capital stock, \$25,000. Henry Keidel, William H. Matthai and James O. Bates of Baltimore county; John W. Lowe, James C. Doyle, Theodore M. Easter and John W. King, of Baltimore City, are named as incorporators.

Bangor, Me.—The Bangor Electric Clock Company, of which Gen. J. S. Smith is vice-president and general manager, have temporarily located their factory in the new Sudbury building on Sudbury street, Boston, Mass., where they are busy perfecting the machines and getting out sample clocks which will be sold all over the country. Every part, even to the smallest screw that goes into the make-up of these clocks, is now made by the company and a great many of the tools had to be specially constructed for this work.

Dayton, O.—The Thresher Electric Company contemplates an extension of its plant and works.

Gettysburg, Pa.—Capitalists interested in the Gettysburg Transit Company will, on April 14, apply for a charter for a corporation to be called the People's Electric Light, Heat & Power Company of Gettysburg. It is rumored that extensive improvements will be made on the electric railway. Among those interested in the enterprise are Henry A. Sage of Easton, Henry Green and Frank Reeder of Easton, Henry A. Boreel, William E. Burk, J. Darlington, William Henderson, Joseph T. Richards, Max Riebenack and Theodore P. Saulnier of Philadelphia.

Lancaster, N. H.—The electric companies of this region are to be consolidated under the name of the Northern Electric Company, comprising the Lancaster, Jefferson, Whitefield and Bethlehem companies, with a capital of \$100,000. The main power house will be at Bethlehem, and the offices and headquarters at Lancaster.

Middletown, N. Y.—A controlling interest in the Middletown-Goshen Traction Company has been sold to

a syndicate of New York capitalists, who have taken possession of the road. The officers of the new company are: President, F. McKeige; vice-president and treasurer, C. G. M. Thomas; secretary, H. M. Brundage; general manager, W. A. Grauten. The new owners intend to make several improvements. It is probable that a lighting plant will be established in connection with the railway.

Pittsfield, Mass.—The directors of the Pittsfield Electric Street Railway Company have voted to increase the capital stock from \$60,000 to \$80,000, provided the Railroad Commissioners grant permission to do so. The object of the increase is to build a new line to Tillotson, about two miles to the west.

Schenectady, N. Y.—The General Electric Company has let the contracts for its new foundry, and is having plans prepared for a machine shop of imposing dimensions.

TRANSMISSION PLANTS.

Atlanta, Ga.—It is said that the new electric power company which proposes to dam the Chattahoochee River and establish an immense plant for the generation of electricity will soon be ready to commence work on the project. The object of the company is to furnish electricity to manufacturers and other consumers in Atlanta and throughout Fulton county.

Visalia, Cal.—Mayor William H. Hammond of this city, A. G. Wishon, manager of the city waterworks, and W. G. Henshaw of the Union National Bank of Oakland have associated themselves in an enterprise of considerable importance. They propose to utilize the waters of the Kaweah River at a point about thirty miles east of here in operating an electric generating plant from which to transmit about 1,000 horse power to this city and neighboring towns. The plant and its appurtenances will cost about \$200,000. Work is expected to begin in a few days.

FIRES, ETC.

Chicago.—The Schoenemann building was destroyed by fire on the 21st inst. Among the firms burned out was the Atlas Electric Company.

Palmer, Mass.—The plant of the Central Massachusetts Electric Company, located at Blanchardville, was almost totally destroyed by fire on the 17th inst. Superintendent E. H. Rollins and Electrician W. E. Shea were badly burned about the hands and face in making their escape from the building. The plant furnished light for all the villages of the town of Palmer, including Thorndike, Bondville, Palmer Center and Three Rivers. It also supplied electricity for lighting purposes for the towns of Monson and Warren. The insurance on the plant amounts to \$30,000. The loss is estimated at about \$50,000.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—On March 24, the Senate passed Senator Brackett's bill, giving the Hudson River Power Transmission Company the power to acquire rights of way in the counties of Saratoga and Schenectady.—On March 25 the Assembly passed Mr. Cowles' bill to incorporate the Electric Water Power Company of Oneonta.

Troy, N. Y.—The furnishing committee of the Court House Commission has awarded the contract for furnishing a system of electric clocks for the new court house to the American Watchman's Time Detector Company of New York, at a cost of \$507. The system is to consist of one master clock and twenty secondary clocks.—The E. G. Bernard Company has received a contract for furnishing the Dobler Brewing Company of Albany two sixty horse power direct-connected generators, one electric elevator, seven direct-connected motors and the necessary apparatus for a lighting plant. It will be the most complete electric plant in this section of the State.

PERSONAL AND MISCELLANEA.

Reuben Franklin Baker, president of the Columbia City Railway of Washington, D. C., died Wednesday last in that city.

S. G. Colman, who has been acting superintendent of the lighting department of the Milwaukee Electric Railway & Light Company since the resignation of William Church, has been appointed to fill the position, and has entered upon his duties. Mr. Colman has been with the company ever since its formation, and was one of the organizers of the old Badger Illuminating Company.

James F. Heyward of Baltimore has completed arrangements for engaging in business in New York as consulting expert of railway companies, capitalists and investors generally. He expects to occupy his office in the Washington Building, No. 1 Broadway, about April 1. Referring to Mr. Heyward's change of location, the Baltimore "Sun" says: "Mr. Heyward's long experience in street railway management would seem to fit him eminently for such work as he intends undertaking. In leaving Baltimore he takes with him the best wishes of his many personal friends for his future success and the gratitude of the thousands whose interests he guarded so faithfully while general manager of the City & Suburban Railway."

The Philadelphia Electrical Exposition Company will give an electrical exhibition in its building, 818 and 820 Chestnut street, Philadelphia, beginning June 6 and continuing for one month. There has been no exhibition given in that city since 1884, and public interest will be aroused by a systematized attempt to place before

it all the progress of electricity since that time. Especial efforts have been made to interest distinguished inventors, such as Edison, Tesla, MacFarlane Moore, Elihu Thomson, Steinmetz and many others. The management has obtained the services of Prof. William D. Marks as director.

The bill to substitute the electric chair for the gallows as a method of capital punishment in Massachusetts has passed the House. The bill also provides that all executions shall take place at the State prison between midnight and sunrise, and carries with it an appropriation for a small building and the necessary appliances.

William Hoffman of Detroit has patented a "composite brake shoe" which is said to be an effective device for "curing" flattened wheels, and which does its work while the car is in regular operation, being carried on the car and easily attached and detached.

A. B. Holmes, a well known electrical inventor and a resident of Newton, Mass., is dead. He was 69 years of age and was a native of Loudon County, Virginia. He was a veteran of the civil war. After the war he turned his attention to the invention of electric lighting appliances and had achieved success in this line of work.

COMMERCIAL PARAGRAPHS.

The Albert & J. M. Anderson Manufacturing Company, of 289-293 A street, South Boston, Mass., well-known makers of Aetna and Hecla railway insulators, switchboards and line material, are said to be extremely busy at the present time turning out switches and switchboards to fill the large number of orders now on hand. This certainly speaks well for the quality of the goods this company is manufacturing.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

At this season of the year the treatment of the dread disease neuralgia is a matter of much consideration. Physicians and people in general have thought that the only permanent cure for neuralgia was a change in climate, water, air and surroundings, and that medical preparations were simply palliative. Neuralgia is in no sense of the word an imaginary disease; the sufferer from this disease is very much aware of the fact, and for this reason the few so-called neuralgia cures, liniments, etc., have been short-lived. The patient very soon discovers their inefficiency. Fortunately, however, there is an institution in Chicago that can and does furnish an effective cure and a sure method of treatment for the cure of neuralgia, which, judging from its rapid growing popularity, will soon take the place of all these palliative treatments. It has certainly made astonishing cures in this obstinate disease, and its merits have made it famous among physicians; and this is known as the Anti-Neuralgic cure, specialized by the French Chemical Company, 356 Dearborn street, Chicago.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The recently patented Newgard Water Proof Receptacle and Globe is finding a large field of usefulness in breweries, paper mills, packing houses, sugar refineries and all other places where moisture or fumes make the insulation of an ordinary lamp socket a difficult proposition. The price of this device is down to a point where it is economy to use it in all places where high insulation is required. The Newgard Receptacle and Globe is so simple in construction and yet so clever in its conception that it commends itself to every one at first sight. The Electric Appliance Company of Chicago are always glad to submit a sample of this globe where there is a possibility of its adoption.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, acts gently and positively on kidneys, liver and bowels, cleansing the entire system, dispels colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY.**

INCORPORATIONS.

The Carbondale Heat & Power Company, Carbondale, Pa. Capital stock, \$100,000.

The United Traction Company, St. Louis. Capital stock, \$2,000. Incorporators: John Scullin, James Campbell and Harry Scullin.

The National Electric Car Lighting Company of West Virginia, capitalized at \$2,000,000, has been licensed to transact business in Illinois with a capital stock of \$2,000.

The Newport Electric Power & Light Company, Newport, Ore. Capital stock, \$3,000. Incorporators: R. A. Bensell, William Matthews and E. Williams.

The Automatic Electric Alarm Company, San Francisco, Cal. Capital stock, \$300,000, with \$50 subscribed. Directors: Arthur C. Donnell, Piedmont; R. B. Woodward, H. D. Walker, Alfred Allayne Jones, Henry P. Dimond, San Francisco.

The Reger & Atwater Company, San Francisco, Cal.—to deal in electrical and mechanical supplies. Capital stock, \$25,000, with \$22,000 subscribed. Directors: A. P. Reger, William M. Reger, C. A. Reger, M. E. Reger and R. D. Duke, all of San Francisco.

The San Gabriel Traction Company, Los Angeles, Cal.—to build an electric railway from Los Angeles to Pasadena, with branches to Duarte, Monrovia and Sierra Madre. Capital stock, \$1,000,000. Directors: James F. Graham and S. P. Anderson, of Chicago, Ill.; Walter Maxwell, Bradner Lee and Albert Hadley, of Los Angeles.

The Littleton Water, Power & Light Company, Littleton, N. J. Capital stock, \$2,000. Incorporators: William B. Hord, A. F. Bennett and Hunter Wykes, all of New York.

The Eastern Electrical Construction Company, Philadelphia—to construct electric plants. Capital stock, \$50,000. Directors: William D. Barnard and Edgar M. Yarnall, Philadelphia; William Hoopes, Baltimore.

The West Oneonta & Laurens Railroad Company, Oneonta, N. Y.—to build and operate an electric railroad connecting West Oneonta and Laurens. Capital stock, \$75,000. Directors: Frank Gould, Parker Wilson, Albert D. Getman, Herbert H. Getman, Walter S. Whipple and Harry W. Lee, of Oneonta, and David S. Peet, Peter Seeber and P. K. Strong, of Laurens.

The Buffalo Valley Railway Company, Buffalo, N. Y.—to operate 27 miles of electric road from Buffalo to Java, Wyoming County, N. Y. Capital stock, \$50,000. Incorporators: Luther S. Bent and Felton Bent, of Philadelphia; Mason D. Pratt and Edgar O. Felton, of Steelton, N. Y.; Herbert P. Bissell and J. Henry Metcalf, of Buffalo; Joseph R. Ford and Frederick W. Wood, of Baltimore; Benjamin Watson, of Stryker, N. Y.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 22, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 630,857. Trolley-Wheel. Austin B. Collett, Lynn, Mass. Filed May 24, 1896.
600,900. Trolley-Wheel. Elbert R. Robinson, Chicago, Ill. Filed Nov. 28, 1896.
603,891. Pneumatic Controlling System for Electric Cars. Sidney H. Short, Cleveland, O. Filed Sept. 20, 1897.
601,206. Brake for Electric-Motor Cars. Patrick R. Hayes and Hugh M. Carbine, Chicago, Ill. Filed Dec. 23, 1896.
601,016. Street-Car Fender. Albert W. Routh, Pittsburgh, Pa. Filed Sept. 25, 1897.
601,131. Car-Fender. Jacob F. Eisenhower, Leighton, Pa. Filed Dec. 20, 1897.
601,155. Car-Fender. Susan F. Moore, Peabody, Mass. Filed Nov. 28, 1896.

ELECTRIC LIGHTS AND APPLIANCES.

- 601,108. Cluster-Fixture for Electric Incandescent Lamps. Nelson Weeks, New York City. Filed Oct. 1, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 600,911. Magnetic-Clutch and Power-Station System. Bion J. Arnold, Chicago, Ill. Filed June 20, 1896.
601,023. Alternating-Current Motor. Walter Langdon-Davies, London, England, assignor to the Davies Motor Company, Limited, same place. Filed Nov. 15, 1897.

MEASURING INSTRUMENTS.

- 600,981, 600,982, 600,983. Electrical Measuring Instruments. Edward Weston, Newark, N. J. Filed Dec. 7, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 600,990. Telephone. George F. Payne, Philadelphia, Pa. Filed Aug. 21, 1897.
600,991. Telephone-Transmitter. George F. Payne and William D. Gharky, Philadelphia, Pa.; said Gharky assignor to said Payne. Filed Sept. 11, 1897.

MISCELLANEOUS.

- 600,866. Electrical Alarm Gage. John Hackney, Norfolk, Va. Filed June 24, 1897.
600,874. Electrical Device for Propelling Boats. Lyman R. Jones, Boston, Mass., assignor to Samuel Jackson and William Potter, Jr., trustees, same place. Filed July 2, 1895.
600,925. Towing Canal-Boats, etc. Thomas S. Miller, South Orange, N. J. Filed Nov. 15, 1895. Renewed Aug. 24, 1897.
600,937. Electric Contact-Box. Joseph N. Thomas, Johnstown, Pa., assignor to the Johnson Company, Lorain, O. Filed Sept. 18, 1897.
600,969. Electric-Circuit-Closing Device. George Newman, El Paso, Tex. Filed Sept. 27, 1897.
601,012. Battery. William Morison, Montclair, N. J. Filed Jan. 20, 1896.
601,172. Portable Camera for Roentgen-Ray Photography. Gaston Seguy, Paris, France. Filed March 23, 1897.
601,115. High-Potential Insulator. John W. Bock, East Liverpool, O., assignor to the R. Thomas & Sons Company, same place. Filed Feb. 1, 1898.
601,222. Drop Signal Apparatus. Oscar A. Danielson, Owatonna, Minn. Filed May 12, 1897.

DESIGNS.

- 24,894. Case for Electrical Measuring Instruments. Edward Weston, Newark, N. J. Filed Feb. 14, 1898.
28,395, 28,396. Electrical-Instrument Case. Edward Weston, Newark, N. J. Filed Dec. 7, 1897.

The Orange County Telephone Co.

The following account of the origin and progress of this successful independent company is taken from a recently issued supplement of the *Daily Times* of Middletown, N. Y.:

"In June, 1895, the question of forming an independent telephone company in Middletown was suggested to our citizens. At that time the Hudson River Telephone Company was charging such a rate that only a comparatively few used the service. Its system was the single wire with ground return circuit. For this it was charging \$48 a year with seventy subscribers in this city. The plan laid before the people by the local organization was to sell one hundred shares of stock at \$100 a share, no one to own more than two shares, and to incorporate for \$10,000.

"When the first meeting of the stockholders was called, April 6, 1895, an organization was effected at once. Soon after a board of directors was chosen and the necessary papers to put in existence the 'Orange County Telephone Company, of Middletown, N. Y.' were made out and sent to the proper authorities at Albany. Rates placing telephones at \$30 a year for business places and \$24 for residences were decided upon, and by the time the stock was all sold over one hundred were secured as subscribers besides the hundred stockholders, who had all taken 'phones.

"At the first meeting of the board of directors, A. B. Wilbur was chosen president, Dr. E. Fancher vice-president; George A. Swalm, Jr., secretary, Frank Harding treasurer, and John L. Wiggins attorney. The board of officers stands the same to-day with the exception of Dr. T. D. Mills, who, on Mr. Wilbur declining to again accept the presidency at the first annual meeting, was elected president. Mr. Wilbur has also been elected vice-president in place of Dr. Fancher, and W. A. Marshall secretary. The board of directors is as follows: Dr. T. D. Mills, C. W. Martin, John L. Wiggins, F. Harding, L. S. Stivers, John E. Iseman, J. J. Silk, Robert C. Tushill, T. A. Weller, W. A. Marshall, Leander Brink, L. V. Sinsbaugh, A. B. Wilbur.

"On July 22, 1895, work was commenced on the construction of the line, the necessary franchise having been granted the new company by the city fathers. It was not until September 7, 1895, that the company really 'got down' to business. At that time Mr. George G. Otis, the present general manager of the company, was placed in charge and from that time on the construction went on in a most systematic manner.

"At present the company stands one of the best independent companies to be found anywhere in the United States.

"The company now has 308 connections. The system used is known as the metallic or common return system on a heavy copper wire which works perfectly. The instruments used were purchased from the American Electric Telephone Company of Kokomo, Ind. They were selected from at least two dozen other makes and were purchased solely on their merits, although costing more than many that were in competition. The switchboards were also purchased of the same company and are most excellent ones.

"General Manager Otis is one of the best electricians in the country, and his wide experience in constructing exchanges, he having built several, greatly aided him in giving our city such a perfect system.

"The company has extended its lines to several neighboring villages and Bloomingburg, Fair Oaks, Circleville, Scotchtown, Phillipsburg and Mechanicstown are now connected with the main office."

The National Telephone Company of Fort Wayne, Ind., at a meeting on the 15th inst., elected the following officers and directors: President, George W. Beers; vice-president, O. H. Corey; secretary, D. J. Cable; treasurer, W. H. Duffield; directors: S. M. Foster, Fort Wayne; C. H. Corey, Lima; W. H. Duffield, Lima; W. L. Parmeter, Lima; D. J. Cable, Lima; Henry C. Paul, Fort Wayne; Charles S. Bash, Fort Wayne; George W. Beers, Fort Wayne; F. W. Holmes, Lima. It was decided to extend the line from Kendallville to Sturgis, Mich., and then to connect with Grand Rapids, Kalamazoo, Lansing, Detroit and a score of intermediate towns of greater or less population. The report of the secretary showed that connections have been made with 175 towns in northeastern Indiana and northwestern Ohio, with a total length of wire of 2,000 miles.

The motion of Senator Brush to discharge the Finance Committee from the further consideration of the bill for cheaper telephone rates in New York having been tabled by a vote of 24 to 13 practically disposes of telephone legislation at this session, as the Finance Committee is apparently friendly to the monopoly.

The city council of Carlyle, Ill., has lately granted two telephone franchises—one to the Central Union Telephone Company, with headquarters at Highland, and the other to the Clinton County Telephone Company, composed of

home capitalists. The former concern will build a long-distance line, while the latter will connect all the towns in Clinton County. The home office will be in Carlyle.

The N. Y. *Herald* says: "Richard Croker has interested himself in a telephone company and has undertaken the task of seeing that it gets the use of the subways for its wires. He has taken an active part in the fight for lower telephone rates which has been going on for years." The company referred to is the American Telephone Company, which has offices in the Townsend building at Broadway and Twenty-fifth street, New York. It has no 'phones of its own in operation and has no connection with the American Telephone & Telegraph Company.

The Mississippi Valley Telephone Company has offered, through its representative, J. E. Craig, of Keokuk, Ia., to pay the expenses of a city election at Omaha, Neb., to vote upon granting it a franchise in Omaha. Its rates are \$48 for business houses and \$24 for residences, and if the franchise is obtained Mr. Craig states that they will begin at once to put in the plant.

A new franchise has been granted by the village board of Fulton, N. Y., to the Fulton Telephone Company, on condition that the company has its system in operation by June 1. The company is the same that applied for a franchise about one year ago under the name of the Automatic Telephone Company.

The borough council of Media, Pa., has granted the Delaware County Telephone Company the privilege of erecting poles and wires in the streets of the borough. The company has a line of poles almost completed between Chester and Media.

Telephone lines are being extended in Sevier County, Tenn. A branch to be known as the Sevierville, Walden's Creek and Wear's Valley line is to be constructed soon. Dr. E. H. Pearce is president, and W. C. Large secretary of the company organized to build the line.

The Pennsboro, W. Va., council has granted a franchise to the Citizens Telephone Company, who will at once put in a large number of 'phones and make connection with other lines passing through Pennsboro.

About twenty independent telephone companies in Iowa have just organized a State Association. The exchange in Des Moines opened with seven hundred subscribers last October, and is now serving twelve hundred.

The city council at Wilmington, Del., has ordered the Bell telephones removed from the city offices. The Delmarvia Company's 'phones are to be used instead.

The People's Telephone Company has made arrangements to extend its line from Romulus to Wayne, Belleville and Maybee, Mich.

A new telegraph line has been completed between Jacksonville, Fla., and Punta Rassa, where connection is made with the cable to Key West and Havana.

New Companies Incorporated.

The People's Telephone Company, Bartlett, O. Capital stock, \$2,000.

The Summit Telephone Company, Summit, Miss. Capital stock, \$10,000.

The Edenton Telephone Company, Edenton, N. C.—to establish and operate a telephone system and an electric light plant. Capital stock, \$1,500. Incorporators: A. T. Bush, George P. Folk, J. W. Branning, W. D. Pruden, E. B. Conger and W. J. Leary, Jr.

The Madison Telephone Company, Belleville, Ill. Capital stock, \$20,000. Incorporators: W. H. Johnston, B. L. Behr, E. W. Lazell and T. H. Wright.

The Tupper Lake Telephone Company—to operate in Franklin and St. Lawrence counties, N. Y. Capital stock, \$1,000. Directors: Nina L. Johnson, E. H. Johnson, Lillian M. Johnson, W. E. La Fountain, Rebecca H. La Fountain, William McLaughlin and Sarah McLaughlin, of Altamont, Franklin County, N. Y.

The New Amsterdam Telegraph & Telephone Company—to operate lines of telegraph and telephone in the several boroughs of New York City. Capital stock, \$100,000. Directors: H. W. Corbin, of Paterson, N. J.; Edward J. Leavy, F. B. Mullaby, Benson F. Currier, James F. Leavy, John J. Healy and A. E. C. King, of New York City.

The West Plains Telephone Company, West Plains, Mo. Capital stock, \$20,000. Incorporators: D. W. Reese, Charles H. Gale, Viola B. Gale, V. M. and F. O. Hines.

The McFall Telephone Company, McFall, Mo. Capital stock, \$1,000. Incorporators: C. O. and H. J. Patton, Lewis Schultz & Co., William A. Patton, Jr., and others.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 12c.; cast, 11½c.

The Boston Electric Light Company has declared its regular quarterly dividend of 1½ per cent., payable April 15 to stock of record March 31.

The New England Telephone & Telegraph Company has declared a quarterly dividend of 1½ per cent., payable May 14 to stock of record March 31.

A quarterly dividend of three-fourths of 1 per cent., payable April 10, has been declared by the directors of the Cleveland City Railway Company.

The Edison Electric Illuminating Company of New York has declared a quarterly dividend of 1½ per cent., payable May 2 to stock of record April 18.

The Westinghouse Electric & Manufacturing Company has declared a quarterly dividend of 1½ per cent. on its preferred stock, payable April 1.

The Edison Electric Illuminating Company of Brooklyn has declared its regular quarterly dividend of 1½ per cent., payable April 15 to stock of record March 31.

The Columbia & Maryland Railway was purchased at public auction on the 25th inst. for \$450,000 by N. P. Bond, president of the Baltimore Security & Trading Company.

It is understood that the Third Avenue Railroad Company, New York, proposes to declare a stock dividend of 100 per cent. to form the basis for an increase in its bonded indebtedness.

The Safety Insulated Wire & Cable Company of New York has received a contract from the Government for submarine and underground cables connecting all the forts and islands of New York harbor.

The Metropolitan Street Railway Company, New York, has declared a dividend of 1½ per cent. per share, payable April 15 to stockholders of record March 26. Transfer books, closed on March 26, will be reopened April 18.

The Cataract General Electric Company of New York City, which was incorporated in 1893 for a period of five years, has filed in the office of the Secretary of State a certificate of continuation for five years from November 3, 1898.

The directors of the Louisville City Railway Company, contrary to expectation, have declared the usual 2½ per cent. semi-annual dividend on the preferred stock, and the regular 1½ per cent. semi-annual dividend on the common.

The directors of the Los Angeles Electric Company have decided to call a meeting of stockholders on the 18th of May at Los Angeles, Cal., to vote upon the question of increasing the capital stock of the company from \$300,000 to \$600,000.

Among the bills passed by the New York Assembly last week was Mr. Kelly's, providing that on or before January 1 next every street surface railroad company whose cars are run by electricity or cable, in every city of over 60,000 inhabitants, shall equip its cars with a feeder to be approved by the State Railroad Commission.

The annual meeting of the Amsterdam Electric Light, Heat & Power Company will be held at the office of the company, 84 Broadway, Brooklyn, on Tuesday, April 5, for the purpose of electing seven directors. The transfer books will reopen on April 6.

Senator Cantor has introduced a bill in the New York Senate authorizing street railroad companies to sell lost property found on cars and unclaimed for three months, and to pay the proceeds to an association having for its object financial assistance to its members in case of sickness or accident.

The Welsbach has won its suit against the Sunlight Incandescent Company. The latter claimed invalidity for lack of invention and denial of infringement, insisting that the patent of the Welsbach could not be infringed by the use of any materials other than those specified in plaintiff's patent.

The Cities Senate Committee lacked one vote to report favorably the Ellsworth bill legislating out of office the Rapid Transit Commission of New York and empowering Mayor Van Wyck to appoint a bi-partisan commission. This vote settles the question of a new Rapid Transit Commission this year.

On and after April 1 the Old Colony Trust Company will act as transfer agent, and the American Loan & Trust Company as agent to register transfers of the stock of the Edison Electric Illuminating Company of Boston. In order to complete the arrangement the stock books will be closed from March 30 to April 4.

The stockholders of the Shelby Electric Company of Shelby, O., have decided to increase the capital stock of the plant from \$100,000 to \$250,000. The factory will be doubled and the work of construction is to begin at once.

The New Jersey Legislature has passed the bill allowing the reinstatement of corporations whose charters have lapsed by reason of non-payment of taxes, on making proper representations to the Governor. The bill is believed to be in favor of the Electro-Pneumatic Company.

The Chicago Electric Traction Company has taken possession of and is now operating the storage battery road formerly known as the Englewood & Chicago. The new company will issue \$270,000 of first mortgage bonds, which will go to the holders of the old Englewood & Chicago bonds at par in proportion to their old holdings and \$900,000 (roundly) of consolidated mortgage bonds and \$1,500,000 in common stock.

The Denver, Col., "Post" of the 22d inst. has the following item: "Louis Enricht and Paul Hirsch were arrested at the Brown Palace Hotel this afternoon by Under Sheriff Perry A. Clay on a message from Sheriff W. L. Hawkins of Canon City. Enricht and Hirsch are the promoters of the Canon City & Cripple Creek Electric Railway Company, and are arrested on a charge of conspiracy to obtain money under false pretences."

The New York "News Bureau" says: "The Edison Jr. Incandescent Light Company is negotiating for a location for its proposed new manufacturing plant at Niagara Falls. It can obtain power there at the rate of \$10 per horse-power per year, whereas ordinary steam power would cost it from \$60 to \$90 per year per horse-power. It proposes to erect a plant within the next four months with a capacity for an output of 20,000 lamps per week, and intends also to establish an independent glass plant for the manufacture of incandescent lamp bulbs. It is estimated that the present consumption of incandescent lamps amounts to 120,000 a week in the United States. Officers of the company state that the offer of \$250,000 of the preferred stock of the company for public subscription is meeting with a ready response and the prospects are that the entire amount will be fully subscribed for within a very few days."

Messrs. Spencer Trask & Co. have issued for distribution a handsome little pamphlet, entitled "The Edison Electric Illuminating Companies of Greater New York," reviewing from the investor's standpoint those splendid properties, and containing an exhaustive resume of their management and operation since their origin to the present day. The book, which is prepared in a way to interest the general reader as well as those financially interested in the companies, has tables showing the gross and net earnings of the companies for several years, the expansion of business, growth of capital, and much other information, and has fine pictures of the central station of the Edison Electric Illuminating Company of New York and the Pearl street central station of the Edison Electric Company of Brooklyn. A folding map of part of New York City, showing the underground mains of the New York company is appended.

EDITORIAL NOTES.

A New Electric Conduit System.

Numerous conduit electric railway systems have been invented from time to time, and several are now in operation in some of our large cities. In looking over the systems brought out it would certainly seem as if almost every conceivable arrangement of apparatus had been thought of and the field in this line most thoroughly covered. Such, however, appears not to be the case, as we now hear of a rather ingenious system suggested by a Chicago man. The conduit systems so far patented—several hundred in number—may be divided roughly into three classes: those having an open or slotted conduit, those having a semi-open or closed conduit, and those having a sealed conduit. The system referred to above and invented by the "Windy City" man belongs to that of the second class. It is said to work on practically the same principle as electric arc lights. There is necessarily a conduit, but quite shallow, sixteen inches in depth by four inches in width. In the pavement on each side of the slot are located two castings twenty feet apart. The ends of the castings nearest the rail are connected by an electric conductor located either underneath or close by the rail. Through the center of the castings a large circular hole is bored at right angles to the line of the track. Within this aperture a movable brass cylinder is located and within the cylinder is placed a heavily insulated metal rod. On the end of the latter, which extends into the conduit, is an ordinary trolley wheel. The movable brass cylinder is provided with two springs which tend to move it forward and away from the charged conductor. Each car is equipped with a wedge-shaped plow, twenty-one feet in length, which, when the vehicle is in motion, strikes between two opposite pulleys, one positive the other negative, and presses them back against the action of the springs. In this manner connection is made with the line conductors situated under each rail. The current then passes through the insulated metal rod and by means of the trolley wheel to the plow on the car and from there to the motors, the negative current passing out in the same manner on the opposite side. As the plow on a car is slightly longer than the distance between the switch boxes, the front of the plow reaches the next set of pulleys before it leaves the rear set, thus insuring a continuous flow of current through the motors. In other words, in this system the general arrangement is the reverse of that usually met with, the long plow on the car in reality taking the place of the continuous conductor. The inventor claims that his system is a great improvement over the various designs heretofore brought out, there being no current in the conduit except where the car happens to be,

and the end of the rod where it is pushed in to receive the current being in an air-tight space where no water or moisture can gain access.

It is claimed that a system as described above can be constructed for \$25,000 a single track mile, or for about one-third what the cable costs, owing in part to the shallowness of the conduit. The inventor is endeavoring, so it is said, to get his system adopted by some of the roads in Chicago.

* * *

Amendment to Patent Laws.

The following important amendment to the Patent Laws was recently introduced in the United States Senate by Senator Hanna: "That in cases of infringement or alleged infringement by purchasers or users of any patented device whatever, any individual, company, or corporation, to establish their claims upon patents of said devices, shall, in the courts having jurisdiction, enter suit against said purchaser or user within the space of five years from the date of the first alleged infringement by said purchaser or user or be forever debarred from collecting royalty or damage for the use of said device, to the end that the purchaser shall become the owner in reality as well as in name and not be further molested."

"That any individual, company or corporation owning or controlling patents acquired by purchase or otherwise, in case of alleged infringement by any inventor or manufacturer of any device whatever, to establish their claim of infringement on such device shall, in the courts having jurisdiction, enter suit within the space of one year from the date of said infringement, or be forever debarred from collecting damage from said inventor or manufacturer, though this act shall not be so construed as to debar any individual, company or corporation from establishing their ownership to patents upon said device thus manufactured."

"That any laws conflicting with the above conditions are hereby repealed and declared null and void, and this act shall become a law on and after its passage."

The reasons offered for the presentation of this bill are that there exists at present an abuse of the rights and privileges granted to owners of patents, which has become widespread and is causing great inconvenience and unnecessary expense to innocent purchasers of devices upon which two or more individuals, companies, or corporations claim patents. These claims are said to be often made through the use of telegrams, circulars, pamphlets, letters and advertisements, threatening and intimidating purchasers of such devices, the intimidation sometimes extending over months and years. In a majority of cases it is contended that the cost of defense of the purchaser's rights would be far in excess of amounts claimed, and in these cases settlements are

forced to be made before claims have been thoroughly established. It is therefore contended that such a bill will give ample time to recognize the rights of inventors and yet protect purchasers from great inconvenience and loss, such as is frequently sustained under the present system.

* * *

Searchlights. In modern naval warfare the electric searchlight necessarily plays a very important part.

Every man-of-war is provided with two or more of these powerful reflectors as a safeguard against the attack of torpedo boats or for signaling purposes. At harbor fortifications the searchlight is invaluable for detecting the approach or attack of an enemy by night. A search lamp, or that part of the apparatus which generates the light, is nothing more, as is well known, than a focusing lamp mounted in a cylindrical box so arranged as to send the beams of light in any desired direction by the aid of a reflector. Of the whole apparatus the latter is by far the most important. It is absolutely necessary to employ a reflector in order to obtain a parallel beam, and this reflector has up to the present time almost invariably been made out of glass. As it takes a number of weeks to accurately grind one of these glasses, a substitute has been widely sought for in the way of a metal reflector. Attempts have been made to obtain metal reflectors by spinning them in moulds, but it has been found impossible to spin them true. Cast metal reflectors have also been tried, but the cost of grinding and polishing them has been found excessive. Stamping has also been tried with equally poor results. Mr. Sherard Cowper-Coles, of England, suggested a rather ingenious method of making a reflector at a moderate cost electrolytically. In a word, his method consists in preparing a glass mould to form a true parabolic reflecting surface. It is only necessary to accurately shape and polish the convex side. Over the prepared surface a coating of metallic silver is chemically deposited. The mould is then immersed in an electrolyte of copper sulphate, and while slowly revolved, copper is deposited. The metal portion is then separated from the mould and coated with a film of palladium to prevent tarnishing. This process is said to give an excellent reflector at a moderate cost.

As previously stated, the main object of the reflector is to make the beam of light parallel. In practice, however, it is impossible to obtain a reflector which will not absorb some light or which will make a beam perfectly parallel. The light, therefore, gradually becomes scattered as the distance from the source increases, but in spite of this drawback powerful lights can be thrown under favorable conditions a distance of 100 miles.

In the larger forms of projectors the adjustment of the beam is accomplished by means of screws or gearing. Searchlights on ships are usually equipped in this manner. To enable the regular pressure, generally in use on ships, of 110 volts to be utilized for operating the searchlight, a rheostat is frequently placed in circuit with the arc lamp. Thus resistance can be either added or cut out at will.

The harbor fortifications in the vicinity of New York are well equipped with searchlights. Sandy Hook is provided with one, Fort Wadsworth has two and is said to be fully equipped for operating them, and Willets Point also has an efficient plant of this nature. The searchlight at Sandy Hook is probably the largest in the world. It is the projector that was on exhibition at the Chicago Columbian Exhibition in 1893 and which attracted so much attention. It weighs 6,000 pounds and has a reflector five feet in diameter. In operating it requires a current of 200 amperes at 50 volts, or in other words, takes an activity of 13.4 horse-power. The upper carbon is $1\frac{1}{2}$ inches in diameter, the lower carbon $\frac{1}{4}$ inch less. This light is provided with a Mangin reflector, which is a spherical mirror whose inner and outer surfaces are of different radii. In this apparatus the

light is not allowed to pass directly from the arc into the beam, but is thrown from the arc back to the reflector by means of a small mirror before being projected outward.

The best searchlight mirrors are said to be manufactured abroad, there being but comparatively few made in this country. There would therefore seem to be a wide field open in this line provided some economical process could be discovered for turning out this article.

* * *

Wave and Tide Motors.

Some little time ago Mr. Thomas Edison, Jr., suggested a means of utilizing the power of the ocean for generating electricity. It may be of interest to our readers to know that several systems of the above nature have been in use for a number of years which are said to have proven comparatively successful. One of these plants is situated on the Pacific coast, the electricity generated being transmitted to Los Angeles, where it is used for various commercial purposes. A wharf 26 feet in width has been built out in the ocean a distance of 350 feet, at which point three motor floats are located. The motion of the waves in raising and lowering these floats is made to pump water from a small reservoir into the pump cylinders and forces it into a storage pressure tank, where it is subjected to a heavy air pressure. This water then flows out of the tank through a nozzle, and impinges upon the buckets of a water wheel which in operating drives a dynamo. The accumulated pressure in the pressure tank is made to exert a force upon the pump pistons so as to resist the tendency of the floats to draw the pistons down. This feature of the plant, invented by Mr. Parvin Wright, is an exceedingly important one, as it enables the floats during storm periods to ride upon the crests of the waves without dropping into the trough of the sea, in which case they would become inoperative.

Recently a number of very thorough tests of this system are said to have been made, extending over a period of sixteen days, during which time the weather conditions varied from calm to stormy, the number of waves per minute varying from three to eight. The tests showed that each float developed from 2.3 to 3.5 horse power, the rating being taken from the power developed at the water wheel. It was further stated that the variations in the power were due to the varying conditions under which the motor was tried. The cost of erecting a plant capable of generating 1,000 horse power, with a transmission line to Los Angeles, is placed at \$175 per horse power.

As will readily be seen, this is considerably more than it would cost to erect a plant of the same capacity to be operated by steam. On the other hand, the operating expenses should be much less in the case of the wave-motor system, especially where coal is more or less difficult to procure.

Another interesting attempt to utilize the power of the ocean has recently been made at Ploumanach, on the northern coast of France. In this region, owing to the nature of the coast, which abounds with numerous deep indentures, there is a difference in tide level frequently amounting to as much as twenty-nine feet. It is these exceedingly high tides that are made use of in the plant in question. A natural pond, triangular in shape, with its base towards the shore, is separated from the sea by an embankment. This pond has an area of almost four acres. In the embankment automatically operated gates have been constructed, which, owing to the angle at which they are placed, open when the level of the sea exceeds the height of the water in the pond, while on the other hand they are closed by the weight of the water in the pond when the tide recedes. This head of water is then utilized to turn two water wheels, which operate dynamos, the electricity generated being utilized for lighting purposes. The capacity of the plant is said to be about 2,000 horse-power hours daily. In order to provide

a sufficient supply of current for lighting purposes during the hours of low tide, a storage battery has been installed which is charged during the hours of full running.

It would seem as though tide mills of the above nature could be advantageously employed at various points along the Pacific coast, where the tides rise and fall from eighteen to twenty feet, or on the Bay of Fundy, where tides have still greater alternations.

Under the Searchlight.

Notes and Comments on Various Topics.

War on the General Electric.

A leading official of the General Electric Company says: "It is true that we have received some contracts from the Government for special work, but the amount of money involved does not begin to compensate us for the loss of contracts which we undoubtedly would have received if there were no disturbance to general business from the Cuba trouble. Where we get one contract from the Government I may say we lose ten from syndicates which were contemplating new work of various kinds."—*Boston News Bureau.*

If the rumor of war is affecting the business of the General Electric Company, as the above statement leads one to believe, the holders of the preferred and common stock will be obliged to gird up their loins for another long and patient wait if war actually breaks out. Such an event would make an excellent excuse for postponing the rumored settlement indefinitely.

* * *

THE *Electrical Review*, London, in a recent issue refers to some exceedingly curious experiments which show that the electric arc is capable of acting either as a telephone transmitter or receiver. The arrangement of apparatus is described as follows: "The primary of a small step-up transformer was connected up in the circuit of the electric arc; a microphone and battery were put in circuit with the secondary of the transformer. When the end of a sounding tuning-fork was placed in contact with the microphone, the same note was heard distinctly at the electric arc. In order to show that the electric arc is capable of acting as a telephonic transmitter, the microphone in the above-described arrangement is replaced by a telephone, and the sound waves are concentrated on the arc by a funnel. Speech, singing, whistling, thus directed on the arc, are heard distinctly at the telephone. The explanation of this phenomenon is plain, when it is remembered that the resistance of the arc varies with the density of gases through which the current passes; the variations of the resistance will produce corresponding variations of the current which, by lateral induction in the transformer, are transmitted in an intensified form to the telephone." Our contemporary across the water aptly concludes the description in the following humorous vein:

"We do not recommend this invention for commercial use; the language transmitted through the present telephone is usually heated enough; at least, there is no necessity for passing it through an electric furnace."

* * *

WE have announced lately the success of the Westinghouse Company in securing contracts for electrically lighting the catacombs of Rome and the Pyramids of Egypt, and it affords us no little pleasure to be able to inform the company that there is a chance nearer home for them to do a stroke of subterranean business that has none of the revolting features of the European charnel vaults. Col. Joe Bennett of Sullivan, Mo., we are told in the *St. Louis Republic*, says that the magnificent cave near his native town is to be lighted by electricity. "The Colonel," says the *Republic*, "is enthusiastic in his praise of the cave and claims that its natural marvels present more awe-inspiring scenery than the famous Mammoth Cave. The cave extends for seven miles. Its generous amount of stalactites and sta-

lagmites are formed in the shape of trees and animals. In the glare of torches they assume weird and fantastic shapes. One might imagine it a primeval forest inhabited by wonderful monsters lurking in the shadows ready to seize upon people who intruded upon their sacred precincts." What a chance is here offered to develop the art of subterranean electric illumination!

* * *

THE Boston News Bureau says:

The General Electric Company has since Jan. 1 cancelled and burned \$2,000,000 more of its debenture bonds, leaving the amount outstanding slightly under \$6,000,000.

Possibly the General Electric Company has set an example burning bonds in the hope that the holders of the common and preferred stock will burn their securities. This would probably have been done long ago if the discouraged stockholders had not been buoyed up by constant rumors of a speedy settlement which never materializes.

* * *

THE following little anecdote recently appeared in the Cincinnati Post:

One of the most prominent electricians in the city resides in the country in a very handsome home. He is early at his fireside from the day's toils and is ever warmly welcomed by his loving wife. The brute in man must assert itself, however, once in a while. The affectionate greetings he nightly received made him too over-confident of himself. He imagined that he was the entire show. One evening last week he returned very much dejected in appearance. His close observing wife noted the cast-down tendency and said: "Too much work, John."

"Oh, no, I've sad news," replied the careworn husband, scarcely noticing the anxiety of his better half.

"What can it be?" queries she in hesitating tones.

"Well, the Government needs electricians to attend to the disappearing guns, and as war is sure, why, they have decided to call upon the cities. Each city must contribute 25."

Then he chuckled inwardly as he thought of the train of thoughts the suggestion would start.

"Well, does that include you in Cincinnati?" rather sorrowfully, but not quite as much of an exhibition as he had expected.

"Yes! Yes! that takes me."

Instead of weeping and wailing as he had figured on, she smilingly remarked: "Well, when you go, auntie and I will take a trip to California; we've been anxious to go for a long time."

Now when he leaves home he takes only that part of the paper that contains no war news.

* * *

REGARDING the matter of lost stock referred to in our last issue, the Kansas City Times says: "The General Electric Company, one of New York's big combines, is advertising for a number of shares of its stock that have gone astray in a freight car somewhere between Schenectady, N. Y., and Worcester, Mass., where the company is putting in a street railway plant. Car and all is missing. No doubt the hue and cry is mostly on account of the car. A single car-load of stock in a modern New York trust wouldn't be worth bothering a great deal about. The directors could issue another million or so shares at any time. But a freight car is another matter." How well the methods of the General Electric Company are getting to be known!

* * *

A MAN employed as a motorman on a St. Louis street railroad, and heretofore bearing the name of Patrik, by gift of his parents, has had it changed to Percy by the court, on the plea that "through his connections with the company, and among those with whom he associated in a social way, the name of Patrik has been used unpleasantly, thereby placing the petitioner in an embarrassing position." What's the matter with St. Louis?

Canadian Electrical Association.

Arrangements have been completed for the next convention of the Canadian Electrical Association, which will be held at Montreal on June 28, 29 and 30. Besides the business sessions, at which a number of valuable and practical papers will be read, many special features have been decided upon.

ELECTRICAL EXHIBITION NOTES.

Magnetic Ore Mining Exhibit.

A great deal of public interest attaches to the work which Mr. Edison has been doing for some few years past in magnetic ore separation, and the general curiosity on the subject will be satisfied at the approaching Exhibition, where Mr. Edison will actually exhibit a model built for him by Mr. Sigmund Bergmann which illustrates admirably the fundamental principle of the process. This model will be kept running by a small motor, and the iron will be continuously separated from the crushed rock in full view. Mr. W. S. Mallory, the manager of Mr. Edison's mining works, is sending to the Exhibition samples of crushed rock in its various stages, as well as samples of the separated ore and of the briquettes which are sent to the furnace. He is supplementing this by some four or five ton masses of rock, which Mr. Edison takes bodily out of the hillside by means of huge excavators, and the magnetic condition of these ponderous masses will be shown and tested by magnets. Around the exhibit will be placed photographs illustrative of the scenes at the mines themselves, and the whole will constitute one of the most instructive demonstrations possible. This valuable exhibit will be placed along one side of the Concert Hall of the Garden in company with a number of very interesting special features which have already been arranged for.

WIDESPREAD INTEREST IN ELECTRICAL EXHIBITIONS.

The interest taken in Electrical Exhibitions is by no means limited to Greater York, and extends in every direction. Numerous comments have been made by the foreign press and by journals in different parts of the country, and Prof. R. B. Owens, Director-General of the electrical work at the Omaha Exposition, beginning in June, has been specially instructed to visit this city in May and acquaint himself with the exhibits and the work being done. Many inquiries have come from foreign managers and manufacturers as to the time and nature of the Exhibition, and it is a fact beyond question that a direct stimulus will be given to export trade. As was the case at the Exhibition in 1896, many of the exhibits will go straight from the floor to foreign countries.

LARGE ACCESSIONS TO THE MEMBERSHIP OF THE NEW YORK ELECTRICAL SOCIETY.

One of the most striking evidences of the general interest that the Exhibition is awakening is to be found in the remarkably large accessions to its membership which the New York Electrical Society has enjoyed since the Exhibition was announced under its auspices. The desire of the Society to promote the welfare of electrical applications is recognized as highly laudable, and has elicited not only many words of commendation, but has brought the largest number of applications for membership within a given time that the Society has known in its history. In almost every instance the new members inquire as to the Exhibition, and express the wish to aid it in any way possible. Last month the Secretary announced a list of a round score of new members, and the following were elected members of the Society on March 30:

New York City—W. C. Broadhurst, H. M. Lamont, Edwin H. Daly, Gustavo Lobo, Richard Lamb, J. B. Taltavall, Fred Catlin, Clarence W. Phillips, Marcus Nathan, Harris I. Goldstein, A. L. Saruya, Joseph Miller, Henry C. Mortimer, Jr., Earle Ovington, Dr. C. A. Doremus, Geo. F. Porter, A. L. Doremus, Morton Webster Haddock, Richard Koch, H. A. Strauss, F. M. Hawkins, Elmer P. Morris, Jens Skougaard, S. Clover Way, Christopher M. Lowther, W. J. Clarke, R. E. Gallagher, E. N. Stevenson, Theodore B. Entz, W. H. Palmer, Wm. F. Crawford, C. W. MacMullen, C. H. Clark, Jos. C. Youenes, L. B. Pearson, Fenton S. Grant, Phillip Menges, D. L. Collins, Louis S. Levy, Samuel F. Butterworth, Geo.

Sanders Weston.—Brooklyn, N. Y.—John Maguire, John Joyce, Calvin Winsor Rice.—Mt. Vernon, N. Y.—Conrad Watober.—Newark, N. J.—C. D. Warner, C. N. Wheeler, J. J. Bellman.—Bloomfield, N. J.—C. Morris Haskell.—Westfield, N. J.—E. Y. Porter.—Weehawken, N. J.—Harold Briesen.

COMMUNICATION.

The Firman Patent.

Electricity Newspaper Co., New York.

GENTLEMEN: The attorneys for the Western Electric Company (Bell manufacturers) having published a statement over their signature, which, by inference, indicates that the Firman patent covers all forms of multiple switchboards, and that this patent was upheld in their favor in a recent California suit, we desire to publicly announce that the Firman patent does not, in any manner whatsoever, affect the multiple transfer system of the switchboard of this company.

We challenge a single particular in which the Firman patent claims refer to our devices. Respectfully,

WESTERN TELEPHONE CONSTRUCTION CO.
Chicago, April 1, 1898.

Electricity in Coal Pits.

The Colliery Guardian publishes some interesting extracts from a report drawn up by Mr. Leproux, of France, on the use of electricity in the Belgian and Westphalian coal mines. In the course of a recent tour through Belgium and Westphalia, Mr. Leproux had the opportunity of studying the state of this question in the districts containing fiery mines of these two countries; and the following is the result at which he arrives from the safety standpoint, quite independently of any economical consideration:

"Neither in Belgium nor in Westphalia do there exist any power-transmission installations any portion whatever of which is in contact with an air current decidedly impregnated with firedamp. In fact, the only dangers that have had to be guarded against are those of fire and also shock through personal contact; and the restrictions laid down in this respect do not differ from those that have been found necessary for surface installations connected with industrial establishments. As to the danger of exploding gaseous or dusty mixtures, if any attention has been bestowed upon it, this may be said to be only for appearance sake, at any rate, up to the present time.

"The measures taken are—in Belgium a careful encasing by special conductors of the parts capable of giving out sparks, and in Westphalia the adoption of polyphase current motors without brushes, and the use, also, of strongly-armored cables. In both countries the Government has been led to require for such installations that previous permission be applied for and obtained, but subject, at any rate ostensibly, to the appointed regulations, which are more stringent in Belgium than in Germany." "I consider," concludes Mr. Leproux, "that this difference is largely due to the dangers of firedamp being far better known, more studied, and especially more dreaded in the former than in the latter country, and that therefore the efforts already made in other countries, especially England, are more closely watched."—*Electrical Engineer, London.*

Electric Progress in Corea.

The United States Consul-General at Seoul, Corea, has sent the State Department at Washington the following letter regarding the electric railways of Seoul:

"I have the honor to inform you that a company has been formed in the city of Seoul for lighting the streets and residences with electricity and for operating electric street railroads through the principal thoroughfares. Only the latter will be begun at once.

"The company, known as the Seoul Electric Company, is composed entirely of Koreans, with the governor of the city as president. They have an exclusive franchise from the Department of Public

Works, Agriculture and Commerce, and have paid in about one-half of the capital of \$300,000.

"This company has made a contract with Mr. H. Colbran, of Denver, the American contractor for the construction of the Seoul-Chemulpo Railroad, for the construction and equipment of an electric trolley street railroad of the latest and most improved design. The railroad will be about six miles in length, and will run from the station of the Seoul-Chemulpo Railroad through the south gate of the city, along the broad streets, past the new palace and foreign quarter, through the busiest part of the city and the great east gate, to the tomb of the Empress.

"Mr. Colbran has received a cash payment of \$100,000 with his contract, and the work will be rapidly prosecuted.

"It is regarded as a profitable enterprise, since, with a city of 300,000 people and no amusements, there will probably be enough passenger traffic from curiosity seekers to make it pay for a year or so, while the people are being educated to the point of regarding the road as a necessity.

"At present, all the financial ventures of importance in Corea are in the hands of Americans."

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XVII.—The Hermite Bleaching and Disinfecting Processes.

The electrolysis of solutions of chlorides always produces chlorine at the anode, and the hydrate of the base (sodium, potassium or magnesium) at the cathode. In the electrolytic alkali processes, the aim of the inventor has been to effect removal of these products before they can react one with the other. In the electrolytic bleaching processes, the chlorine and the caustic hydrate are allowed to react, in order that the chemical changes represented by the following equations may occur:

If the temperature be allowed to rise above a certain point, a further action will occur, and chlorate will be produced. (See Chapter V of this series). It is therefore necessary in all electrolytic bleaching and disinfecting processes to pay great attention to the temperature, as chlorates are useless for bleaching purposes. The hypochlorites on the other hand are very active, and the Hermite process is simply one for producing these hypochlorites in a convenient and economical manner by means of the electric current. In principle these processes resemble the Kellner bleaching process, described at length by the writer in Chapter VI of this series, but the apparatus and details differ, and hence it has been possible to obtain separate and distinct patents for these two processes.

The Hermite bleaching process has been in use for many years at Stjernfors in Sweden; and it is also stated to be in use for bleaching purposes at La Haye in Normandy, and at Boston, Mass. The Hermite disinfecting process has been experimented with at Havre, Marseilles, Worthing, Lytham, Ipswich, Southampton and Bombay; and the plants at the three latter places are believed to be still in operation.* In order to enable the readers of *ELECTRICITY* to understand the processes, the plants and procedure at Stjernfors and at Ipswich will be described in detail.

The Hermite Bleaching Plant at Stjernfors, Sweden.

—The apparatus used here for preparing the bleaching fluid consists of a series of vessels through which the electrolyte is constantly circulated by means of

a pump. Each vessel contains a horizontal spindle, bearing a large number of disks made of zinc plates capable of rapid rotation by means of a pulley wheel. These zinc disks are the cathodes of the cell, while an equal number of pieces of platinum gauze fixed in lead or glass frames hang between each of the consecutive pairs of zinc disks and act as anodes. The rotation of the spindle bearing the disks and the rapid circulation of the electrolyte cause a complete mixture of the solution, and little chlorine escapes as gas from the cell, the greater portion combining with the hydrate to form hypochlorite, in accordance with the chemical equation given above.

In Hermite's original patents, a mixture of magnesium and sodium chloride solution was recommended as the electrolyte for use in this cell. The electrolytic decompositions led to the production of insoluble magnesium hydrate at the cathodes, and the zinc disks speedily became coated with a deposit of this compound. Fixed scrapers did not satisfactorily remove it from their surfaces, and the EMF. necessary to work the process became permanently increased owing to the resistance offered by this film of hydrate on the zinc plates. The writer believes that on this account the procedure has been altered, and that sodium chloride is used alone in preparing the electrolyte for the cells. The dilute solution of hypochlorite, which is obtained by passing the sodium chloride solution rapidly through the 5 cells which form the system, is run into the pulping vat, where it is intimately mixed with the sulphite wood-pulp by means of mechanical mixing arms. An output of 1,750 kgs. bleached wood-pulp per day is obtained by an expenditure of energy equal to 75 HP., and of salt 192 kgs. The Hermite bleaching process has been operated at Stjernfors since 1890, and the firm who own the works state that the bleaching of the pulp costs them less now than by the older process with bleaching powder. In the chapter already alluded to, dealing with the Kellner bleaching process as carried out at Hallein, the writer gave a detailed examination of the costs of bleaching by means of sodium hypochlorite solutions, and readers interested in this aspect of the subject may refer to the issue of *ELECTRICITY* for October 6, 1897, for further information upon it. It may be pointed out, however, that while at Hallein 200 HP. is said to bleach 15,000 kgs. wood-pulp per day, at Stjernfors 75 HP. only suffices to bleach 1,750 kgs., and therefore the Hermite electrolyzers apparently possess only one-third the efficiency of the Kellner electrolytic cells. Wood-pulp however differs greatly in coloring matter, and therefore the difference in efficiencies of the two electrolyzers may be more apparent than real. At La Haye the Hermite process is used for bleaching cotton goods.

The Hermite Disinfecting Plant at Ipswich, England.

—The apparatus used for preparing the disinfecting fluid at this place does not differ greatly from that in use at Stjernfors. Sea water is used as the electrolyte. One of the forms of electrolyzer used possesses a pair of horizontal spindles, each carrying a large number of the zinc disks. The platinum gauze is carried by a frame work of glass rods. This form of electrolyzer can produce 250 grms. chlorine, as hypochlorite, per hour. The electrodes are in parallel, and an EMF. of about 6 volts is requisite to work the cell to the best advantage.

A modified form of the electrolyzer has been designed for the use of currents having a higher EMF. than 6 volts. In this a number of the zinc and platinum pans of electrodes are coupled in series. A full description of the apparatus will be found in British patent No. 6,497, 1894.

The energy required to produce 1 kg. chlorine in the form of hypochlorite with this apparatus is given as .48 HP. day, or 11.4 HP. hours. At 100 d. per EHP. hour this represents a cost of 1.14d. = 2.28 cents per 1,000 grms. active chlorine. The solution obtained by the electrolysis of sea water contains both sodium and magnesium hypochlorites. The latter quickly decomposes into magnesium hydrate

and hypochlorous acid when mixed with the sewage effluent or when allowed to stand.

This solution, according to M. Hermite, is a powerful deodorizer and an efficient sterilizing agent. The reports of the numerous experiments that have been carried out respecting its action on sewage are however very conflicting. With a clear effluent there would appear to be no doubt of its deodorizing and sterilizing properties, when used in sufficient quantity, but upon solid faecal matter its effect is much less satisfactory. The most important independent criticism of the process as applied to sewage has been made by Sir H. Roscoe and Mr. Lunt.*

They found that the weaker solutions of hypochlorite were exceedingly unstable, while the stronger solutions containing 1.0 gram active chlorine per liter, though much more stable, occasioned a considerable loss of energy in the electrolyzer in order to obtain them. They nevertheless stated that the solution containing .25 gram active chlorine per liter was an excellent deodorizer.

The experiments made with the process at Ipswich in 1895 led Mr. Napier, the Borough Analyst, and Dr. Elliston, the Medical Officer, to report favorably upon the process as applied to the sewage of their town, the desire here being merely to arrest decomposition of the organic matters until the sewage had been carried out to sea. The Ipswich plant, which cost \$12,000, was started in May, 1895. A 30 HP. engine drives dynamos yielding 600 amperes at 28 volts; 4 electrolyzers, coupled in series, yield 2,400 grms. chlorine per hour. The electrolyzers are equal to providing 1 gram chlorine per head of the population per 24 hours, and the cost of running the installation is stated to be \$1,680 per annum, or 3 cents per head per annum.

Last year a complete plant was shipped to Bombay, in order that a portion of the sewage of that city might be treated with the Hermite deodorizing fluid. The experiments that have so far been made there have not been very successful,† and unless the second series, which were to be commenced in the autumn of 1897, gave more satisfactory results, it was not intended to permanently adopt the process for the treatment of the sewage of that city.

The Hermite deodorizing fluid has been experimentally used in Paris hospitals for antiseptic purposes by Dr. Proger with good results.

Conclusions.—As a convenient and simple means for producing bleaching or disinfecting fluids from sea water, the Hermite electrolyzers are to be commended. The long period for which the Hermite process has been in use at Stjernfors would seem to show that under certain conditions it is more economical than the older bleaching methods, and the opinion expressed in Chapter VI with regard to electrolytic methods of bleaching is thus confirmed. The remarks made in that chapter concerning the cause of the slow rate of growth of the electrolytic bleaching industry apply equally here.

As regards the use of the Hermite fluid for deodorizing sewage and for disinfecting purposes generally,‡ the future is less certain. In many cases, where the sewage is turned directly into rivers or into the sea, there is at present no obligation to deodorize it, and the adoption of the Hermite treatment would simply be resisted as an unnecessary expenditure. In cases where treatment of the sewage is absolutely essential, the Hermite process fails in that it is only successful when applied to the clear effluent, and the nuisance arising from the decomposition of the solid faecal matters is in no way abated. As an alternative procedure to the use of chloride of lime and carbolic acid, for the mere purpose of lessening the effluvia from main sewers, it may find adoption; but it certainly cannot be regarded as the solution of what is still one of the greatest problems of the age—the production of innocuous and useful materials from the sewage of our great cities.

**Jour. Soc. Chem. Industry*, 1895, p. 224.

†See Report, *ELECTRICITY*, October 13, 1897.

‡These remarks apply equally to the Wolff sewage treatment process in the United States.

*The writer has applied to Messrs. Paterson & Cooper, the agents for the Hermite processes in England, for information as to the present position of the processes at the places named, but he has not received any answer to his inquiry.

INSULATION AND CONDUCTION.*

BY REGINALD A. FESSENDEN.

(Continued from page 183.)

In the formula, the valency was introduced. This term has no definite meaning, as the valency varies with the compound. Consider the writer's chart of the elements (Fig. 3) a modification of those of Meyer, Newlands and others. On one side are seen the metals of the arts. Above them in vertical rows are marked the figures 1, 2, 3, 4, etc. These figures indicate the number of chemical linkages which as a general rule the elements under the figures tend to take up. But there is no very definite rule. Among the univalent metals some unite with bivalent atoms, as does copper, and in general all that can be said is that a certain valency holds generally and not in general. Consequently when we find that by taking a group of metals having very closely the same values of Young's modulus, as for instance gold, silver and aluminum, their conductivities are, within the limits of errors of observation, proportional to the velocity of sound \div valency, and that in any of the group of metals having the same valency the conductivity is directly proportional to the velocity of sound, within experimental errors, we are to a certain extent justified in making a choice of valencies when this is needed. Fortunately, however, this only occurs in two cases: 1st, we must suppose copper to have twice the valency of silver, which we might, *a priori*, have granted, for though they are in the same group yet copper has markedly through all its salts twice the valency that silver has; 2d, that thallium has twice the valency of aluminum, a supposition which has no other justification than the fact that since the formula holds in other cases where the valency is known we have a certain right to use the formula to find the valency.

Now it is well known, especially from facts in organic chemistry, that similar atoms or molecules can combine together to form what are called polymerized substances. For instance three molecules of C_2H_2 , acetylene can form one molecule of benzol, C_6H_6 . In general we find that these polymerized compounds are more crystalline and have higher melting points than the original substance. Also we note that the number of atoms in such a polymer is generally a multiple of the valency of the atom. Carbon, for instance, seems to prefer to go in groups of four.

Considering now the table of elements, we see that as we pass along from row to row, and as the valency increases, the substances get more crystalline and in many ways evince a linking together.

- 1st. As mentioned, they are crystalline.
- 2d. Their specific heats get abnormally low, this indicating that they are polymerized, or plexed.
- 3d. They are capable of existing in allotropic forms.
- 4th. Their vapor densities show that several atoms are joined together into one molecule, and hence they are almost certainly polymerized as solids since the general tendency of heat is to disassociate. Consequently there is some evidence for the theory that metalloids differ only from metals in that they have a greater tendency to polymerize from their higher valencies, which are probably in some way dependent upon the shapes of the atoms, and are so more crystalline, etc. We might therefore look for some evidence of polymerization among the metals. This is readily found, as before, from variation of the specific heat from its theoretical value. If this linkage were but loose, it is evident that it might affect the specific heat but little and yet have a marked effect on other phenomena. For instance, we might suppose that it would affect long sound waves less than short ones.†

*Paper read before the 123d meeting of the American Institute of Electrical Engineers, New York, March 23, 1896.

†The writer ventures to suggest that the velocity of very short waves of sound in copper may be found somewhat less than half of that given now for audible tones, while that of lead may be reduced to but one-eighth of its value as given at present.

We might therefore consider that when the period of a sound wave coincides with that of the molecules it is a heat wave; the period of the amplitude of a sound wave being the period of the heat wave. If this be proven by experiment we would have this relation: the electric conductivities are in the same ratio as the velocities of very short sound waves, being thus analogous to Maxwell's law for the velocity of light in insulators, in that the velocity varies with the periodicity.

We have seen above that the electric resistivity varies directly as the valency. Also it has been indicated that there is some evidence to show that the polymerization or plex varies as the valency. There-

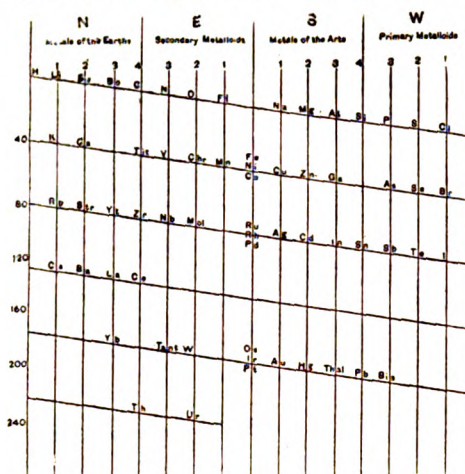

FIG. 3.

fore we are led to assume that increase of resistance accompanies polymerization or the linking together of the atoms into groups. We see that this might hinder the transmission in various ways since the groups would not vibrate so quickly as the single atoms and there would be fewer of them per unit cross-section. Anything, therefore, which tends to give molecular complexity tends to give high resistance; hence we see why alloys are generally higher in resistance than the average of their components.

The resistance increases with density and molecular complexity and inversely with the elasticity. Consequently whether a resistance increases or decreases with temperature will depend upon whether the molecular union is weakened at a less or greater rate than the elasticity falls off.

In getting a concept of this we may consider a conductor as analogous to a government department, the different atoms or officials being bound together into groups by valency bonds, the analogue to which is evidently "red tape." The rate at which a given impulse is handed on will evidently depend inversely

FIG. 4.

upon the amount of red tape and the density, or stupidity, of the individual official. The two causes are often confused.

We must therefore, for solid insulation, get substances which are strongly linked together, of great density, and of small modulus of elasticity. The first is the property which varies most, since density and elasticity vary between comparatively narrow limits.

3. *Conductivity in Fluids.*—The nature of the manner in which electricity is conducted in electrolytes has

been very thoroughly worked out by Clausius, Arrhenius, Hittorff, Kohlrausch, Nernst, Ostwald and others, and the work of these physicists has led to the linking together of results in a way which is simply marvelous. As the results can be obtained from works on physical chemistry, a brief resume is given.

The atoms of a solid are held together by the force of cohesion and driven apart by the hitting of the atoms on each other, due to the fact that they are in vibration, possessing kinetic energy proportional to the temperature. The molecule may also be pulled apart by the cohesive attractions of its atoms for other atoms. Whether a substance is a solid or a gas depends upon whether the fraction

Cohesive force of atoms for one another \div external force Kinetic repulsion \div cohesive attraction for other atoms is greater or less than unity. We can thus turn a substance into a gas in two ways, i.e., by increasing the kinetic energy of the atom by heating it, or by bringing it in contact with other atoms, when, if the sum of the terms in the denominator is greater than the numerator it will dissolve.

We have to distinguish two kinds of linkages in solids, the cohesive force of the atoms for one another in uniting to form a molecule, and the attraction of the molecules for each other. The former generally is stronger than the latter; consequently we may have a substance which on being put into contact with a solvent will have its molecules pulled apart from one another but not its atoms. In the presence of another solvent, however, the second term may be sufficiently great to pull apart not only the molecules but also the atoms of the molecules. The substance is then said to be not only dissolved but disassociated. But dissolved substances give an osmotic suction per sq. cm. which is equal numerically to the kinetic pressure which the substance would have if it were turned into a gas at the same temperature and volume as the solution. A number of proofs of more or less validity have been given for this, but it seems to the writer to follow at once from the obvious fact, that if we take a solid and heat it and dissolve it the kinetic repulsion must always equal the cohesive attraction plus the vapor pressure when equilibrium is reached.

This phenomenon of osmosis has been generally treated of as due to pressure and the dissolved substance to exercise a pressure equal to that which it would have if turned into a gas at the same temperature and volume. The writer (in the *Elec. Review*, London, Nov. 27, 1891.) pointed out, as above, that the results were better explained by supposing that the solvent took up the cohesion of the solute, and that this got rid of the great difficulty of the disassociation theory, i.e., that solution was generally accompanied by heating. Recently this theory has been put forward by other well known physicists. Prof. Poynting (*Phil. Mag.*, Oct., 1896,) has treated the subject mathematically, and whilst the mathematical reasoning cannot be considered conclusive, as Prof. Poynting himself states, yet, as he puts it, it shows "that it is not necessary to ascribe osmotic pressure to disassociation, but rather to association, or some kind of combination of salt and solvent." I have ventured therefore, in view of this fact, to do what I would not have done otherwise, i.e., to substitute my own conception of a suction for that of a pressure, otherwise making no change.

In this way by measuring the osmotic suction we can tell whether a salt is disassociated or not; and it is found that only those salts which are disassociated can conduct electricity. The molecules split up generally into two parts, one charged with positive, the other with negative electricity. These charged parts or ions, when placed in an electrostatic field, move with a velocity proportional to the slope of potential and to the specific ability of each ion to move among the crowd of molecules of the solvent. Consequently the faster an ion can get along through the crowd of other molecules, i.e., the faster it can diffuse, the faster will the electricity be carried, and the greater the amount carried per second for a given

slope of potential; also the greater the quantity of electricity carried per ion the greater the current. The total quantity carried will be the sum of that carried by each ion, so that by adding the velocities of the ions we get the total velocity with which the electricity is moving.

The conductivity of a solution is thus dependent upon the following:

1. How powerful the attraction of the molecules of the solvent is for the ions of the solute, for on this depends how much of the solute is disassociated, i. e., how many ions are set free to carry the current.

2. How fast the ions move.

3. What the valency of the ions is.

In designing insulations, the first is the important point. For from it we see that two good insulators mixed do not necessarily make a good insulator. A solid may dissolve in one substance and be an insulator in solution, but in another solvent may conduct quite well.

This is what makes the chief difference between fluid insulators, for practically all the fluids which are not simple elements, like mercury, have very high ohmic resistance, and all have practically about the same dielectric strength. The ohmic resistance of pure water is, according to Kohlrausch and Heydeweller, about one megohm per cubic centimeter, consequently on account of its non-inflammability and great specific heat, its great heat of vaporization and low boiling point, it would be a very valuable insulator for some types of apparatus were it not for the fact that it dissolves almost everything in slight proportions and splits them up into ions. Var-nished paper will dissolve in some high resistance oils, forming a conducting solution.

4. *Conductivity in Gases.*—There is much evidence to show that conduction in gases is electrolytic, more especially J. J. Thomson's beautiful work on this subject. Also the fact that in air or CO₂ carbon is deposited on the negative pole, sometimes to the thickness of more than an inch in enclosed arc lamps, according to Marks, while in hydrogen or hydrocarbons in many instances the carbon is deposited on the positive carbon, would seem to favor this view. Also in its favor is Prof. Elihu Thomson's observation of the formation of copper "trees" in incandescent lamps with coppered filament joints. Against this is Schuster's observation that the metallic lines in the spectrum have a fairly high velocity, and also the general appearances of the arc, which looks as if something were going in one direction down its center and something else back on the outside. Also there is one other phenomenon which looks as if it were convective. This is the fact that if we take a solid carbon and bring it nearer to a similar carbon while the current is passing, the resistance first decreases and then increases. This was, I believe, first pointed out by Mrs. Ayrton in her admirable paper on the subject. The reason of it has not, I believe, been given; it seems to be due to a necessity for circulation in the arc. If we have two carbons as in Fig. 4, at 1, the center part of the current seems to flow all right, but the part B cannot flow unless the + carbon is very hot, and this is only cured by increasing the current so as to heat the whole carbon up or by reducing the cross-section, as at 2 in Fig. 4. Whether a carbon is cored or not has nothing to do with this increase of resistance on the distance being shortened, as all that coring does is to diminish the cross-section of the carbon, and I have repeatedly found by actual test that the difficulty is entirely obviated by using carbons of + or — cross-section, provided the greatest thickness at any point of the cross-section is less than that of the cored. The phenomenon is evidently analogous to the jumping back of the discharge in a Geissler tube when the electrodes are brought too close together. The theory of this was given by J. J. Thomson, and it was by applying this that I got over the difficulty with the carbons. A true arc can be run from a much lower voltage in open air than is generally

supposed when the section of the carbon at any point is not more than $\frac{1}{16}$ cm. thick. On the whole, the evidence seems to be in favor of the belief that both convective and electrolytic discharges take place in air. The whole subject is very fully treated in J. J. Thomson's "Recent Researches in Electricity and Magnetism." There can be, in my opinion, very little doubt but that when a true electrolytic discharge takes place, as it does in a hot flame, the conductivity is proportional to the velocity of sound in the gas, though so far I am not aware that any experiments have been made on the subject. It is possible that in certain cases the elasticity itself may be a function of the slope in the electrostatic field. As the vacuum increases up to a certain point, the dielectric strength decreases, and this point depends somewhat on the electrodes and voltages, and has led to the amusing result that on the average every two years the discovery is announced that a vacuum is a good conductor. Above this the discharge appears to get more and more convective, and a fact may be stated which I have not seen mentioned, i. e., that the largest quantity of X rays is not got from a tube unless the path of the positive particles back to the cathode is blocked up as much as possible. An experimental tube made by Mr. Meadowcroft for the writer last spring, in which there is a small tube running from the back of the anode to the back of the cathode which can be blocked up by tilting it, shows this very nicely.

As regards the electrolytic discharge, this can only take place when the gas is disassociated by heat or by a strong slope of potential. To the convective discharge the same remarks apply as to the convective discharge in gases. At ordinary pressure the only gases which allow a discharge to pass easily are helium, argon and possibly that unknown gas whose spectrum we see in the light of the aurora borealis. Helium, as shown by Ramsey, behaves at ordinary pressure much as air at low pressure, and a spark will jump through it for about thirty times the distance it will through air at the same pressure when the pressure of both approximates that of the atmosphere.

Having got rid of the theory which was necessary in order to give opportunity to condense later, and which has led me to wonder if it were ever possible to find the pleasing mean between the conciseness of the Carpenter and the discursiveness of the walrus, we shall take up the practical part of the subject.

HIGH RESISTANCE INSULATION.

In laboratory apparatus in many cases, for instance with electrometers and resistance boxes, we need as high ohmic resistance as it is possible to get. Here however we are met by the fact that the two substances most commonly used, i. e., hard rubber and glass, are among the poorest insulators known for this class of work.

Rubber is very objectionable from the fact that whilst it presents a nice bright appearance when new, it contains sulphur and is very easily oxidized, especially when exposed to light. A film of sulphuric acid is thus formed on the surface, and if the tongue be applied to a piece of rubber which has been in use for some time the taste of the acid is very strong. I have seen the top of a Wheatstone bridge, supposed to be capable of measuring accurately to one part in 5,000, in which the total length exposed to leakage, divided by the average distance between which leakage could take place and the average voltage was only .008, with the top so acid that the tongue could hardly be allowed to touch it.

As a rule it is very hard to remedy this; rubbing the surface does no good as the acid extends in to some distance. Rubbing with cigar ashes is advocated by some, but I should fancy it would be almost impossible to remove the last traces of alkali. The method used by the writer is to steep the rubber in warm 10 per cent. caustic soda, then in warm distilled water frequently renewed, then drying in the dark quickly and rubbing with pure paraffin, treated as described under paraffin, then polished while

warm. This does good for a time, until the paraffin takes up dust.

For rods, a good way is to treat as above and coat half an inch thick with paraffin; then run over the rod with a wooden die and cut a thread in the paraffin. Run over the thread about once a month, and good results will be obtained.

With bridges, however, it is impossible to remove the top, and the only thing that can be done is to keep them covered up from light.

Rubber has also one other disadvantage, in that it does not show dirt, and where rubber comes in contact with copper it is apt to rot.

Glass is very bad, because the alkali in it has a great affinity for moisture. The alkali is slightly soluble, and hence it is the custom with analytical chemists to boil all beakers used in exact work for several days before using, so as to get the soluble alkali and silica out of them. When possible this should be done with the glass of electrical apparatus. Another very serious trouble is that the angle of contact between water and glass is zero, so that when a drop of water is placed in the middle of a pane of clean glass it immediately spreads all over it in a thin film. This method is used by chemists to determine when a glass is clean. Nothing much can be done with glass but to keep it dry. Sulphuric acid is generally used, but it sometimes, if allowed to get dust in it, gives off vapors which condense on the sides of the apparatus. This, however, does not often happen.

Evidently we need some substance of high ohmic resistance and one which water will not wet. Boys, who has earned the thanks of electricians for his happy discovery of an almost perfectly elastic fiber, has given us also, as he himself has pointed out, such an insulator in quartz. Dip a thread of glass in water and lay it between the knob of a charged electrometer and the ground, and the leaves close almost at once, the whole fiber being covered with a film of water. Treat a quartz fiber similarly and the water slides off it, or remains in little drops each separate from its fellow, and the insulator is apparently as good as the air itself.

Quartz should therefore be used as much as possible in electrical instrument work. It can be melted in a powerful gas flame furnace, and though it can never be melted down free from small bubbles, these make no difference except in appearance. It is however possible to obtain glass which contains no alkali and resembles quartz in that it is not wet by water. Such a substance is Faraday's borate of lead glass, as he himself points out. This is however too brittle for most work, but by an admixture with silica a glass could no doubt be made which would be perfectly satisfactory. If some glass manufacturers would take up this question and furnish us such a material for electrical instruments, the greater part of the present annoyance met with in making delicate experiments would vanish. It would not leak, would show dirt, could be readily cleaned, and would be free from one of the great disadvantages of rubber, i. e., a large coefficient of expansion, which is always making trouble by bending terminals of resistance coils, thus changing their value and sometimes opening the circuit.

It is also probable that a fine grade of porcelain would be a great benefit to the electrical profession, if coated with a good non-alkaline glaze.

(To be continued.)

Electric Lighting of Mail Cars in Germany.

According to an item in the *Volkzeitung* of Cologne, 64 per cent. or 1,108 out of 1,723 mail cars on the North German railways are now provided with electric light, whereby a saving of \$17,500 per annum has been effected. In consequence of this all the new cars now being built (73 in number) will be furnished with this form of illumination. The success which has attended these experiments being so great, the Bavarian and Austrian postal authorities are now taking steps in the same direction.

BIOGRAPHY OF A PIECE OF COPPER WIRE.*

BY CHANNING T. GAGE.

I desire to give you as briefly as possible an outline of the various processes through which the Bare and Insulated Copper Wire of commerce passes from the crude natural condition to some of the numerous forms in which it becomes useful to man.

Copper occurs in this country in two distinct conditions. In Montana and Arizona there are enormous deposits of copper ore in the form of sulphides, oxides or carbonates, though it is believed the two latter are a result of the decomposition of the former. This ore seems to have been projected upward in a semi-fluid state from the interior of the earth, and through great fissures or cracks in the earth's crust, after violent volcanic action which had tilted the rocks from a horizontal to an angular or nearly perpendicular position.

The ores require a very complex system of treatment to eliminate impurities and reduce them to metallic copper.

The second class of copper ores, found on the south shore of Lake Superior, constitute the only natural deposit of ore in the world containing pure metallic copper, free from all chemical impurities. There we find the ore in all forms and sizes, from particles as fine as flour to masses weighing hundreds of tons. From the Phoenix mine there was taken out a single mass weighing 50 tons.

The Arizona ore is the richest of any produced in this country, containing about 10 per cent. of copper; that in Montana contains about 7 per cent., while the conglomerate rock of Lake Superior contains from 1 to 4 per cent, and the amygdaloid rock from $\frac{1}{2}$ to 1 per cent. The greater expense involved in reducing and purifying the western ores practically balances their greater richness, so that the Lake Superior mines are able to produce the purest and cheapest copper in the world.

The Lake Superior copper deposits exist in the greatest abundance on that geological freak, Keweenaw Point, jutting out into the waters of the lake for about sixty miles in a northeasterly direction from the upper peninsula of Michigan. Here we find, extending nearly the entire length of the peninsula, outcroppings of copper-bearing rock, and the same strata have been traced far to the southwest through Michigan and Wisconsin. Copper ore occurs in two distinct forms in these parallel veins on Keweenaw Point: first, the so-called "ash-beds" or amygdaloid ore. In this the containing rock is of a soft, easily crushed material, of igneous origin, somewhat similar to lava, and in the porous cells of which the metallic copper is deposited in fine particles. This ore is easily worked, and, as in the Atlantic mine, can be made to pay well even when containing but $\frac{1}{2}$ of 1 per cent. of metallic copper; second, the conglomerate beds, in which the great fissures in the original rocks were filled with a sort of pudding-stone in which the cementing material has been partially displaced by metallic copper, tough and fibrous, binding together the pebbles and stones in masses almost impossible to crush.

Geologists differ somewhat as to the exact process by which this metallic copper was deposited, but many think that these fissures were originally filled with lava in the one case, and the conglomerate mixture in the other, by the action of intense heat and pressure from below. This cooled and subsequently, through a period of time possibly extending through ages, a solution of some copper salt gradually percolated through the fissures and, by a sort of electro-chemical action, deposited metallic copper in place of the original cementing material. Thus we find in the conglomerate veins copper in every conceivable form—in little nuggets, in thin leaves and threads, and in great irregular jagged masses.

For the purpose of this paper I will consider that our piece of copper wire originally formed a part of one of these masses, and was taken from the famous Calumet & Hecla mine.

There is positive evidence that the copper deposits were once worked by aboriginal miners, long before the period of the present race of American Indians.

It is stated that on the site of the Calumet & Hecla mine an Irishman had located his cabin, and one day his pig in exploring for edible roots accidentally tumbled into one of these ancient excavations. On getting the pig out, it was found to be well covered with a green mud, giving evidence of the presence of copper ore. The mud and rubbish were cleared away and a fine deposit of rich conglomerate rock was uncovered.

These deposits occur in so-called "chimneys" or strata of copper-bearing rock, alternating with strata of non-metallic rock. In this mine the "chimney" is about 13 feet in thickness and extends a distance of nearly three miles, of equal richness, and all controlled by this company. They had in 1891 seventeen shafts, following the dip of the vein at an angle of about 37 degrees to a depth of 3,800 feet. Some of these shafts are down over a mile.

Their latest shaft, recently completed and called the Whiting mine, has three compartments, two for hoisting rock and one for pipes, wires, etc. This shaft extends down vertically 5,500 feet, tapping the vein of ore at a point nearly 7,000 feet from the surface of the ground measured on the dip of the vein. Through this vertical shaft, steel hoisting ropes $2\frac{1}{2}$ " in diameter lift to the surface 20,000 lbs. of ore at a time. At this great depth the ore shows no sign of failing in quality or quantity, and to secure it becomes only a question of expense in hoisting it to the surface.

After the ore has been removed from the mine, and to a certain extent sorted, it is sent to the stamp mills where immense stamps crush it to small particles; large quantities of running water wash away most of the pulverized rock, the heavier copper settling to the bottom. This residue contains from 40 to 50 per cent of copper and is next sent to the smelter. There it is placed in a large reverberatory furnace in ten ton charges. By treatment with the proper flux and the intense heat of the furnace, the last vestige of rock and sand is removed, and the pure metallic copper is cast into ingots weighing from 250 to 300 lbs. each. These ingots are then shipped to the numerous wire mills and enter on the final process of conversion into wire.

At the wire mills the ingots are pushed into one end of a furnace and gradually brought to a white heat by the time they reach the other end. There a workman reaches in with a pair of immense swinging tongs, and starts one of these ingots down the incline and through the first pair of rolls, by which it is somewhat reduced in size and increased in length. Other pairs of rolls are in line just ahead, and the hot ingot passes rapidly through these until it is reduced to the appearance of a long fiery snake writhing and coiling about the great iron floors, yet guided through the proper openings by hands that are quick and sure. After passing the last roll it finally shoots at lightning speed into a revolving reel, into which it is coiled, then removed and hung up to cool. It is now a "rod" about $\frac{3}{8}$ inch in diameter, and the coil is known in the mill as a "bundle of rods." It is covered with a coating of black copper oxide, and in this condition looks like iron wire and must be cleaned. It is dipped in an acid bath, where the oxide is dissolved and the bundle comes out clean, bright, reddish-yellow copper. This is thoroughly washed and goes to the drawing room. Here one end is tapered and passed through a "die" or block of steel with a tapering hole in it; the end is fastened to a revolving drum and the wire drawn through the die and reeled on the drum. This operation is repeated, each time reducing the size and lengthening the wire, until the desired size is reached. This also thoroughly hardens the wire,

and makes what we call "hard drawn" copper, such as trolley and telephone wire.

For further drawing, or to make "soft drawn" copper, the coils are annealed or subjected to a high temperature for a certain length of time, and, after cooling, the copper is again soft and pliable. This drawing process may be continued until our original ingot, about 3 feet long, has been lengthened to a piece of No. 36 telephone magnet wire 750 miles in length.

These finer sizes are drawn by specially arranged machinery through dies made from the hardest of precious stones. It is possible by this means to produce an almost invisible wire, 1-1000 of an inch in diameter.

I have now carried the story of this piece of wire from its bed near the waters of Lake Superior to the form in which it can be used for many purposes, while bare, but there remains now to describe some of the numerous coverings or garments with which we will dress it in order to make it a more useful member to society.

First we will take the simple magnet wire—just a little round wire with a half-dozen parallel threads of cotton wound around it. Remember the great cotton plantations in the South, with the negroes cultivating and picking it. The cotton balls go to the gin where the seeds are separated, then go to the baling press, and then to the mammoth mills in New England where the white threads are spun out by automatic machinery.

In the wire mill this thread is wound on special spools, and these are in turn swung around and around our piece of copper wire, held firmly in place, until a beautifully smooth white covering just hides the wire from sight. One layer of cotton makes our "single cotton covered" magnet wire, and a second set of spools, following the first, winds another set of threads in the opposite direction and we have "double cotton covered" magnet wire.

Now bring from China the choicest product of her silkworms, spun into threads of finest quality, and putting this through the same process we have "silk covered" magnet wire, which you all know is such an important factor in telephone construction.

Think for a moment also of what might be the present development (or lack of it) of all the varieties of electrical machinery without magnet wire—generators, motors, transformers, voltmeters, ammeters, wattmeters, telephone and telegraph instruments, electric bells and alarms, arc lamps, etc., etc.

When Prof. Morse made his first experiments in telegraphy he secured a great length of wire in his laboratory by carrying it around the room back and forth on pegs, and his crude magnet was made by coating a piece of horseshoe-shaped iron with varnish and winding this with bare copper wire, the turns spaced just far enough apart to prevent touching. In the next electro-magnets, made by his partner, Alfred Vail, they used the only covered wire then known, viz., that used by milliners for stiffening hat and bonnet rims.

Now, step over into the oil fields of Pennsylvania and see the great tanks, full of black, "fragrant" crude oil; follow it to the refinery and watch the process of distillation and cleaning, until, as one product, you see a clear white, semi-transparent substance called paraffin, nearly impervious to water yet easily melted. Wind two layers of heavy cotton over a small wire, at the same time saturating it thoroughly with this warm paraffin, and you have the common "annunciator" wire, with the aid of which half the doorbells in the city are made to jingle at the push of a button.

"Office" wire is made of the same materials, but the cotton is braided on instead of being wound, and is made heavier.

Next we will journey to distant Poland and bring back some of that peculiar bituminous deposit called mineral wax or ozokerite, and, compounding it with other suitable materials, we will thoroughly saturate the two or three cotton braids which we have woven

* Paper read before the Chicago Electrical Association, March 18, 1898.

on another piece of wire and we will have the well-known "weatherproof" wire, of which immense quantities are now used for the outside lines of electric light and street railway plants. It is also superseding annunciator wire for interior bell and signal work.

Now travel with me once more to still another foreign land, and deep in the forests of South America we will find the wonderful india-rubber tree. Watch a swarthy native as he slashes into the bark with his knife, and there slowly oozes out a milky white fluid which he deftly catches in a rude basin. This is allowed to stand until upon its surface rises a creamy layer, which he gathers on a clay ball attached to the end of a stick and dries over a fire of leaves and twigs. This rough ball gradually increases in size by repeated dippings and is changed by the action of smoke and atmosphere to a dark red color, and after removing the clay center by breaking in pieces is finally sent off to the market as Para rubber. This is also known as caoutchouc and comes to us from the forests in all stages of impurity, often mixed with leaves and sand, or even pebbles, which become quite valuable when paid for at the rate of \$1.50 per pound.

The modern method of collecting the caoutchouc is to mix an equal quantity of water with the milky juice, and the cream then separates rapidly and completely. This is skimmed off and worked into a solid white mass by kneading and rolling. This may be sent to market in this form, or may be cut into thin disks and dried in the air, which changes it to a dark brown color by oxidation.

This brings us to the subject of rubber covered wire, a product which has during the last few years assisted greatly in the progress of electrical development. When we stop to think of it, is it not one of the wonderful things to consider in nature that this one material possesses the peculiar properties necessary for electrical uses, viz., a perfect insulator, thoroughly flexible, yet capable of receiving treatment that will harden it almost to the texture of ivory and still retain its wonderful insulating properties? The pure rubber would be almost valueless for many purposes except for this property of being hardened or "vulcanized" by the action of sulphur and heat. That was a wonderful discovery of Mr. Goodyear, which, though called accidental, must have been a part of the Creator's plan for the development of our modern civilization!

Now comes in play the art of the maker of rubber-insulated wire. Pure rubber used as an insulator gradually deteriorates and loses its insulating qualities, therefore he skillfully mingles with it various materials in just the right proportion, and the mixture is then applied to the wire (which has previously been well tinned) with the aid of specially designed machinery, and is then taken to the vulcanizing ovens, where just the necessary degree of heat is applied and the resulting product is an insulating covering for the wire which will maintain its value as an insulator for many years without change.

Now, taking this plain rubber-covered wire as a basis, look for a moment at its various uses. Covered with a cotton braid, usually saturated with a protective compound, we have the ordinary wire for interior electric light work. Again, this piece of copper wire may be made up of many fine wires, twisted together, making what is called a "strand," to secure greater flexibility. This may be wound with a single layer of cotton, then a thin coating of the rubber compound, not vulcanized, and an outer coating of bright colored cotton braid, and two of these twisted together form the ordinary "commercial lamp cord." This is now being superseded very largely by a similar product made with vulcanized rubber.

We will now take another length of the plain rubber-insulated wire, wind about it spirally a coating of adhesive tape, and pass it slowly through the lead press. By this machine a smooth uniform coating of lead is placed over the tape, making the well-known

"lead-encased cables" used so largely for underground service. Pure lead is too soft to withstand the friction of drawing the cable into ducts, so two or three per cent. of tin is added to the lead, which hardens it somewhat, but not enough to permit cracking when bent. This lead covering acts as a mechanical protection to the rubber and adds very materially to its life.

Another class of cables are made in which the rubber is replaced by a saturated paper insulation. These cables have a very high insulation resistance as long as the lead covering remains intact, but as soon as the lead becomes perforated from any cause, mechanical, chemical or electrical, they must be replaced. For underground telephone lines the paper-insulated cables have a special value and are extensively used in all the large cities. Usually 50, 75 or 100 pairs of wires are bunched together and a lead casing is placed over all.

For submarine cables, crossing rivers, harbors, etc., the lead-encased rubber cable is covered with a layer of jute, and then an armor of galvanized iron wires is laid on spirally for protection against boats and anchors.

For ocean cables there is used as an insulator a gummy material known as gutta-percha. It is gathered from tropical trees, similar to caoutchouc, but it has certain properties from an electrical standpoint making it peculiarly adapted for use in submarine work. These cables are not lead-encased, but usually have three layers of armoring laid on in reverse directions and well juted between.

The first submarine cable ever laid was in Calcutta in 1839, across the Hugli river; the copper wire was insulated with cotton thread, pitch and tar, and did very good service for a long time. From that small beginning, submarine cables have increased in numbers until they form a veritable network encircling the earth in all directions.

Thus hurriedly have I traced the story of our piece of copper wire and its coverings, realizing that I have but just touched on a few salient features, leaving much of interest that would repay further study.

NEW SYSTEM OF ELECTRIC TRACTION BY ALTERNATING AND DIRECT CURRENTS.*

BY C. JORIGNOT.

During the last few years alternating currents have become of great value as a means of transmitting power over long distances. Besides the advantages that they present through high voltage easily obtained, which allows of the weight of copper in a conductor being greatly reduced, the compact and substantial qualities possessed by polyphase motors have just brought them into favor.

For electric traction however, and especially railroad work, few practical alternating current systems have been devised. This is due not only to the nature of the motors which does not allow of their being satisfactorily operated at variable speed, but owing to the greater number of conductors which it is necessary to stretch along the line and which greatly complicate installations.

M. Déri, giving up the idea of transferring direct current to alternating by means of rotary transformers located at various sub-stations along the line of a road, which is by no means economical and requires constant supervision, suggests the use of storage batteries in combination with alternating currents. He thus simultaneously makes use of the qualities possessed by direct-current motors and of motors operated by an alternating current.

The larger part of the energy utilized is directly furnished by alternating currents in the ordinary manner by means of conductors situated along the line; these overhead wires could however be done away with at points where it would be difficult to erect them, namely, at crossings, tunnels, etc.

* Translated for *ELECTRICITY* from *La Vie Scientifique*, Paris.

The cars or engines are equipped both with alternating-current motors, either single phase or poly-phase, and with direct current motors which can be run as generators. The direct and alternating current motors may be placed on the same vehicle side by side or on different axles. The line conductors feed the alternating-current motors, while the storage batteries are attached to the motors operated by direct current. When the amount of alternating current is greater than is necessary for the operation of the train, the surplus energy could be utilized in charging the batteries through the continuous-current motors. In the reverse case, the direct current motors would receive the surplus current from the storage batteries which would assist in operating the alternating-current motors.

At points along the line where it would be found difficult to place conductors, the batteries would

Electric traction by means of alternating and direct currents. General arrangement.

furnish the necessary current for operating until contact could again be made with the line wire.

This system would allow of single-phase currents being employed, which, although objectionable in starting, are advantageous in operating at a given rate of speed.

In this manner the economical advantages of stationary batteries is made use of; besides, the power drawn from the central stations, being almost constant, permits of their being operated most economically. The accompanying illustration shows the general arrangement of the apparatus either on a car or an engine.

L L L are the conductors for triphase alternating currents, the rails and earth taking the place of one conductor. G is the continuous current dynamo, D the storage batteries, and M the exciting coils provided with a rheostat.

The Northwestern Electrical Association.

The committee to whom was referred the matter of this Association's 1898 summer meeting has adopted the plan suggested at the recent Annual Convention, of taking steamer from Chicago to Duluth, holding short daily sessions on the boat, and ending with business and social sessions at Duluth and a reception and banquet at Superior. Following is the proposed itinerary:

Leave Chicago on steamer Northwest at noon on Friday, June 10, touching at Milwaukee for delegates who may find it convenient to join the party there, thence proceeding to Mackinac Island for a short stop, enabling a brief inspection of that celebrated resort; thence to Sault Ste. Marie and through the Government locks and ship canal; thence to Hancock and Houghton to visit the famous Calumet and Hecla copper mines; thence, on the largest body of fresh water on the globe, past the "Pictured Rocks" and Apostle Islands to Duluth, "the Zenith City of the Unsalted Seas." Two days' stay in Duluth and Superior, then home by rail. The mayors and common councils, the boards of trade and commercial clubs of both cities have united in a cordial invitation to the Association and its guests, and are now preparing for their welcome on arrival and entertainment during the visit. Special invitations from these cities and from this Association will be personally delivered to Mr. Edison, Mr. Tesla, Mr. Thomson, Mr. Brush, Mr. Wood and other distinguished electricians.

A "Convention hour" each day on the boat will

be devoted to discussions by practical men on topics of practical interest to owners and operators of central station plants. It is intended to make the trip a valuable as well as a delightful one to all on board. The Northwest, specially chartered for the occasion, is the largest and finest steamer on the lakes, and is surpassed by no ocean vessel in stannohness and elegance of appointments. She carries a fine orchestra, and has every modern improvement known to passenger boat construction, including an extensive and complete electrical equipment.

LONDON NOTES.

[From our London Correspondent.]

New Municipal Lighting Plant at Torquay.

There has just been inaugurated by the Torquay Town Council a \$110,000 municipal electric lighting installation. The generating station contains three Babcock & Wilcox water tube boilers supplying steam for three 150 HP. Willans & Robinson engines which are coupled to three 125 KW. alternators. There are three Ferranti rectifiers for arc lighting. The plant is capable of supplying seventy 1,600 CP. arc lamps and 12,000 8 CP. incandescents. The current is transformed down to 200 volts at sub-stations. Current is charged for at 7d. per unit for the first hour and 3d. per hour after.

Municipal Telephony.

There has been quite a craze in progress during the past few months in England for municipalities to work their own telephone systems. This is of course the outcome of the very inefficient service given by the National Telephone Company which is hand in hand with the General Post Office, and has practically a monopoly of the whole of the United Kingdom. The Glasgow Corporation and various other municipal bodies have been applying to the Postmaster-General for municipal licenses, but these have now been refused. The feeling all over the country is so strained against the National Telephone Company that it is difficult to say what may be the next step—especially in view of the Postmaster-General's refusal to grant licenses. There are numerous and important objections to municipal telephone exchanges, but the country is demanding an alteration for the better, whatever the steps taken to effect that alteration may be.

A New Technical Institute.

On March 18 the Lord Mayor of London officially opened a new technical institute which has been built and splendidly equipped in the Clerkenwell District of London. The site upon which the buildings stand was presented by the Marquis of Northampton (value £25,000), hence the Institute is known as the Northampton Institute. In addition to numerous workshops of a general kind, there is a boiler house containing two 100 HP. boilers—one of the Lancashire type and the other a water-tube type—for the purpose of affording students an opportunity of making comparative tests of the different performances of the boilers under different conditions of working and with different kinds of fuels. There is a well equipped power room for the joint use of the mechanical and electrical departments, and from the plant in position here power is supplied for the various workshops and laboratories. There is an instrument workshop, senior and junior physical laboratories, a heavy electrical engineering laboratory, and a laboratory for electro-chemistry. Altogether there are seventeen large workshops and seven laboratories, as well as a great hall and a variety of social and recreative departments. The total cost of the buildings and equipment has been from £50,000 to £90,000.

Help to fight the Electrical Trust by subscribing for **ELECTRICITY**.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to **ELECTRICITY**.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of **ELECTRICITY**, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of **ELECTRICITY** duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of **ELECTRICITY**, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

Congressional Notes.

An appropriation of \$1,500 has been asked for the construction of a telephone line from the United States light-house at Table Bluff, Cal., to connect with the general telephone system at Salmon Creek, Humboldt County, Cal.

An amendment has been introduced for the annulment of an act granting right to the Des Moines Rapid Power Company to construct and operate a power station on the Mississippi River provided the work is not commenced within four years from February 24, 1898.

The act granting extension of time for the com-

mencement and completion of a wagon and motor bridge across the Missouri River at St. Charles, Mo., from June 3, 1898, and June 3, 1902, respectively, has passed the Senate.

Proposals Invited for Electric Elevators.

Sealed proposals are being invited until April 14 for furnishing and erecting in the Government Printing Office at Washington seven electric elevators. Detailed specifications and regulations with which bidders must comply may be obtained by addressing F. W. Palmer, Public Printer, Washington, D. C.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Appellate Division of the Supreme Court of New York on the 25th ult. affirmed a judgment awarding damages to W. Preston Hix on a verdict given in his favor on the second trial of his suit against the Edison Electric Light Company, upon a contract of employment to promote and organize for the benefit of the defendants a company to be known as the Edison Electric Light Company of Philadelphia. Mr. Hix received as compensation for his services 15 per cent. of the \$1,000,000 of stock of the Philadelphia corporation, but he claimed to be entitled to one-third of three separate issues of shares subsequently made by which the capital stock of the Philadelphia Company was increased, and the Appellate Division sustains the claim.

A bill in equity has been filed at Columbia, Pa., by the Lancaster & Susquehanna Turnpike Road Company, the Lancaster & Columbia Railway Company and William B. Given, receiver of the Pennsylvania Traction Company, against the Columbia Telephone Company. In the bill filed the plaintiffs state that the defendant company asserts that it has the power, without making compensation, to erect its poles and place telephone wires on them, on the roadbed of the Lancaster & Susquehanna Turnpike Company, which was leased to the other plaintiff. The plaintiffs say the telephone company's poles will interfere with the operation of the electric railway and pray for an injunction to prevent the defendants from erecting the poles on their roadbed.

The decision of Justice White of Buffalo relieving the village of Le Roy, N. Y., from the obligation to buy the plants of the Le Roy Gaslight Company was received with satisfaction by the taxpayers. The village acquired the plants (gas and electric) by condemnation proceedings and it now turns out that the ballot upon which the question of establishing a municipal lighting system for the village was submitted to the taxpayers was illegal. The water commissioners took possession of the plants on December 1st. By operating them since then it has been shown that it is cheaper for the village to buy its light of a company than to own the plant itself. Therefore the decision is looked upon as a deliverance from a financial burden.

In the county clerk's office in Saratoga, N. Y., on Wednesday last, was entered a judgment for \$280,686.30, with interest from January 25, 1898, in favor of the New York Security & Trust Company and against the Saratoga Gas & Electric Light Company. It is directed that the proceeds of the sale of the concern be divided equally and ratably between the holders of the 300 bonds in the mortgage foreclosed.

The report of Receiver J. L. Bradford for the Indiana Traction Company (Clodfelter) was filed last week in the Superior Court at Marion, Ind. The statement shows the receiver to be charged with \$42,831.81; that the property at public sale brought \$35,619.55, leaving a balance of \$7,212.26. He has \$3,061.81 in cash, the balance in notes with approved security. Claims yet to pay amount to \$7,212.26. These are under three classifications. A claims amount to \$4,951.21, B claims \$368.11 and C claims are more than \$3,000 in the aggregate. The claims will be paid in the lettered order.

William R. Cole has brought suit against the Detroit Telephone Co. making the Detroit Switch.

board & Telephone Construction Co. correspondent, and asks damages of \$400,000. Mr. Cole claims that he is the inventor of the switchboard used by the company which enables them to evade Bell patents, and that he was ignored in the formation of the Switchboard Company and his invention credited to Thomas F. Ahern.

On the 25th ult. at Salt Lake City, Utah, Judge Marshall entered a decree against the Salt Lake & Ogden Gas & Electric Light Company and the Union Light & Power Company, in the foreclosure suit brought by the Farmers' Loan & Trust Company. Under the decree, the sale is ordered of all the first named defendant's property and rights in Ogden and Salt Lake, including the manufacturing and distributing plants. The mortgaged property is to be sold in its entirety, and the defendant is accorded no right of redemption. The debt is due on interest coupons amounting to \$45,000 due July 1, 1897, and \$45,000 on coupons due January 1, 1898, and a principal of \$1,500,000, making a total indebtedness of \$1,613,610. The defendants are given twenty days in which to pay the amount, and in case of default the whole mortgaged property will be sold. The decree appoints S. H. Lewis master commissioner.

A jury at Tacoma, Wash., on the 24th ult., decided that the sale of the Payallup Waterworks by the Tacoma Light & Water Company to the Tacoma Gas & Electric Light Company was a fraudulent one and that the city is entitled to levy on the waterworks under the judgment for \$800,000 given in favor of the city in its suit against the Tacoma Light & Water Company last August.

In the suit at San Francisco of the California Electric Company against the California Safe Deposit Company, as executor, and Laura Roe, executrix of the estate of the late George H. Roe, Judge Slack, on the 16th ult. found for the plaintiff for \$71,324 24. George H. Roe was a director in the plaintiff company at the time of a sale of its property for \$1,000,000. On the sale a cash commission of \$100,000 was paid, and it subsequently developed that Roe received \$50,000, being one-half of the commission. After his death the California Electric Company sued the estate to recover Roe's share of the commission, and about four months ago a jury returned a verdict in favor of the plaintiff, leaving the amount of the judgment to be ascertained and determined by the court.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Allentown, Pa.—The franchise of the Allentown & Reading Electric Railway Company for the construction of a trolley line from this city to Kutztown has been sold to a syndicate which will apply to the State Department for a new charter. The new concern will be known as the Allentown & Kutztown Traction Company.

Baltimore, Md.—Under the new charter adopted by this city no franchise can be granted to a street railway until it is advertised and sold to the highest bidder, and then the privilege is only a license for a limited term. The city may, after the expiration of the license, run the street railways or lease them.

Battle Creek, Mich.—The contract for building the electric railway from this city to Gull Lake and Kalamazoo has been let to the New York Construction Company of New York City. The construction company begins work on the line on the 10th inst. and is to have it completed in 90 days.

Chattanooga, Tenn.—The electric railroad from Lookout Inn to the site of the old Lookout Mountain house is expected to be in operation by May 1.

Cleveland, O.—The injunction recently granted to prevent the Cleveland, Medina & Southern Electric Railway from taking its proposed route through Linnendale was dissolved by Judge Stone on Tuesday of last week. The judge said electric lines have as much right on country roads in these progressive days as on city streets.

Detroit, Mich.—During the past year Patrick M. Kinsella of Livonia has been organizing a company to build an electric road between Detroit and Ann Arbor. His plan was to interest farmers along the route as stockholders, and he now reports that within a few weeks the company will be organized, with \$500,000 capital, under the name of the Detroit, Pike's Peak & Ann Arbor Railway Company. The line will be 50 miles long

and the fare one cent a mile. A power house will be built at Pike's Peak, where there is a fine water power.

Elizabeth, N. J.—Governor Voorhees having signed the Squires trolley bill enables the board of freeholders of this county to sell outright the trolley franchise from Elizabeth to Plainfield for a term of seventy-five years.

Frankfort, N. Y.—Highway Commissioner Wetmore has signed the franchise granting to the Frankfort & Utica Railway Company the right to build an electric trolley road over and along the highway from the westerly line of the corporation of the village of Frankfort to the Oneida county line. By the terms of the franchise the road is to be completed by December 1.

Gallion, O.—William E. Haycox, of Mansfield, O., and associates have been granted the right to construct and operate an electric street railroad in this city. The grant permits the carrying of freight, baggage and express matter as well as passengers.

Independence, Va.—A public meeting is to be held here this week in the interest of the proposed electric railroad to run from Chestnut Yards, on the North Carolina Division of the Norfolk & Western road, to Grant post-office, by the way of the Mouth of Wilson, in Grayson county, a distance of some forty miles.

Jersey City, N. J.—As a result of the lease of the Consolidated Traction Company to the North Jersey Railway Company, which was consummated on the 28th ult., the latter company will start out at once to develop the traction lines and to extend them throughout Northern New Jersey. A network of trolley lines is to be established until communication will be afforded between most of the various towns in the northern part of the State. The new company is to have a capital stock of about \$25,000,000.

Milford, Ia.—There is strong talk here of building an electric railway to connect Spirit Lake, Milford and Arnold's Park. The proposition of a Peoria, Ill., capitalist to build the road and put in an electric lighting plant is received with much favor by the business men of Milford.

Milford, Mass.—The committee on street railways of the Legislature reported favorably a bill incorporating the Milford, Attleboro & Woonsocket Street Railway. The original petition was for the incorporation of the Worcester, Milford, Attleboro & Woonsocket Street Railway, but the strength of the remonstrance of the Grafton & Union Company, whose line between Grafton and Milford the proposed railway was to parallel, led the committee to strike out the section between Worcester, Grafton and Milford.

Montclair, N. J.—The town council has come to an agreement with the North Jersey Street Railway Company to allow trolley cars to run through the streets of the town. The efforts of the North Jersey Company to get a franchise from the town began in July, 1894, and the discussions in the council relative to the matter if printed would fill a volume as large as the Bible.

New York.—The question of rapid transit across the city above 57th street was discussed a few nights ago by the East Side Progressive Association, and the general opinion was that electric surface lines on the depressed streets that cross the Park would give the most satisfactory transit. The matter will be taken up by the proper authorities.

New Brunswick, N. J.—It is announced here that the New York & Philadelphia Traction Company and the Brunswick Traction Company, which have until recently fought each other aggressively for trolley franchises in Middlesex and Somerset Counties, have combined with the purpose of building several trolley lines from this city to Camden County. Edward Radcliff, secretary of the Brunswick Traction Company, and J. Blair MacAfee, vice president of the New York & Philadelphia Traction Company, are now working together to get rights of way for the towns of Burlington County. The Brunswick Traction Company now has lines connecting this city with Bound Brook, Metuchen, South River and Milltown, and will soon extend them to Perth Amboy. The New York & Philadelphia Traction Company is about to operate its line between Bound Brook and Somerville, a distance of five miles.

Pensacola, Fla.—Electric cars are now running on the street railway in this city.—It is expected that within six weeks Key West will have an electric line in operation.

Pittsburg, Pa.—The consolidation of the Homestead & Schenley Park, Homestead & Highland, Braddock & Homestead, and the White Traction Company of McKeesport has been completed. Improvements and extensions will be made.

St. Louis.—The suburban passenger business of all the steam railroads running out of this city shows an enormous decrease in earnings during the year 1897. The loss is due to the competition of the trolley lines that have been extended into the territory formerly occupied by the steam roads. The commutation business on the Missouri Pacific shows a decrease of 42 per cent. in the number of passengers carried; the average distance carried increased 23 per cent., the revenue decreasing over \$21,000, due to electric car competition. Other lines show similar decreases.

Trenton, N. J.—The Bergen trolley bill, which has been signed by Governor Voorhees, empowers boards of freeholders and similar bodies to sell franchises for street railway lines on county roads to the highest bidder provided the consent of the municipality is given, the term of such franchises to be 75 years.

Tremont, Mass.—Agitation for an electric road from Tremont to Plymouth is in the air. Arguments in favor of such a scheme are multiplying, and it is intimated that capital might be secured by the right party to push it. Such a road would command a passenger traffic of large proportions. It would complete a straight line from New Bedford, Fall River, Fairhaven, Cape Cod and southern Plymouth county towns to Plymouth.

Washington, D. C.—The House District Committee has voted to report favorably a bill to allow the Washington & Gettysburg Railway to enter the city of Washington.

Worcester, Mass.—The route of the proposed trolley line between Worcester and Danielson, Conn., parallels the Norwich division of the New England Railroad the entire distance, about thirty miles. The road as now planned will pass through Webster, Perryville, Wiltonville, North Grovesdale, Grovesdale, Mechanicville, Putnam, Ballouville, Attawansan, Dayville and Elmville. About ten miles of track will be in Massachusetts.

LIGHTING PLANTS.

Bradford, N. H.—At a special town meeting held here last week there was a unanimous vote in favor of putting in electric lights.

Clarion, Pa.—After a long struggle the borough council has decided to light the streets of this town with electricity.

Greenwood, S. C.—A contract has been closed which will give this place an electric system and waterworks. The plants are to be completed by September 1.

Kenosha, Wis.—The council has extended the franchise of the Electric Light Company from twenty to forty years.

Mansfield, Mass.—Governor Wolcott has signed the Barnard electric light bill, which permits the Mansfield Water District to furnish the town with electricity for lighting the streets and public buildings.

Medina, O.—A petition signed by nearly 400 of the best citizens, asking that the entire city be lighted by electricity, has been presented to the council. A few arc lights around the public square, run by business men, supply all the electric illumination the city at present enjoys.

Nashville, Tenn.—The Nashville, Chattanooga & St. Louis road is preparing to equip its engines with electric headlights, and with that end in view has already furnished one of the engines which make the run between Nashville and Atlanta with an electric headlight. The railroad men say the light is a great improvement on the old method.

Ortonville, Minn.—Arrangements for the establishment of waterworks and electric lighting plants in this city have been completed. The contract for furnishing the entire system was awarded to Patrick Doherty of St. Paul. The electric lighting plant will be furnished by the Fort Wayne Electric Corporation of Fort Wayne, Ind.

Piercetown, Ind.—The town council has decided to put in waterworks and an electric light plant as soon as possible.

Reno, Nev.—The city council will issue \$130,000 bonds to put in a new water system and \$20,000 for an electric light plant.

San Francisco, Cal.—W. B. Summerhayes, representing the Mutual Electric Light Company of this city, appeared recently before the street committee of the Supervisors and stated that his company if granted the same privileges as the San Francisco Gas & Electric Company would establish a plant and furnish light to the city at a saving of \$40,000 yearly, also serve the citizens with light at a reduction of 25 per cent. from the present cost. He said his company would put up a bond of \$100,000 as a guarantee.

Spring City, Pa.—Peter Vroman and W. A. Keffer, a committee of the borough council, will receive until May 2 proposals for lighting the streets with electricity for a term of one or five years. Specifications may be had by applying to the committee.

Superior, Wis.—Mayor Starkweather, who is up for re-election, announces himself in favor of municipal ownership of an electric light plant both for city and commercial lighting.

TRANSMISSION PLANTS.

Harper's Ferry, Va.—The Harper's Ferry Paper Company, owner of the Harper's Ferry water power on the Potomac River, has almost completed arrangements to turn one-fifth of its power into an electric generating plant which will represent 400 horse power.

Little Falls, N. Y.—The electric power plant on the East Canada Creek at Beardsley's Falls, five miles east of Little Falls, has been completed. The power station is located on the east side of the creek about 300 feet below a natural dam of solid rock, and the water is conveyed by sluiceways partly cut in the rock and partly of wooden construction to a steel tube through which it is conducted to the turbines. The capacity of the present plant, about 600 H.P., can be trebled at slight expense. Poles have been erected and wires strung to convey the power to St. Johnsville. Guy B. Beardsley, of East Creek, proprietor of the plant, is the originator of the enterprise.

Marysville, Cal.—The Yuba Power Company has completed the transmission line from its plant in the hills

above Brown's Valley to Marysville, and on the night of the 21st ult. a fine electric-light display was given here that created great enthusiasm. The power house of the company is about 23 miles from Marysville. It is situated at the head of what is known as Captain ravine, down which for 850 feet is laid the heavy steel pipe which leads the waters of the Brown's Valley irrigation canal to the Pelton wheels at the power-house. These wheels are buckled to and run the large electric generators, three in number, of 500 H.P. capacity each. The machines supply the current for the lights in Marysville and power for the mines at Brown's Valley. The fall from the ditch to the Pelton wheels is equivalent to a vertical fall of 293 feet, and the power produced is equivalent to 1,878 H.P. The company is figuring on extending its current to Wheatland, Smartsville, Woodland, Lincoln and other surrounding towns.

Toronto, Can.—The Niagara Falls Power Company is building a new power house on the Canadian side, and by November of next year expects to be able to supply all the power Toronto needs. To build a line for 10,000 H.P. from the Falls to this city would cost about \$1,000,000. The loss in transmission for this distance is estimated at 25 per cent.—that is to say, a current of 10,000 horse power would be reduced to 7,500 when it reached Toronto.

MANUFACTURING, ETC.

Jeannette, Pa.—The Keystone Telephone Supply Company of Pittsburgh will build its plant in this place. The company gets a cash bonus of \$10,000 and two acres of ground from the town. It agrees to operate the plant steadily for three years and will employ 200 hands.

COMPANY MATTERS.

Alton, Ill.—The Alton Railway & Illuminating Company's petition for the appointment of a receiver for the Alton Gas & Electric Light Company has been granted by Judge A. W. Hope, who appointed James Duncan receiver.

Oakland, Cal.—The street railroads owned and operated by the Realty Syndicate have been amalgamated and incorporated under the name of the Oakland Transit Company, with a capital stock of \$5,000,000. The directors are F. M. Smith, E. A. Heron, F. C. Havens, W. H. Martin, D. D. Harris, J. C. Winans and Charles R. Bishop.

Ottawa, Can.—The Hon. John Haggart, W. A. Allan, A. Charlevoix, Sir Sandford Fleming and R. G. Code of Ottawa are applying for incorporation as the Canadian Electric & Water Power Company of Ottawa, capital stock \$100,000, for the purpose of establishing waterworks and manufacturing electrical machinery and electricity for the purposes of light, heat and power in the cities and towns of Canada.

St. Louis, Mo.—The Central Traction bill, an amended form of the North and South ordinance vetoed by the mayor, has passed the House of Delegates and also by the council.

White Plains, N. Y.—An order issued by Justice William D. Dukey in the Supreme Court, dissolving the Tarrytown Electric Railway Company, with the company's consent, has been filed in the county clerk's office here. Thomas C. Preso is appointed receiver of the property of the corporation.

NOTES FROM A CORRESPONDENT.

Troy, N. Y.—In the case of a boy who was killed by being run over by a motor car March 23, the coroner's jury exonerated the motorman but condemned the fender now in use on the cars of the Troy city railway as practically useless.

Schenectady, N. Y.—The lecture of Mr. Steinmetz before the Historical and Art Society of Albany was postponed on account of the illness of the speaker.—Detective G. S. Docherty has captured a noted criminal, William Davis. It is strongly believed that Davis is implicated in the murder of George R. Blodgett, patent attorney for the General Electric Company. Mr. Blodgett was shot by a burglar December 3, and died two days later. A reward of \$5,000 was offered by the General Electric Company for the arrest and conviction of the murderer.

PERSONAL AND MISCELLANEA.

S. Percy Sellon, W. M. Morday and C. E. Hodgkin of London, Eng., representing the Brush Electric Company of England, visited the Westinghouse works at East Pittsburgh last week.

A Lebanon, O., newspaper complains of the electric street lights in that town. The editor says "it would be a good idea to have the electric light poles painted white. With such miserable street lights the people need to be protected from running against the poles."

Charles McNellis, aged 14 years, was instantly killed at Pittsburgh, Pa., recently by an electric current. He was playing with comrades on South Twenty-sixth street when one of them dared him to touch the crank on an arc light pole with a rusty hoop. McNellis said he would not "take the dare," and reaching on his tip toes succeeded in touching the crank. It was charged and sent a death shock through the boy.

New Orleans street-car conductors have a champion in a Northern woman, who entered a car and kicking off her muddy goloshes placed them beside her feet. To her great surprise the conductor produced a newspaper and with the air of a gallant gentleman asked that he

be permitted to wrap up the overshoes for her. He made a neat package, and now she says that New Orleans street-car conductors are the most polite she has ever met.

The Cincinnati "Post" states that H. P. Bradford, former manager of the Main street electric road, Cincinnati, has gone to the City of Mexico, where he will have charge of a system of railways now operated by horses and steam which are to be converted into electric lines. Several conductors and motormen of the Main street line went to Mexico with Bradford.

Charles W. McLean, whose death occurred lately in a hospital for incurables at Fordham, N. Y., was a former resident of Toledo, O., where he was well known as a promoter of several commercial enterprises. He introduced the electric railway into Toledo.

The power house of the Kansas University at Lawrence, Kan., was recently destroyed by fire. The machinery in the power house, comprising two fine engines, several dynamos, and all the machinery used in the mechanical work of the students of the electrical engineering department, as well as all the tools, was damaged beyond repair. The value placed on this machinery by Prof. Blake, the head of the department, is about \$12,000, and there was much other property lost.

During the year 1897, 385 carloads of slate were shipped from the station at Monson, Me. The slate business is yearly increasing. Eighty per cent. of the electrical appliances in England are American made, and Maine slate is used for them in great part. The Monson-Burmah Slate Company is busy on electrical work and is now furnishing slate for a great office building approaching completion in New York City. The order for this building calls for 1,800 pieces of slate for electrical appliances alone.

M. F. Halbert, in a letter published in the Baltimore "American" of the 28th ult., says: "In Glasgow, London, the Hague, and Amsterdam, horse cars are the means of locomotion. In Edinburgh there is an electric road scarcely worth mention, and one in Paris, running from the Madeleine to the tombs of the kings at St. Denis, which is outside the city limits, but the snail's pace at which the cars move makes them but a slight improvement on those drawn by horses. Brussels, that gem of a city, which has in fact been called a miniature Paris, is one of the few cities possessing electric cars that in equipment and management equal our own."

The Electro-Magnetic Concentrating Company, which formerly operated the Gray Eagle mine at Rowena, has moved its plant to Ward, Col. The plant consists of six 4 x 12 concentrating tables, steam power machinery and a dynamo. The mill will commence business about May 1, and will set the tables to running on slimes and waste that flow from the Utica and Binford mills. It will later branch out in other directions and do a general custom business of treating ore. The company officers are J. O. Dimmick, president; E. K. Woods, vice president, and L. Dimmick, secretary, all of whom are of Denver.

The United States Lighthouse Board gives notice that on June 1 the first order fixed white light in the southern tower of the Highlands of Navesink, entrance to New York harbor, will be permanently discontinued. There will be established in the tower, in place of the discontinued light, an electric light showing a white flash of about one tenth of a second duration every five seconds. The height of the local plane of the electric light above mean high water will be the same as that of the present light, 246 feet, and the light will be directly visible 22½ nautical miles in clear weather, with the observer's eye 15 feet above the sea. Under certain conditions the reflection of the light in the sky will be visible at a much greater distance.

Abner Cheney Goodell, a noted inventor, died at Salem, Mass., on the 27th ult., at the age of 93. He was born in North Orange, Mass., February 9, 1805, being the son of Zina and Johanna Goodell, who had thirteen children, four of whom lived to be over 90 years of age, and four over 80. Mr. Goodell was the great grandson of Robert Goodell, who was the original emigrant from Ipswich, Eng., and who sailed April 30, 1634. He was of an inventive turn of mind, and perfected the first printing press that printed on both sides in one operation. His inventions in this line became the foundation of the present Hoe press. The Boston "Advertiser," from which we collate the foregoing, states that in 1837 Mr. Goodell "went to Salem and worked on the first electric motor ever built, that designed by Dr. Charles Grafton Page, and which was run between Baltimore and Washington."

RECENT COMPANY ELECTIONS.

Citizens' Gas & Electric Company, Jacksonville, Fla.—President, S. B. Hubbard; secretary and treasurer, Lewis J. Carder; directors: S. B. Hubbard, W. A. McEluff, John Clark, A. D. Stevens, A. F. Perry and J. D. Lincoln. The only new director elected was Mr. Lincoln, who is of Plainville, Mass.

Delhi & Bloomville Electric Railroad Company, Delhi, N. Y.—President, George Adee; vice-president, R. P. Cornnack; secretary and treasurer, A. J. Corbin; general manager and superintendent of construction, B. C. Friel; chief engineer, W. B. Peters.

Edison Electric Illuminating Company, Altoona, Pa.—President, H. O. Dorn; vice-president, S. H. Smith; secretary, A. J. Anderson; treasurer, Henry Cryder; auditors: H. E. Ferguson and O. A. Wood; directors: S. H. Smith, A. J. Anderson, H. E. Ferguson, John Lloyd, H. C. Dorn and O. A. Wood.

Fall River Electric Lighting Company, Fall River, Mass.—President, F. S. Stevens; clerk, Owen Durfee; treasurer,

A. F. Dow; directors: Frank S. Stevens, John D. Flint, F. O. Dodge, Edw. and L. Anthony, O. M. Hawley, R. W. Bassett, J. K. Osborn, J. B. Hawley and Jerome C. Borden.

Laconia Electric Lighting Company, Laconia, N. H.—President, Dennis O'Shea; treasurer and clerk, Charles W. Tyler; general manager, John F. Merrill; auditors: John W. Ashman and Addison G. Cook; directors: Dennis O'Shea, John F. Merrill, Jefferson Gilbert, Albert G. Folsom, Frank P. Holt, Gardner Cook and Addison G. Cook.

Newtown Electric Light & Power Company, Newtown, Pa.—President, Ashbel W. Watson; vice-president, T. S. Kenderdine; secretary and superintendent, William M. Watson; treasurer, Robert Kenderdine; directors: Ashbel W. Watson, George O. Worrell, T. S. Kenderdine, Edward H. Buckman, George C. Blackau, William M. Watson and Robert Kenderdine.

Petersburg Electric Railway Company, Petersburg, Va.—President, Edward C. White of New York; vice-president, Lloyd Nash of Westport, Conn.; secretary and treasurer, W. P. McKee of Petersburg; directors: the officers and Alexander Hamilton of Petersburg.

Scottdale, Everson & Broad Ford Street Railway Company, Scottdale, Pa.—President, John P. Breunnen; treasurer, W. N. Porter; secretary, John R. Byrne; directors: E. H. Reid, W. F. Sadler, A. Reader Partridge, O. De Witt Bassler, John R. Byrne, John P. Breunnen and H. J. Byrne.

Trenton Gas & Electric Power Company (reorganized), Trenton, N. J.—Directors: G. W. Gardner, W. H. McKinley, H. B. Stanley, Alfred Gregory, H. M. Beardsley, P. E. Parrott.

COMMERCIAL PARAGRAPHS.

The Orient Electrical Company of Youngstown, O., the well-known manufacturers of High Grade Incandescent Lamps, state that their trade during the past season has been very much larger than during corresponding months of the year before and that they are receiving large orders for their Strictly High Grade Anti-Trust Lamps. They justly attribute this to the fact that their lamps are strictly first class in every particular and are sold at less than Trust prices. The well-known quality of the product this firm turns out needs no comment.

Educate Your Bowels With Cascarets.
Candy Cathartic, cure constipation forever.
10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

Removal Notice.

The Pennsylvania Steel Company beg to announce that in future their Boston office will be in Rooms 11 and 12 Mason Building, 70 Kilby street, corner of Milk street.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

The rapid increase in the number of independent telephone exchanges has made the telephone supply business a very important item in the business of all the electrical supply companies. One of the items used by the telephone companies for which there has been quite a large demand is that of rubber-covered telephone cables. The Parante Telephone Cables which are being sold in the West by the Electric Appliance Company, Chicago, are securing a very high reputation among telephone people. The Electric Appliance Company are in a position to make the most prompt delivery on these telephone cables for the reason that they represent the only rubber-covered wire factory located in the West. The Electric Appliance Company are thus enabled to ship any ordinary order for special telephone cables from their Indiana factory within a very few days after the receipt of the same, which makes an unusually prompt delivery for this class of material. The Electric Appliance Company are always pleased to submit samples at any time of what they are producing in this line.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

INCORPORATIONS.

The Illinois Electric Company, Chicago—to deal in electrical appliances. Capital stock, \$20,000. Incorporators: F. E. Healey, L. K. Cushing, Carl Keith.

The Jersey City Electrical Construction Company, Jersey City, N. J. Capital stock, \$10,000. Incorporators: H. C. Newton and T. M. Simonson of Paterson, N. J., John McCullough of Jersey City.

The Citizens' Electric Railway, Light & Power Company, Mansfield, O., has certified to an increase of capital stock from \$125,000 to \$400,000, also enlargement of purpose and change of termini.

The Peninsular Electric Light & Power Company, Orlando, Fla.—to supply electric light and power, construct electrical machinery and apparatus, and purchase and sell electrical goods of all kinds. Capital stock, \$12,000. Stockholders: B. C. Abernathy, A. Macallum and W. B. Tucker.

The R. Roggatt Manufacturing Company, St. Louis, Mo.—to manufacture electrical appliances. Capital stock, \$25,000.

The Montrose Electric Light & Power Company, Montrose, Col. Capital stock, \$20,000. Incorporators: E. E. Kassler, C. M. Kassler and D. P. Barnes.

The Vinalhaven Electric Light & Power Company, Vinalhaven, Me.—to generate and sell gas and electricity. Capital stock, \$9,900, of which \$300 is paid in. President, George P. Ginn; treasurer, H. L. Hammond, both of Vinalhaven.

The South Bend & Elkhart Railway Company, Elkhart, Ind.—to build an electric railway in Elkhart and Mishawaka as well as over the roads between those cities. Capital stock, \$100,000 of which \$10,000 is subscribed. Incorporators: Arthur Kennedy, J. McEl Smith, Frank Dunahoo, A. L. Brick and DeWitt Dilworth.

The Electrical Wiring Company, Orange, N. J. Capital stock, \$15,000. Incorporators: Kurtz H. Popley and William A. Johnson of West Orange; George W. Huker and Adolph J. Levi of East Orange, N. J., and Gustav A. Hornbeck, of Verona, N. J.

The Cosmopolitan Construction Company, Chicago—to do the construction work of the Cosmopolitan Electric Light Company. Capital stock, \$500,000. Incorporators: Carl Meyer, Charles K. Holden and Alfred S. Austrian.

The Delford Electric Light Company, Hackensack, N. J.—to furnish electric light in the borough of Delford, including Oradell and New Milford. Capital stock, \$10,000. Incorporators: Hugh J. Grant, ex-mayor of New York, Kimball C. Atwood and John B. Lozier.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MARCH 29, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 601,458. Electric Rail-Road. Frederick W. Atkinson, Chicago, Ill. Filed Oct. 4, 1897.
- 601,482. Electric Railway Signaling System. Barney Samuels, St. Joseph, Mo. Filed May 6, 1896.
- 601,212. Car-Fender. George W. Douglas, San Francisco, Cal., assignor to the Market Street Railway Company, same place. Filed Nov. 29, 1897.
- 601,441. Safety-Buffer Car-Fender. John E. Jones, Kingston, Canada, assignor of one-half to Howard S. Folger, same place. Filed March 22, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 601,208. Electric Arc-Lamp. Philip F. Krug, New York City, assignor of one-half to Ernest Unger, same place. Filed Jan. 7, 1897.
- 601,351. Electric Lighter for Gas-Burners. Ladislav V. Lewitzky, Brzeziny, Belgium, assignor to the Compagnie Internationale pour l'Alimentation et l'Extinction Instantanée du Gaz, same place. Filed April 15, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 601,213. System of Electrical Distribution. William L. Hilsa, Brooklyn, N. Y. Filed Oct. 14, 1897.
- 601,216. Electric Switch. Oscar B. Platt, Bridgeport, Conn. Filed Feb. 2, 1897.
- 601,492. Automatic Cut-Out. Henry F. Blackwell, Jr., Brooklyn, N. Y. Filed Aug. 24, 1897.
- 601,581. Electric Heater. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, same place. Filed Feb. 14, 1898.
- 601,588. Rheostat. Frank E. Pool, Quincy, Ill., assignor to the Smith Hill Elevator Company, same place. Filed Jan. 31, 1898.

ELECTRIC ELEVATORS.

- 601,301. Safety Device for Electric Elevators. John D. Hilder, Yonkers, N. Y., assignor to the Otis Brothers & Company New York City. Filed Oct. 15, 1896.
- 601,581. Elevator Safety Mechanism. John T. Taylor, New York City. Filed Oct. 5, 1897.

MISCELLANEOUS.

- 601,253. Maximum Meter. Adrian H. Hoyt, Penacook, N. H. Filed July 29, 1897.
- 601,246. Fuel-Cut-Out. Ferdinand Schwedtmann, St. Louis, Mo. Filed May 6, 1897.
- 601,318. Regulator for Organs Having Electrical Air-Pumps. Levi K. Fuller, Brattleboro, Vt., assignor to the Estey Organ Company, same place. Filed July 20, 1896.
- 601,347. Means for Supporting Electric Wires. Benjamin Du Bois Smock, Wickatuck, N. J. Filed Feb. 10, 1897.
- 601,347. Electric Furnace for Manufacturing Calcium Carbide. Corydon L. Wilson, Charles Muma, John W. Unge, Henry Schneekloth, Ames P. Brosius and Joseph C. Kuehl, Holstein, Iowa. Filed Feb. 13, 1897. Renewed Feb. 4, 1898.
- 601,344. Cathodic-Electrode Support. Merrill W. Hollingsworth, Philadelphia, Pa., assignor to the M. S. White Dental Manufacturing Company, same place. Filed Nov. 24, 1897.
- 601,412. Wire-Holder. Frank Canfield, Boulder, Col. Filed Oct. 23, 1897.
- 601,434. Clamping-Buckle for Electric Line Wires. Augustus H. Weikman, Palmyra, N. J. Filed Dec. 8, 1897.
- 601,471. Storage Battery. Charles S. Kaufmann, Chicago, Ill., assignor to the American Battery Company, same place. Filed Sept. 4, 1897.

TELEPHONE AND TELEGRAPH.

Some Good Contracts.

The American Electric Telephone Company, Chicago, has secured a very large contract, covering apparatus for 3,000 instruments for the Saginaw Valley Telephone Company, and the company is to put in an underground system at Saginaw, Flint, Bay City and West Bay City. We understand that the apparatus referred to was selected after a very exhaustive test of all apparatus on the market and after the committees had visited all of the large installations using independent apparatus. The company has just expressed to Seattle a 100-number Express style switchboard complete and one hundred telephones, to be used by a company at Dawson City, N. W. T. In this instance the American Electric Telephone Company's apparatus was in competition with the goods manufactured by the American Bell Company and sold through their Dominion agents at Montreal and Vancouver. The apparatus for Dawson City was all packed in very narrow boxes so that it can be placed on sleds and carried through the passes successfully and quickly.

The West Penn Telephone Company has completed arrangements for constructing and maintaining a system of telephone lines between Washington, Pa., Canonburg, McDonald, Burgettstown and other points along the Panhandle Railroad, covering the western and northwestern portion of Washington county. Some of the towns named at present have no telephone communication with other places, and negotiations are pending whereby the company will get communication with Pennsylvania and West Virginia towns through contracts with other private telephone companies. A metallic circuit will be maintained and rates will probably be \$15 per year for private and \$24 per year for business houses.

The Utica, N. Y., Observer says that the farmers in the town of Niles, Cayuga county, are away ahead of their fellowcraft in other parts of the country, for they have a co-operative telephone line in successful operation. Nearly every farmer in the town has a telephone in his house, and when he wants to swap stories with his neighbors all he has to do is to go to the telephone and ring them up. As there is no central station, when he turns the little crank on the 'phone he calls up every man on the circuit. This is a disadvantage when he wishes to carry on a private conversation, but it has not broken any friendships yet, and all consider the telephone a great convenience.

On behalf of the city of Richmond, Va., C. V. Meredith has filed a petition for a writ of certiorari with the Supreme Court of the United States in the case of the city against the Southern Bell Telephone Company. The questions of law involved are of great importance and general interest, because they very materially concern the extent and the limits of the power of municipalities over the construction and operation of telephone lines in their midst.

The Bell Telephone Company has appealed to the State courts from the decision of the Railroad Commission at Raleigh, N. C., reducing the rates of the rental of telephones in North Carolina. The Commission has the privilege of designating the county court to which appeal shall be taken. In the case of the Bell Company's appeal the chairman of the Commission has designated Iredell Superior Court. This court meets in May, when the case comes to trial.

The city council of St. Paul has granted franchises to the Mississippi Valley Telephone Company for a local exchange and to the Minnesota Central Telephone Company for a long-distance system. The mayor has also signed the franchises. Both companies are already in possession of franchises in Minneapolis and within six months expect to be ready for business.

The Mississippi Valley Telephone Company has deposited \$5,000 in cash with the city treasurer at Minneapolis as earnest money for the fulfillment of the ordinance granting it a franchise to carry on a telephone service in that city. Within thirty days from March 26 the company must file its acceptance of the franchise and a big bond or forfeit the money.

The Omaha World-Herald has a despatch from Tecumseh, Neb., stating that the Home Telephone Company to be organized at Tecumseh proposes to make connection with the International Telephone Company. The Nebraska Telephone Company has already begun the erection of its lines in Tecumseh.

The Home Telephone Company of Fort Wayne has been forced to extend its switchboard facilities. The net gain in 'phones in the month of February was 40. The directory of the company, just printed, is the largest so far printed in northern Indiana.

The Standard Telephone Company has, it is said, contracted for a telephone line from Kansas City to Marshall, Mo., and will build several long-distance lines in the State.

Annual Meeting of the American Bell Telephone Co.

The annual meeting of the American Bell Telephone Company was held at Boston on the 29th ult. John R. Hudson was re-elected president, and the directors elected are: Charles W. Amory, Thomas B. Bailey, Francis Blake, Geo. L. Bradley, Alex. Cochrane, T. Jefferson Coolidge, Jr., J. Malcolm Forbes, Henry S. Howe, Chas. Eustis Hubbard, John E. Hudson, Chas. E. Perkins, Thos. Sanders, Moses Williams. The directors' report contains these figures: Instruments in the hands of licensees, under rental, December 20, 1897, 919,111; increase during the year, 146,494; exchanges, January 1, 1898, 1,025, increase 58; branch offices 987, increase 16; miles of wire on poles 327,315; increase 40,683; miles of wire underground 28,684, increase 47,833; miles of wire on buildings 13,776, increase 1,182; miles of wire, submarine, 2,675, decrease 143; total circuits 205,904, increase 31,159; total employees 16,682, increase 2,257; total stations 384,230, increase 58,986. Toll lines—miles of poles 67,791, increase 7,228; miles of wire 324,883, increase 56,017. The report says "the number of exchange stations operated under the licenses of the company is 384,230. This equals within a few thousand the aggregate number of exchange stations in all of Continental Europe. Next to our own country comes the German Empire with 122,361 exchange stations (1896), and next, Great Britain with 83,316. In the United States conversation is now had by subscribers over distances of 1,800 miles, which is twice the length of line anywhere else employed for telephonic use.

"The estimated number of exchange connections daily in the United States, made up from actual count in most of the exchanges, is 3,099,472, or a total per year of about 998,000,000.

"The number of daily calls per station varies in different exchanges from 17 to 18, the average throughout the United States being 8.1-10, which is the same as the number reported last year.

"The average cost to the subscriber by exchanges varies according to the size of the exchange and character of the service from less than 1 to 9 cents per connection."

The long contest between the Mutual and Iowa telephone companies in Des Moines, Ia., for the patronage of the business houses and residences has now practically closed, with a victory for the Mutual Company. The Iowa Company is yet in the field and is doing business, but it has less than half the business of the Mutual Company.

The People's Telephone line is being built from Blountville, Tenn., to Fall Branch. The construction is being done by farmers and business men along the line, each individual building two miles, thereby securing one paid-up share.

The personal tax assessment of nearly every corporation in Kansas City, Mo., including the telephone, telegraph, electric light, gas and street railway companies, has been raised by the board of equalization.

E. A. Wiles of Randleman, N. C., is said to be contemplating the establishment of a telephone system in Ashboro, N. C.

James Clark is considering the construction of a telephone system at Eddyville, Ky.

New Companies Incorporated.

The Kibble Telephone Company, Kibble, Mich. Capital stock, \$10,000.

The American District Telegraph Company, Dayton, O. Capital stock, \$30,000.

The Worcester Telephone Company, Snow Hill, Md. Capital stock, \$2,500. Incorporators: O. J. Purcell, W. S. Powell, W. F. Johnson, J. P. Moore and others.

The Canadian & Cheyenne Telephone Company, Canadian, Hemphill, County, Tex.—to construct and maintain telephone exchanges and a telephone line from Canadian to Cheyenne, Ok. Capital stock, \$2,500. Incorporators: Robert Moody, George Gerlack and D. J. Young.

The City Telephone Company, New York City—to operate a telephone and telegraph system in and about New York City, New Jersey, Pennsylvania and Southern New England. Capital stock, \$100,000. Directors: Thomas D. Bowen, F. D. Britton, W. F. Chester and Jacob Schwartz, of Manhattan borough; W. J. Scott, of Richmond; J. H. Hingle, of Rutherford, N. J., and W. J. Kelley, of Jersey City.

The Denver News states that a telephone company was incorporated on the 23d ult. to operate in Rio Grande, N. M., general, Saguache, Conejos and Costilla counties, with headquarters at Monte Vista, Col., the object of which is to bring all the towns of the San Luis Valley into "hello" reach. Capital stock, \$10,000. Directors: Adelbert J. White, Henry D. Abrams, Albert M. Isbell and Albert W. Horn.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Abbreviations: crt. indb., certificate of indebtedness; coll., collateral; cons., consolidated; const., construction; conv., convertible; com., common; deb., debentures; exten., extension; gen., general; g. gold, gold; guar., guaranteed; inc., income; imp., improvement; pd., paid; pfd., preferred; mtg., mortgage; tr., trust; A., annually; S., semi-annually; Q., quarterly; A. & O., Apr. and Oct.; F. & A., Feb. and Aug.; M. & S., May and Sept.; J. & D., July and Dec.; J. & J., Jan. and June.

*Unlisted. † Ex div.
 A Consolidation of Baltimore Traction Company and City & Suburban Railway Company.
 Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikeville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h 90 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$50,100 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 j 10 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$25,100 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 6 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crotonwater Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %
 h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 i Leased to Metropolitan Street Railway for 18 % on stock.
 j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter
 k Leased to Metropolitan Street Railway for \$145,000 per annum.
 l Leased to Metropolitan Street Railway for 18 per cent. on capital stock.
 m Controlled by Third Avenue Railroad by purchase.
 n Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.
 o Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitts' Trac. Co.
 p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
 q Leased to Fort Pitt Traction Company for 8 % on \$8,000,000 capital stock.
 r Leased to Consolidated Traction Company for 4 % on capital stock after October.
 s Leased to Consolidated Traction Company for 1 % on capital stock after October.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11 1/2c.; Lake, 11.90@12c.; casting, 11 1/2c.

The Pennsylvania Heat, Light & Power Company has declared the regular semi-annual dividend of \$1.55 on the preferred and 50 cents on the common stock.

Among the American securities listed recently by the London Stock Exchange was \$603,000 thirty-year consolidated 5s of the Milwaukee Electric Railway & Light Company.

The New England Motor Company has been incorporated under the laws of Massachusetts and will establish works at Lowell, Mass., for the construction of electric motors. The capital stock is \$10,000.

The Philadelphia "Times" remarks: "The failure of the Acetylene Light, Heat & Power Company recalls the remarkable rush to subscribe for the stock three years ago. The amount offered was over-subscribed several times."

The Boston "News Bureau" states that the acetylene plant at Niagara Falls, costing \$150,000, has been taken under foreclosure of mortgage for \$83,000 by the Electro Gas Company, from which corporation the Acetylene Company purchased its patent rights.

An attachment against the Imperial Electric Company, New York, is in the hands of the sheriff. The product of the company was electric motors and lamps; for a year it has been working for the Puritan Electric Company which was recently closed out by the sheriff.

Judge Simonton of the United States Court entered a decree at Lynchburg, Va., on the 30th ult., confirming the sale of the Lynchburg Electric Company's plant, recently made to Walter S. Johnson and R. A. C. Smith, of New York, representing a majority of the bondholders.

Judge Cox has appointed Henry A. Griswold and Benjamin S. Minor receivers of the Anacostia & Potomac River Railroad Company, Washington, D. C. The court directs that the receivers shall give bond in the penalty of \$50,000 conditioned for the faithful discharge of their duties.

Justice Dickey in the Supreme Court of Brooklyn has granted Receiver Frothingham of the Kings County Elevated Railroad Company permission to issue \$400,000 receiver's certificates to be used in completing the connection between the elevated structure and the Brooklyn Bridge.

A deed of trust has been filed in the office of the Recorder of Deeds at Washington, D. C., by the Capital Traction Company to Thomas Hyde, James M. Johnson and Charles A. James, to secure the payment of \$1,000,000, represented by 100 bonds of the denomination of \$10,000, upon its roads and franchises, to pay for improvements recently made.

The annual return of the Thomson Electric Welding Company, Boston, is as follows: Assets—Machinery, \$6,234; cash, debts receivable, \$50,120; manufactures, merchandise, etc., \$8,403; patent rights, \$104,983; miscellaneous, \$61,564; total, \$231,304. Liabilities—Capital stock, \$192,040; debts, \$341; balance, profit and loss, \$38,923; total, \$231,304.

One of the largest mortgages ever filed on property in Montgomery, Ala., has been filed in the probate office in that city in favor of a Baltimore firm by the Montgomery Light Company. It is for \$750,000 and it is to secure the first mortgage bonds that are to be issued by the company for the improvement and enlargement of its gas and electric light plants.

A deed of trust has been filed at Parkersburg, W. Va., given by the Parkersburg Gas, Electric & Street Railway Company to the Mercantile Trust & Deposit Company of Baltimore, Md., upon all the Parkersburg company's property, franchises, etc., to secure the issue of \$150,000 five per cent. forty year bonds. The proceeds of these bonds are to be used in the construction of an electric railway.

The financial statement of the United Electric Securities Company, Boston, as of March 1, 1898, just filed with the Commissioner of Corporations, is as follows: Assets—Investments, \$908,204; underlying first mortgage bonds, \$4,196,600; accrued interest, \$74,169; cash, \$141,734; total, \$5,320,707. Liabilities—Capital stock, \$1,500,000; collateral trust 5 per cent. bonds, \$3,620,000; surplus, \$200,707; total, \$5,320,707.

Receiver Uhlmann of the Brooklyn Elevated Railroad has been authorized by Justice Dickey to enter into a contract with the Long Island Railroad providing for the joint construction of a connecting line at East New York and the running of through trains from the Brooklyn Bridge via the Broadway line of the Elevated Company to Rockaway Park and other stations on the Rockaway branch of the Long Island road.

The Baltimore and New York capitalists who have purchased the electric street railways and the electric light plants of Knoxville, Tenn., will form a new company with a capital stock of \$750,000. The properties in the consolidation are the Knoxville Street Railway, Citizens' Railway and the West End Railway, the Knoxville Electric Light & Power Company and the Mutual Light & Power Company. It is proposed to issue bonds for \$850,000, paying interest at the rate of 5 per cent. per annum, to cover the bonds on the individual properties and to provide for extension, new equipments, etc. These bonds are to be secured by a first mortgage. The Baltimore Trust & Guarantee Company is the trustee. Frank S. Hambleton of the banking firm of Hambleton & Co., Baltimore, will, it is said, be the president of the new company, with C. C. Howell, manager of the Knoxville Street Railway Company, as vice-president and general manager.

The General Electric Company has filed a statement of its condition January 1 (the company's fiscal year ends January 31) with the Commissioner of Corporations, Boston. The statement, to which we append that of 1896 for comparison, is as follows:

	1897.	1896.
Assets:		
Real estate.....	\$659,113	\$444,487
Cash and debts receivable.....	6,560,727	10,176,755
Goods on hand and in process.....	8,896,872	8,898,757
Patent rights.....	8,000,000	8,000,000
Debentures in treasury.....	2,000,000	512,182
Miscellaneous securities.....	10,774,398	11,767,650
Balance (deficit).....	11,804,111	12,697,685
Total.....	\$48,199,228	\$47,607,428
Liabilities:		
Capital stock.....	\$34,712,000	\$34,712,000
Debts and reserve.....	8,487,228	12,895,428
Total.....	\$43,199,228	\$47,607,428

The lease of the Consolidated Traction Company of New Jersey to the North Jersey Street Railway Company provides for a guaranteed dividend of 2 per cent. for the first year and an annual increase to 4 per cent. in eight years and remaining at that afterward. The new board of the Consolidated, just elected, consists of Peter A. B. Widener, William L. Elkins, Thomas Dolan, Almeric H. Paget, John D. Grimmins, Thomas F. Ryan, Edward F. C. Young, Jeremiah O'Rourke, Clement A. Griscom, George F. Perkins, A. J. Cassatt, David Young, Abram Q. Garretson, Elisha B. Gaddis and J. B. Shanley. The officers re-elected are: E. F. C. Young, president; E. B. Gaddis, first vice-president; David Young, second vice-president; E. N. Hill, treasurer; Thomas J. George, secretary. The North Jersey Company will control all trolley lines in northern New Jersey except the North Hudson County. The officers of the North Jersey are: President, J. K. Corbiere; vice-president, H. M. Doremus; secretary and treasurer, Wilbur S. Johnson.

EDITORIAL NOTES.

Courts End the Trust Monopoly.
The Van Depoele trolley patent No. 495,443, controlled by the General Electric Company, has been declared invalid by Judges Wallace and Shipman of the United States Circuit Court of Appeals. This patent and a prior one granted to Van Depoele in 1890 have been in constant litigation almost from the day of their issue. In an editorial which appeared in ELECTRICITY, July 28, 1897, we gave in detail a history of these patents. As the principal one is now declared void it might be in place to again relate the various steps which led up to this recent and final decision. A suit was brought in May of 1893 by the Thomson-Houston Company, a branch of the General Electric Company, against the Winchester Avenue Railway Company in Connecticut and the Westinghouse Company for the infringement of the Van Depoele patents No. 495,443 and No. 495,383. The claim made by the Thomson-Houston Company was that the former covered broadly the combination of a car, a track, an overhead conductor, a contact device supported at the end of a long swinging arm bearing against the under side of the conductor, and a tension device for pressing the contact up against the wire, and that the 495,383 patent covered a turntable device in which the trolley arm was mounted. After a protracted and expensive contest between the above mentioned companies before Judge Townsend of Connecticut in December, 1895, the 495,443 patent was sustained, but the patent for the turntable device was declared invalid.

This defeat of the Westinghouse Company was one of, if not the principal reason for the combination on patents of the General Electric and Westinghouse companies which immediately followed. The patent, backed as it was by the opinion of Judge Townsend, at once became the main instrument in maintaining an oppressive monopoly against all outsiders. Injunctions were obtained against manufacturers of railway apparatus and against railroad companies all over the country, and among others the Walker Company of Cleveland, O., were enjoined. In one case a company settled with the complainants by paying \$100 a car, or \$20,000 for the right to continue to use the equipments on 200 cars.

The Walker Company of Cleveland however refused to give up the fight, and appeared as a bidder for a share of the trolley business of the country. Consequently, in 1897, suit was brought by the General Electric-Westinghouse combination against the Hoosick Railway Company, equipped with Walker apparatus. The attorneys for the Walker Company determined to oppose the motion for injunction on the ground that the Van Depoele patent 495,443 was invalid owing to a prior patent having been granted

Van Depoele, covering the same invention, in 1890. When the motion came up before Judge Cox in the Circuit Court, Judge Cox followed the decision of Judge Townsend and granted the injunction. An appeal was taken from this decision to the Court of Appeals. The plaintiffs claimed that the earlier patent was intended to cover the switching arrangements and the latter the under-running contact. This court, however, decided that the so-called broad Van Depoele trolley patent 495,443 was invalid on the ground that the prior Van Depoele patent of April 1, 1890, was for the same invention. The owners of the patent then shifted the ground of attack to two of its other claims, endeavoring to gain a favorable decision in this way.

In February last, Judge Lacombe of the United States Circuit Court decided in favor of the patent on the two new claims. The decision just rendered is in the Union Railway or "Huckleberry Road" case. It was a decision on a motion for a preliminary injunction, restraining the Union Railway from using the Walker Company's apparatus, but it is nevertheless controlling and conclusive with respect to the validity of the patent, and no appeal lies to any higher court. The earlier patent is still in force, but its claims are so narrow that it is practically worthless, at least so they were construed by the Circuit Court of Appeals in the "Elmira" case.

The recent decision makes the last controlling patent owned by the Trust worthless. In the General Electric Company's statement of its condition, recently filed with the Commissioner of Corporations in Boston, among its assets the patent rights are valued at \$8,000,000. It is safe to say that the patent rights owned by the General Electric Company are worth at the present time but very little.

* * *

The Trans-Mississippi and International Exposition.
From all accounts, the Trans-Mississippi and International Exposition, which is to be held at Omaha from June 1 to November 1, 1898, will be a great success. No efforts are being spared on the part of the management to make the Exposition everything that could be desired. The electrical features especially are being given careful attention. The lighting of the grounds and buildings has been consigned to the charge of Mr. Luther Stieringer, the well-known electrical engineer, who acted in the capacity of consulting engineer at the late Columbian Exposition in Chicago. In the Machinery and Electricity Building it is proposed to exhibit all the latest electrical and mechanical devices that are being manufactured both in this country and abroad, and undoubtedly many of the inventions that have been creating wide attention of late will form some of the attractions. The illumination of the grounds and buildings at

night will in all probability be one of the most interesting and striking features. A careful study of the illuminating plan shows a great array of incandescent lights. It is proposed to outline every building with the glowing bulb. Along cornices, around windows, on pillars, domes, and at the water edge incandescent lights will shine forth. At the west end of the lagoon, the salient points of the architecture forming the Government Building will be made distinct by electric starpoints. On either side the colonnades connecting the Government Building with the neighboring buildings will be defined by pillars of light. The Fine Arts Building with its domes encoirled with lights should make an attractive spectacle. But probably the feature of the nightly illumination that will attract the most attention will be the electric fountain, designated Nautilus. The latter, located in the center of the Mirror (a small lake) and surrounded by electric lights, will be constantly bombarded from an invisible source with light ever changing in color and of great intensity.

The Trans-Mississippi & International Exposition should prove of inestimable value from an educational as well as an industrial and commercial standpoint.

* * *

Locating Submarine Mines by Means of the Telautograph.

In a recent issue of the *Chicago Times-Herald*, Professor Elisha Gray, the inventor of the telautograph, describes at some length a very ingenious arrangement by which the telautograph could be adapted in coast and harbor defenses for locating the exact position of an enemy's vessel. In other words, by means of suitable electrical connections the device would serve as a range-finder. Referring to a conversation on this subject held with an army officer some years ago, Prof. Gray says:

"The plan then suggested by the writer contemplated an apparatus that would trace a line on a map of the harbor, or a section of the coast, that had been carefully surveyed and laid out into squares of a convenient size. If such an apparatus has been perfected and put into use since that time the writer does not know of it, and if it has not this article may help some one who is familiar with the details and requirements of harbor defenses to adapt such an apparatus to practical work. The value of such a system consists in being able at a glance to determine the exact position of a vessel at any moment—without calculation—by a direct reading."

At the time Prof. Gray originally suggested the above method a mathematical calculation had to be gone through before the exact location of a vessel could be determined. Since then however the Fiske range-finder, and still more recently the Lewis depression finder, have been developed and perfected, by means of which the distance between the observer and the object at which a gun is to be fired is automatically recorded. As will be seen from the following description, Prof. Gray's device is quite similar in its general arrangement to the Fiske range-finder, although the final results obtained differ somewhat. The system suggested by Prof. Gray necessitates the making of an extremely accurate survey of a harbor, dividing it up into convenient but imaginary squares and marking on the map in each of these squares the distance from the gun, the exact direction and the angle of depression. This map must be placed in a permanent position in such a manner that its meridional points exactly agree with the points of the compass of the harbor. The map should moreover be conveniently located with reference to the gun. The operation is then described by Prof. Gray as follows:

"Two points of observation are established on the shore of the harbor, so related to each other that the lines of observation will always cross each other at some angle when the observation glasses are both

directed to any single point on the surface of the harbor, or that section of the harbor that this particular station has charge of. These glasses are attached to a perpendicular standard or shaft that rotates in bearings, and means are provided for elevating or depressing the observation glasses as occasion requires. On the rotating standard is fixed a device for transmitting electrical impulses, and a certain number of impulses will always be transmitted for a given amount of rotation of the standard. These impulses represent equal steps, which may be as short as is desired. The equipments at each point of observation are exactly alike in construction and in electrical attachments. These two points of observation are the transmitting stations, and from each an electric wire is run to the map where the gun is located. At two points on the shore of the map that coincide exactly with the two transmitting stations on the shore of the harbor are mounted rotating standards, each of which carries an arm long enough to cover that section of the harbor map that it is designed to stand guard over. These arms should be light and no longer than is necessary to do the work. A ratchet wheel that is electrically controlled, having fine teeth, is carried by each standard carrying the arms. These wheels are moved step by step, the same as in the telautograph, by the electric impulses that come from the transmitters or the observing stations. There must be a means of unifying the transmitters with the receivers, the same as in the telautograph, and also a reversing mechanism. These devices are all worked out in the telautograph, so that they will only need to be adapted to this particular use. Now, if the two sets of apparatus are put in unison—which can be done in a second or two—and the two observers train their glasses upon some object located in the harbor, which we will say is in square 100 as marked on the map, it will be found that the point where the two arms of the receiver cross each other over the map will be in square 100, and in the exact part of the square that the object is in on the harbor. In fact, it is only a question of accurate survey and accurate construction of apparatus to locate an object to the fraction of a yard. . . . The movement of the observation glasses transmits electrical impulses to the corresponding arms over the map, causing them to move in the same manner—relatively. At the point where the two arms cross, a tracer is carried that may or may not trace a line on the map, whichever is desired. The two observers should be in telephonic connection, and both with the receiving station; and in order to be able to converse freely and at the same time have their hands free to move the observation glasses they should wear receivers fastened to the head, as they do in central telephone stations. The tracer will rest on the map in the same position that the ship occupies on the water, and will move as it moves. A station on a harbor fitted out with this apparatus and a disappearing gun could load and take aim behind the works and then elevate the gun and fire. If a harbor were filled with torpedoes or mines, and they were accurately located on the map, anyone could watch the indicator as it followed the movement of a vessel and when it was over a torpedo it could be instantly exploded by touching a button."

In the latter respect Prof. Gray's apparatus would be more desirable than the Fiske range-finder, as it could be utilized either for training a gun or firing a torpedo, whereas the range-finder could scarcely be made use of in its ordinary form in determining when a vessel was directly over a mine. A modified form of range-finder has however been designed for this purpose, which we described in a recent editorial and which in a word consists of two pivoted telescopes in circuit with a submarine mine, so arranged that when both telescopes are pointed directly at the mine the switches are closed and the mine exploded. As Prof. Gray's apparatus could be made to serve two purposes it should prove of great value. If, however, a harbor or other body of water was not

already mapped out into suitable squares, the necessary extremely accurate surveys would entail a considerable expenditure of both time and money.

Another method of firing a mine is by means of a camera obscura. An operator sits in a dark room in the outer wall of which a fixed camera is located. The lens of this camera would take in the entire view of the surface of a bay. The light admitted into the room by the lens would, by the aid of a mirror, be projected down on a chart on which each mine was accurately located and numbered. Any moving object on the surface of the bay or harbor would be reflected on this chart. If therefore an enemy's ship appeared on the chart, as soon as its reflection covered one of the numbers marking the location of a mine, the operator would close the circuit corresponding to that number, and the mine would be exploded.

* * *

The Electrical Exhibition.

As the time gradually approaches for holding the Electrical Exhibition in Madison Square Garden, the interest in the event is unquestionably growing. There would seem to be an idea prevalent in the trade that owing to the more or less unsettled condition of the country the Exhibition might have to be indefinitely postponed. Such however is not the case, as the management has determined that, even though further complications with Spain should arise, the holding of the Exhibition will not be interfered with in any respect, and the revised list of exhibitors which appears in this issue of *ELECTRICITY* would seem to guarantee a splendid showing. The management is sparing no pains to make this Exhibition attractive, having instituted a telegraphic competition, a typewriting contest and numerous other interesting events. The Madison Square Garden show should prove extremely fertile in exhibits new and as yet little known. The Diesel Motor Company are importing, so it is said, one of their prime movers from Germany with a view to showing its high efficiency in actual work at the coming Exhibition. Several new vacuum tube lights will also be shown in actual operation, and thus the public will have an opportunity of forming an opinion as to whether this new form of illuminant embodies the many advantages claimed for it. A large number of the latest and most important inventions will undoubtedly be shown.

Under the Searchlight.

Notes and Comments on Various Topics.

"Progressive Eucbre."

A careful perusal of the following notices, with a glance at the dates, which have appeared from time to time in various papers, will show what these hopeful and cheerful little effusions amount to:

(*Boston Advertiser*, March 23.)

It is said by people who claim to be usually well informed in matters connected with the General Electric Company that the plan to adjust the claims of the preferred stockholders is practically matured, the official notice of which may be given out in the near future. The purpose of the directors, it is reported, is to offer about three shares of common stock for one of the preferred, comprising the back dividends on the latter. Direct verification of these reports, however, cannot be obtained.

The fiscal year of the company ended January 31 and the annual report may be expected during the latter part of April, just previous to the annual meeting, which is held the second Tuesday in May. The last dividend on the preferred stock was paid in July, 1893, and up to January, 1898, the accumulated payments amounted to 81½ per cent, which must be paid before the common stock can receive anything.

(*Boston Advertiser*, March 31.)

It is said that the plan for putting General Electric in a condition for paying full dividends is well matured, if not entirely matured. The latest information is that the company proposes to give the preferred stock debenture bonds in full settlement of their claims, if not in full exchange for their stock. It seems that the company in retiring its debenture bonds in past years has held them uncancelled

and can therefore release them if necessary. When the preferred stock is out of the way it is rumored that the common will be put in two and dividends on a 6 per cent. basis be undertaken on this new stock.

(Boston Advertiser, April 5.)

A meeting of the preferred stockholders' committee of the General Electric Company was held in Boston, Saturday, at which, it is understood, an amicable agreement has been reached for settlement of the accumulative dividend question. The seven millions of this stock is now entitled to something over 50 per cent. back dividends.

(Boston News Bureau, April 6.)

If the General Electric Company should settle with the preferred stockholders and correct the impairment of capital by reducing the common stock 50 per cent., and it should cost \$100,000 a year to do this, there would be left for the new stock on the basis of 1897 earnings, ignoring amounts charged off, a sum equivalent to 7½ per cent. Taking only the actual surplus last year, and allowing for the preferred dividend and \$130,000 cost of settlement, there would be left for the new common stock 3.7 per cent. The company is known to have done much better in 1898 than it did in 1897. On the basis of earnings for the last three years there is no question that General Electric could pay the full preferred stock dividend and at least 4 per cent. on one-half the present common stock. There is little doubt that the affairs of the company will be straightened out soon and favorably to both classes of stockholders.

(N. Y. News Bureau, April 7.)

While it has been rumored that an agreement has been reached between the common and preferred stockholders of the General Electric Company for a settlement of all their differences, an important interest concerned in the negotiations says positively that no such agreement has been reached. It is admitted that the matter pertaining to a settlement has been under discussion for several months past between committees of the common and preferred stockholders, but no agreement has been reached, and the whole matter has again been referred to the lawyers in whose hands it has been for the last two years.

From the last item, notwithstanding the excellent work of the General Electric Company's press agent, it will be seen that absolutely nothing has been done in regard to arranging a settlement of the accumulated dividends. In other words, the stockholders are invited to be patient for another three or four years or so.

"Corporations for the Consumption of Stockholders."

The following, contributed to the *U. S. Investor* by "Constant Reader," is so much in accord with our own views as they have been expressed time and again in regard to the General Electric and other stock jobbing concerns which have inflicted incalculable injury on the electrical business, that we reproduce it simply as a verification of our own views by one who is apparently well informed. It is addressed to the editor of the *Investor*:

The *Boston Herald's* financial article of Sunday last speaks of "corporations for the consumption of stockholders," a phrase which very pitifully describes a large number of our financial concerns, which may with advantage be enlarged upon. There are corporations created solely for that purpose. These are, on the whole, less numerous and less dangerous than the corporations in which the consumption of stockholders is simply one of the incidental objects of the promoters and managers.

There is nothing which has been so disastrous to the country and the people of this country for a generation as this nefarious industry, as there has been no industry in the United States so enormously profitable or on the whole so safe. . . . Since then the methods have been perfected, and taking advantage of the timidity of the stockholders, and the general complacency and sometimes the corruption of the courts of justice, the industry has been developed to the further corruption of our political life, and our financial system generally. Of the great fortunes that have been built up since the civil war, it is speaking within limits to say that a great number have been amassed by this method of wrong and robbery. Corporations of almost every kind have been and are diverted from their ostensible objects by trusted officials and managers, to the end of swindling the holders of the stock. The thing has become so common, and in financial circles so well recognized, that even in the most glaring and shameless instances it hardly attracts attention, or involves any loss of reputation or social standing.

Why is this state of things allowed? The explanation of a most respectable Boston broker is: "Because the stockholders are damned fools." The stockholders in general may be fools, but those who manage corporations for the consumption of stockholders are knaves—a sort of high-grade confidence men, vastly more dangerous, if not worse, than bunco steers and gold-brick men. They live in luxury and honor, and have memorial churches and universities erected to them after death, with glowing eulogies

from the writer of obituary notices; but they ruin the widow and the fatherless, and are the worst enemies of the prosperity, and in the long run, the liberties, of the people.

* * *

ACCORDING to the *New York Mail and Express*, the votaries of electrical science "express their feelings now and then in singular ways. One gentleman has in his sitting room in this city a revolving glass disk with cushions which generate electric sparks. When the mechanism is in motion there is a torrent of sparks between two brass conductors attached to the contrivance accompanied by a fusillade of tiny reports. He claims that it produces ozone and prevents the headaches from which he formerly suffered. A woman with the same fad has a bedstead, washstand and three chairs made of iron decorated with brass. The iron is magnetic and she believes that it exerts a beneficial influence upon her nerves and brain, inducing sound sleep and strengthening all the tissues of her body." No wonder the originator of such fakes as electric belts, shoes, etc., prosper.

* * *

It is really surprising the new uses to which electricity is constantly being adapted. In all probability the public will before long be drinking (except the Prohibitionists, of course,) electrically treated wine. This is accomplished by means of carbon electrodes, the positive being placed in a cylinder containing diluted alcohol and separated from the wine by a diaphragm. The negative electrode is placed directly in the wine and the hydrogen generated by the current destroys the acid. It is stated that wine treated in this manner can acquire in a few hours properties that would otherwise consume a long period of time.

* * *

FRANK J. SPRAGUE, vice-president of the Sprague Electric Company and a graduate of the U. S. Naval Academy, is said to be organizing an emergency corps of electrical engineers to work in conjunction with the State Naval Reserve in the event of war. His plan is said to have the endorsement of Mr. Roosevelt, Secretary of the Navy. Electricians desiring to learn more about this movement can do so by writing to Room 1,511 Commercial Cable Building, New York.

* * *

THE French steamer *La Gascogne* brought over on its last trip two electric racing machines which are said to be creating quite a stir in America's cycle racing circles. The electric tandem has a motor weighing 25 kilogrammes (55 lbs.) attached to the lower tube of the frame. The necessary current for operating the motor is obtained from a number of storage batteries grouped in four boxes above the motor. A current ranging from 1 to 80 amperes can be obtained. It is claimed the machine will travel at the rate of 40 miles an hour for three quarters of an hour with one battery charge. A bond of \$500 must be given before the owners will be allowed to take the machines from the Custom House.

* * *

THE *New York Sun* is responsible for the following: "In a brief visit to the borough of Brooklyn the other day," said a Manhattan boroughite, "I saw on the fender of a trolley car a single sheet poster printed with the announcement of a theater. I should think that as billboards the fenders of trolley cars would serve admirably, especially for pictorial work for circuses, for instance. A trolley car with its fender covered with pictures of lions and tigers and so on, coming toward the beholder at a high rate of speed, could not fail to be impressive."

An Easter Souvenir.

The American Electrical Works, Providence, R. I., Eugene F. Phillips general manager, never fails to commemorate the cherished festivals of church and people by some pleasant and ingenious device appropriate to the occasion or suggestive of its spirit. The

Easter souvenir which the company sent out this year for the delectation of its multitude of friends and customers is quite pretty. It is an ornamental card handsomely printed in green and red, the two ends folding over a flap which represents an egg-plant in shape and color. When this flap falls back, a miniature crimson envelope is disclosed, which on being opened is found to contain some seeds of the plant. The idea is set forth so well and so pleasantly in the remarks printed on the card that we cannot resist giving them in full, as follows:

EASTER.

We desired to send you some souvenir at this joyous Easter time. The problem was, what to send.

Should we send lilies? They would wither before you could receive them.

The sending of a colored egg was suggested. Well you can imagine the condition in which an egg would reach our friends if sent through the mails. A happy thought suggested itself.

An Egg—An Egg Plant.

So here you have it. Upon opening the egg-plant you [Here is given the semblance of an egg-plant.]

find the seed. It seems to us a beautiful and suggestive idea to request each of our good friends to plant the enclosed seed, and from it raise a

Commemorative Egg Plant

with the hope that its growth and fruit may frequently bring to mind your friends,

AMERICAN ELECTRICAL WORKS,

Best equipped and largest plant in the United States for bare and insulated electric wires.

THE LATEST TROLLEY LITIGATION.

The Circuit Court of Appeals Reverses Judge Lacombe's Decision in the Walker Suit—The Under-Running Trolley Open to All—The Best Patent Asset of the G. E. Wiped Out—A Trolley Case in Cincinnati.

In the suit of the Thomson-Houston Electric Company against the Union Railway Company, New York, the United States Circuit Court of Appeals has reversed Circuit Judge Lacombe's decision, in which he granted an injunction pending final hearing in the case, restraining the railway company from using certain overhead trolley car appliances to which the plaintiff claims exclusive right under the Van Depoele trolley patent. The Union Railway Company is using the Walker Company's apparatus, and the officers of the latter company state that under the decision the right to make and use the trailing freely mounted trolley arm pressed up against an overhead conductor is now no longer limited to the General Electric and Westinghouse companies and their licensees.

In the United States Circuit Court of Appeals at Cincinnati on the 5th inst. argument began in the case of Oliver S. Kelly and the General Electric Company vs. the Springfield (O.) Electric Street Railway Company. The case under consideration involves the validity of the patent on the single trolley street-car system. It was tried in the court below before Judge Sage and was decided in favor of the defendants and the complainants have appealed. Alluding to the case the Cincinnati *Enquirer* says: "The litigation really began in 1880 in the Patent Office, by interference proceedings instituted by Edison of Menlo Park; Field, of Stockbridge, Mass., and Siemens, of Berlin, Germany. Green, of Kalamazoo, Mich., was the one who sought to have the invention patented, and after a long litigation the United States Supreme Court decided in his favor, and in 1893 the present suit was begun in the Circuit Court for this district. In speaking of the case, Attorney Dowell [counsel for the G. E. Co., who is assisted in the appeal case by F. P. Fish] stated that Green's first model appeared in 1856, and then in 1875 he built an electric street railway 200 feet long and placed thereon a car large enough to carry at least one person, and this was in fact the first electric street railway in existence used to carry passengers. The defendants have on hand among their exhibits a reproduction of the model of an engine claimed to have been in use in 1840. They also have two or three other models nearly as old as this one. The case will be bitterly fought in the Court of Appeals, and the outcome will be watched with interest."

REVISED PARTIAL LIST OF EXHIBITORS

At the Second Electrical and Kindred Industries Exhibition (held under the Auspices of the New York Electrical Society), Madison Square Garden, New York, May 2 to May 31, 1898:

Armstrong Interior Conduit Co., Pittsburg, Pa.
 American Rheostat Co., Milwaukee, Wis.
 American Pulley Co., Philadelphia.
 American Watchman's Time Detector, 231 Broadway, New York.
 American Engine Co., Bound Brook, N. J.
 Adams-Bagball Electric Co., Cleveland, Ohio.
 Arrington & Sims Co., Providence, R. I.
 American Electrical & Maintenance Co., 451 Greenwich st., New York.
 American Electrician Co., New York.
 American Electrical Works, Providence, R. I.
 American Electric Novelty & Manufacturing Co., 231 Broadway, New York.
 American Circular Loom Co., Boston, Mass.
 Bullock Electric Co., St. Paul Building, New York.
 Bosert Electric Construction Co., Utica, N. Y.
 Baylis Co., The, 99 Cedar st., New York.
 Borne, Sorymser Co., 80 South st., New York.
 Belknap Motor Co., Portland, Me.
 Brewster Engineering Co., 27 Thames st., New York.
 Barrows & Co., C. H., 302 West 53d st., New York. (Electric Vehicles.)
 Broomell, Schmidt & Co., York, Pa.
 Boston Electric Duct Co., Boston, Mass.
 Burhorn & Granger, 136 Liberty st., New York. (Woodbury Engine.)
 Babcock & Wilcox Co., 29 Cortlandt st., New York.
 Crocker-Wheeler Electric Co., 39 Cortlandt st., New York.
 C. & C. Electric Co., 143 Liberty st., New York.
 Corey, R. B., 26 Cortlandt st., New York.
 Cobo & Co., H. B., 220 Broadway, New York.
 Card Electric Co., Mansfield, Ohio.
 Camp Co., H. B., Aultman, Ohio.
 Cleveland Twist Drill Co., Cleveland, Ohio.
 Crouse-Tremaine Carbon Co., Fostoria, Ohio.
 Crown Woven Wire Brush Co., Salem, Mass.
 Cook's Sons, Adam, 313 West st., New York.
 Cutter Elec. & Manufacturing Co., Philadelphia.
 De La Vergne Refrigerating Machine Co., 138th st. & East River, New York. (Hornshy-Akroyd Oil Engine.)
 Diamond Electric Co., Peoria, Ill.
 Diesel Motor Co., 11 Broadway, New York.
 Edison, Thomas A., Orange, N. J.
 Edison Electric Illuminating Co. of N. Y., Duane and Elm streets, New York.
 Eddy Electric Manufacturing Co., Windsor, Conn.
 Electric Storage Battery Co., Philadelphia.
 Excelsior Electric Co., Brooklyn, N. Y.
 Edison Manufacturing Co., Orange, N. J.
 Edison, Jr., Thomas A., 96 Broadway, New York.
 Electrical Engineer, New York.
 Electrical Review, New York.
 Electrical Age Publishing Co., New York.
 Electricity Newspaper Co., New York.
 Electrical World, New York.
 Elliott & Hatch Book Typewriter Co., 253 Broadway, New York.
 Electrical Engineer Institute of Correspondence Instruction, 120 Liberty st., New York.
 Fischer Foundry & Machine Co., Pittsburg, Pa.
 Fort Wayne Elec. Corporation, Fort Wayne, Ind.
 Fuel Economizer Co., Matteawan, N. Y.
 Fostoria Incandescent Lamp Co., Fostoria, Ohio.
 Fiberite Co., Mechanicsville, N. Y.
 Fairchild & Sumner, 39 Cortlandt st., New York.
 Francis Bros., Philadelphia, Pa.
 Gold Car Heating Co., Cliff & Frankfort sts., New York.
 Garton-Daniels Electric Co., Keokuk, Ia.
 Garvin Machine Co., Spring and Varick sts., New York.
 General Incandescent Arc Light Co., 33d st. and 1st avenue, New York.
 Griffing Iron Co., A. A., Jersey City, N. J.
 Harrison Safety Boiler Works, Germantown Junction, Philadelphia, Pa.
 Highland Chemical Co., Connellsville, Pa.
 Haines Co., Wm. S., Philadelphia, Pa.
 Haring Steam Plant Equipment Co., 26 Cortlandt st., New York.
 Hope Electric Appliance Co., Providence, R. I.
 Ideal Electric Corporation, 13th and Hudson sts., New York.
 Imperial Porcelain Works, Trenton, N. J.
 India Rubber & Gutta Percha Insulating Company, Glenwood, N. Y.
 International Air Lamp Co., Mercer and Houston sts., New York.
 Jones & Son, J., 69 Cortlandt st., New York.
 Kenfel & Esser Co., 127 Fulton st., New York.
 Kelley & Sons, B. F., 81 Liberty st., New York.

Keystone Electrical Instrument Co., 9th st. and Montgomery ave., Philadelphia.
 Keiley & Mueller, 7 West 13th st., New York.
 Kosmin O I Filter Co., Easton, Pa.
 K. & W. Company, Pittsfield, Mass.
 Ka zenstein & Co., L., 357 West st., New York.
 Kensington Engine Works, Ltd., Philadelphia.
 Kirkland, H. B., 120 Liberty st., New York.
 Lewis Tool Co., 44 Barclay st., New York.
 Lynn Incandescent Lamp Co., Lynn, Mass.
 Morris, Elmer P., 15 Cortlandt st., New York.
 Machado & Roller, 203 Broadway, New York.
 Mowrey, P. M., & Co., 318 Broadway, New York.
 Monarch Manufacturing Co., Waterbury, Conn.
 Niles Tool Works Co., Hamilton, O., and New York.
 National Meter Co., 118 Chambers st., New York.
 Nowotny Electric Co., Cincinnati, Ohio.
 National Carbon Co., Cleveland, Ohio.
 Nash Gas Engine Co., 99 Cedar st., New York.
 New Britain Machine Co., New Britain, Conn.
 N. Y. Safety Steam Power Co., 30 Cortlandt st., New York.
 N. Y. Car Wheel Works, Buffalo, N. Y.
 N. Y. Telephone Co., 18 Cortlandt st., New York.
 Oswego Boiler Works, Oswego, N. Y.
 Otis Electric Co., 38 Park Row, New York.
 Onondaga Dynamo Co., Syracuse, N. Y.
 Paragon Arc Lamp Co., Boston, Mass.
 Peru Electric Manufacturing Co., Peru, Ind.
 Peckham Motor Truck & Wheel Co., 26 Cortlandt st., New York, and Kingston, N. Y.
 Partrick, Carter & Wilkins, Philadelphia.
 Paragon Electric Fan Motor Co., 39 Cortlandt st., New York.
 Porter & Remsen, 39 Cortlandt st., New York.
 Prindle Pump Co., 136 Liberty st., New York.
 Partridge Carbon Co., Sandusky, Ohio.
 Pope Manufacturing Co. (Motor Carriage Department), Hartford, Conn.
 Platt Manufacturing Co., O. S., Bridgeport, Conn.
 Roebling's Sons Co., John A., Trenton, N. J.
 Riker Electric Motor Co., 45 York st., Brooklyn, N. Y. (Electric Vehicles.)
 Safety Insulated Wire & Cable Co., 229 West 28th st., New York.
 Stephenson Co., Ltd., John, 47 East 27th st., New York.
 Silex Insulation Co., 39 Cortlandt st., New York.
 Sprague Electric Co., 20 Broad st., New York.
 Simonds Manufacturing Co., Pittsburg, Pa.
 Sinclair, D. J., Caledonia, N. Y.
 Street Railway Journal Co., New York.
 Street Railway Review, Chicago.
 Shaw, H. M., 126 Liberty st., New York.
 Samson Cordage Works, Boston, Mass.
 Translucent Fabric Co., Quincy, Mass.
 Thomas & Sons Co., R., East Liverpool, Ohio.
 United States Electrical Supply Co., 141 East 25th st., New York.
 Universal Electric Co., 126 Liberty st., New York.
 Vacuum Oil Co., Rochester, N. Y.
 Van Horne, Burger & Co., Dayton, Ohio.
 Worthington, Henry R., New York.
 Walker Co., Cleveland, Ohio.
 Weston Electrical Instrument Co., Newark, N. J.
 Warren Electric Mfg. Co., Sandusky, Ohio.
 Williams & Co., J. H., Brooklyn, N. Y.
 White, J. G., & Co., 29 Broadway, New York.
 Western Electrician, Chicago and New York.
 Worthington Water Tube Boiler, 30 Cortlandt st., New York.
 Williams, J. P., 39 Cortlandt st., New York.
 Warren-Medbery Co., Mechanicsville, N. Y.
 Wilday, J. H., 23 Duane st., New York.
 Warren Electric and Specialty Co., Warren, Ohio.
 Zmdars & Hunt, 127 Fifth avenue, New York.
 Ziegler & Co., Boston, Mass.

ELECTRICAL EXHIBITION NOTES.

AN INTERESTING EXHIBIT.

The Brooklyn Polytechnic Institute and Dr. Samuel Sheldon, its Professor of Physics and Electrical Engineering, have kindly loaned the Electrical Exhibition several interesting units and standards upon which precision in electrical measurements is based. Even the electric public, while it hears a great deal of such standards rarely sees them, and this exhibit therefore will be at once of technical and popular interest. The exhibit will include especially some standards from the German Imperial Physico-Technical Institute (Reichsanstalt), whose celebrated work has been done under the guidance of such men as Helmholtz and Kohlrausch, and it is probable that these standards have never before been exhibited in this country. Dr. Sheldon will show the Reichsanstalt form of the standard Clark cell, the Reichsanstalt pattern of photometer, with Hefner amyloacetate standard lamp and Lummer-Brodhnn contrast

screen, standard .01 ohm for carrying heavy currents, large standard compensation set for the precise comparison of voltages from .01 to 1,200 volts and currents of any magnitude, standard Wheatstone bridge, Thomson's double bridge for conductivity measurements, standard Carhart-Clark cell, etc. The exhibition of such apparatus and the explanation given as to its use will do much to bring electrical measurements within the comprehension of the public, and to demonstrate the wonderful refinement of accuracy that modern electricians aim at in their apparatus.

Costly Litigation.

The Cincinnati Enquirer of the 3d inst. contains the following item:

"Mr. J. C. Harper, appointed special master in the Main Street Electric Railway controversy to pass on the claims of attorneys for fees, yesterday afternoon filed his report in the Circuit Court. E. A. Ferguson asked for \$10,000, and is allowed \$6,000; Messrs. Humphrey & Davies asked for \$6,000 and are allowed \$5,000; St. John Boyle asked for \$6,000 and is allowed \$4,000; Outcalt & Granger asked for \$7,500 and are allowed \$3,500; Follett & Kelly asked for \$6,250 and were allowed \$3,500; the Louisville Trust Company asked for \$1,000 and is allowed \$2,500; W. A. Goodman, trustee, asked for \$2,000 and is allowed \$500; Thornton M. Hinkle asked for \$500 and is allowed \$350. The claim of M. H. Winkler for \$500 is disallowed because Manager H. P. Bradford, who employed him, had no authority for so doing. The above claims are for services rendered in the litigation and foreclosure of mortgaged property."

Electrical Engineering Schools United.

The Correspondence School of Technology and the Institute for Home Study of Engineering, both of Cleveland, O., have recently united under the name of the Institute for Home Study of Engineering. Mr. E. P. Roberts is Technical Director, Mr. F. D. Leslie Business Director, and Mr. J. N. Norton Secretary and Treasurer.

A descriptive catalogue has recently been issued by the Institute in which the consolidation and method of teaching are set forth. The announcement says:

"One frequently sees in technical papers advertisements of 'A College Education by mail.' So far as we know, this is the only institution giving correspondence courses in engineering that does not make some such extravagant statement. Neither this nor any other correspondence school is giving by mail courses equal to those of the average technical college. We believe, however, that we are giving the most thorough courses to be had by this method of study. The men having the courses in charge are consulting engineers of repute, who have proved themselves to be capable specialists."

Personal.

Mr. Chas. A. Boyd on the 12th inst. resigned his position of superintendent of the Walker Company of Cleveland, O., and will enter business for himself, doing general engineering, with offices in the American Trust Building, Cleveland. Mr. Boyd had been with the Walker Company four years, starting as engineer in the railway motor department, having charge of the design and construction. About one year later he was placed in charge of the entire engineering department, and was promoted to the position of assistant superintendent on January 1, 1897. The following March he was appointed superintendent of the Cleveland works, having in charge both the engineering department and shops.

The General Electric Company owed on January 1, 1898, \$1,329,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

INSULATION AND CONDUCTION.*

BY REGINALD A. FESSENDEN.

(Concluded from page 198.)

For insulating the coils of resistances it is doubtful if we have any good solid material. Paraffin cannot be used, as its expansion and contraction are so great that large pressures are put upon the wire and the resultant strains change the resistance. It might be easy enough to prevent the strain on the first solidification in a way similar to that devised by Rowland for cementing flat mirrors without buckling them, i. e., by mixing a little glycerine with the beeswax; the glycerine not dissolving in the beeswax makes it act like a viscous fluid, i. e., deform under the action of infinitesimal forces in time. The glycerine however finally works its way out like zinc in a resistance alloy (as first pointed out by Mr. Weston), and if a similar method were used with the coils, it would still be subjected to strains on change of temperature. Another objection which has been made in England is that paraffin absorbs moisture. It is possible that this is due to the dissimilar methods of producing American and English paraffin as I have never had to complain of this, except of course when cold paraffin was placed in saturated, moist air. The insulation resistance of paraffin seems however to be markedly increased by the treatment mentioned below. The great objection to paraffin is its tendency to collect dust. Shellac has been recommended, and since the coils are in the dark the material will oxidize but slowly, and if care be taken to use pure alcohol for a solvent, and not denaturalized spirit (which sometimes contains conducting impurities), has a very high resistance when dry. Some forms of Japan lac seem to remain flexible permanently, as for instance the sample *a* (composition unknown) which is ten years old.

Oil is sometimes used for resistance coils, and this is without doubt the best method, since the great point in the use of resistance coils is to know their temperature. The writer's experience with manganin and constantin as practical laboratory standards has been unfortunate, and he has hence decided to use only standards of pure lead run into glass tubes and kept in water. The reason is that, other things being equal, the most sensitive Wheatstone bridge is that which takes the greatest current without appreciable heating, and in the ordinary form of resistance coil a very small current will heat the interior up to such a temperature as to alter the value. Moreover, if the coil is of a material not affected by such changes of temperature, it (with our present alloys) will have a larger temperature coefficient, and as the temperature of the interior of the coil is not known this introduces another uncertainty. With the oil mounting this is all done away with, and pure oil has a very high resistance for low voltages.

For condensers and induction coils it is not only necessary to have materials of great ohmic resistance and of great dielectric strength, they must also be perfectly pure and free from admixture. For the first two properties there is nothing so good as paraffin when properly used, all compositions such as beeswax (oerotic acid), etc., being quite inferior in both respects. Paraffin, and what is practically the same thing, pure ozokerite, will stand according to the tests of Mr. Chesney, which I had the pleasure of witnessing, at the rate of 500,000 volts per inch. This I have confirmed up to 60,000 volts, alternating. Most substances, such for instance as glass, are at once out of consideration from the fact that they have too much electrical absorption and heat when subjected to a fluctuating voltage.

We must have an electrically homogeneous dielectric, i. e., one of the same specific inductive capacity all through. This is for two reasons. First, because if we have a dielectric *A* between two charged conduct-

ors, the introduction of a dielectric of greater specific inductive capacity, even if of infinite dielectric strength and ohmic resistance, will cause *A* to break down. To take a numerical case—suppose we have two plates, 1 cm. apart, and attached to the terminals of a 10,000 volt A. C. dynamo (Fig. 5). Suppose the dielectric, air, to support 50 per cent. more than this pressure. Introduce two plates of glass of $K = 8$, each $\frac{1}{2}$ cm. in thickness. Since the voltage divides itself up inversely to the capacitance, we will now have 8,889 volts between *c* and *D*. This being at a rate of 17,778 volts per cm. and as it only supports 15,000, we will get a spark between *c* and *D* at every reversal of the voltage which will quickly heat the glass and make it conduct. The full potential of 10,000 will then be between *c* and *D*, and a regular arc will form. Thus we see that the introduction of a good insulator will, in all cases where an intermittent or alternating voltage is used, have the paradoxical effect of weakening the insulation, unless the whole space is filled up with the material. This weakening is not generally apparent at once, as the spark takes some time to eat its way back, and this explains why many induction coils only last for a few years of operation.

Another cause is that treated of by Poisson, Clausius and Maxwell.* This is, that layers of dielectrics of different capacities and resistances show electrical absorption, and this theory has been proven experimentally by Muraoka, who showed that by taking two fluids, neither of which showed absorption, a layer of one on top of the other did do so. Maxwell treated the general case. It has, however, been treated in a more specialized way in *La Lumiere Elec.*, 1891. In this paper are brought out the following points:

1. A dielectric, as in Fig. 6, containing conducting particles of water, for instance, may be considered as an arrangement of condensers and resistances in series and shunt with each other. Two cases, shown in Figs. 7 and 8, are worked out, and Fig. 9 gives the curve of charge in the cases of Fig. 7; *E* is the voltage on the condenser part, and *E'* that on the condenser and resistance.

2. A condenser can show large residual charge, though its true ohmic resistance is infinite.

3. With dielectrics showing absorption there will be found some discharge time at which the amount of discharge will be constant at all temperatures.

4. Why in some tests insulation seems to be lower with higher voltages.

5. Why the presence of conducting particles increases apparent capacity.

6. That to get true ohmic resistance of most dielectrics, voltage must be kept on for a long time, even for days.

7. Why Siemens' method of taking the rate of loss of charge by electrometer does not give correct results.

8. That specific inductive capacity of such dielectrics can only be determined by rapidly alternating currents. This possibly explains an effect noticed by the writer many years ago, i. e., that an A. C. static wattmeter immersed in water did not give anything like the torque it should have if the true value of *K* for water were 80.

9. The importance of getting out the last traces of water in guttapercha and paper when used for cables.

As mentioned, this author considers a simple case of Maxwell's general theory and proved the above results by making actual measurements on condensers and resistances connected up so as to correspond to a simple case of a dielectric of high resistance with conducting particles in it. This paper should be read by all electricians, especially those concerned with cable work. I would like to speak of this subject more in detail, but for lack of time will only add that most of the conclusions in that paper have been confirmed by me, and that some which had been arrived at independently were seen to be in perfect agreement.

It is this absorption and the consequent losses which make glass useless as an insulator against high A. C. voltages. In some experiments made by Messrs. Stanley and Chesney which were shown me, the glass plates of the condenser when on an A. C. voltage (though thick enough to have stood ten times the D. C. voltage), after a few moments got hot, sparks could be seen passing inside the glass, and the plates finally broke down. Glass is not homogeneous, as it is made up of a number of substances, some much better conductors than others, and of different capacities and all stirred together but not dissolved. This is shown by the care which has to be used in getting glass homogeneous enough for optical purposes, it even having, as been told me by Mr. Brashear, to be kept perfectly horizontal when annealing, as the heavier parts tend so much to sink down to the bottom, even when the glass is only plastic, that the only way to do is to keep the levels of different density parallel to the surface of the dielectric so that their effect on the light will be as equal as possible for all rays. Otherwise one side of the lens would be of heavy glass and the other light, while at present it is so arranged that one face is dense and the other light. Mica is much less objectionable, especially if its cracks are filled up and it is well dried. Paraffin when properly treated makes very good condensers. The old method of piling together pieces of paraffin paper and tinfoil and then pressing them, left much air and moisture inside. This produced large electrical absorption and gave large capacity. Messrs. Hutin and Lablanc were the first to discover that good condensers could be made by heating such condensers till the moisture and air were expelled. Their results* showed that the specific inductive capacity of this more homogeneous dielectric could be reduced from 8 to 2.5. I have myself found it come down as low as 2. They then found that the same results could be obtained by heating the paper before making up the condenser. Since then, this method of forming condensers by heating them to expel moisture, air and acid has been used quite generally, with some modifications and improvements resulting in a shortening of the process.

It may be said as a general rule that the capacity of all substances showing absorption may be reduced by this treatment if the heating be kept up long enough. A great many oils, for instance, are given high capacity, but I have found that in many cases this can be greatly reduced by this method, and that the slight remaining excess of *K* over that called for by Maxwell's theory can be almost entirely removed by removing the free fatty acids, mucins, etc. Oils tested by me were olive, castor, linseed and cottonseed. All these have very high insulation resistance and low specific capacity when so treated and purified, but they soon lose this again when exposed to air. It is evident, therefore, that the anomalous results obtained by Hopkinson and others were due, in some cases at least, to impure material, and such results must be considered as forming a strong proof of the correctness of Maxwell's theory.†

But when the substances are not themselves solid, but viscous, they must have a mechanical backing. For this pure cellulose is generally used. Pure cellulose contains some loosely combined moisture. Consequently it can exist in two states. Dried below 100° C. it decreases its specific inductive capacity very much, and has very high resistance and is flexible. Kept above 100° C. for any length of time it loses some of its combined water, has a much higher ohmic resistance and its specific inductive capacity sinks to 1.9 or 2. It however becomes very brittle, and even though the temperature be only a few degrees above 100° C. it finally cannot be bent without breaking. (This brittleness must be carefully distinguished from the so-called rottenness which

* Paper read before the 123d meeting of the American Institute of Electrical Engineers, New York, March 23, 1898.

* *La Lumiere Elec.*, July 25, 1891.

† A rule connecting this effect with the sign of the Kerr electrostatic optical effect has been given by the writer, in *Elec. World*, Jan. 2, 1897.

cotton fabrics get when dipped in linseed oil and dried. The fact that cotton tears easily in such a condition is due to the same cause as makes a wire mosquito netting tear when painted, i. e., the fibers are stuck fast by the varnish and cannot help one another. This can be proven by removing the dried oil, when the fiber will be found to have nearly its original strength.) In this condition it is best suited for making condensers. The paraffin itself is greatly improved, as was pointed out by Hntin and Lablanc, by heating to about 140° C. Three hours' heating I have found satisfactory. The dried paper, immediately on removal from the oven, is plunged into the hot paraffin, so as to protect it from absorbing moisture. The condenser is then made up and boiled, so as to remove the air, for several hours. This boiling method was described in a recent patent as a novelty, but it was used by Mr. Chesney at Pittsfield in 1891.

A condenser so made, if perfectly pure cellulose is used (perfectly pure paper is used in practice), and with pure paraffin, will stand 250 volts per thousandth of an inch when the dielectric is less than .01 inch, and at a higher rate for greater thicknesses when the effect of small defects in one sheet of paper is not so serious.

Practically the same remarks apply to the making of induction coils. Here, however, we meet with the great difficulty that the paraffin in cooling is sure to shrink, and will leave hollows inside. The way to get over this is to construct the coil so that when cooling the shrinkage will take place outside, just as if one were making a casting of some metal having great contraction. The coefficient of adhesion also should be less between the walls of the mould and paraffin than between the wire and paraffin; also the outside should never be let harden first, as then, of course, a hollow space is left inside. Another precaution is to expel all gases by heating the paraffin for some time above the temperature at which the coils are to be boiled. The coils should be boiled above 100° C. for some hours to drive off the loosely combined water. This destroys the mechanical strength of the cellulose, but as the whole coil forms a solid mass this is of no great consequence.

Silk should never be used where high insulation is required, as pure cellulose dry and boiled in paraffin is so much superior to it that there is no comparison. With pure cellulose, coils with only 1,700 feet of wire per inch of spark stand perfectly, i. e., the spark may be five times longer than the coil. In ordinary use, coils having a spark length 3½ times that of the coil have been run for long periods with no break-downs.

As regards oil insulation for ordinary induction coils, the writer has not had sufficient practical experience. I believe, however, that very good results are obtained. With regard to the Thomson high-frequency coil,* there is no question of the efficacy of oil there, especially with regard to ease of repair. As is well known, however, the oil and coil should always be heated above 110° C. for some time if the best results are to be obtained. A very curious increase of insulating power for high frequencies in oil has been noted by Elihu Thomson, who has suggested that it might be due to inertia of the molecules of oil. To test this, one of the writer's students, Mr. Bennet, constructed a two-phase high-frequency electrostatic field. Though insulators placed in this rotated even when placed within a 1/16 inch glass flask, the effect was found to be due to air currents, and when these were eliminated no movement was obtained, so that the cause of this effect is still unknown, and it is doubtful if true dielectric hysteresis has ever been observed.

So far as Mr. Chattock's experiments and the experience of the writer go, there is not a great deal of difference between the dielectric strength of different substances. It is probably related to the tensile

strength. As mentioned previously, the writer* pointed out that there was strong evidence to show that the tensile strength of a substance was due to the mutual attraction of charges in the atoms and that the observed values agreed well with the calculated and followed the same law. Some time later Chattock† in a very interesting and able paper showed that, as the results of his experiments, the dielectric broke down when the slope of potential was great enough to pull apart atoms having charges of the same dimensions as the ionic charges. This was shown for gases, fluids and solids, and forms a very interesting—and, I believe, independent—corroboration of the writer's electrostatic theory of

FIG. 5

FIG. 6

cohesion. Consequently, the nearer the atoms are together and the greater their rigidity, the greater also their dielectric strength.

Chattock's experiments give for solids and fluids—

Substance.	Volts per cm. for breaking down.
Glass.....	919,000
Water.....	1,050,000
Oil.....	930,000

which agrees well with the theory.

From the above it will be seen that if the materials are pure, and ohmic resistance is of not much importance, a compound having its molecules held together tightly will have good dielectric strength for D. C. voltages.

This paper is already so long that I cannot touch in detail on the question of cables. There are also other papers in existence written by men better equipped for the task. I had intended saying something about what Siemens has called the "absurd craze for high insulation resistance," but the fact is now generally recognized, except by inexperienced engineers, that the best cables are those of medium ohmic resistance. I will only mention two methods which have occurred to me as feasible for certain purposes. One is based on the fact that the dielectric strength of air, as shown by the experiments of J. J. Thomson and Peacor, increases very rapidly with the pressure at 90 lbs. per square inch, being equal to that of a good quality of rubber. A similar plan, though not requiring any very large pressure, is due to Mr. Westinghouse, who thought of employing it four or five years ago in Philadelphia. The second occurred to the writer on reading Elihu Thomson's articles on the use of liquid air as an insulator. It is this: Since ice at only 12 below freezing has a specific resistance of over 1,000 megohms, i. e., as good as some brands of insulation, why not make the conductors hollow, lay them in a trench filled with water, pass cold brine through the pipes,

FIG. 7.

FIG. 8.

use the brine for cooling houses, making ice, etc., and let the frozen water act as the insulator. A rough calculation shows that this is commercially feasible, even neglecting all sources of profit from the furnishing of the brine (i. e., if it were used only for cooling the pipes). After making all allowance for friction of fluid, cost of power, etc., the balance comes at the right end if the line is always fully loaded.

The question is sometimes raised, whether we can ever hope to have a non-inflammable substance which shall be elastic like indiarubber. The probable cause of the elasticity of rubber is known,† and it

would seem as if there was no reason why such a substance should not be prepared. All we have to do is to coagulate one substance in the midst of another. In fact we have at present in tetrametaphosphate of sodium such a substance, elastic as rubber, transparent and tough, and when pure a good insulator. It would be an admirable material if it were not for the fact that the elasticity is due to water, and when this dries out it becomes brittle.

As regards an organic artificial rubber, I have very little doubt but that it will be made as soon as it is understood by chemists that its properties are due to structural and not chemical causes.

Armature Windings.—The present methods of using mica leave little to be desired. The writer might mention, however, one novel method he used in a case where very heavy currents were to be carried. Asbestos and silicate of soda, as is well known, form a good coating, but is however poor mechanically. The armature bars were wrapped with asbestos string and then coated with the silicate. This made when dry an extremely firm covering which could only be removed with a hammer. Though at first a bank of 100 lamps could be lit up through the insulation, after a little running it dried out to quite a high figure and the machine did good service, at one time running several hours, as I am informed on good authority, under such an overload that the brushes were red hot.

In cases where cloth is to be treated we have a very different question. There are two ways of using cloth, 1st, as a backing merely, by coating it on the surface with some substance which is supported by it, as plaster on lathing. Many substances work well in this situation, but the fact that little tubes of cellulose are very apt to stick up through the coating, as was pointed out to me by Mr. F. R. Upton many years ago, and that if moisture gets in at the edge it spreads all over, renders it not the best kind of insulation. Rubber is sometimes applied in this way to cotton tape, but though of very high resistance and insulation at first it rapidly deteriorates. In general it should be said, that where a permanent result is desired rubber should never be used unless kept in the dark and out of contact with air. If these precautions be neglected the life is very short. The other method is to saturate the whole cloth with some substance which will penetrate every crevice, but when this impregnating substance has solidified it must continue to fill these crevices and capillary tubes. For this reason no substance which is dissolved in anything else can be used. If for instance we try a varnish dissolved in alcohol it will be found that the strength of the solution in the capillary tubes is much smaller than outside, for the same reason that sea water filtered through sand becomes fresh.* Consequently, on drying, these capillary spaces are not filled up, and let water in. Therefore unless we adopt the first method and plaster the insulator on thickly and deep enough so that it does not matter whether the support insulates or not, we must use melted solids or drying oils. Unfortunately, but few solids which melt are elastic, since this elasticity is obtained by a structure which is destroyed by melting, and those solids which melt into thin liquids and remain flexible when solid do not preserve this property except within narrow limits of temperature, as can be easily tested by holding under a cold water tap and striking the specimen sharply. Soft paraffin can be used in some cases if the cellulose be well dried and thoroughly saturated. The asphalts cannot as a rule be used, as they never get sufficiently fluid on melting. There is, however, one notable exception: uintabite, or, as it is commercially called, gilsonite. This substance I found many years ago had the peculiar property that, when melted, like paraffin or oil, it will pass into the pores of cellulose or cloth. Having a very high melting point, nearly 300°, if I remember, and mixing perfectly with paraffin in all

* Popularly known as the Tesla coil, on account of his having brought it into prominence through his use of it in his lectures, though it was invented and first described by Elihu Thomson.

* J. J. Thomson, "App. on Dyn. to Phys. and Chem.," p. 199.

proportions, it gives mixtures which are admirably adapted for induction coil work as these compounds can be made to have high melting points and to penetrate a coil thoroughly. I also some years later, in 1891, used this material in combination with linseed oil for transformers, the process at first proposed being boiling in vacuum, but it was found that even without this saturation was complete. I understand that this method is still used, though modified in form, by the company for which I first devised it. Of the drying oils, with the exception of some foreign oils, as Chinese wood oil and an African oil whose name I cannot recollect or ascertain, linseed and the drying nut oils are the best. Linseed oil has the remarkable property of expanding on drying. This enables it to fill up all pores. Its durability is evinced by the good condition of old oil paintings. The varnishes crack and go, but the oil remains. Its insulation is not injured up to very high temperatures at which shellac, rubber, etc., would be worthless. This material was used a great deal by the Edison Company in its early days, but it often broke down. The trouble was traced to the lead drier, and after many experi-

FIG. 9.

ments Mr. Marshall, who had charge of this work, finally settled upon the use of pure raw oil. This gave excellent results, and was long used but took some time to dry, and the writer finally, after many tests, found that borate of manganese drier got rid of the trouble, while, as is well known, it gives a very quick drying varnish. This was used by the United States Company in Newark on their machines with the result that in 1890, after use for a year, the foreman reported only two armatures so treated as returned for repair (they were injured by lightning) and no fields. This material was also used by the Stanley Company for transformers. Another advantage of this borated oil is that it always retains a slight stickiness, and so gives a good joint when wrapping around wires, etc. Many substances so used are not sticky and let moisture in through the joints. Where a smooth surface is required, it is readily obtained by dusting on a little talc, a method first suggested, I believe, by Mr. Edison. It can also be given a coat of Japan on the outside. Varnish gums should never be used with linseed oil, as they are brittle, and the dried oil is only just flexible enough. Consequently when the oil has dried the resultant varnish is always very brittle. A temporary elasticity is given at first by the fact that when the solvent has dried off the oil is still fluid and undried, and as the varnish gum keeps the air from getting at it

rapidly, it sometimes remains flexible for a year. Such mixtures also crack when cold.

Sample *c* is a specimen of borated oil saturated cloth which is now between eight and nine years old. It will be noted it is still fresh and flexible, and a recent dielectric strength test showed up very high, 7,000 volts, if I recollect. The pure raw oil is boiled at about 200° with $\frac{1}{2}$ per cent. of borate of manganese for several hours till it begins to be thick.

Non-inflammable materials can be made, as I have pointed out elsewhere, by taking out the hydrogen atoms of hydrocarbons and substituting chlorine. Even paraffin can be thus treated if kept warm, and first turns to a fluid and then to a solid. At one time it seemed as if this process might be valuable, but the use of enclosed conduits has done away with the greatest source of danger from fire.

I will conclude by describing a couple of devices which I have found useful in preventing insulation from being spoiled. Soldering acid, as commonly used, is a solution of chloride of zinc. If this falls on cellulose it turns it to a paste. It never evaporates and always takes up moisture from the air, and will gradually eat its way through quite a thickness of insulation. Whether it is acid or neutral makes no difference so far as its action on the insulation is concerned, though the neutral solution does not corrode the wire. Rosin has the disadvantage that it is not a fluid and is clumsy to handle. I have found that by shaking up powdered rosin in a very strong ammonia an ammonia soap is produced which works well in most cases. The ammonia dissolves the copper oxide and evaporates afterwards, leaving the powdered rosin, which is an insulator.

Apparatus can be protected from overheating by putting in the apparatus a small glass tube filled with carnauba wax. This melts near the danger point, but remains quite hard up till then, so that by imbedding a spring and contact in the wax when the apparatus gets too warm the wax gives, and the spring expanding causes a short circuit which blows the fuse.

The largeness of the subject must be my excuse for the fragmentary nature of this paper. After I had begun it I found I had made a mistake—what I should have undertaken was to write a book. I trust, however, that some of the points I have developed may prove of interest.

THE REGULATION AND PROTECTION OF THE ELECTRIC MOTOR.*

BY HARRY H. CUTLER.

Electric transmission of power is fast becoming recognized as capable of almost universal application to all kinds of machinery. Scarcely a meeting of manufacturers, trade associations or engineering societies takes place where something of a favorable nature is not said about this rapidly growing and important industry. It can be truthfully stated, however, that the public is only just beginning to recognize the adaptability of the electric motor, and that an enormous demand awaits it in the near future.

The introduction of the electric motor into general use has not been as rapid as is generally supposed. Seventeen years ago the writer took for the subject of his graduation thesis "The Losses in the Transmission of Power by Means of Shafting and Belts." The results obtained were exceedingly interesting, and it might not be out of place here to mention some of them.

It was found that five-sixths of the power consumed by the engine was absorbed in the belts and shafting of the machine shop, and the very best result obtained with every machine in the shop running full, something which never occurs in practice, was an efficiency of about 30 per cent. The following deductions were then made from these results.

Attention is called to the saving which would ensue if power could be produced at each machine by means of a miniature steam engine or electrical machine, as illustrated by the low efficiency obtained in these experiments, the power to be transmitted by pipes in the form of superheated steam, or by wires conveying a current of electricity, instead of the present system of cumbersome and expensive shafts and pulleys.

It has been known, then, for at least 17 years, and undoubtedly a great deal longer, that transmitting power by means of belts and shafting was expensive and uneconomical, and a remedy was pointed out at that time which is just being recognized today as good practice, and yet it is safe to say that nine-tenths of our mills and factories are still wasting unnecessarily enormous amounts of money by clinging to this antiquated practice of belt transmission. This is what is meant by the assertion that an enormous demand is in store for the electric motor.

We now see motors not only fast displacing belts and shafting, but also operating many kinds of machine tools, traveling cranes, hoists and elevators, pumps, ventilating fans, printing presses, mining machinery, dredges, street cars, railways, vessels, air ships, implements of war, telescopes and scientific apparatus, and in fact almost every conceivable application of power.

Now there is one peculiar feature which comes up with each and every motor that is installed, namely, that a connecting link between the motor and what it is to drive must be provided which shall be adapted to the peculiar kind of work to be performed. This connecting link is the rheostat or controller, and the rapidly growing demand for these devices has given rise to what could almost be called the profession of rheostat engineering. By means of the rheostat or controller the motor is started and stopped, its direction of rotation is determined upon, and the speed at which it shall rotate is varied at will.

The same motor which drives a pump would drive a fan, a printing press, or a line of shafting as well, but the proper type of rheostat to use for these various applications of power would be vastly different in each case. Generally speaking there are but three kinds of direct-current motors, the series, shunt and compound wound, and the best suited of these three types of motors is selected to do the work. The types of rheostats for controlling these motors, however, are so numerous that only a few can be mentioned in this paper.

By far the largest number of stationary motors in use to-day are direct-current, plain shunt-wound, non-reversing and run at a constant speed. These motors are usually provided with motor-starting rheostats, whose resistance is in circuit only during the few seconds consumed in starting the motor. Simple as these rheostats are, great care should be taken in selecting the size and style best suited for the work.

A motor that is started and stopped but two or three times a day can be satisfactorily handled with a starting rheostat that would frequently be almost useless for starting and stopping a motor two or three times a minute. A rheostat arranged to start a motor under full load to the best advantage will not start a motor equally as well at 100 per cent. overload. A rheostat satisfactory to the Fire Underwriters of Chicago is not necessarily adaptable to the New York authorities, and would be looked upon as unnecessary extravagance by the country trade. It is important then even in the very simplest cases that the character of the work should influence the selection of the proper starter or rheostat, and when it comes to applying a motor to almost any other use than that of driving belts and shafting, this question becomes of still greater importance. Most stationary motors are operated at constant speed, but consumers of power are finding out that the speed of a motor can easily be regulated at will, and are calling for appliances which will accomplish this.

I can almost say that there is but one way by which the speed of a motor, of direct current, can be

* Paper read before the Chicago Electrical Association, April 1, 1898.

changed, and that is by changing the voltage across some of its parts or windings. There are a great many ways to accomplish this. The simplest, but unfortunately the most unsatisfactory, way of reducing the speed of the motor is to reduce the voltage across the armature by inserting external resistance in series with it. This method is uneconomical on account of the current absorbed by the rheostat, and also destroys the self-regulating property of the motor. The speed of a shunt-wound motor varies approximately with the voltage across the armature or brushes; with external resistance in series with the armature, the speed will vary to a much greater extent for the following reasons: When the load on the motor is increased the current (C) must increase. This increase of current can only occur by a decrease in speed which lowers the counter-electromotive force of the armature, thereby permitting more current to flow. But the current of course has also increased in the rheostat, while the resistance (R) of the rheostat has, unlike the armature resistance, remained the same, hence since

$$C = \frac{E}{R} \text{ we see that the electromotive force (E)}$$

across the rheostat must be increased in some way in order to allow more current to flow. This increase can be derived by slowing down the armature and reducing its counter-electromotive force. A very slight increase in the load when external resistance is in series with the armature will then often actually stop the motor entirely. Such cases as this have been so frequently causes of complaint from customers that it would appear that the effect of external resistance in series with the armature is not at all well understood by either users, owners or salesmen of electric motors in general. The prevailing opinion seems to be that a speed regulator of the above type can be set so that the motor will run at a certain speed independent of the load. In proof of this assertion many orders can be shown from some of the largest manufacturers of motors in the country, calling for a certain number of steps in the regulator to give a corresponding number of fixed speeds for the motor.

Another method of changing the voltage across the armature is to operate the motor on a three-wire system, connecting the armature across the outside wires for high speed and between the neutral and one of the outside wires for low speed. This method wastes no current and causes the motor to assume a definite speed independent of the load.

Still another method, which is ideal so far as the motor regulation is concerned, is to connect the armature across a variable number of storage batteries, thus obtaining any desirable speed over wide ranges. Another method consists in so winding the armature that the coils may be changed from parallel to series, which can be accomplished in several ways.

Altering the voltage across the field of a motor also affects its speed, but in exactly the opposite way from that caused by changing the voltage across the armature. To increase the speed of a motor we can decrease the strength of its field, and there are many ways of doing this. The simplest and one of the best is the insertion of external resistance into the shunt field circuit. This method is not only very simple and inexpensive, but, unlike the armature regulation through resistance, it wastes comparatively nothing in heat and allows the motor to assume the desired speed and maintain that speed independent of the load.

Motors are to be had of nearly all the large builders which will operate satisfactorily with a field variation of 50 per cent. in actual ampere turns. The same result is frequently obtained by using a compound wound motor, winding the series fields in separate sections and cutting out these sections one by one by means of a special switch. At least one manufacturer goes so far as to use so many of these field sections that their resistance is sufficient to

prevent more than the proper amount of current from flowing on closing the circuit without using any external resistance whatever. The series windings are then cut out one by one as the armature revolves. A very powerful starting torque and a wide range of speed is thus obtained. This method however will not regulate the speed independent of the load, as the field strength cannot be kept constant. It is applicable therefore chiefly to cases where an attendant is constantly on hand, as in the case of elevators, cranes and hoists.

One more method of varying the field strength consists in throwing the windings of the field cores into series connection for high speed and series multiple for slow speed.

Motors are sometimes regulated by means of using a separate generator for each motor and varying the voltage of the generator by means of its field rheostat. This method is known as the Leonard system and gives perfect regulation over a wide range.

We have now before us a long list of methods from which to choose the system of regulation best adapted for the work at hand. One of the simplest and best is that frequently used for regulating motors driving fans and blowers, by means of so-called compound speed regulators. No large office or school building is now considered up to date which is not provided with artificial ventilation that can be regulated at will.

The motors which drive the fans are so belted or geared to the fan that when the fan is operating at the average speed desired no external resistance of any kind is in circuit. To reduce the speed, the rheostat lever is moved to the left and resistance is cut into the armature circuit, and to increase the speed the lever is moved to the right and external resistance cut into the shunt field circuit.

To select the proper sized motor and to determine upon the proper speed to run the fan, requires an accurate knowledge of and experience with fans, air ducts and the laws of moving air. This is another subject which has not been reduced to a science by fan builders. Some builders always use a series wound motor for driving fans, and others have adopted the shunt wound motor. When it is not necessary to vary the speed of a fan, the series motor is probably preferable as being simpler, but for driving large fans where speed regulation is always desirable the use of a plain shunt wound motor and a compound wound regulator appears to be the best practice.

In proportioning the resistance for a fan regulating rheostat it must be borne in mind that the power required varies directly as the third power of the speed, and not directly as the speed as in driving shafting and machine tools. A regulating rheostat for a fan is therefore designed on entirely different lines—even the contacts and mechanism are different, because a fan is never started and stopped at frequent intervals during the day, and a cheap button front will do the work satisfactorily.

Diametrically opposed to the fan regulator is the electric elevator controller. This work calls for continually starting and stopping several times a minute all day long; heavy renewable contacts are absolutely necessary, as well as a special type of motor, and problems of entirely different character are to be met with. It is not practicable to build an elevator controller all ready to fasten to the wall with a string latched to it for the operator to pull. Such devices are on the market in abundance, but should be regarded as a source of great danger.

An elevator controller to be safe should be embodied into and form a distinct part of the elevator mechanism, and should be attached to the elevator mechanism by the elevator manufacturer, and not by the motor manufacturer or his selling agents.

There are a great many good methods of operating electrical elevators on the market. Among those methods in most common use is the system which uses a compound wound motor and compound regulation. The motor is started through external re-

sistance which can consist of a rheostat or the windings of the series coils themselves. This resistance is then cut out in several steps under control of some kind of a governor; the series field coils are then cut out, and finally the shunt field is weakened by the insertion of external resistance. The operation of electric elevators brings up the problem of—how to reverse an electric motor. To accomplish this it is only necessary to change the relative direction of the current in either field or armature circuits. The moment we do this however new troubles arise; means must be provided to prevent the possibility of reversing the direction of the current without either first stopping the motor or at least inserting external resistance into the armature circuit. Means must be provided to prevent excessive sparking or burning at the switches as well as undue strain on the insulation of the motor.

In order to reverse a motor the field and armature have to be controlled by independent circuits. Whenever a circuit is suddenly opened that contains coils of wire wrapped around a mass of iron, a secondary or induced current is formed, which has a potential many times higher than that of the primary current. This current not only burns the switches, but is sure to puncture the insulation of the motor, sooner or later, unless means are taken to prevent it. Many designs of elevator controllers and rheostats on the market try to overcome sparking by opening the circuit with a snap switch, but electricity cannot be fooled in any such a simple mechanical manner as this. The flash and consequent strain on the insulation of the motor is only increased the more, and all that is gained is that the switch does not burn up so quick. This is no dream but it is an actual fact that the market is flooded with rat-trap devices which claim to eliminate sparking by means of snap-switches. A snap-switch is well enough for use in a lighting circuit, but when used in connection with a reversible motor it is a constant menace to the safety of its insulation. Everyone knows, who has handled a motor, that if the double-pole knife switch is pulled, even when the motor is heavily loaded, a destructive spark is never obtained. The reason for this is that the armature and shunt fields are not separated, and consequently no induced current is formed in either and no strain whatever on the insulation occurs. The motor becomes a generator, energizing its own field and gradually slows down and loses its magnetism. A similar condition of affairs can be obtained on a reversible motor. Before opening either the field or armature circuits, both sides of the line should be opened simultaneously, which of course will cause no sparking, as just pointed out. External resistance should then be inserted into the armature circuit, and finally the armature connections should be reversed, leaving the shunt field circuit at all times closed upon the armature. No destructive sparking or strain upon the insulation of the motor will then occur—the supply of current is absolutely cut off from the motor, and the short circuiting of the armature through the resistance of the rheostat occurring while the field is at full strength acts as a dynamic brake and assists to stop the motor. This method of braking a motor is easily worked out so that the ordinary mechanical brake never sets until the motor has stopped or nearly so.

When an elevator is coming down with a heavy load the motor has no work to do and consequently has a tendency to run away, being driven by the weight of the elevator. If the motor is plain shunt wound and its field kept at constant strength, the load on the elevator will tend to drive the motor so much above its normal speed that it becomes a generator and returns current to the line. The speed of the motor will then increase until a potential is reached sufficiently above that of the line to consume the power derived from the effective weight of the elevator. The motor will continue to revolve at this speed, which in case of the plain shunt wound motor would not be a dangerous speed. But plain

shunt motors are now seldom used for elevators; almost all builders of elevators use compound wound motors, or at least shunt motors whose field is weakened after starting.

Motors which bring an elevator to full speed by weakening the field would run much faster when driven by a heavy load on the elevator, and it becomes necessary for the attendant to check the speed by moving the lever back and thus strengthening the field. Should the attendant move the lever so far back that external resistance is inserted into the armature circuit, the speed of the elevator would be increased instead of decreased as at first might be supposed, and a dangerous speed would result. This curious condition of affairs is due to the fact that with external resistance in the circuit with the armature when the motor is running as a generator it will have to run enough faster to produce sufficient potential at the brushes to overcome the external resistance and deliver to the line the increased potential necessary to check the speed of the motor.

The application of the electric motor to the printing press is another problem full of interesting points which time will not permit of taking up, and we will pass on to the second part of the subject.

THE PROTECTION OF A MOTOR.

Motors burn out when overloaded because they get hot. They frequently burn out also because currents of high potential are allowed to occur which puncture their insulation. Excessive currents scar the commutators and foreign materials produce circuits which lead to damage.

To properly protect a motor from damage by the electric current, these four effects must certainly be guarded against.

Motors can only become dangerously hot by abnormal currents being allowed to flow for an appreciable length of time. A current of double or treble that of the continuous safe carrying capacity of the motor will not do the slightest harm unless allowed to flow long enough to overheat the motor. When such abnormal currents last only a few seconds it is neither necessary nor desirable for the protecting device to operate, and a properly designed protector should not operate unless the temporary abnormal currents exceed this amount, or last long enough to overheat the motor. Since it is the heating effect of the current which causes an overloaded motor to burn out, the most natural protection would be a device that operates through the influence of this same heating effect of the current. The well-known fuse was, therefore, recommended for this work, and the electrical trade accepted it without question. As motors came into more general use it began slowly to dawn upon the electrical profession that they were being misled in their implicit faith in the fusible cut-outs offered by the trade. Too many motors supposed to be protected by fuses burn out, and experiments show that the ordinary commercial fuse will blow at almost any amount of current or not at all, just as it happens to feel at the time.

The manufacturers then attempted to more thoroughly standardize their fuses, and even made a faint attempt to standardize the cut-outs for holding them.

College professors took up the subject and made careful tests, and wrote able articles about standardizing fuses. The conclusion which came was, that the chief trouble lay in the fact that the fuses in common use were so short that the terminals and blocks to which they were fastened caused their blowing point to vary by conducting off heat which would otherwise have caused the fuse to blow. This, they said, could be entirely overcome by using fuses 6 or 8 inches long, and then we would have reliable fuses. Not enough significance appears to have been given to the cooling effect of the ever-varying drafts of air to which the ordinary commercial fuse is exposed, and, therefore, to expect any exposed fuse, no matter how long, to blow at a certain predetermined amount of current, appears to

the writer to be little short of an absurdity. People naturally became disgusted and looked around for something better with which to protect their motors. Into this breach the magnetic circuit breaker bobbed up serenely with its claim for perfection.

The magnetic circuit breaker recognizes nothing but amperes, and takes no account of whether the motor is hot or cold. Now amperes do not of themselves burn out our motors, it is the heating effect of these amperes, caused entirely by the length of time which they are allowed to flow. Volts, on the contrary, care nothing about time, so to speak; when the voltage gets high enough the current jumps, and the damage is done instantly, not through ordinary heat, but by the irresistible heat of the electric arc, which volatilizes the wires themselves. It should be noticed, however, that excessive abnormal currents cause instant damage to the commutator of a motor, if not to the armature itself, and should be cut down as quickly as possible. This latter office the ordinary commercial circuit breaker will generally perform satisfactorily. It becomes a nuisance, however, by opening the circuit and interrupting the service at every little temporary abnormal fluctuation of current, which current would not do the slightest harm, and calls for no protection. What is needed then for properly protecting a motor is—first, a device that will not allow extremely abnormal currents to flow into the motor at all; second, one that will allow slightly abnormal currents to flow through the motor, until the motor begins to approach a dangerous temperature, and third, the device should check an excessive flow of current so that no undue strain will be put upon the insulation of the motor. No such ideal protection exists to day to my knowledge.

The first requirement would be very difficult to meet, and the best that has been done so far is to stop the excessive flow of current through the motor as quickly as possible. The other two requirements are more easily complied with. To protect a motor from heat, it is evident that the heating effect of the current should be utilized in the protective device. This is accomplished in at least two devices now on the market, namely, the inclosed fuse and a peculiar make of circuit breaker designed by the writer. Both of these devices are shown by samples on the table. The inclosed fuse shown is of the D. & W. make, and the fiber case has been removed in order to show its construction more clearly. The distinguishing feature of this fuse is the inclosed air chamber around the fuse proper, consisting of a gelatine capsule, similar to those used by apothecaries for filling with quinine and other medicines.

The fuse proper is very short, and is contained entirely within the capsule; copper wire leads are connected to the fuse, and lead out to the terminal caps through closely packed sand or plaster of paris. The capsule provides a definite amount of air within which the explosion takes place, thus greatly increasing the accuracy of blowing at predetermined currents. The force of the explosion is taken up by the layers of sand on each end, and as there is no air and but little metal to feed the arc, it immediately goes out. These fuses are surprisingly accurate, and being absolutely sparkless would certainly appear to be an ideal protection both for the motor and as against fire. They are ahead of the times however, and the vast majority of those who operate motors still cling to the old bare fuse, working in the open air, for the protection of their motors.

Circuit breakers are being introduced very rapidly as a protection for motors, and I have one here which is constructed on a somewhat different principle from anything on the market.

The action of this circuit breaker depends upon the combined magnetic and heating effect of the current. Its mechanical construction is very similar to the usual type, the chief difference being that the magnet or solenoid used to release the trip or catch carries only a portion of the current passing through

the breaker. The rest of the current is shunted around the active coil of the circuit breaker, just as Edward Weston does in his well-known station ammeters. The shunt used in this circuit breaker, however, is composed of material whose resistance increases very rapidly as it becomes heated. The action of this circuit breaker is very simple. On starting up a motor under load, both motor and circuit breaker are cold, therefore the resistance of the shunt on the circuit breaker is at its lowest point, and it carries then the largest part of the current flowing through the breaker; as this current continues to flow the shunt heats up, its resistance increases, and more current passes through the magnet or active coil, which will finally act should the abnormal current last long enough to become dangerous. It is also evident that an extremely abnormal current, or a short circuit, would not wait for the heating effect of the current, but would cause the breaker to open instantly.

In practice these breakers are generally so proportioned as to allow a current of 50 per cent. greater to flow for a second than would finally open the circuit if allowed to flow for a minute or two. Any current over 60 per cent. greater than the continuous current which would finally open the circuit breaker will do so instantly.

A modification of the circuit breaker is the so-called overload attachment to motor starting boxes provided with the magnetic release. They are frequently spoken of as an under and over load motor starter. All the various makes of this type of motor starter use an electro-magnet for retaining a switch or rheostat lever in closed circuit position. This retaining magnet is wound so as to connect in series with the shunt field, in series with the armature across the lines, or in series with external resistance across the lines. The overload magnet is invariably connected in series with the armature, and carries usually the entire current supplied by the motor. When the current becomes excessive it attracts its armature and demagnetizes the retaining magnet by short circuiting, or opening the circuit of the windings of the retaining magnet. There are also several other ways of demagnetizing the retaining magnet.

A surprising degree of accuracy and reliability can be obtained in this way of protecting a motor from overloads. The system has, however, one chronic fault, which appears to have been entirely overlooked, and that is, that no device constructed on the above principle can possibly act quickly enough to protect a motor against extremely abnormal currents, short circuits or lightning, notwithstanding all circulars and advertisements to the contrary. It takes time to demagnetize a magnet, no matter whether it is short circuited or open circuited, and this time is fatal on short circuits, and the motor will not be protected. We must then choose some combination of the various methods just described of protecting a motor. We have here on the table such a combination, which would appear to afford adequate protection for the least money. This device utilizes inclosed non-arcing fuses, the magnetic release, overload magnet, and double-pole knife switch. The magnetic release affords ample protection from liability to damage from interrupted current. The overload magnet takes care of all ordinary overloads, and also performs the office of an ammeter which will indicate the approximate load on the motor at any time. The fuses are selected so as to blow on 100 per cent. overloads up to short circuits. The overload magnet can also be provided with the time limit device described above in connection with circuit breakers. This method of protecting a motor is laid before you for your consideration, and I desire to place myself on record as believing that with such a device on the market for protecting a stationary motor, there are very few places or conditions where the ordinary magnet circuit breaker will afford equal protection and satisfaction, or be provided at as small a first cost,

LEGAL NOTES.

Argument in the suit of the Sprague Electric Railway Motor Company of New York vs. the Steel Motor Company of Johnstown, Pa., was heard in the U. S. District Court at Pittsburgh, Pa., on the 6th inst. The suit is for an infringement of a motor for electric railways. Judge Bullinton reserved his decision.

The St. Paul Globe of the 1st inst., in its court report, says: "A decision was handed down yesterday by Judge Otis in the case of Joseph M. Hill vs. the Carpenter Electric Heating Manufacturing Company and the American Heating Company. Judgment is given for plaintiff against each of the defendants in the sum of \$1,344.59. The sheriff is instructed that failing to collect the judgment from the Carpenter company he is to levy on the property of the American company, which is held to be the holder of all the property of the Carpenter company."

The full bench of the Massachusetts Supreme Court on the 1st inst. overruled the defendant's exceptions in the case of William Thompson vs. the Lowell, Lawrence & Haverhill Street Railway Company. As a result the defendant must pay the plaintiff the verdict of \$5,045, which he recovered in the Superior Court. The suit was brought for damages for the loss of an eye consequent upon an exhibition of negligent marksmanship given by a "man born with-out hands" in a grove owned and maintained as a pleasure resort by the defendant. The plaintiff was a spectator, having been brought there on one of the defendant's cars, induced by an advertisement on its cars. While witnessing a stage performance the plaintiff's eye was injured by the fragment of a bullet fired by one of the performers at a playing card. The exhibition was given by a manager who was under contract with the defendant, and who furnished the handless marksman as well as the other entertainers. A butt was provided to receive the bullets, and all the appliances were furnished by the manager. The Supreme Court says it is apparent that the accident happened from a cause which might have been prevented and that ought to have been foreseen or guarded against by somebody; that the general arrangements for an exhibition of this nature should be such that fragments which might fly from the impact of the bullets could not reach the spectators; that due care was not taken in the arrangement of the stage with reference to possible accidents of this kind, and that the defendant company failed in its duty in this respect.

It is stated in a dispatch to the Chicago Inter-Ocean from Bloomington, Ill., that Judge Myers in the McLean County Circuit Court made a ruling on the 31st ult. in the Bloomington City Railway litigation sustaining the findings of the master in chancery. The gist of the decision is that the company's property must be sold in a lump and not by sections, as it was acquired by the present owners. The litigation involves a plant which is bonded for nearly \$500,000 and has been in operation for more than a year. If no plans mature by May 1 to raise money to fund the bonds, the road will go to foreclosure and sale and the proceeds be distributed according to the mastery in chancery's findings. Incidentally the ruling of Judge Myers provides for the payment of attorneys' fees aggregating nearly \$25,000. The Bloomington City Railway plant includes thirteen miles of track in Bloomington and Normal. Ex-United States Senator J. J. Patterson of Pennsylvania is at the head of the syndicate which controls the property.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Alexandria, Va.—It is understood that the Southern Railway Company contemplates adopting electricity to operate its line between Washington and Herndon.

Boulder, Col.—An electric street railway company is being organized by five of the heaviest capitalists in the city. The company will build about four miles of street railway, running from the depot to the Colorado Sanitarium in the northern part of the city, with a branch to the State University, and the new Texas Chautauqua grounds. The council will be asked to grant the franchise at its next meeting.

Chicago.—The South Side Elevated (Alley "L") people expect to have a considerable number of their trains operated by electricity by April 15.

Cleveland, O.—A company has been formed with a capital of \$1,200,000 to build an electric railway from

Cleveland through Geauga and the south part of Ashtabula County. The road will touch Punderson lake, which Cleveland capitalists have recently purchased, and thence run east to Andover, through Burton and Orwell. The entire route will be a private right of way for the purpose of permitting the company to transport freight over its lines as well as passengers. The route has been surveyed to Burton and the work of construction will probably begin soon.

Cumberland, Md.—West Virginia, Pennsylvania and Maryland capitalists are planning to build an electric railway from Cumberland to Petersburg, W. Va., a distance of sixty miles. The road would run through three counties and would open up a rich and prosperous section of West Virginia, and pierce a country the greater part of which is from fifteen to forty miles from a railroad. The freight traffic, now carried on along the route of the proposed road by wagons and stage, is enormous, and it is thought would be greatly increased should the railway be built.

Danilson, Conn.—The People's Tramway Company have transferred their charter to Sanderson & Porter of New York City and Robert L. Warner of Boston. Engineers will be put at work at once on the road between Danielson and Putnam, and if nothing serious happens the road will be in operation by the 1st of August.

Elizabeth, N. J.—The board of freeholders of Union County will hold a special meeting on Thursday of the present week to consider the question of selling to the highest bidder the franchise to build a trolley line on Westfield avenue from Elizabeth to Plainfield.

Frederick, Md.—The directors of the Myersville & Catoctin Valley Electric Railway have ordered their engineers to begin work at once. The proposed line is five and a half miles in length, and connects Myersville with the Frederick and Middletown electric line.

Freehold, N. J.—The Monmouth County board of freeholders has granted a franchise to the Monmouth Traction Company for the use of the county road from Freehold to Matawan for a single track trolley road. The franchise covers but a part of the traction company's intended system. It is the intention of the company to build a trolley road from Keyport through Matawan, Freehold, Allentown, Bortown and Burlington to either Beverly or Rivington, respectively fifteen and eight miles up the Delaware river from Philadelphia, and connect the terminals with New York and Philadelphia by lines of fast steamboats, thus making a cross State trolley road.

Kingston, Jam.—The construction work on the tramway here was begun on the 6th inst. A number of American and Canadian capitalists are interested in the road.

Lewiston, Me.—The stockholders of the Lewiston & Auburn Horse Railroad Company have closed a deal by which their road is transferred to the Brunswick Electric Railroad Company for the purpose of securing consolidation of the lines of both companies and forming a new company to be known as the Lewiston, Brunswick & Bath Electric Road. The new company will put two powerful generators upon the Cabot Company's wheels at Brunswick and distribute power from that station to all its lines.

Madisonville, O.—The completion of the electric railroad was celebrated on the night of the 2d inst. with fireworks, illuminations, bonfires and cannon salutes. The houses all along the line were decorated with flags and bunting, the village band played its liveliest airs and there was great rejoicing. The line is ten miles long.

New Haven, Conn.—The New Haven Railroad Company will equip with the trolley its Stamford and New Canaan branch, which is about eight miles long.

New Brunswick, N. J.—The New York & Philadelphia Traction Company and the Brunswick Traction Company, heretofore bitter rivals, joined hands at a banquet in this city lately in which about 200 officials of Burlington county and others took part. Secretary Radel, in announcing the union of the two companies, said that they were now controlled by Gottfried Krueger of Newark; Andrew Radel, of Bridgeport, Conn.; J. Blair MacAfee, of Bound Brook, and himself. They are now seeking for franchises in Burlington county, and it was to show the Burlington people what kind of a road they could give them that the officials were brought to this city. It is hoped to unite New Brunswick with Camden by trolley, and the route to be taken is by way of Franklin Park, Princeton, Trenton, Bordentown and Burlington.

Ottumwa, Ia.—The Ottumwa Electric Railway is advertised by W. C. Howell, Master in Chancery, to be sold at the court house in Ottumwa on the 28th inst.

Portsmouth, N. H.—Negotiations have been concluded for transferring the charter and stock of the Portsmouth Horse Railroad Company to the Portsmouth & Dover Railroad Company, a branch of the Boston & Maine Railroad. The Portsmouth & Dover will now proceed to build the projected electric line in Portsmouth, the other company retiring from the field. The officers of the new company are: President and managing director, Lucius Tuttle; treasurer, Herbert E. Fisher; clerk, Frank S. Streeter.

Shamokin, Pa.—The Shamokin Street Railway has been sold to Judge Savidge and Congressman Kulp, who will make many improvements and put it in operation at an early date.

Syracuse, N. Y.—William K. Niver has made application to the council for a franchise for an electric railway from the center of the city to the western city line,

Whitehall, N. Y.—A conference of those interested in the proposed electric railway to connect Whitehall and Granville was held here a few days ago, and it is understood that the construction of the road was determined upon. The company when organized will have a capital stock of \$300,000, and Hon. H. G. Burleigh of Whitehall will probably be the president.

LIGHTING PLANTS.

Boston, Mass.—The Committee on State House has requested Engineer Legg and Electrician Bailey to suggest a detailed method of electrically lighting the dome of the State House.

Concord, Mass.—At the annual town meeting on the 4th inst., it was voted to construct a municipal electric lighting plant to cost \$35,000.

Covington, Ga.—The Electric Supply & Construction Company of Savannah has signed a contract for an electric light plant for Covington. An exclusive franchise for 20 years is granted.

Des Moines, Ia.—Mayor MacVicar has received a letter from Eugene Holcomb, member of the McCaskey-Holcomb Company of Springfield, Ill., in which the writer says that Des Moines can rest assured that if the contract with this company is abided by and the work started, Des Moines will have the "best and most perfect plant for municipal lighting in existence," and that its erection will "mark a new epoch in superiority of design and economy of operation."

Elmira, N. Y.—The council has appropriated \$300 to defray the expense of making investigations and preparing plans and estimates for an electric lighting plant for the city.

Fortress Monroe, Va.—The big electric searchlight has been placed in position in the fort and is now ready for operation. It is one of the strongest in the country.

Henning, Minn.—At a mass meeting held here recently to consider the advisability of putting in an electric light plant, a committee of six was appointed to make investigations as to the expense, etc.

Huntsville, Ala.—C. F. Bost, contractor for the erection of the new electric plant here, has begun laying the foundation for the power house, which will be equipped with the most modern machinery.

Huron, O.—At the election held here on the 5th inst. the question of electric lights was carried almost unanimously, the vote being 301 for and 44 against.

Lyons, Mich.—The proposition to bond the village in \$3,000 to establish an electric light plant was carried at the recent election.

Macon, Ga.—It is rumored that another electric light plant will be erected here by a company whose organization is nearly completed.

Martinez, Cal.—At the request of C. P. Baird, a franchise for right of way and permission to erect poles and wires in Martinez for transmitting electric power for lighting and other purposes has been advertised for sale to the highest bidder. Bids will be received by the town clerk up to the 18th inst.

Miami, Fla.—There is a growing movement here in favor of putting in an electric lighting system.

Springville, Ia.—At the recent election the proposition for electric lights carried by a vote of 56 to 46.

Toledo, O.—Plans have been completed and some of the machinery purchased for lighting the local docks. Forty-four arc lights are to be distributed along the docks and throughout the yards of the Pennsylvania and Hocking Valley Railroads.

Valley Junction, Ia.—The new council is expected to carry out the wishes of the people as expressed by vote a year ago and secure electric lights for the town.

Ventura, Cal.—Lincoln Nissley has been selected by the town board to draw up plans and specifications for an electric light plant.

MANUFACTURING, ETC.

Bridgeton, N. J.—Inventors are experimenting at the Cohansy Glass Company's plant here in the manufacture of glass conduits for electric wires. The inventors claim that conduits made of glass are cheaper and better adapted for the purpose than metal or porcelain.

TRANSMISSION PLANTS.

Knoxville, Tenn.—An ordinance has passed the council granting the Knoxville Water & Electric Power Company franchises over the streets and alleys of this city. This is the company which proposes to generate electricity by damming the Holston river.

Los Angeles, Cal.—As a result of the investigations of J. W. Eddy in the Randsburg district among miners and business men, the Kern-Rand Company has been incorporated under the laws of Arizona, for the purpose of introducing electric power for milling, hoisting, lighting and domestic purposes at Randsburg and neighboring mining camps. The electricity will be generated by water power located on the south fork of the Kern river, where the water leaves the canyon and enters the valley, a distance of thirty-eight miles from Randsburg. At this point the Kern-Rand Company will have 80 cubic feet of water per second at its lowest stage, with a fall of 200 feet, insuring them an 1,800 horse-power. This can be increased to a consider-

ble extent if circumstances demand it. The incorporators of the Kern-Rand Company, all of whom are well known Los Angeles men, are as follows: General A. A. McDonnell, L. W. Godin, M. W. Stewart, William F. Rosbyshell, R. J. Waters and J. W. Eddy. The board of supervisors has granted a franchise to the Azusa Electric Lighting & Power Company to maintain and operate lines for the transmission of electricity over the public streets of Azusa and up to the mouth of the San Gabriel canyon.

New Brighton, Pa.—The Rochester Electric Light Company and the Beaver Valley Electric Light & Power Company have consolidated with the Beaver River Power Company, whose new plant will be completed as soon as possible. All the towns of Beaver Valley will be furnished with lights by transmission lines from the two plants of the company. It is expected that several manufacturing plants will be established at Fallston because of its proximity to the Beaver River Company's works, which will be able to furnish all the power required.

Tacoma, Wash.—Charles H. Baker, president of the Snoqualmie Falls Power Company, who will reside in Tacoma, is pushing the construction work of the company at the falls. Most of the machinery for sinking the shaft through the rock and for drifting the tunnel at the base of the falls is already on the ground, and as soon as it can be put in place work will go forward very rapidly. The shaft, which will be 15 feet square, will be sunk 250 feet through the rock to connect with a tunnel about half as large which will discharge the water from the falls after it has been used to create power. The power house will be excavated at the bottom of the tunnel and will be 50 feet wide and 200 feet long. It is the only power house in the world 250 feet below the surface of the ground, and will be cut out of the solid rock. The minimum capacity of the falls is 30,000 horse power, but only 8,000 horse power will be developed at this time. It is estimated that the demands of Tacoma and Seattle are now from five to seven thousand horse power and the company will develop only sufficient power to supply this demand.

COMPANY MATTERS.

Norfolk, Va.—The consolidation of the City Gas Company and the Electric Company of Virginia, the two companies which control the lighting business in Norfolk, was effected on the 1st inst. A new company has been organized, to be known as the Virginia Electric Company, with a maximum capital of \$500,000. An up-to-date equipment of electrical apparatus will be purchased and everything done to make the electric light service as fine as possible. The officers of the company are: President, Peter Wright of Newark; vice-president, W. W. Chamberlaine, Norfolk; secretary, J. W. Wilcox, Norfolk; treasurer, George Chamberlaine, Norfolk; directors: Peter Wright, W. W. Chamberlaine, W. W. Guillauden, W. W. Randolph and William H. White.

Shenandoah, Pa.—The Westinghouse Electric & Manufacturing Company filed a bill here on the 5th inst., praying that the Equitable Trust Company of Philadelphia, as trustee, be required to take possession of and operate the Lakeside Electric Railway and apply the net income to the payment of the unpaid interest on \$14,500 worth of bonds issued by the railway company and held by the plaintiff. The appointment of a receiver is also asked for. The Lakeside Electric Railway is operated between Shenandoah and Mahanoy City.

PERSONAL AND MISCELLANEA.

In case of war the X rays will be of the greatest service to surgeons in locating a bullet or splinter in a man's body, a fracture of a bone, or other serious injury. Many a limb and life may be saved by their use.

The electrician of the Capitol at Washington, Mr. Gleim, has received notification from an official source that his services will be required to take charge of the installation of an electrical system to be used in the submarine defenses of the Potomac River. A board is to be formed of electrical experts to act in conjunction with the military authorities, who will plant the mines, and the electricians will connect them with the shore batteries.

Capt. Eugene Griffin, First Vice-President of the General Electric Company, has undertaken to organize an auxiliary corps of electrical engineers to serve either in the army or navy in case of war. Dr. Louis Duncan of Baltimore has formulated plans for a similar organization to be known as the Volunteer Electrical Corps. Enough electricians have offered their services during the last few weeks to wire the whole island of Cuba so effectively that not a Spaniard could escape. All our electricians are brimful of patriotism. Even Frank W. Hawley, the canal electrician, whose insolvency was recently made public in court proceedings, has offered to the Government a regiment of 1,000 men skilled in handling electrical appliances, who will serve without pay, Mr. Hawley himself offering his services free.

Louis Enricht and Paul Hirsch, the promoters of the Canon City & Cripple Creek Electric Railroad, who were arrested and imprisoned at Denver, Col., on the 22d ult., on a charge of conspiracy to obtain money under false pretenses, were released a few days afterward under bonds for \$20,000 furnished by Dr. C. L. Perrin and A. R. Gumaer of Florence, Col. Dr. Perrin became interested in their case, says the Denver "Post," and employed two private detectives, who reported to him that Hirsch and Enricht were unjustly incarcerated.

H. A. Butters of Johannesburg and San Francisco, a member of the syndicate who purchased the Mexican

District Railway system, is in Mexico City arranging for the electrical equipment of the car lines in that city. The first line to be equipped is the one between Guadalupe and San Angel, twenty six miles in length. The system used will be the trolley. It is the present intention of the company to build a great central power station where the electricity will be generated and distributed to all the lines. Steam will be used in generating the electricity, but in the future it is found practicable to use water power in any way, the company will adopt that manner of generation. The company has already appropriated \$1,250,000 for the equipment of the first section of the road. It is expected that before all the lines in the city are equipped the total construction expenses will be somewhere in the neighborhood of \$6,000,000. A. E. Worswick is the resident engineer of the company and is getting the plans in shape. The company is composed of prominent capitalists in London. They own tramways in South Africa, Portugal and Switzerland.

The only way Mrs. Marilla L. Wood could make good a judgment secured against the Henderson Street Railway Company of Henderson, Ky., was to buy the road. This she did, rolling stock, sheds, motors, real estate, machinery, rails and every other appurtenance, for the sum of \$1,639.39. Mrs. Wood is a resident of Henderson. During the winter she was bruised and otherwise injured in a street car accident. She sued the street car company for damages and received judgment at the last term of court for \$1,500. The judgment was not paid and an executor's sale of the road was ordered by the court. The sale was made subject to all recorded mortgages and taxes, which amount to a little over \$60,000. It is not believed the court will affirm the sale for the reason that it will be impossible for Mrs. Wood to meet the demands of the bondholders or to secure funds to operate the road.

A special dispatch to the Pittsburg "Post" from Canal Dover, O., says: "Anna Mitchener, superintendent on the Tuscarawas electric line between Canal Dover and Uhrichsville, distinguished herself during the recent flood. The electric line was badly crippled, more than two miles of the thirteen being under water. While the flood was at its height, Miss Mitchener hired a livery horse, donned a waterproof habit and went without an escort to the scene of the washout, where she personally directed the work of the employees of the line in guarding the railroad property against damage. She then pushed through water half way up on the horse's side, rode to Uhrichsville, and, without dismounting, returned over the route the same day, making a total of 26 miles."

One of the guests registered at the Hollenden, Cleveland, O., a few days ago was I. Fuyioka of Tokio, Japan, president of the Tokio Electric Railway Company and formerly professor of electrical engineering at the Imperial University of Tokio. Prof. Fuyioka is accompanied by a fellow countryman surnamed Oda. The professor's visit to this country is primarily for pleasure, but in making a tour of the continent he will inspect the electric railway systems of the leading cities and visit the various schools of electrical engineering. Mr. Oda will remain in Cleveland two years, during which time he will be connected with one of the street railway companies, studying practical electrical work as applied to railways.

The Edgerton, Wis., "Reporter" tells this fish story: "One day the past week the Edgerton Electric Light Company were engaged in testing some of the machinery employed at the power station on the Rock river at Indian Ford. The wires leading from the dynamo were run out of the station into the tail race for the purpose of getting a strong resistance to the machine. The wires carried a hot current of 2,000 volts and of course charged the water immediately about with its heavy current of electricity. The river was high and full of fish endeavoring to work themselves up over the dam. Whenever a red-head sucker or pickerel got anywhere near the live wires it took a shock that sent it to the surface, when it would roll upon its back with mouth and gills wide open. Occasionally one more cautious would come close enough to the danger line to get a touch of the current, when it would take a shoot across the river, but the greater portion were easily caught in the trap. A good string of fish could have been taken there in a very few moments."

RECENT COMPANY ELECTIONS.

Citizens' Electric Light & Power Company, Upper Sandusky, O.—Secretary, Frank Tschanen; treasurer, Charles F. Plumb; directors: W. T. Tschanen, George Tschanen, Frank Tschanen, Ed Tschanen, Charles F. Plumb, P. H. Von Blom, M. H. Brinkerhoff.

Easton, Palmer & Bethlehem Electric Railway Company, Easton, Pa.—President, Charles A. Richardson; treasurer, W. L. Kindall; directors: Charles A. Richardson and W. L. Kindall, Worcester, Mass.; Charles E. Barnes and N. S. Myrick, Boston, Mass.; E. J. Fox, T. A. H. Hay and William O. Hay, Easton.

Knoxville Traction Company (reorganization), Knoxville, Tenn.—President, Frank S. Hambleton, Baltimore; vice-president and general manager, G. C. Howell, Knoxville; treasurer, W. S. Shields; secretary and auditor, C. H. Harvey; directors: Frank S. Hambleton, C. W. Boer and John W. Steele, Baltimore; G. C. Howell, W. S. Shields, R. M. Rhea and E. E. McMillan, Knoxville.

Little Falls & Herkimer Railway Company, Little Falls, N. Y.—President, John V. Quackenbush, Mohawk; vice-president, Col. Clinton Beckwith, Herkimer; secretary, N. J. Davis, Herkimer; directors: same as last year with these added: Thomas E. O'Shea, Nathan F. Briggs, New York City; James Conkling and John A. Giblin, Dion; W. F. Lansing, Little Falls. The Utica & Frankfort Electric Railway Company is practically one with the Little Falls & Herkimer.

People's Light & Power Company, Newark, N. J.—President, Philip N. Jackson; first vice-president, Gottfried Krueger; second vice-president, E. F. C. Young; treasurer, Dr. Leslie D. Ward; secretary, L. D. H. Gilmour; general manager, Dudley Farrand; assistant secretary and treasurer, Percy Ingalls; directors: B. M. Shanley, E. F. C. Young, Gottfried Krueger, Charles A. Sterling, William Fairlie, John F. Kehoe, Leslie D. Ward, F. W. Jackson, P. Sanford Rose, Joseph D. Biddle, Charles M. Decker, Abram C. Denman, William Scheerer, William M. Clarke, Samuel Klotz, Peter Hauk, Jr., Thomas T. Kieny, James E. Reynolds, Randal Morgan, James G. Haskins, William C. Shanley, William G. Humstead, Frederick S. Douglas, Uzal H. McCarter, A. Q. Garrison, Matthias Plum, Jr., William Runkle, John D. Harrison, Philip N. Jackson, Dudley Farrand.

Webster & Dudley Street Railway Company, Webster, Mass.—President, Edgar S. Hill; treasurer, John Flint; secretary, Charles Haggerty; directors: Edgar S. Hill, George R. Marble, E. N. Bigelow, Cyprien Danduraud, Oscar Shumway, Lyman B. Eddy, John Flint, Charles Haggerty, Eben S. Stevens.

Woonsocket Street Railway Company, Woonsocket, R. I.—President and general manager, Edgar K. Ray; secretary, Willard Keet; treasurer, Walter Whittlesey; superintendent, H. M. Young; directors: Edgar K. Ray, Willard Kent, Joseph G. Ray, Edward H. Rathbun, Thomas Martin, Charles H. Wilson, Henry L. Whittlesey.

COMMERCIAL PARAGRAPHS.

We would call our readers' attention to the advertisement which appears in this issue of the Gerlach House, located at 55 West 21st street, New York. It is Mr. Charles A. Gerlach's intention to make his well-known hostelry a headquarters for those visiting the Electrical Exhibition to be held in Madison Square Garden during May. With this end in view, every accommodation will be afforded visitors to the Exhibition in the way of a special dining room and reading room, the latter containing the latest and best electrical publications. As this excellent hotel is situated within less than five minutes' walk of the Exhibition it should be well patronized.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address: Sterling Remedy Co., Chicago or New York.

The American Electrical Directory, formerly known as the Standard Electrical Directory, has just made its appearance. It is published by E. L. Powers, Monadnock Block, Chicago, and contains as usual valuable information in the way of electric lighting central station statistics. According to this work there are 2,594 electric lighting central stations operating in the United States, of which 333 are operated by municipalities. The tables in this Directory giving the number of central lighting stations in the various States, with the number of arc and incandescent lights in use, are extremely valuable. The buyers' finding list is gotten up with great care and arranged in alphabetical order with regard to the products sold. As this Directory appears quarterly and the subscription price is but \$1 a year, it should be in the hands of all persons in any way interested in the electrical industry.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

We are in receipt of an attractive catalogue from the Partridge Carbon Company, Sandusky, O. This little pamphlet, containing over thirty pages of reading matter, is handsomely gotten up and should be in the hands of all persons using dynamos or motors and desirous of procuring a high grade of carbon brush.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, acts gently and positively on kidneys, liver and bowels, cleansing the entire system, dispels colic, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

Users of Miniature Incandescent Lamps will very readily appreciate the advantage of having a miniature lamp of a standard, reliable make that can be depended upon for efficiency and length of life. The Packard Sign Lamp, which is a miniature lamp about 2 inches long over all and 1 inch in diameter, fills the demand for a high grade miniature lamp. It is mounted with regular Edison candelabra base, gives about 2 c. p. and burns 4 in series on 50 to 60 volts or 8 in series on 100 to 120 volts. This lamp is car-

ried in stock in Chicago in large quantities by the Electric Appliance Company, who always hold themselves in readiness to ship promptly any number of these lamps and the necessary sockets. This lamp is very largely displacing other miniature lamps for sign work.

INCORPORATIONS.

The Salmon City Electric Light & Power Company, Salmon City, Idaho. Capital stock, \$10,000. Incorporators: G. G. Shaver, William F. Boxwell, William Peterson, W. T. Robinson, R. W. McBride and Ed. Mingle.

The Paterson Trolley Car Appliance Company, Paterson, N. J. Capital stock, \$25,000. Incorporators: Peter D. Milloy, Buffalo, N. Y., and Franz A. Von Mochzisker, Paterson.

The Joliet Railroad Company, Joliet, Ill.—to construct and maintain an electric street railway line in Joliet and other towns, with authority to sell power, light and heat for manufacturing and other purposes. Capital stock, \$600,000. Incorporators: Clinton C. Rush, W. H. Hearn, and A. P. Hirschman.

The Cleveland Electric Light Enlarging Company, Cleveland, O. Capital stock, \$10,000. Incorporators: Jacob J. Denmark, Harry C. Mason, Fred L. Taft, W. T. Black and A. M. Austin.

The Geneva Power & Light Company, Geneva, N. Y. Capital stock, \$50,000. Directors: P. N. Nicholas and F. C. Bloodgood, of Geneva, and S. D. Greene, J. C. Carr and M. A. Oudin, of Schenectady.

The Northern Electric Company, Auburn, Me. Capital stock, \$125,000. President, George O. Wing of Auburn; treasurer, Herbert I. Goas of Berlin, N. H.

The Campbell Electric Traction Company, Charleston, W. Va.—to manufacture and sell electrical and mechanical supplies for railway companies. Capital stock, \$100,000. Incorporators: A. C. Gunther, D. M. Black, Richard Fisher, E. A. Botkin and C. W. Smith, all of Charleston.

The Third-Rail Block System Company, East Orange, N. J.—to manufacture a patented third rail for trolley roads. Capital stock, \$100,000. Incorporators: Louis F. Walkins and J. Warren Wiley of Springfield, Mass.; C. D. Chase of Northampton, Mass., and Howard K. Wood of East Orange.

The M. B. Wheeler Electric Company, Grand Rapids, Mich.—to manufacture and deal in electrical appliances and supplies; also in acetylene gas generators and apparatus; also do a general electrical construction business. Capital stock, \$25,000, of which \$5,000 is paid in. Incorporators: A. Oren Wheeler of Manistee, Morton B. Wheeler of Grand Rapids, and Sigel D. Kopt.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 5, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

601,751. Mechanism for Lowering Car-Fenders. Robert Harris, Bridgeport, Conn., and Marcus K. Goldsmith, New York City. Filed Aug. 24, 1897.

601,961. Fender for Cars. Henry Haywood and George Totten, Toronto, Canada; said Haywood assignor to said Totten; said Totten assignor of one-fourth to Harry F. Lowe, same place. Filed July 13, 1897.

601,965. Car-Fender. John Keller, Philadelphia, Pa. Filed June 25, 1896.

ELECTRIC LIGHTS AND APPLIANCES.

601,860. Clip for Drop-Light Wires. Charles Schuetz, Newark, N. J. Filed Dec. 1, 1896.

601,930. Adjustable Hanger for Incandescent Lights. Fred O. Bell, Cour d'Alene, Idaho, assignor, by direct and mesne assignments, to N. S. Paul, same place. Filed March 26, 1895.

ELECTRICAL MACHINERY AND APPARATUS.

601,717. Solenoid Blow-Out for Dispersing Arca Formed in Breaking Electric Circuits. Sidney H. Short, Cleveland, O. Filed Nov. 1, 1897.

601,871. Electromagnetic Circuit-Breaker. Gano S. Dunn, East Orange, N. J., assignor to the Crocker-Wheeler Electric Company of New Jersey. Filed June 12, 1897.

601,979. Electric Welding Machine. Christen Nielson, Brooklyn, N. Y. Filed June 15, 1897.

601,992. Electric Brake Mechanism. Alexis Vanderbeck, Scammon, Kan. Filed Sept. 13, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

601,768. Printing-Telegraph System. John Barry, Fort Lee, N. J. Filed Sept. 10, 1897.

601,786. Lock for Telephones. Ralph H. Allen, Fitchburg, Mass. Filed Sept. 8, 1897.

601,865. Telephone. Thomas F. Abern, Detroit, Mich. Filed April 26, 1897.

MISCELLANEOUS.

601,694. Machine for Restoring Insulated Wire. Nelson Wilson, Portland, Ore., assignor of one third to Charles Bolen, same place. Filed Aug. 20, 1897.

601,730. Heat-Detector for Electric Fire-Alarm Systems. John D. Gould, Brooklyn, N. Y. Filed Jan. 30, 1896.

601,758. Electric Lantern. Oscar O. Prasse, West New Brighton, N. Y. Filed June 23, 1897.

DESIGNS.

23,452, 28,453. Bulb for Electric Lamps. Edward Miller, Akron, O., assignor of two-thirds to Orlando W. Groff and Anton Rapp, same place. Filed Jan. 29, 1898.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

TELEPHONE AND TELEGRAPH.

That Patent Case in San Francisco.

Commenting upon the decision of Judge de Haven at San Francisco, granting the injunction asked for by the Western Electric Company against the use of the Perrin multiple switchboard by the Capital Telephone & Telegraph Company, M. J. Dillman, manager of the latter company, said to a Sacramento Bee reporter:

"The case referred to is one of two suits that were instituted against the Capital Telephone Company by the Sunset-Western Electric-Bell combination in October, 1895, or about the time we commenced doing a telephone business in Sacramento. The first was upon the use of the Watson automatic telephone switch upon our instruments and was decided in our favor.

"This one is upon the use of the Perrin multiple switchboard, and I will say that the decision as rendered does not concern us in the least, as we never have since the commencement of business operated our system under anything but the trunk system, which system is open to the free use of the public.

"While our original board was constructed for either multiple or trunking work, all recent additions have been purely trunking boards, hence our system must be operated under that system and could not be operated under the multiple. Therefore, the suit simply restrains us from using something we do not wish to use and would not use if we could. As for an accounting, that was waived in open court by the Bell attorneys, there being no showing whatever for damages."

The San Francisco call in its report of the decision said: "The switchboard used by the defendant [the Capital Telephone Company] was invented by Thomas J. Perrin and was patented in April, 1885. The court found that Leroy B. Firman had reduced his invention of a multiple switchboard to practice early in 1879 and several months earlier than the other patent."

The N. Y. Commercial states that "D. A. Reynolds, representing the Citizens' Telephone Company, is authority for the statement that in the course of a few weeks a new company would be incorporated in this State (New York) and would probably be known as 'The People's Telephone Company.' The Citizens' is an independent company operating in New York and New Jersey, and using the 'Martin-Cole duplex system.' The new company proposes to charge \$100 per year for unlimited service for New York, \$75 for Brooklyn and \$50 for a limited service of 500 calls. The present flat rate for telephone service in New York City is \$240 per year, with rates for limited service correspondingly high. The patent duplex system, which the company intends to use here, is now figuring in a suit for \$400,000 damages which was begun recently by Charles Martin, who claims to be the inventor, against the Detroit Telephone Company for 'slander of title.' The Citizens' Company, owning the rights to the duplex system through a contract with Messrs. Cole and Martin, will charter the new company which is to operate here."

Attorneys Watson and McCleave, of Pittsburg, Pa., have given notice that an application will be made to the Governor of Pennsylvania on Thursday, April 21, by John Phelps, Martin Meyerdirck, John McCleave, L. H. Mathews and John M. Freeman, under the act approved April 29, 1874, for the charter of an intended corporation, to be called the "Pittsburg and Allegheny Telephone Company," the character and object of which is the constructing, maintaining and leasing lines of telegraph for the private use of individuals, firms, corporations, municipal and otherwise, for general business, and for police, fire alarms or messenger business, or for the transaction of any business in which electricity over or through wires may be applied to any useful purpose. The new company has been organized, it is said, to take up the work of the defunct Home Company and install a complete system of telephones in Pittsburg and Allegheny.

The Pennsylvania Electric Company of Marietta, Pa., has received a large order for telephones from the War Department, to be used for forts, coast defenses and signal stations along the Atlantic coast. The company received instructions to rush the order. This is quite a compliment to the Crescent Telephone apparatus, as no doubt many other makes were considered before the order was placed. The Crescent telephone embodies the latest improvements.

The Southern Bell Telephone Company at Atlanta, Ga., has reduced its price for residence 'phones to \$2 per month, which is the rate set by the new Standard Telephone Company. The officials of the latter company say they rely upon the people to patronize the new company, without whose competition the rates would never have been lowered.

The directors of the West Penn Telephone Company of Washington, Pa., which proposes to cover the entire western and northwestern portion of Washington county, Pa., with a telephone system, are C. O. Cracraft, of Clays-

ville; J. G. Hanna, of Independence; D. K. Irwin, of Claysville; O. M. Henderson, of Washington; D. M. Pry, of Burgettstown and W. E. Thompson, of Claysville, O.

The Telephone bill, which aims at a reduction in rates, was ordered to a third reading in the Massachusetts House on the 1st inst. by a vote of 95 to 61, four members declining to vote as being stockholders in the Bell Telephone Company. The House will probably pass the bill, but its passage in the Senate is extremely doubtful.

A press dispatch from Menominee, Mich., dated April 4, states that "the largest deal in telephone poles ever made in this section has just been closed between Titus & May for the American Telephone Company of New York and A. V. Freeman of Menominee, agent for Raber & Watson of Chicago. It involves a money consideration of between \$75,000 and \$80,000."

The American Telephone & Telegraph Company (Long Distance) has filed with the Massachusetts Commissioner of Corporations the following statement to date of February 28, 1898: Assets—Real estate, \$83,637; cash, debts receivable, \$1,180,710; equipments, etc., \$13,865,665; miscellaneous, \$8,554,966; total, \$23,684,998. Liabilities—Capital stock, \$20,000,000; debts, \$2,223,208; reserves, \$522,063; profit and loss, \$939,742; total, \$23,684,998.

Three telephone companies have made application to the city council of Lancaster, Pa., for franchises to operate in that city. They are the Columbia Telephone Company, the Independent Telephone Company and the Lancaster County Telephone Company. The Columbia Telephone Company has already secured franchises in Elizabethtown, Mt. Joy, Ephrata and Lititz.

The city council of Albion, Mich., has granted a 30-year franchise to the Calhoun County Telephone Company. The company is required to put in free four 'phones for the use of the city; also 'phones, not to exceed ten in number, for school uses at an annual rental of \$12 each.

A prominent business man of Elizabeth, N. J., is quoted as saying that an agreement had been virtually entered into by the big express companies whereby they are to assist the American Bell Telephone Company in its efforts to force local telephone companies out of business.

A telephone franchise in Indianapolis is to be sold to the highest bidder, bids to be opened on the 18th inst. Companies bidding must have \$300,000 of actual stock, and each bidder must deposit \$10,000 in cash with his bid.

The Perry Telephone Company has been granted a 20-year franchise in Guthrie Center, Ia., with many restrictions and conditions in favor of the town. A Bell company is asking for a similar franchise.

An ordinance granting to the Home Telephone Company the right to construct, maintain and operate underground wires in New Albany, Ind., has reached the third reading in the New Albany council.

The Minnesota Central Telephone Company has certified to an increase of capital stock from \$500,000 to \$1,000,000.

The Graceville Telephone Company of Graceville, Minn., has been incorporated with a capital stock of \$200.

New Companies Incorporated.

The Blue Ridge Telephone Company, Stranger, Falls County, Tex.—to establish and maintain a telephone line between Stranger and Marlin. Capital stock, \$1,001. Incorporators: W. S. Hunnicutt, J. C. Shaw and E. J. Garrett.

The Carroll County Telephone Company, Huntingdon, Tenn.—to construct and maintain a telephone line from Huntingdon to Buena Vista. Incorporators: L. P. Clark, A. M. Lee, G. B. Dalton, J. O. R. McCall and J. McN. Wright.

The Pawnee City Telephone Company, Pawnee, Neb.—to put in a telephone system at Pawnee. Capital stock, \$5,000. Incorporators: G. E. Becker, J. M. Rogers, H. H. Bull, J. W. Bullard, E. H. Hollister, S. N. Hoff, A. S. Anderson and W. M. Brown.

The Harrisonville Telephone Company of Waterloo, Ill., has certified to an increase of capital stock from \$8,000 to \$20,000.

The Independent Telephone Company, Lititz, Pa.—to establish telephone lines in Lancaster, Berks and Lebanon counties, Pa. Capital stock, \$25,000. Directors: Israel G. Erb, H. B. Landis, A. M. Amer, P. B. Bucher and A. B. Long, Lititz; E. B. Brubaker, Lexington; S. B. Karl, Millway; E. L. Garber, Stevens; S. W. Buch, Kissel Hill; M. L. Weidman, Ephrata; Jacob Mace, Reamtown; Philip F. Ruhl, Brickerville, and A. E. Lane, Brunnerville.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Abbreviations: cert. indb., certificate of indebtedness; coll., collateral; cons., consolidated; const., construction; conv., convertible; com., common; deb., debentures; exten., extension; gen., general; g. gold; guar., guaranteed; inc., income; imp., improvement; pd., paid; pfd., preferred; mtg., mortgage; tr., trust; A., annually; S., semi-annually; Q., quarterly; A. & O., Apl. and Oct.; F. & A., Feb. and Aug.; M. & S., May and Sept.; J. & D., July and Dec.; J. & J., Jan. and June.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 11.95@12.10c.; casting, 11½c.

The North Chicago Street Railroad Company has declared its regular quarterly dividend of 3 per cent., payable April 15. Books reopen April 16.

The Brooklyn Rapid Transit Company's earnings on its lines for the month of March were \$468,387; in March, 1897, they were \$407,780.

The Nassau Electric Railroad Company, Brooklyn, N. Y., reports for March gross earnings of \$156,420, an increase over March, 1897, of \$34,143.

The United Electric Securities Company, Boston, has declared a semi-annual dividend of \$3.50 on preferred stock, payable May 2 to stockholders of record April 20. The last dividend declared was in February, 1896.

The plan of the New Orleans Traction pooling committee is said to contemplate reorganization, with an entirely new company. The Louisville "Times" says the May installment of interest will probably be defaulted; an assignment will be made on the stock.

The Boston Gas and Electric Light Commission have prepared a bill to revoke the charter of the Boston Gas Light Company unless the contract with the Brooklyn Company is annulled before December 1.

The Onondaga Lake Railroad Company has, it is stated, made a mortgage of \$400,000 to the United States Mortgage & Trust Company as trustee to cover cost of construction of its road from Onondaga Lake to Syracuse, N. Y.

The Dayton & Western Traction Company, Dayton, O., which has a franchise and right of way to build an electric street railroad from Dayton to Eaton, has mortgaged its road and equipment to the Central Trust Company of New York for \$400,000. This money is to be used to complete and equip the road from Dayton to Eaton, a distance of 25 miles.

An ordinance has been introduced in the Philadelphia council allowing the Drawbaugh Telephone Company to lay conduits, erect poles and to conduct a general telephone business in that city. The company has been making constant efforts since 1894 to get a satisfactory franchise in Philadelphia.

The Van Choate Electric Company has made the following return to the Commissioner of Corporations at Boston: Real estate, \$358,625; machinery, \$68,423; cash and debts receivable, \$54,381; merchandise, etc., \$10,000; patent rights, \$5,990,000; total assets, \$6,486,431. Liabilities—Capital stock, \$6,000,000; debts, \$9,083; balance, profit and loss, \$477,348.

The returns of the Erie Telephone & Telegraph Company have been filed at the State House, Boston. They show the fixed capital of the corporation to be \$5,000,000 and the paid up capital to be \$4,800,000. The assets consist of real estate, \$8,57,268; cash and debts receivable are set down as \$250,895. Total, \$8,758,161. The liabilities are: Capital stock, \$800,000; debts, bonds and notes, \$3,630,500; reserves, \$94,369, and profit and loss balance of \$233,292.

Corporation Counsel Whelan announces that he is going to bring suit at once to set aside the contract made by the former trustees of the Brooklyn Bridge and the trolley companies of Brooklyn, N. Y., for the running of cars across the Bridge. Under that contract the street railroad companies pay to the city 5 cents for each car, but the Bridge receipts for tolls have fallen off about \$1,500 a day. Counsel Whelan thinks the cars ought to pay 25 cents a trip instead of 5 cents.

Several stockholders of the Kings County Traction Company, Brooklyn, N. Y., have applied to Attorney General Hancock for permission to commence an action in the Supreme Court for the appointment of a receiver for that company. The company is about to be dissolved, and the applicants allege that the officials are so under the influence of the persons having control of the Nassau Railway that a receivership is necessary for a fair and equitable dissolution.

April 15 is the day set for the beginning of operation by electricity on the South Side Elevated Road, Chicago. President Carter of the company has notified all of the contractors who have been putting in the new machinery and electrical equipment that the management expects them to have everything in shape for the turning on of the full current on that day. The work of changing the motive power is practically completed. All that remains to be done is to put on a few finishing touches here and there and to make the necessary tests of the machinery to see that everything is in good working order.

A concern which is to bring together the scattered remnants of the acetylene gas enterprise, to wit, the Union Carbide Company, has been incorporated in Virginia with \$6,000,000 capital stock. The failure thus far to make acetylene gas commercially profitable is attributable to its explosive tendency and difficulty of controlling it. Thus far it is said the sale of calcium carbide has been to hundreds of individuals who are experimenting with the view of producing a generator free of danger of explosion and which will keep the odor of the gas from becoming obnoxious.

The Thomson Houston Electric Company's annual statement to the Massachusetts Secretary of State, shows:

Assets:	1897.	1896.	Changes.
Buildings.....	\$371,396	\$343,000	Inc..... \$28,396
Machinery.....	449,713	424,000	Inc..... 25,713
Cash and debts receivable.....	14,557,782	14,933,648	Dec..... 375,866
Manufactured merchandise, etc.	824,376	1,175,656	Dec..... 351,280
Patent rights.....	8,895,050	8,395,050
Total.....	\$19,802,267	\$20,4,9,349	Dec..... \$607,082
Liabilities:			
Capital stock.....	\$10,000,000	\$10,000,000

Total.....	\$19,802,267	\$20,409,349	Dec..... \$607,082

A dispatch to the Philadelphia "Press" from Lancaster, Pa., April 10, says: "Efforts are again being made to reorganize the Pennsylvania Traction system, which has been in the hands of a receiver for nearly two years. William B. Given, representing outside capital, is said to have secured \$550,000 of the \$600,000 bonds issued on the Lancaster City lines, and has also purchased over two-thirds of the bonds secured on the Columbia and Ironville & Donegal roads. Negotiations are now in progress for the Lancaster & Columbia line. It is stated that the Provident Life & Trust Company of Philadelphia is back of the deal, and that several of the best known financiers and business men of Lancaster will co-operate in the new organization."

The Philadelphia "Stockholder" says: "Contrary to general expectation, little interest is thus far manifested in the securities of the new Pennsylvania Manufacturing, Light & Power Company. Both the stock and the bonds were anticipatively regarded as active features of local speculation, and their comparative inactivity is the subject of some comment. Talk of an investigation by the city councils into circumstances connected with the Penn Heat ordinance may have inspired some people with uncertainty regarding the stock, but those well informed on the subject are convinced that no danger is to be feared from this source. The fact appears to be that the status of the new company is imperfectly understood. Constituted as it is of numerous consolidations and absorptions, its relations and obligations to underlying concerns are somewhat puzzling. Good opinion is that the prevailing quiescence, especially in the stock of the new company, will not be of long duration."

ELECTRICITY.

EDITORIAL NOTES.

Steel Foundations of Buildings and Electrolysis.

In view of the fact that electricity is rapidly being adopted as a motive power on the street railways in New York City, and to the fact that extremely high office buildings are constantly being erected, the result of an unofficial investigation which was recently made in Chicago to determine whether stray electric currents were doing any damage to the steel foundations of high structures in that city should prove of interest. General Sooy Smith, who made the examination, makes the following statement, according to the Chicago Tribune:

"Yes, I have investigated certain steel foundations for indications of the action of electrolysis, and found unmistakable evidence that it has begun.

"The work had not progressed so far as to place the building in immediate peril. But the fact that it had visibly started was sufficient to convince me that the electrolysis question is alarming to the last degree. I consider it the engineering problem of the age. An effective insulator for light and power wires must be found, and a means of preventing the escape of electricity into the ground from electric car tracks."

The discovery that electrolytic action is actually taking place in the metal foundations of high office buildings in Chicago is an extremely valuable one, and should serve as a warning to other cities at a time when iron is so extensively used for structural purposes of the above nature. It would seem to have been the general opinion that the metal in most of our high buildings was amply protected against the attack of any stray currents by the surrounding medium, but according to General Sooy Smith such is not the case, as he refers to this important point as follows:

"Insulation is claimed to be an existing protection for steel foundations, the so-called insulator being the cement in which the steel work is imbedded. This is another empty claim, for cement, while not a good electric conductor, is not an insulator by any means. One of its essential elements is unslaked lime, which is not only a conductor but, much more important, one of the greatest known absorbents of moisture. The subsoil under Chicago, it is unnecessary to state, is never dry. The unslaked lime, acting according to its distinguishing principle, must inevitably draw in dampness from the surrounding earth, and thus keep saturated the pores of the composition of which it forms a part. Electricity will find its way through any moisture-containing material. Even though the sand and other elements of cement were non-conductors,

therefore—which they are not—steel foundations would be electrically exposed.

"But argument as to the conductivity or non-conductivity of cement, after all, is idle for purposes of the point in hand. The current need not penetrate the cement in order to reach the steel, nor need it penetrate any crevice in the cement. It can come up underneath and pass directly from the clay to the steel beams or rails in the foundation piers, thence to the columns. Following its rule of choosing the easiest channel for circulation, that is the line on which it will work. The dampness always existing in the strata of soil a few feet below this city's surface suffices to aid the electrolytic decomposition of foundations quite as well as of water and gas pipes."

In the case of foundations of buildings there would seem no reason why electrolytic action should not take place, especially in a city that has innumerable electric railways running through it in every direction and all using the rails as a return. If we are not mistaken, at one time the earth was so saturated with electricity in Brooklyn that an instance is on record where a party by suitably connecting the water and gas pipes in his cellar was enabled to obtain a sufficient amount of stray current to operate a small fan. Such being the case, it is difficult to see why the base of a column forming the substructure of a high building would not be acted on electrolytically under the same conditions.

Mr. Geraldine, formerly city engineer of Chicago, refers to General Sooy Smith's discovery in the above paper as follows:

"Electrolysis I regard as the greatest of engineering problems. It has been considered in connection with other menaces to the permanency of high buildings, but the alarming possibilities that accompany it and the urgent necessity for immediate preventives against its encroachments have not yet been at all properly realized. The time is coming soon, I am satisfied, when it will force itself upon builders' attention as the engineering problem of the age.

"While I have made no direct investigations, I can see no reason whatever to doubt that the underground portions of the tubular supports to the high buildings are already feeling the primary effects of electrolytic action. The current which separates itself from the tracks of electric railroads has full access to the steel foundations. The Elevated loop, which passes within a few steps of some of the tallest buildings in the city, depends upon its rails to return an enormously heavy current to the power station. That a good part of this current escapes from the rails to the structure and thence to the earth and all beneath the earth I feel no doubt. There is no insulation whatever to prevent it.

"It is, of course, unnecessary to remark that the Elevated loop, for a good part of its length, is on the

same street with a surface electric road. The aggregate of electricity passing off from the two must be enormous. There is no satisfactory way to measure it, and thus far we can only conjecture the extent of the damage that it is working."

Unquestionably the solution of this most important problem lies in properly controlling, or keeping within certain limits, the return trolley currents. In practice this has been found almost an utter impossibility without having recourse to the double-trolley system, which, owing to its unsightliness, is prohibitory in large cities. As we pointed out in an editorial some time ago, what is known as the three-wire system might answer the purpose. In this method the trolley line is divided into sections of any convenient length, the positive wire from one dynamo being connected to one section and the negative of a second dynamo to the adjoining section. Thus the line consists of a number of positive and negative sections insulated one from another. The third, or neutral, wire is then connected in the ordinary manner to the rails. This system is said to have proven successful in the few towns in which it has been tried, and although it undoubtedly has objectionable features, as, for instance, were a large number of cars to become bunched on one section the neutral wire would become heavily charged either positively or negatively, and some current would seek the ground as a return; still, taking it all in all, as a means of avoiding electrolytic action, it would seem far preferable to the ordinary trolley. Now that this question of electrolytic action on the foundations of buildings has been brought up, it certainly behooves Chicago to order a careful investigation made. The high metal structures in that city have been erected long enough to show any effect of electrolytic action, and if it is possible for such action to take place, it certainly should in Chicago, where a perfect network of trolley systems exists.

Power Rates of the Cataract Power & Conduit Company.

The Cataract Power & Conduit Company, which we referred to in an editorial in our issue of March 9, have just published a statement of rates to be charged for electric power in Buffalo. The document issued by the Niagara Company refers to the rate charges as follows:

"The establishment of a system of charges which shall favor no one class of users of power at the expense of others has proved to be a matter of considerable difficulty in view of the great variety of service required. It is probable that in no other city is power used in a greater variety of ways than in Buffalo. We have on the one hand our electric railways and lighting companies, flour mills and factories, requiring hundreds or thousands of horse power, and on the other hand a very large number of manufacturing and other establishments using power only in very small amounts. Again, as regards plants of all sizes within these limits, it is necessary to take into account the fact that while some require power continuously during twenty-four hours per day, others use power intermittently, in some cases averaging only two or three hours per day. As a result of the wide range in the amounts of power which must be kept available for various users and of the radical differences in hours of use, neither the so-called flat-rate system of charges under which each user is charged a certain amount per horse-power kept at his disposal, nor the ordinary method of charging by meter under which each user pays a certain amount fixed by schedule for the actual number of kilowatt hours or horse-power hours used, as recorded by meter, can be adopted without imposing upon one or more classes of users of power charges which are relatively excessive.

"The rates which we have fixed are for Niagara power as distributed from our sub-stations. This is supplied in the form of three-phase alternating cur-

rent, and we are now prepared to deliver it to all points within distances which can be conveniently reached from our sub-stations."

In the editorial referred to above we spoke of the difficulty this company was having in convincing a large number of manufacturers in Buffalo that electricity as delivered from Niagara, a distance of almost 26 miles, could be utilized by them more economically than steam. The schedule of rates has evidently been carefully prepared to accommodate all classes of possible consumers, but, as we have several times stated, it is difficult to see how, under the conditions existing in Buffalo, current can be delivered from Niagara and made to compete with steam other than at a loss to either the producer or consumer. The monthly charge for power will depend upon the actual amount used, as determined by meters installed by the Conduit Company upon the premises of the consumer. The charge will be determined by the record of the meter and by calculation from the schedule. The rates will vary from .64 cent per unit to 2 cents per unit, depending on the number of units used.

Besides the charge for power the Conduit Company also require a monthly payment for service. The latter will amount to \$1 per kilowatt per month. Where a large amount of power is continually used the combined charges would certainly seem extremely favorable to the consumer, and would amount to considerably less than one cent per horse-power hour. Where however but a comparatively small amount of power is intermittently required, say 40 horse power on an average of five hours a day for 26 days in a month, the cost of power and service would amount to about 1.4 cents per horse-power hour.

With steam as a motive power, and assuming a consumption of 4 lbs. of coal per horse-power hour, coal costing \$1.80 a ton, for which it can be purchased in Buffalo, the cost of the same amount of power as above would come to 1.3 cents allowing \$50 a month for labor. This in the course of a month of 26 working days would make a difference in favor of steam of \$16. Under the circumstances therefore, and bearing in mind that a change of motive power means an extra outlay for electrical machinery, it is not to be wondered at that small manufacturers are adopting the proposed innovation but slowly.

Electrical War Inventions Pouring into the Patent Office.

From all accounts the war excitement has caused a flood of applications for various electrical devices to pour into the Patent Office in Washington. Examiner Seely, chief of the electrical division of the Patent Office, is credited with having devised an electrical dynamite gun for throwing a large number of projectiles in an exceedingly short space of time. The weapon consists of a tube made up of a series of coils of wire—a solenoid in short—which is fed with the explosive shells from a hopper. Along the tube there runs a copper channel, and wires are so arranged as to connect the two ends of the gun with a suitable electric battery. The spherical projectile, as it runs through the tube, closes the circuit at a number of points, its velocity being gradually augmented until it is finally projected from the mouth of the gun with sufficient force, so it is claimed, to throw it a distance of six miles. There are several important advantages claimed for a gun of the above description. It could, in the first place, from behind an embankment, pour a steady stream of bursting projectiles upon a ship at sea without in any way informing the enemy of its location, owing to the absence of both smoke and noise. As the shell in being thrown receives no shock, the chances of a projectile exploding in the tube is reduced to a minimum.

Another original but scarcely practicable electrical device is that suggested by two inventors of Russian birth. Their method consists in utilizing the tremendous heat generated by the electric arc for boring holes in the hull of an enemy's ship. There are various ways in which this could be accomplished, in their opinion, but preferably a submarine boat should be employed. They propose operating as follows: Having reached a point immediately beneath the vessel that is to be attacked, the operator would attach a copper wire to her bottom (it is not stated how this would be done). This wire would then be connected to the negative pole of a powerful electric battery, a second wire being attached to the positive pole and terminating in a carbon stick similar to those used for arc lighting purposes. By then causing an arc to be formed between the metal hull of the vessel and the carbon, the former would be melted, leaving an opening through which water would enter. According to the inventors, it would take but a very short time to bore a sufficient number of such holes as to cause the vessel to founder.

There are also several new inventions which have for their object the substitution of the electric spark for the detonating cap in rifle cartridges. One of these devices is the invention of a Philadelphian, and consists of a magazine gun with a small storage battery in the stock. Each cartridge to be used in a weapon of this nature has two short wires embedded in the powder, the points of which project out of the rear end. The act of pulling the trigger causes these points to be brought into contact with another pair of wires connected with the battery; the circuit being thus closed a spark is communicated to the powder and the cartridge exploded. The main apparent objection to such an arrangement is the necessity of an army carrying a dynamo plant with it during a campaign for the sole purpose of recharging the storage batteries in the stocks of the rifles.

General Edward W. Serrell, the inventor of the hydraulic vertical gun-lift for barbette guns, has, it is asserted, also invented a device by means of which a bolt of electricity can be hurled from a height upon the deck of an enemy's vessel that happens to come within certain bounds. The exact nature of General Serrell's invention is not as yet generally known. It is understood, however, that the device calls for the erection of two towers on opposite banks of a river or bay high enough to allow of a vessel passing under a cable stretched between them. On the latter will operate the electrical engine of destruction, which will be under thorough control from the shore. In connection with the device, and in order to show the exact position of the vessel, there will be an instrument somewhat resembling the range-finder. When a vessel enters a certain zone, a discharge of electricity will take place, so it is claimed, striking the ship's deck and tearing its way through to the water. General Serrell, it is said, perfected his device several years ago, and entrusted the plans and specifications to the Government, which has had them in its possession ever since. So far the details of this new electrical engine of war are known only to General Serrell and certain Government officials, who will not make them public.

Under the Searchlight.

Notes and Comments on Various Topics.

The G. E. Capital Impairment Problem.

(From the Boston Commercial Bulletin.)

Financial Editor Commercial Bulletin:

Can you confirm or deny the reports as to the restoration of the General Electric capital impairment? What are the prospects for the common stock?

J. P. T.

Remarks: Regarding the reports in question, Mr. Samuel Carr of the General Electric preferred shareholders' committee says: "We have held no recent meeting, and nothing has been settled as to what will be done in the matter of General Electric capital impairment or back dividends on the preferred. The matter is a very intricate one. The questions of reducing both the common and preferred stock and giving debenture bonds in the company's treasury for accumulated dividends have all been

under consideration, but nothing has been agreed upon. It stands, however, in a fair way for early adjustment, and it is quite probable that our committee will hold a meeting shortly to consider the matter."

The above will give the stockholders of the General Electric Company an idea of what arrangements were being made up to a few days ago looking to a settlement of the accumulated dividends. Contrary to the statements that had been given out in press paragraphs for months, that a definite arrangement had been arrived at, there seems to have been no conference of the directors even in reference to the matter. Whether the following, which appears in the *Boston News-Bureau* of Saturday, has any better foundation is doubtful, but as it gives some suggestions that are apparently of inside origin it may be of interest to the unfortunate stockholders:

A meeting of the directors of the General Electric will occur May 3, at which time it is expected a final decision will be arrived at regarding recommendations to be made to the stockholders at their annual meeting, which is to be held May 10, as to the payment of the back dividends upon the preferred stock. It is understood that authority will be asked of the stockholders to reduce the capital stock to \$15,000,000.

The particular manner by which the preferred stockholders are to be taken care of is not quite clear. It was at first supposed that debenture bonds would be given for the accumulated dividend, but as the company has destroyed practically all bonds purchased this cannot be done. There are now only \$6,000,000 of these bonds outstanding out of an original issue of \$10,000,000. It may therefore be proposed that the preferred stock be increased by about the amount of the dividends unpaid and reduce the dividend from 7 per cent. to a 4 or 5 per cent. basis.

* * *

The American Sardine Corporation is the title adopted by a fish trust just formed in Maine. It is not the only trust devoted to catching sardines. There are others.

* * *

The *Republican* of Denver, Col., says: "The election in Sterling passed off more quietly than any event of the kind in years. There was but one ticket in the field, the temperance ticket. Out of the 500 votes registered only 98 were polled. Of these the temperance ticket got 90. The ticket elected is: Mayor, Dr. L. E. Stanton; treasurer, F. J. Henderson; trustees, A. C. Sherwin, J. W. Wells, L. W. Gard. The proposition to bond the town for \$12,000 to build an electric light and water works plant was defeated three to one."

The inhabitants of the above community appear to think vastly more of registering than of voting, but what seems stranger under the circumstances is the heavy vote against waterworks. However, you can seldom or never tell how a community that gets along without electric lights will vote anyway.

* * *

REGARDING the recent trolley patent decision the *Boston Advertiser* says: "The general advice was to sell General Electric for a term at least, as the court decision rendering the trolley patents invalid is expected to seriously affect the revenues of this company. These trolley patents were valued at \$8,000,000 by the General Electric Company, and while the company has a large volume of business in sight in other lines the room traders are inclined to the belief that there will be a setback in the price of the stock under the influence of this decision."

An advertisement from the U. S. Navy Department will be found on page 235 of this issue, giving particulars as to the requirements and pay of electricians who desire to enlist in the Navy.

Proposals Invited.

The Secretary of Agriculture is inviting sealed proposals until May 5 for furnishing the Department with telegraph instruments, etc. Intending bidders can secure specifications and all necessary information upon application to James Wilson, Secretary, Washington, D. C.

Theo. A. Bingham, Colonel U. S. Army, is inviting sealed proposals until May 10 for furnishing electric battery supplies. Information will be furnished upon application to the Office of Public Buildings and Grounds, Washington, D. C.

ELECTRICAL EXHIBITION NOTES.

OFFICES REMOVED.

The managers of the Electrical Exhibition beg to announce that they have removed their offices from 15 Cortlandt street, New York, to Madison Square Garden.

THE TELEGRAPH TOURNAMENT.

The telegraph tournament judges held a meeting at the Astor House, New York, on April 13, among those present being Fred Catlin, T. J. Smith, J. B. Taltavall, H. W. Pope, George H. Guy, A. E. Sink, E. A. Leslie, W. D. Weaver, P. T. Brady, P. B. Delany, S. F. Austin, T. R. Taltavall and William Maver, Jr.

The meeting was called to order by Mr. Catlin, who was elected chairman. J. B. Taltavall was elected secretary. After some discussion it was decided that the conditions to govern the judges in their decisions, as printed in the circular which has been widely circulated, sufficiently covered the ground.

An Executive Committee was then appointed to take care of all matters embraced in the duties of the judges.

The Executive Committee, consisting of Fred Catlin, A. E. Sink, T. J. Smith, P. B. Delany and J. B. Taltavall, held a meeting immediately after the judges adjourned. Mr. T. J. Smith was appointed a committee to arrange for suitable phonographic records, and Mr. P. B. Delany to provide apparatus for chemical or other records not phonographic.

The Executive Committee then adjourned to meet on April 21.

Mr. A. E. Marr, of the Associated Press, an exceptionally good code operator, has been added to the list of judges.

The Smith-Premier Typewriter Company state that those living at a distance who desire to use their machine in the contests need not bring their typewriters with them to New York. Mr. W. H. Durphy, the New York manager of the company, is prepared to furnish all comers with typewriters.

Mr. Fred. E. Barnell, of New York, proposes to enter one or two events in the tournament, more with the idea of demonstrating the fact that telegraphers' paralysis is a curable disease, and giving telegraphers a practical demonstration of his complete cure by electricity itself.

Friday evening, May 13, and Saturday afternoon and evening, May 14, are the dates on which the tournament will take place.

NATIONAL ASSOCIATION OF STATIONARY ENGINEERS.

Arrangements have been made for the meetings of about fifty associations of the N. A. S. E. during the Electrical Exhibition at Madison Square Garden in the month of May. These associations will come from New York, New Jersey, Pennsylvania, Massachusetts, Rhode Island and Connecticut. Several rooms suitable for meetings have been provided, and the various lodges invited almost without exception have accepted the invitation and will hold their meetings there on their regular meeting night as the guests of the Exhibition Company. It is expected that there will be an attendance of at least 5,000 practical engineers (two lodges every evening), and the exhibition management is arranging a registry system, with bulletin boards in different sections of the building, so that exhibitors may know just what associations of engineers are present and the plants with which they are connected.

PERSONAL.

Mr. Samuel Insull, president of the National Electric Light Association and of the Association of Edison Illuminating Companies, was in New York last week. He takes a very lively interest in the progress of the Exhibition, and has informed the management that he will take the utmost pleasure in coming on specially from Chicago, in behalf of those two representative bodies, to participate in the opening exer-

cises on May 2. These exercises, as now arranged, promise to be of an unusually striking and interesting character.

The Pennsylvania Iron Works Co.

A special meeting of the stockholders of the Pennsylvania Iron Works Company was held on the 14th inst. at the general office of the company, Fiftieth street and Lancaster avenue, Philadelphia. Steps were taken, it is understood, to raise additional funds to provide for the company's increased business.

WIRELESS TELEGRAPHY.*

BY W. J. CLARKE.

Mr. President and Gentlemen:—In commencing this evening, I will first of all describe to you the work of my predecessors in the line of wireless telegraphy before telling you what I have myself accomplished during the last few months. Guglielmo Marconi, who claims to be the inventor of wireless telegraphy, is a young Italian, now a resident of London, England, and he certainly deserves credit for having accomplished a great deal in this direction, although he has made use of methods and principles which were well known for many years. In the picture before you of Marconi and his instrument [reproduced below], the transmitter is shown on his right and the receiver upon the left. You will notice that all the apparatus in the receiver is enclosed in an iron box, with the exception of the telegraph sounder. This is done for the purpose of showing that the electric waves will penetrate a mass of solid iron. You here have (see Fig. 1) a diagram of connections showing the method used by Marconi in transmitting signals. In the upper part of the diagram is the primary of an induction coil, which is operated by means of a small storage battery, and in the circuit of which is a Morse key. The secondary of this coil is connected, as you will see, to two brass balls, which are about an inch and a half in diameter, and placed at a distance of about an inch and a half from the two larger brass balls shown, which are about four inches in diameter. These latter balls are separated from each other by about one thirtieth of an inch, and their inner hemispheres are enclosed within a heavy rubber tube, D, which is filled with a superior quality of vaseline oil. When the Morse key in the primary of the induction coil is closed, sparks pass across between all of these balls, and in doing so it will be seen that they have to pass through the bath of oil. These sparks produce electrical oscillations of high frequency, which in turn send out electrical waves into space. These waves travel along until they reach the receiving apparatus, which is shown in the lower part of the diagram. The most essential part of the receiver consists of a small glass tube, d, about an inch and a half in length and one-thirtieth of an inch internal diameter. This tube is fitted with two plugs of silver, tightly fitting, and separated in the center of the tube by about one-thirtieth of an inch, the intervening space being partly filled with a mixture of nickel and silver filings. Two platinum wires are soldered to the outer ends of these silver plugs, and pass out through the ends of the tube, the glass being sealed down upon them so that the air cannot possibly enter the tube, and the filings are thereby preserved from undue corrosion. Attached to each of the platinum wires leading out of the tube is what Marconi calls a wing, which is a metallic plate, W, about a half inch wide, and of such a length as to cause the receiver to be in what we might call "tune" with the transmitter. A small choking coil is attached to the outer end of each of the wings, and the whole is then placed in circuit with this one cell of battery and high resistance telegraph relay, whose contact operates this telegraph sounder by means of this local battery. Now when the filings in the glass tube are lying in their normal state they pre-

*Paper read before the New York Electrical Society.

sent a resistance to the passage of the current varying from 10,000 to 20,000 ohms, but the moment that the key is pressed at the transmitting station, and the sparks pass across the balls, the filings immediately cohere, and their resistance decreases to from 7 to 25 ohms. This great decrease in resistance is, as you will see, sufficient to cause the current of the one cell of battery to pass through the circuit in sufficient quantity to operate the magnets of the relay, and so operate the sounder. It is found, however, that once the filings in the tube have responded to the waves from the transmitter, they remain in the same condition until such time as the tube has been struck a smart tap, when the filings immediately decohere and the tube returns again to its high resistance. Now it is manifestly evident that in order to transmit Morse signals we must have some means of tapping the tube automatically. For this purpose Marconi makes use of a little vibrating arrangement attached to the sounder, the magnets of which are of very high resistance. Now suppose that the key of

FIG. 1.

the transmitting station is closed, the filings cohere, the relay pulls up its armature, closes the sounder circuit, and at the same instant sets the vibrator attached to the sounder in motion. The tapping of the vibrator against the tube tends to decohere the filings and raise the resistance, but everything is so adjusted that the waves from the distant station are just sufficiently powerful to keep the filings cohering until such time as the key of the transmitter is raised, when the tapping of the vibrator instantly decoheres the filings, the resistance goes up, the relay releases its armature, and the sounder and vibrator circuit is opened. In this way you will see that it is quite possible to transmit Morse signals, but although Mr. Marconi has accomplished wonderful results with this piece of apparatus, which he has very ingeniously devised, it is not that class of apparatus which is suited to the American market, on account of the fact that it requires very sensitive adjustment and very careful management.

I will now describe to you some of my own improvements which I have been successful in making in this class of apparatus. I have designed two distinct sets, each consisting of transmitting and receiving devices. One set is capable of transmitting intelligible Morse signals, and the other is used where a cheaper class of apparatus is desired, and where it is only necessary to ring a vibrating bell, or operate some similar piece of apparatus at the receiving station. The transmitter is the same in both cases, and consists of an induction coil specially wound so as to give the most suitable kind of secondary spark. This coil is mounted upon a mahogany base, together with a specially arranged vibrating device and high class Morse key, the condenser of

the coil being so connected as to kill the spark at the key contact as well as at the contact of the vibrator. On the upper part of the coil are mounted two brass balls which are one and a half inches in diameter and arranged so that the distance between them can be adjusted within reasonable limits. When the coil is connected to a suitable battery, and the key pressed, sparks will pass between these two balls, and electric waves will be sent out into space. I find that the greater the distance between the balls the better the effect, provided, of course, that the sparks

the transmitting station, and on the other hand the plugs in the tubes are so adjusted that the filings will immediately cohere when the electrical waves strike the tube on the key of the transmitter being pressed. The relay in this case is wound to a very high resistance, and is placed in series with the glass tube and one cell of dry battery. Its armature is made as light as possible so as to respond to the most feeble current, and its local contacts are so arranged as to operate the telegraph sounder and the decohering apparatus in multiple, using about twelve

WILLIAM MARCONI.

pass quite freely. I have discarded the use of oil altogether, except in very large transmitters for long-distance work. The receiver consists of two separate instruments, the decohering apparatus mounted upon one base, and a special relay and sounder, together with suitable switches and connections, mounted upon another base. The coherer consists of a glass tube about two inches in length, fitted with two brass plugs, arranged with spring and screw adjustments

cells of dry battery. The decohering apparatus used in the cheaper set of instruments is not provided with as many adjustments as the more expensive set, but these are not found to be necessary where it is only required to operate a signal similar to a vibrating bell. The relay used in the cheaper set is also of a smaller pattern, and is not provided with any means of adjusting the distance between the armature and the magnet cores, these adjustments having to be

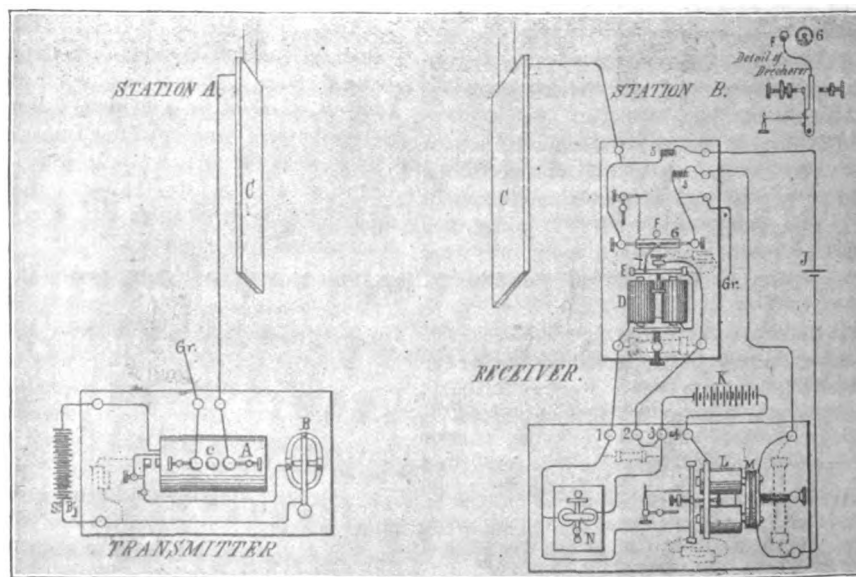

FIG. 2.

to each, so that the distances between the plugs in the tube and their pressure upon the filings can be readily adjusted at will. The magnets of the decoherer are specially wound so as to overcome the effect on the tube of too much self-induction. Every desirable adjustment is provided for, so that not only can we adjust the distance between the magnets and the vibrating armature, but also the tension of the spring on the front of the armature and the distance through which the armature vibrates. In this way we are able to so adjust the coherer that the vibrating armature will strike the tube with just the proper strength of blow, so that the filings will not decohere except on the instant that the key is raised at

made by means of the screws at the back and front of the armature. The relay in this case is mounted on the same base with the electric bell or buzzer which it is intended to operate, and the whole outfit gives excellent results for signaling of this kind. I wish to say here that I have found it necessary to have a special form of dry battery made for this purpose, it being so constructed as not to deteriorate for a very long time, but at the same time it is only intended to be used with apparatus of the kind where a very small amount of current is required. One of our diagrams, giving all the connections of our best apparatus, is shown in Fig. 2. The connections and arrangements of the transmitter which you see upon

your left, at station A, are so apparent that it will not be necessary for me to describe them further than to call your attention to the manner in which the condenser is connected so as to include the Morse key as well as the vibrating contacts. You will notice in this transmitter three brass balls, C, mounted upon the top of the coil. These balls are about three-quarters of an inch in diameter, but, as previously explained, we are now using only two balls of one and a half inches in diameter, and I think we obtain considerable results. One terminal of the transmitter is, as you will see, connected to the ground and the other to plate C, which should be placed as high in the air as possible and very carefully insulated, together with the wire leading to it from the coil.

Now coming to the transmitter at station B, we will commence at battery J, and trace its circuit upwards to the binding-post of the decohering apparatus. From this post it passes through the choking coil, 5, and across to one of the plugs in the glass tube; from the other side of the tube it goes down to the other choking coil, and thence runs direct to one of the binding-posts of the high resistance relay L, after passing through the magnets when it returns to the battery J. You will further see that one terminal of the glass tube is connected to the ground, and the other to plate C, which is placed opposite to and parallel to plate C of the transmitter. Now it is evident that if the resistance of the filings in the tube decreases to any considerable extent, the current from the battery J will pass through the magnets of the relay L and energize them. The magnets will now pull up the relay armature and close the local contact, and in order that you may see clearly what then occurs we will trace out the circuit of local battery K. Beginning on the right, the wire leads to binding-post 4 of the receiver, thence to the front contact of the relay, across the contact to the armature, from the armature over to the sounder N, and from the sounder to post No. 3, and thence back to the battery, the magnets D of the decohering apparatus being placed in multiple with the sounder N through the binding-posts 1 and 2 of the receiver. In this way you will understand that when the armature of relay L is pulled up the sounder N gives the down click and the decohering apparatus D begins to vibrate rapidly, the hammer F striking the glass tube with just that kind of blow required to decohere the filings the instant the waves cease coming from the distant station, and the moment the filings decohere the circuit of the relay L is opened, the armature drops away, the sounder N gives its up click and the decohering apparatus D ceases to vibrate. The only difference between a receiver used for operating an electric vibrating bell or similar signaling device and the one we have just described lies in the fact that the relay is not provided with as many adjustments and is not of such large size, and that the decohering apparatus is of a cheaper grade and also not provided with as many adjustments. This outfit will readily operate the vibrating bell as often as the key of the transmitter is pressed. It is however sometimes found that the bell will continue ringing for an instant after the key of the transmitter has been raised, but for bell signaling this makes little difference, while for Morse signaling it would cause serious trouble, and consequently the high class outfit is absolutely necessary where it is required to transmit Morse signals.

DISCUSSION.

Mr. Dunn—What is the idea of using the plates?

Mr. Clarke—The idea in using plates instead of wings is, if we use wings we will have to place the transmitter and receiver at an elevation in order to secure any satisfactory results at all. Now, by using the plates we can place the receiver and transmitter on the ground floor of the building if we wish, and connect with the plates by well-insulated wires.

Mr. Dunn—When you use the wings they are only a few square inches, whereas the plates are nine or ten square feet?

Mr. Clarke—It is a matter of length more than cross-section. A piece of wire 3-16 inch in diameter is sufficient.

Mr. Dunn—How long?

Mr. Clarke—That depends upon the transmitter. We have used from six inches to three feet six inches.

Mr. Mailloux—Is there any definite relation between the plates?

Mr. Clarke—They should be placed parallel. The results are far better if they are placed parallel. Sometimes you do not get results when they are otherwise placed.

Mr. Dunn—Would the tin roof of a building intercept the signals?

Mr. Clarke—We have not tried that. I have an idea that it would, for the reason that in train telegraphy the tin roof of the car was made use of. I fancy the roof of a building is not insulated, and we find it necessary to insulate the plates carefully.

Dr. Pupin—Would an insulated tin roof be transparent to electric waves?

Mr. Clarke—I don't know.

Dr. Pupin—Have you tried placing the two plates inside of a building?

Mr. Clarke—Yes, sir.

Dr. Pupin—I have tried the effect of the waves upon a coherer placed behind the screen of a tin-pan as a reflecting mirror. The pan was grounded and made a perfect mirror. An electric wave would be reflected nicely by a tin roof I should think.

Mr. Clarke—The experiment is simple to make, and you can do it readily.

Dr. Pupin—Why don't you do it?

Mr. Clarke—We will.

Dr. Pupin—Should nothing intervene between the two plates?

Mr. Clarke—There is some difference of opinion. We have not made any long-distance experiments yet, but for short distances we find it possible to transmit through fire-proof walls for a considerable distance.

Dr. Pupin—Is the coherer a contrivance of Marconi, or who is supposed to have invented this means of receiving wave signals?

Mr. Clarke—I hardly like to say invention, but the coherer is certainly the fundamental part of the whole thing.

Dr. Pupin—The coherer used in 1894 by Lodge worked perfectly—the very same thing. It certainly was not brought before the public previous to 1894.

Mr. Clarke—It was undoubtedly used by Lodge, although Marconi has secured an American patent with fifty-two claims, covering every known form of coherer, and the coherer in combination with the other apparatus.

Mr. Dunn—Can you explain why there is no motion when the particles cohere under the influence of the waves? Is it necessary to give them motion by a blow to make them decohere?

Mr. Clarke—There is great difference of opinion on that point. Few have ascertained so far that that is the case. A great many persons who have looked at the matter casually think that the filings actually move, but under a powerful microscope they show no motion whatever. The only solution I can give for that is that the sparks are produced in contact with the filings, and that possibly something in the line of a welding effect takes place. That was suggested to me by another, who had investigated the matter more thoroughly than I had.

Dr. Pupin—There is always a thin film of air between bodies in contact. This is certainly true of the contact of light bodies. Must you not produce a new film in order to have high resistance, and to do that you have to move the coherer?

Mr. Clarke—There is no motion perceptible under a perfect microscope.

Mr. Dunn—What do you call a perfect microscope?

Mr. Clarke—One magnifying about 2,000 diameters.

Dr. Pupin—How do you wind a coil of a thousand ohms resistance without inducing self-induction in it?

Mr. Clarke—We find it advantageous in winding the relay coil, instead of winding it in one continuous coil to wind it in several different coils, connecting these in multiple so that the combined resistance of the coils will only be a thousand ohms. In order to do that it is necessary to have a magnet.

Dr. Pupin—I do not see how that is going to diminish the self-induction.

Mr. Clarke—It reduces the sparking very greatly; and the sparking of the coherer and relay affects the tube which is in proximity. Sometimes the decoherer operates alone, causes the filings to decohere and open the circuit, and you have to eliminate the sparking almost entirely.

Dr. Pupin—Could you not interpose a metallic screen between the local spark and coherer—would not that do?

Mr. Clarke—We have tried that, and find even a screen a half inch thick has no effect.

Mr. Dunn—I understand that the transmitting device works inside an iron box?

Mr. Clarke—We have tried it by covering it with metal and it works well.

Dr. Pupin—Lodge explains that. You cannot get wires into a box unless there is an opening, and the waves go through the opening. They crawl through the smallest hole, and that is the reason the box does not act as a screen.

Mr. Clarke—The only way to offset that would be to enclose everything in an iron box, batteries and all.

Dr. Pupin—Yes, but you cannot help putting the wires leading to the coherer through a hole in the box. I am sure that a box surrounding completely the coherer and all would act as a screen.

Mr. Clarke—I mean to enclose the battery also in a box.

Dr. Pupin—You have to get from the coherer to the battery.

Mr. Clarke—Can you not enclose the battery in the box, too?

Dr. Pupin—The wires leading from the coherer to the battery have to go through the box.

Mr. Clarke—Not necessarily, if the battery is enclosed in the box also.

Dr. Pupin—How about the plate in the air?

Mr. Clarke—In an experiment of that kind we would not use the plate, but enclose everything in a box and put the transmitter at a short distance.

Dr. Pupin—Perhaps, if you could enclose it entirely in a big iron ball.

Mr. Dunn—The decoherer acts as a sounder?

Mr. Clarke—Yes; I prefer to read the signals from a decoherer. It is impossible to have a sounder work without "chattering." The sounder I show to-night chatters somewhat. That is because the apparatus was made to-day and connected so hurriedly that we have not had time to put in choke coils, resistance coils and condensers.

Dr. Pupin—I do not discredit the invention, but I think there is some ground connection. When we put a screen between, just now, there was no sparking between the spheres, and the arrangement acted just as well.

Mr. Clarke—In order to convince you of that, I think we will connect up our larger coil which we have here for the purpose of exhibiting the fluoroscope to anyone who wishes to see it. I may be wrong, but I hardly think that this coil will give any results when the points are separated so that we will have no sparking.

(The test was made, and was followed by applause.)

(To be continued.)

Help to fight the Electrical Trust by subscribing for **ELECTRICITY.**

SOME RECENT IMPROVEMENTS IN ACCUMULATORS AND THEIR APPLICATION TO TRACTION ON COMMON ROADS.*

BY J. T. NIBLETT.

Means of vehicular locomotion by the aid of some power other than that of horses is a subject that is now receiving a vast amount of attention. Not only is it of interest to electrical and mechanical engineers and carriage builders, but it has been taken into serious consideration by all those responsible for the regulation of traffic in our large towns. The subject is of such huge importance that it not only affects those whose business or pleasure calls for some rapid and safe means of transport from place to place, but it affects the safety and comfort of the ordinary pedestrian as well. Our present system of horse traffic is open to many objections not only from a humanitarian point of view, but from its sanitarian and economic aspect as well. The streets in our large towns would present a vastly different aspect if, instead of horses, some other means of drawing our vehicles were used.

Much attention has been given to the application of steam, petroleum, and spirits to produce the necessary motive power, but there is but little doubt that electricity will eventually supersede them all, not only on the score of economy, but owing to its freedom from heat, steam, disagreeable odor, and to the ease with which it can be manipulated.

In this communication we do not propose touching upon the numerous applications of electricity for the propulsion of tramway cars and light railways, but we shall devote our attention more especially to the subject of the electrical propulsion of vehicles on common roads by means of batteries. We shall point out some of the recent improvements that have been made in batteries suitable for this purpose, and shall then indicate in a few words how they are best employed, and the most approved methods of dealing with them. An endeavor will be made to deal with the subject in a popular manner, and all technicalities will be avoided as far as possible.

Electro-chemical generators may be divided into two distinct types, viz., primary and secondary. In a primary cell the electrical energy is developed by the direct chemical decomposition of the excitant or electrolyte and one or both of the elements, the magnitude and rate of such electrical development being chiefly dependent upon the chemical activity of the materials employed.

The secondary, storage or accumulator cell, as it is variously called, is the name given to that class of apparatus which is quite inert in itself, but on passing an electrical current through it certain chemical changes are induced which render it capable of receiving, retaining, and then redeveloping a certain amount of electrical energy. The ratio between the amount of energy put in and returned is dependent upon the chemical activity and nature of the materials employed, and also the mechanical construction of the cell.

As a convenient means of obtaining an electrical current of small amount and of short duration, perhaps no electrical generator is so convenient and easily manipulated as a good form of primary battery. But, on the other hand, where cost is a consideration, or where large and continuous currents of uniform pressure are required, primary batteries are altogether out of the question.

Perhaps no other branch of electricity possesses so much fascination for the electrical amateur as the study of primary cells. In the hands of the unscrupulous the primary battery, with its wonderful and oftentimes deceptive allurements, has been for many years past the bait for drawing money out of the pockets of the unwary and inexperienced, and doubtless many thoroughly legitimate electrical enterprises

have been greatly injured by such deceptions as these.

In the best types of primary batteries zinc is used as the decomposable element, and zinc may therefore be regarded as the fuel of this particular form of cell. Sulphuric acid is generally employed as the excitant fluid, and some form of oxidizing agent as a depolarizer is required if only approximate constancy is aimed at. To produce a unit of electrical energy, it is found that, excluding the cost of the depolarizer, zinc is fully 20 times as expensive as coal. Taking into account all losses in a secondary battery and allowing for an efficiency of only 50 per cent., it follows that for continuous and regular working for say such a piece of apparatus as an electromotor the maintenance of a primary battery would come out fully 10 times more costly than that of a secondary battery.

Secondary batteries may be divided into two classes, viz., those in which the active material is formed from the substance of the element itself, either by direct chemical or electro-chemical action, and those in which the chemical formation is accelerated by the application of some easily reducible salt of lead. Elements of the former type are usually termed "Planté," and those of the latter "Faure" or pasted, Messrs. Planté and Faure being the respective inventors.

The active materials in all the best known types of secondary cells, whether of the Planté or Faure pattern, is peroxide of lead in the positive element and spongy lead in the negative. The medium through which the necessary chemical changes occur during either a charge or discharge is a solution of sulphuric acid and water. There is still much doubt as to the precise nature of the chemical changes involved in a lead sulphuric acid cell, due to the action of an electric current, and therefore this matter will not be discussed here. Enough, however, is known to enable those concerned in their commercial manufacture to construct cells of almost any electrical capacity, and capable of taking up and giving out any rate of charge or discharge. It is now usual to speak of any given type of secondary cell as being of so many ampere hours' capacity per pound of plate, or per pound of complete cell. In the latter case the precise nature of the containing vessel, whether it be of glass, earthenware, metal or vulcanite, must, of course, be specified.

PLANTÉ CELLS.

The Planté original secondary cell was of an extremely simple nature, consisting merely of two long strips of thin sheet lead placed one upon the other. To prevent contact between these lead strips a piece of coarse felt was placed between them. This plate was rolled up into the form of a cylinder, and was immersed in a solution of one part of pure sulphuric acid to 10 parts of water. The "forming" process was managed in the following way: The current was caused to pass through the cell until gas was freely given off from the lead plates. On examining the elements, that plate which had been joined to the positive pole of the charging source was found to be coated with a thin film of peroxide of lead. The plate which had been joined to the negative pole was scarcely altered in appearance, neither did it have any electrical capacity. At each successive charging the peroxide on the positive plate was found to sink deeper into the metal. This "eating in" operation was allowed to go on until a sufficient amount of peroxide was formed, or, in other words, until the requisite capacity had been obtained.

In all cells of the Planté type little or no difficulty is experienced in "forming" the positive element. With a negative element, however, the case is very different. Here the active material is chemically spongy lead, and it is only by repeated oxidizing and deoxidizing the metal surface that the necessary depth of this finely-divided lead can be obtained. This is the difficulty experienced in all forms of Planté cells.

The original method employed to produce the desired quantity of active spongy lead was a system of charging, allowing to rest, and then reversing the current through the cell. By each reversal of current the peroxide is reduced by the nascent hydrogen liberated on its surface during the decomposition of the solution, first into the lower oxide, and then into metallic lead in a very finely-divided state. At each successive reversal this oxidizing and reducing action sinks more deeply into the substance of the lead, and by careful treatment any desired depth of active material may be obtained. To form plates by the above process is an exceedingly long, tedious, and therefore expensive operation, and many workers have exercised much ingenuity in devising methods to accelerate the forming operation. To this end Planté himself tried a large number of experiments, the most successful being a preliminary treatment of the lead with dilute nitric acid to thoroughly scour and roughen its surface, and the application of heat to the cell during its formation to open the pores of the metal and allow the electrolyte to penetrate more deeply into it. This, then, is the original secondary cell from which our present-day accumulators have been evolved.

Among the first to improve upon the Planté element was M. de Meritens, who constructed plates made up of very thin lead lamina folded one upon the other like the leaves of a book. M. de Kabath's cell was somewhat similar to De Meritens', but consisted of a thin, cast lead perforated chamber packed tightly in with a large number of lead strips. To allow for the free circulation of the electrolyte, each alternate strip was either fluted or corrugated. Emile Reynier's plate consisted of a thin sheet of lead folded up zigzag fashion, and encased by a stout leaden ring. Cheswright endeavored to improve matters by passing lead plates through suitably shaped rollers, thereby raising on each side a series of dovetailed rims, thus largely increasing the amount of exposed surface. Montaud endeavored to accelerate formation by coating a laminated lead plate with electrolyzed lead.

An early improvement made in our own country was due to Messrs. Elwell and Parker, who used perforated plates of cylindrical form. A number of these perforated tubes were placed concentrically, alternately a positive and then a negative. To retain the elements in position notched vulcanite frames were placed at their base and grooved cross bars of the same material were tightly wedged in at the top.

In addition to various forms of the Planté type of cell already enumerated, many other modifications have been suggested and tried. Few of these early forms have become a commercial success. Probably enough has been said to show the gradual growth from the original cell up to our present-day patterns.

One of the earliest to introduce into this country a commercial cell of the Planté type was Mr. Epstein, and a cell bearing his name has been long on the market. Mr. Epstein has given much attention to the production of accumulators of this type, and in a recent communication to the Institution of Electrical Engineers he promised to shortly introduce an improved form of his plate which he stated was particularly suitable for traction purposes. Such a promise, coming from one so well versed in the subject, leads us to expect a real improvement. The original Epstein plate was made by deeply grooving both sides of a lead plate. The plate, when grooved in this way, was boiled in a solution of nitric acid and water, or some similar solution. This process is said to so corrode the metal that it is easily acted upon electrolytically. Owing to the serrated nature of the plate, the active material appears to wedge itself in the narrow grooves, and does not fall out under ordinary working conditions.

The Crompton-Howell cell, which we do not hear much of now, was constructed of plates sawn from a

* Paper read before the Self-Propelled Traffic Association, Liverpool Center, Eng., March 29, 1893.

cast mass of porous lead. We believe this material was prepared by a system of aerating the metal while in its molten condition. The resulting plate was of a highly porous and crystalline nature, and, owing to its porosity, the electrolyte easily permeated it, thus rendering the formation quite an easy matter.

A form of cell now on the market, known as the "D. P." accumulator, manufactured by the D. P. Battery Company, is also of the Planté type. The elements in this case consist of a large number of narrow strips of lead built up one above the other. By this method a large active area, enabling the cells to be charged and discharged at high rates, is obtained, while disintegration of the active material or buckling is said not to occur. As in the case of the Epstein cell, the plates are chemically treated to accelerate the formation.

The traction cell made by this company is not designed with a view to extreme lightness, but rather with the idea of combining durability with as little weight as possible. The containing case of this particular form of cell is of ebonite, and it contains three plates—one positive and two negative. The weight of the complete cell is about 33 lbs., and three cells are put in a crate for convenience of handling, the weight of the three thus fitted being about 100 lbs.

The capacity of each cell is 100 ampere hours, at a normal discharge rate of 15 amperes; they can, however, the makers state, be discharged at any rate within reason that may be desired without damage to them, the only consequence being a loss in capacity as the discharge rate is increased. The makers assert that with this form of cell a current capacity of four ampere hours per pound of plate, and three ampere hours per pound of complete cell, is obtained.

The "Lamina" accumulator elements, as manufactured by the Lamina Accumulator Company, are made up of a series of perforated and corrugated lead strips. The method of making these plates is somewhat as follows: Lead is received in the form of rolls of 8 to 10 inches wide, and of varying thicknesses of from 1-64th to 1-32d of an inch. The lead is first perforated, and is afterwards corrugated by a suitable machine. After being treated in this way the lead is cut up into strips of the desired size. These strips when built up are encased by a sheet of perforated lead, held in position by leaden rivets, and lead-burnt at the top and bottom.

The forming process is said to take only 36 hours. As the mechanical construction of the plates is simple and strong, they are said to withstand quite well the severe work imposed upon them when used for traction purposes. The makers state that a cell of this form of construction can safely be charged or discharged in one hour. The following data of the company's "As" traction cell may be of interest. The containing case is of ebonite, and is of the following dimensions: 10½ inches long, 4½ inches wide, and 12 inches deep. The complete weight of the cell, with elements and electrolyte, is given as 40 lbs. The dimensions of the positive plates are as follows: 8½ inches long, 7½ wide, and ¾ of an inch thick. The size of the negative plates are: 8½ inches long, 8½ inches wide and ¾ of an inch thick. The discharging rate of this form of cell is 20 amperes, but it may be run up to 100 amperes. The normal charging rate is 25 amperes, but this can also be run up to 100 amperes.

The various types of Planté cells just described are a few of those best known in our own country, and most of these are being used more or less extensively for electric traction purposes.

Having now briefly described the original secondary cell and its developments, we shall turn our attention to a more widely known type.

(To be continued.)

ELECTRICITY SUPPLY IN ENGLAND.

(From our London Correspondent.)

During the first few months of the year it is the custom of most electrical engineers in England, and particularly those in charge of large lighting installations, to inquire into the progress made during the preceding twelve months in the reduction of the generating and distributing expenses for current. The data necessary for such investigation and comparison is easily obtainable, the Electric Lighting Act of 1882 making it compulsory for undertakers of either municipal or company installations to register on or before March 25 in every year an annual statement of accounts of the undertaking made up to December 31 in the preceding year. These statements have to be open for public inspection, and if these conditions are not complied with a fine of 40s. per day is inflicted.

The Board of Trade has so arranged the form in which these accounts have to be drawn up that it is possible to obtain a very accurate idea of the actual working of the plants, for not only has the amount of revenue and working expenses of the undertakings to be shown, but the expenditure has to be analyzed under numerous headings as follow:

1. Coal or other fuel.
2. Oil, waste, water and stores.
3. Wages on generation and distribution.
4. Repairs and maintenance.
5. Rents, rates and taxes.
6. Management, i. e., salaries, stationery and printing, general establishment charges, law expenses, insurance, etc.

A statement has also to be made from which it is possible to easily arrive at the cost of as well as the average revenue arising from the units sold, to discover the load-factor, and to determine the percentage of "quantity not accounted for."

The whole subject of "the cost of generation and distribution of electrical energy" has been exhaustively dealt with by Mr. Robert Hammond before the London Institution of Electrical Engineers. The paper which was read covers 132 pages, and is in itself a small volume, so that it is obviously impossible to publish the complete paper even were it of more than passing interest to electrical engineers in America. Mr. Hammond's paper was advisedly read in abstract, on the evening of March 24, and we propose dealing with the main points.

The author has been connected with the electric lighting industry in England from its earliest days, and he has compiled the following list, which shows the increase in number of plants in operation under statutory powers, or for which statutory powers were subsequently secured, from 1882 up to 1897:

1882..... 2	1886..... 4	1890..... 17	1894..... 81
1883..... 3	1887..... 6	1891..... 31	1895..... 93
1884..... 3	1888..... 7	1892..... 39	1896..... 112
1885..... 4	1889..... 14	1893..... 62	1897..... 121

Having held for many years the view that the general use of electrical energy for purposes other than lighting would result from low costs of production, the analysis of these returns has proved a great fascination for Mr. Hammond, and since 1892 he has published weekly analyses in *Lightning*. The present paper was therefore compiled by him to show the gradually decreasing cost of the production and distribution of electrical energy from electricity supply stations.

The existence of such data is remarked to be unique in the history of English industries, if not in that of the industries of the world, and gas companies would shrink from such a rigid analysis of their cost sheets as that set out by the Board of Trade for electricity undertakings. Although this requirement may seem an onerous one from a general point of view, it is stated to have unexpectedly operated most markedly in assisting the reduction of costs of production and in the lowering of prices to consumers. The publication of the analyses has

acted like an irritant upon the engineers of those works whose costs were high, and as a stimulus to still greater economies on the part of these works. Table I, which covers fifteen pages, sets out, for all the undertakings in the kingdom except the very smallest, the following data: *a*, units sold; *b*, coals used per unit; *c*, average price of coal throughout the year; the costs per unit sold of—*d*, coals or other fuel; *e*, oil, waste, water and stores; *f*, wages (on generation and distribution); *g*, repairs and maintenance; *h*, total of *d*, *e*, *f*, *g*—i. e., works costs; *i*, rent, rates and taxes; *j*, management—i. e., salaries, stationery, printing, general establishment charges, law expenses, insurance, etc.; and *k*, total costs.

In reply to recent criticism that "For about twenty years we have been told that the cost of electricity is to be reduced next year—the reduction has not come yet," Mr. Hammond points out that the prices charged at present are on the average less than one-third of those fixed by the pioneer concerns that started into existence about twenty years ago. At Leeds this year the average price will be 4d. per unit, compared with 8d. per unit five years ago; and at Brighton the charge is 1½d. per unit for all consumption beyond an average of one hour per day, the first hour's consumption being charged at 7d. per unit.

The oldest works in London are those at Kensington, where in 1891 the number of units sold was 385,050, the works cost per unit sold being 3.53d. and the total costs per unit sold 4.91d. These same works in 1896 sold 1,514,729 units, the works cost being reduced to 1.57d., and the total costs to 2.66d.

The Westminster works gave the following results:

	Units sold.	Works costs.	Total costs.
1891.....	627,500	3.32d.	5.32d.
1897.....	4,355,781	1.29d.	2.19d.

The Manchester municipal works gave the following results:

	Units sold.	Works costs.	Total costs.
1894.....	1,168,382	1.49d.	2.17d.
1895.....	1,748,244	1.22d.	1.80d.
1896.....	2,708,598	0.94d.	1.45d.

The works laid out by Mr. Hammond himself at Leeds showed the following:

	Units sold.	Works costs.	Total costs.
1894.....	291,113	2.17d.	3.11d.
1897.....	833,280	0.78d.	1.50d.

The Edinburgh municipal works show:

	Units sold.	Works costs.	Total costs.
1895.....	883,335	0.92d.	1.67d.
1896.....	1,721,557	0.63d.	1.13d.

These and other figures given in Mr. Hammond's tables go to prove that costs of production and distribution tend to decrease year by year as the output increases. The obvious inference is that on still further increased outputs the costs per unit will continue to decrease, and after dissecting the various costs and finding out the lowest cost of fuel at any station, the lowest oil and waste, the lowest wages, the lowest management, etc., of any station, Mr. Hammond draws out some "ideal" figures to show what the total costs would be in an ideal station where everything costs the lowest figures. From these figures he deduces that, if the most favorable features of each works were reproduced in one single works, electrical energy for lighting would be produced and distributed for 0.84d. per unit; but this happy combination necessitates the command of fuel as cheap and as efficiently used as at Aberdeen and Leeds; it necessitates the careful control and use of oil which characterizes Oldham and Leeds; it requires the minimizing of the wages list to the standard of Edinburgh, and the absence of breakdowns to machinery which signalizes the working at Newport; it demands the happy position of freedom of rent and the friendly consideration of the rating authority which obtains at Cardiff and Worcester, combined with the economical apportionment of management charges that prevails at Whitehaven.

The assemblage of all the virtues in one works may come in time, but meanwhile we have to be content with an approximation thereto, and it is satisfactory to find that two of the above named

Help to fight the Electrical Trust by subscribing to **ELECTRICITY**.

works, Edinburgh and Leeds, show satisfactory signs of nearing the goal with increased outputs, both having respectively succeeded in lowering the record of costs per output. In view therefore of the exceptional conditions under which the above ideal costs are obtained, Mr. Hammond does not think it would be right to take 0.84d. as the goal to which the bulk of English works can expect to arrive, and he prefers to direct attention to Mr. R. E. Crompton's carefully reasoned-out ideal standard costs laid before the Institution in 1894. Mr. Crompton then prophesied to a somewhat incredulous audience that the day would come when, with an output of five million units, costs of production and distribution where best coal is 20s. per ton would work out at a total of 1.32d. per unit sold. After the lapse of four years these ideal standard costs have in one case been improved upon, and in two others closely approached, with much lower outputs than the 5,000,000 units fixed by Mr. Crompton. These are Edinburgh, Leeds and Manchester; but in all these cases the coal was obtainable much below the 20s. per ton which Mr. Crompton took as a basis. The lowest costs achieved in the City of London are those of the St. James's Company and the Westminster Company. In the former, on a total of 3,028,212 units, the total cost per unit sold was 2.19d. In the latter on a total of 4,355,781 units, the total cost per unit sold was the same, 2.19d. It is a singular coincidence that both these works, though with widely different outputs, should achieve exactly the same total cost per unit, i. e., 2.19d. These results have been considerably improved upon by provincial plants, even after making allowance for cheaper coal.

The question arises, what are the conditions tending towards such low costs as those recorded? Manufacturers of electrical apparatus, of engines and of boilers, or advocates of certain systems, claim the costs as entirely due to their plant, or the adoption of their pet system; but an examination of the records achieved dispels the illusion that the lowest costs can only be obtained by the use of particular engines, boilers, dynamos, etc., or special systems of distribution. Low costs are rather the result of the combination of favorable conditions. The output is of course the greatest factor in the reduction of costs per unit.

Mr. Hammond gave a number of curves illustrating graphically the relation of works costs per unit to units sold in a number of places. In each place the works costs per unit sold fall rapidly as the output increases from year to year.

Obviously, however, output is not the only influence on costs, for if it were we should find that throughout the kingdom costs were in inverse ratio to output; whereas from record costs shown it is seen that the highest costs are by no means characteristic of the lowest outputs, though the converse does apply—i. e., that the lowest costs accompany the higher outputs. In estimating the influences bearing upon the costs question, Mr. Hammond places load-factor directly after output. Without the latter the most favorable load-factor is useless, but, combined with a healthy output, a favorable load-factor greatly reduces cost. So convinced is Mr. Arthur Wright, the Brighton Borough electrical engineer, of the importance of load-factor, that he offers to supply all his customers at 1½d. per unit, for any consumption beyond an average of one hour per day, of their maximum demand throughout the year. A good deal of data is put forward in the paper showing the load-factor and units used in distribution.

"Reliability of plant" comes in for treatment, and while acknowledging to the full the indebtedness of the profession to those firms of manufacturers who have placed excellence of work above every other consideration, he expresses the belief that in certain cases the pursuit after efficiency has sometimes resulted in the sacrifice of reliability. Perfectly reliable generating and distributing plant has a very important bearing on costs. After completion of

erection of plant on station site, Mr. Hammond always insists upon very rigid and prolonged tests. These tests invariably include ten or twelve hours' consecutive running at full load, two hours' running at emergency load, governing, the whole load to be thrown suddenly on and off, limit of temperature rise at the end of the ten or twelve hours' run. Generally speaking, when plant has passed this ordeal it can be depended upon to cope with almost every emergency arising in the regular course of its work. To run works economically, perfectly reliable plant must first be secured, at almost any cost.

What is termed the "engineer factor" is mentioned as one of the greatest factors, and an engineer in charge must be distinguished for ability, assiduity and earnestness, combined with rigid weekly analysis of his works costs, if the desirable result is to be obtained. The gradual improvement of status in the position of electricity works engineers is encouraging, and though higher salaries will increase management expenses, they will be much more than counterbalanced by the lower works cost. The deplorable niggardliness in some electricity works towards the assistant engineers is not mentioned by Mr. Hammond, and as it only prevails in a few exceptional cases it need hardly be taken into consideration.

Efficiency of generating plant, efficiency of distribution and all round efficiency are considered briefly, and the author then proceeds to consider the range of ultimate costs of production and distribution. The effect of output, load-factor, reliability of plant, engineer factor, etc., in this connection is also viewed. In provincial towns and cities, if not in the metropolis, the supply of electrical energy for tramway traction would afford a splendid day load; and works that succeeded in reducing their costs on a lighting load to, say, 1.50d. per unit (total costs) would probably have the costs reduced to 0.75d. by the addition of one million units delivered to the tramway feeders between the hours of 6 A. M. and 10 P. M. Unreliable plant should be weeded out and replaced by solid high-class apparatus, or decreased costs cannot be expected.

At the conclusion of his very useful and interesting paper, the author, like Mr. Crompton on a previous occasion, ventured a prophecy as to the reduction of costs in works situated in an industrial center. He prophesies that when the Leeds output reaches the ideal figure of five million units the costs of production and distribution will work out at .75d. per unit sold (total costs). Seeing that the Leeds output for 1897 was only 833,280 units, it would seem that the time referred to is not immediately upon us.

TEMPERATURE COEFFICIENTS OF MAGNETS.

The results of an interesting investigation, made by Mr. J. R. Ashworth to ascertain what kinds of iron and steel are least liable to a change of magnetic intensity under moderate fluctuations of temperature, were recently communicated to the Royal Society by Prof. Schuster. Specimens of steels containing severally tungsten, manganese, cobalt and nickel, also specimens of cast irons, of different blends of pig irons, and of different percentages of carbon, were procured from a number of different English and Scotch firms. The size of these specimens was in general about 15 cm. long and 1 cm. or 2 cm. thick, and the course of an experiment was as follows: The rod or bar in its normal state, or after being hardened or annealed as occasion required, was magnetized between the poles of a powerful electro-magnet excited by a battery of twenty-six storage cells. The magnet was then fixed rigidly in a horizontal tube, through which a stream of cold water and steam could be alternately passed. The tube and its contents were placed at a convenient distance from a sensitive dead-beat magnetometer and at right angles to the magnetic meridian. The deflections of the magnetometer needle were read

by the usual mirror and scale, and from the readings were deduced directly the temperature coefficient and the total irreversible loss of magnetism. The process of heating and cooling the magnet was continued until the intensity fluctuated between two nearly constant values corresponding to the temperatures of the cold water (10 or 20° C.) and steam (100° C.). The coefficient α was then calculated by inserting these values in the equation $I' = I(1 - \alpha t - t)$. The author found that the temperature coefficient is generally least in the hardest irons and steels, and is particularly small in hardened cast iron. Certain hardened nickel steels had very small negative coefficients, i. e., underwent an increase of magnetic intensity with increase of temperature. Experiments were also made with pianoforte wire, lengths of 12 cm. each being out from a coil of the wire and tested after various treatments. Magnetized in the normal state this material gave a negative coefficient. When heated to bright redness and chilled rapidly or slowly the coefficient became positive. As it was thus possible to change the sign of the coefficient, an attempt was made to find the particular temper which would give a zero coefficient. Lengths of the wire were heated severally in oil to 200 degs. and 260 degs., and in air to a temperature producing a film of oxide, and rapidly chilled in water. The coefficient still remained negative, and of nearly the same magnitude. But when heated to dull redness and quenched, the coefficient was very nearly reduced to zero. Heated to higher temperatures and quenched, the coefficient became positive. In some steels it was also found possible to change the sign of the temperature coefficient by alteration of the ratio between the length and diameter of the bar. Some relations between this "dimension ratio" and the self-demagnetizing factor, temperature coefficient and permanent loss of magnetism after alternate heatings and coolings were also investigated. Experiments are in progress with the object of procuring a steel with a zero coefficient, but adjusting the temper and dimension ratio. The complete paper, with curves and tables, is published in No. 382 of the *Proceedings of the Royal Society*.—*The Electrician, London.*

BOOK REVIEW.

MODERN SWITCHBOARDS. By ALBERT B. HERICK. Published by the Cutter Electrical and Manufacturing Co., Philadelphia. Pp. 222. Price \$3.

This work, as the title indicates, is devoted to the description of switchboards, switches and similar appliances. The book is divided up into eleven chapters as follows: Circuit-breaking Devices, Switchboard Construction, Switchboard Appliances, Protective Devices, Low Tension Switchboards, Low Tension Central Station Switchboards, Railway Switchboards, Alternating Current Switchboards, Arc Light and Special Switchboards, Circuit-breakers and their Use in Power Transmission, and the Development of the Circuit-breaker. The introduction gives an extremely interesting historical sketch of the switchboard, and points to the various steps that have led up to the present practice. The work itself contains a great amount of useful information and is fully and handsomely illustrated throughout. This valuable addition to the literature on the above subject should certainly be in the hands of all those in any way connected with central stations, either as operators or designers.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LONDON NOTES.

[From our London Correspondent.]

The Telephone Service.

There has for years past been widespread dissatisfaction with the English telephone service, and the British Parliament has now resolved to appoint a select committee to go into the whole question, especially taking into account the positions of the National Telephone Company and the British Post Office in regard thereto. One of the special points which this committee will have to consider is whether the telephone service is of such public benefit as to justify a municipality in using public funds for working the telephone within its area. The committee will sit almost immediately and will cover the matter in about half a dozen sittings, reporting to Parliament before it prorogues.

Nottingham Electric Tramways.

The Corporation of Nottingham has been investigating the question of mechanical traction, and after considering the cable, conduit and accumulator systems, has resolved in favor of the trolley. The Corporation will buy up the city lines, carry out extensions, and equip them all with electric power, at an estimated outlay of \$2,200,000.

Municipalities and Electrical Work.

Electric lighting undertakings are making good progress financially in the hands of English local authorities, but it has just been held by a Leicester County Court judge that it is illegal for municipal authorities to carry on business as electricians and wiring contractors, as the Electric Lighting acts do not include such a provision. This point was raised by an electrical contractor who purchased lamps and fittings from the Corporation and then refused to pay for them in order that when the matter went to court he might test the legality of the Corporation trading in materials. He has been ordered to pay the bill, but the judge decided in his favor on the point raised. As there are several English Corporations trading in a small way on somewhat similar lines, the matter was considered of considerable importance to the electrical tradesmen who were thus placed in direct competition with the local authority to whom they were ratepayers. The point may yet be contested in a higher court.

CANADIAN NOTES.

The Montreal Street Railway Company is building twenty motor cars for the Kingston, Jam., street railway.

The Halifax, N. S., Electric Street Tramway Company will spend about \$50,000 in improving their plant. They have just installed two large generators.

E. F. Hutchings and others, of Winnipeg, Man., ask power from the Provincial Legislature to construct an electric or steam railway from Winnipeg along the east side of Red River to St. Andrew's Rapids.

In respect to the proposed auto car service to be established between Toronto and Richmond Hill this summer, it is said the initial car will be fitted with electric lights, and buttons for the use of conductors and passengers by which a warning may be given the motorman to turn to the right or left. It is claimed that this car will develop sufficient power to ascend heavy grades between Toronto and Richmond Hill at a speed varying from 6 to 12 miles per hour, carrying a full complement of passengers.

By an agreement entered into upon the commencement of the road, Mr. J. H. Beemer had a two years' option for the purchase of the Quebec Street Railway. It is now said to be his intention to purchase the road, and to consolidate it with the Quebec, Montmorency and Charlevoix Railway. The motive power of the latter road will at once be converted from steam to electricity. Later on an extension of the road will be made to Murray Bay.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

Personal.

Few men are better known in the electrical field than Mr. Edward R. Knowles, the electrical, civil and mechanical engineer, and the trade will be interested to learn that Mr. Knowles has become identified with the Sprague Electric Company, where he will have entire charge of their power motor department. Mr. Knowles is so well known that it is almost superfluous to say much about him. He is a Californian by birth, but his work and life have been

almost entirely in the East, where as an engineer for electrical installations, in his specialty of supplying electric motive power to all classes of machinery, and as consulting engineer for the New York and Brooklyn Bridge Company and scores of other corporations, he has attained a very enviable reputation. Mr. Knowles' career as an inventor, and in the developing, perfecting and rendering commercially successful the ideas of others, has been more than noteworthy, and his all-round reputation and ability will surely prove of great value to the Sprague Company. His engagement furnishes additional evidence that the Sprague Company is determined to have the best men in the right place, and both the Sprague Company and Mr. Knowles are to be congratulated on their new alliance.

THE TROLLEY DECISION.

What the Walker Company Thinks of It.

The Walker Company of Cleveland, O., which was the real defendant in the suit of the General Electric Company against the Union Railway Company of New York, has issued a circular containing the recent decision of the Court of Appeals and a preface thereto giving a synopsis of the proceedings leading up to the decision. The following is the story in detail as given in the circular:

The long story of harassing litigation on the question of the right of manufacture by independent electric companies of the overhead trolley is finally closed.

After months of fighting and repeated efforts of the trolley trust to prevent all competition in the manufacture of this important item in the equipment of the electric car, the Walker Company has secured a final verdict from the highest court which absolutely prevents further annoyance of its customers and makes the trolley absolutely free.

The case was considered closed when on July 23d, 1897, the U. S. Circuit Court of Appeals, Second Circuit, handed down a decision setting aside the injunction granted by the lower court against the Hoosick Railway Co. (the Walker Co.'s customer) on all except claims 2 and 4 of the Van Depoele patent.

Not satisfied, however, with this reversal of the lower court's decision, the General Electric Company again brought suit in February, 1898, against the Walker Company, this time through another customer, the Union Railway Company of New York.

This suit was brought on claims 2 and 4 of the Van Depoele patent, which were used simply as a last resort, as they were of so broad a nature that it was considered futile to bring them to trial in the first place.

The lower court again gave a decision for the plaintiff but refused to grant an injunction. A prompt appeal was taken, and, as before stated, the decision was rendered April 7, declaring the clauses null and void, and making the trolley free for all time to come.

The suits were brought by the General Electric Company in the name of the Thomson-Houston Electric Company, which is an integral part of the former concern.

The importance of this decision can hardly be overestimated. The General Electric Company considered these patents of such import that they were counted as a large per cent. of the \$3,000,000 of assets represented by patents controlled by the Trust.

We quote from President Coffin's annual report, submitted April 27, 1897:

"The courts have invariably recognized the validity and controlling importance of the Van Depoele patents on the electric railway trolley and switch system, and at the present time substantially all manufacturers of infringing trolleys and switches are under injunction. The company has met with no reverses in its patent litigation during the past year."

During the past year the Walker Company has rendered invalid two important motor patents and all the trolley patents controlled by the Trust, and one cannot help looking forward with interest to that part of the forthcoming General Electric report which will deal with the patent situation.

It is hardly necessary to say, in view of the foregoing, that this trolley patent was considered the most important and valuable controlled by the General Electric Company.

A word concerning the policy of the Trust will not be out of place here. Its policy has always been that of intimidation, and it has endeavored (successfully in many cases) to force all competing concerns

to the wall. The Walker Company is to-day the only independent concern manufacturing all types of electric machinery which has successfully competed with the Trust and which has had the resources and determination to resist its continual attacks. Its magnificent record in the past in defending its customers from malicious suits can be referred to with pride, and one by one the all-embracing claims of the Trust are being set aside.

LEGAL NOTES.

Judge Woolson of the U. S. District Court at Keokuk, Ia., has handed down a decision against J. C. Hubinger for \$22,760 and interest from June 10, 1896, in favor of the Central Trust Company of New York. In January, 1894, the Central Trust Company foreclosed a mortgage on the Gate City Electric Street Railway at Keokuk. Mr. Hubinger bought the property on April 29, the same year, for \$10,000. The sale was opposed by the Central Trust Company and appealed to the Supreme Court of Iowa, which two years later ordered a new sale. In the meantime Mr. Hubinger had improved and finally disposed of the property to a corporation which he formed. The Central Trust Company sued Mr. Hubinger for conversion of property and has been successful.

In the suit brought by the city of Indianapolis against the Citizens' Railroad Company, the Circuit Court has rendered a decision in conformity with the law passed by the last Legislature, ending all street railroad franchises in Indianapolis January 1, 1901. The Citizens' Railroad Company claims that its charter is perpetual, and will appeal to the Supreme Court.

The Imperial Electric Company, New York, was sold out by the sheriff on the 11th inst. The property brought \$160.

The sheriff has received an execution against the Electric Self-Playing Piano Company, of 66 East Houston street, New York, for \$5,278 in favor of Hattie C. Davis on an assigned claim of George Howlett Davis for services and money loaned to the company in the last three years. He was secretary and treasurer, and Frederick C. Alden was president. The company was incorporated in August, 1895, and capitalized at \$100,000.

THE NEWS.

What is Going On in the Electrical World.

Bordentown, N. J.—The council has passed an ordinance granting the right of way through the city to the Monmouth Traction Company.

Brooklyn, N. Y.—The representatives of the street railroad companies whose cars run on the bridge held a conference with the Department of Bridges officials a few days ago on the question of tolls. During the conference the representatives of the companies said that the cost of running cars over the bridge had been averaged up to be 20 cents each trip. The power required to propel them costs 7 cents, 13½ cents were required to pay for additional labor and 3½ cents for additional inspectors, besides the 5 cents paid the city for toll. They said that up to the present time the passengers had averaged fourteen to each car. They submitted that when the cost of transporting the passengers to the various parts of Brooklyn was considered, the railway companies were putting themselves to a great extra expense and could hardly be asked to pay a larger toll. The representatives admitted that an average of 100,000 persons had ridden over the bridge on the trolley cars every day. They promised Bridge Commissioner Shea to prepare sworn statements as to the cost of operating the cars on the bridge and the receipts and number of passengers carried.

Buffalo, Wyo.—A proposition to construct an electric line from this place to Clearmont station on the Burlington & Missouri Railroad, 32 miles distant, is being considered by an Eastern company located at Syracuse, N. Y. The road would be used primarily for freight traffic, and it is believed would prove a profitable investment on the amount required to construct the line, which would be under \$4,000 a mile.

Columbus, O.—Senator Burke's street railway franchise bill is indefinitely postponed. The bill provided that franchises should not be granted to street railway companies for more than 25 years, and that subsequent franchises should not be for more than 15 years and be granted during the last year of the first franchise. There were but 10 votes in its favor.

Delaware, O.—The Delaware Electric Street Railway was offered at public sale for the second time on the

11th inst. There were no bidders. The road is appraised at \$35,000. The court has ordered the road reappraised and again advertised.

Jackson, Miss.—The city council has granted a franchise for an electric railroad and light plant, this time to Gen. W. T. Carnes of Memphis, Tenn., and H. H. Corson, representative of the General Electric Company of New York. The franchise is the same as was granted last summer to Mayor McKisson of Cleveland, O., and associates, except that work is to begin in sixty days, and five miles of roadbed to be completed in seven months from date of franchise, a thirty days' discontinuance of work after being begun to forfeit the charter. The city agrees to take 120 arc lights at \$114 each per year for ten years. Work on the light plant is to begin in five months.

Laporte, Ind.—The county commissioners have granted a franchise to the Hon. John W. Lovett and W. H. Huffman of Anderson to build an electric railway from Laporte to Michigan City, a distance of 12 miles. A survey of the line will be made at once.

Mechanicsburg, Pa.—The Harrisburg & Mechanicsburg Electric Railway Company has accepted the conditions imposed by the borough council of Shiresmantown for right of way through that town, and operations will at once commence to continue the trolley from White Hill to that town, and thence to Mechanicsburg.

Newport News, Va.—The council of Hampton has granted right of way through that town to the Newport News, Hampton & Old Point Railway & Electric Company which proposes to compete for passenger traffic between this place and Old Point with the line already in operation.

Portland, Ore.—The Northern Railway & Improvement Company of this city has become the owner of all the right of way, franchises, cars, buildings, power house, tracks, etc., of the New Whatcom (Wash.) & Fairhaven Street Railway Company, and thereby succeeds to all the interest therein of the Thomson-Houston Electric Company. Some needed improvements will be made in the road at once.

Quincy, Ill.—The city council has passed an ordinance granting J. C. Hubinger a thirty-year street railway franchise, specifying the streets through which the line must run.

Richmond, Va.—At a meeting of the Richmond & Petersburg Electric Railway Company in this city on the 9th inst., Corbin Warwick of Richmond was elected president of the company, and John S. Primrose of New York vice-president. It is the purpose of the company to push the enterprise to completion. The line will be about 20 miles long.

Saginaw, Mich.—Mayor Baum in his message advocates the purchase and operation by the city of the electric street car lines, now in the hands of the receivers. It is proposed to get legislative enactment permitting Saginaw to buy the entire system and either run the cars under municipal control or lease the tracks to a private corporation. Mayor Baum suggests a non-partisan commission to govern a street car department under civil service regulations. This, he says, will end the trouble which the city has had for several years and the result will be a benefit to the municipality.

San Francisco, Cal.—Manager Vining of the Market Street Railway has under consideration a plan to operate a through line of electric cars to the Cliff House and ocean beach. The new line will be operated as soon as the road now being built on H street south of the Park is completed. This will be about the 15th of next month. The proposed through service will be run in conjunction with the Ellis and O'Farrell street electric line.

LIGHTING PLANTS.

Allegheny, Pa.—The bids for furnishing a dynamo for the electric light plant were as follows: Western Electric Company, \$1,900; the Fort Wayne Electric Corporation, \$2,000, and the General Electric Company, \$2,038.

Alton, Ill.—The bond for \$10,000 filed by Receiver James Duncan of the Alton Gas & Electric Company has been approved by Judge Hope, and the judge has entered an order giving Mr. Duncan possession of the property.

Annapolis, Md.—By an act of the Legislature the corporate authorities of Takoma, Md., are empowered to bond the town to the extent of \$10,000 and employ the proceeds to establish a water and sewer system and electric lights.

Brooklyn, N. Y.—The War Department will, it is said, install an electric searchlight of 20,000 candle power on top of the iron observatory at Surf Avenue and West Third street, Coney Island.

Chelsea, Mich.—The village has voted to borrow the sum of \$13,000 to be used exclusively in the purchase of the local electric light and waterworks plants.

Davenport, Ia.—The Consolidated Gas, Electric Light & Steam Heating Company has filed amendments to its articles of incorporation changing its name to Davenport Gas & Electric Company and its capital stock from \$400,000 to \$800,000.

Elmira, N. Y.—Sealed proposals will be received until May 2 for lighting the city streets by electric arc lights (240 or more) for one, three and five years from Novem-

ber 7, 1898. Information can be obtained by addressing M. H. Murphy, city clerk.

Lamar, Col.—The proposition to grant a franchise for electric lighting to a responsible company was carried at the recent election.

Long Branch, N. J.—The commissioners rejected all bids offered for lighting the city, and will have to advertise again. It costs at present \$13,000 or \$96 per lamp for lights, and the mayor and commissioners consider \$10,000 sufficient.

Milwaukee, Wis.—H. M. Green, of this city, who owns a twenty-five year franchise for furnishing electric lights in South Milwaukee and operates a plant there, offers to sell outright to the city his entire plant at an annual payment of \$90 per year for each of thirty-one lights, or \$2,723 per year for ten years, at the end of which time the entire property passes to the city.

Mechanicsburg, Pa.—Proposals for lighting the streets of the borough of Mechanicsburg, Cumberland County, Pa., will be received until May 10. The requirements are for 47 or more arc lights of 1,600 cp., and 12 or more incandescent lights of 32 cp., the bids to specify price for all night lighting or until 12 o'clock nightly. Bids should be addressed to C. N. Owen, chairman light committee, Mechanicsburg.

Mount Olive, N. C.—J. D. Williams of Kenansville will own and operate the electric light plant now under construction in this place. He expects to have it in operation by May 1. Mount Olive has only about 1,200 inhabitants and is the smallest town in the State to introduce electric lights.

St. Louis, Mich.—The citizens by their vote at the recent election decided to bond the town for \$20,000 and purchase an electric light plant.

St. Paul, Minn.—The board of public works has decided to immediately abolish thirty gasoline lamps and about an equal number of gas lamps on the west side. In place of these lamps twelve arc lights will be supplied. The electric lights will be furnished by the Edison Heat, Light & Power Company at their bid of \$94 per light per year, for an all-night service.

Superior, Wis.—The committee on city and commercial lighting plant advertise for bids for the construction and installation of a municipal electric lighting plant to supply both city and commercial lighting. Bids must be sent to the city engineer not later than April 30.

Tonawanda, N. Y.—There seems likely soon to be an end of the lighting contest that has agitated the people of this city for the last two years, and as between the gas and the electric light company popular feeling is so strong in favor of the latter that it is very probable that the contract for lighting will be secured by the Tonawanda Lighting & Power Company. The voters have already decided against municipal ownership of a plant.

Wapakoneta, O.—The proposition to issue and sell \$5,000 worth of city bonds for improving and enlarging the electric light system was carried at the recent election by a large majority.

Wayne, Neb.—At the election held here recently the proposition to bond the town to secure an electric light plant was carried by a large majority.

Westfield, Mass.—The 1,400 citizens of this town who voted recently for municipal ownership of the gas and electric lighting plant are said to be apologizing to each other for the act. They expected to have to pay about 100,000 for the plant, but the company has filed a statement with the town clerk in which they value the property at \$250,000 and would sell for this sum. The laws require the purchase of existing plants by a town or city before it can go into business for itself.

Wilkesburg, Pa.—The Rural Electric Light Company has asked the council for permission to operate lines for the distribution of electric power throughout the borough.

MANUFACTURING, ETC.

New York.—One of the latest electric elevator contracts awarded the Sprague Electric Company is for ten machines for the Commerce Realty Building in St. Louis. Says a St. Louis contemporary: "This installation represents a distinct advance in St. Louis in modern installations of this character, and its performance will be watched with interest." The St. Louis contract is but one of a large number of out of town contracts recently awarded the Sprague Company.

Indianapolis, Ind.—The Jenney Electric Company has been newly organized with a capital stock of \$50,000. The new company, which is composed of Charles D. Jenney, William C. Hansen, Timothy L. Bosart and John G. Wynn, has purchased the property of the old one and a contract will be let at once for the main building to take the place of the one burned a year ago.

Atlanta, Ga.—W. R. McBride of Chicago states that he has made arrangements for the establishment in this city of a factory for the manufacture of electric lamps and all kinds of electrical supplies which will give employment to from 75 to 100 hands.

TRANSMISSION PLANTS.

Albany, N. Y.—Gov. Black has signed the bill incorporating the Electric Water Power Company of Oneonta, Otsego county, with the right to construct dams on the Susquehanna River for the purpose of developing hydraulic and electric power.

PERSONAL AND MISCELLANEA.

T. M. Steger has resigned the presidency of the Nashville (Tenn.) Street Railway and L. D. Tyson of Knoxville has been elected to the vacancy.

What struck a Fiume, Austria, warehouse and set it on fire turns out to have been a meteor. It was assumed to have been lightning till a four-ton meteoric stone was found in a deep hole in the cellar.

A young man named Warren F. Garis was instantly killed on the 9th inst. in Philadelphia by shock from an electric light wire which he caught hold of while working on a roof at North Second street.

The trolley has driven out the hitching posts in New England towns. There are said to be very few left. Suburban farmers are no longer required to hitch up a horse to take them to town. The trolley cars save them that trouble.

The Governor of Massachusetts on the 14th inst. signed the bill substituting electricity for the rope in putting condemned criminals to death in that State. The new law will not apply to those now under indictment nor to any person who committed murder prior to the act going into effect.

Philip Hess of the Fort Wayne Electric Corporation has received notice of his appointment as electrical engineer of the navy. He was notified, says the Ft. Wayne "Journal," to report at Erie, Pa., for active service on April 15. He will be assigned to one of the new ships recently purchased by the Government.

The Societe Generale des Industries Economiques of Paris has built an electric light installation in the French National Printing Offices free of cost to the Government on condition that they should be paid for the light for thirteen years, the rate to be lower than that formerly paid for gas, and that at the end of the thirteen years the plant shall become the property of the Government.

Thomas H. McLean, vice-president and general manager of the Toledo Traction Company, Toledo, O., has announced a number of changes in the force. Superintendent Hinckley has been succeeded by John Collins, and F. B. Perkins by J. M. Yates. The position of purchasing agent, held by O. E. Merrill, has been abolished. Mr. McLean has abrogated some of the most offensive rules for the guidance of motormen and conductors.

Harry H. Winter, borough auditor and secretary of the Dunmore Electric Light & Heat Company, was instantly killed at Dunmore, Pa., on the evening of the 9th inst. He was notified that an arc light on Chestnut street was not working. He summoned a lineman, who lowered the light, and Winter, standing in the street on the street car track, grabbed the carbon with both hands, the rail completing the circuit. The entire current, 2,800 volts, passed through his body, causing instant death. Winter was 23 years old.

Some of the delicate instruments of the Toronto Magnetic Observatory intended to measure fluctuations in the earth's magnetism have been greatly disturbed by the electric currents flowing through the earth from adjacent trolley lines. Consequently these instruments are to be removed to another site nine miles from the city and two miles from any possible trolley route. The records of the Toronto Magnetic Observatory date back more than half a century and are said to be the most valuable of their kind ever obtained on this continent.

If newspaper reports are true, a Paris physician has made a discovery that will be of undoubted value to electrical men who are so unfortunate as to be burned by the electric current. The Paris doctor says that a solution of one part picric acid and seventy-five parts of water will cure quickly the most serious burns. The pain is instantly removed without blistering or irritation, and the wound heals in four or five days. A yellow tint is left on the skin, which may be removed by a solution of boric acid.

The failure of the firm of Alfred Dolge & Son of Dolgeville, N. Y., has caused deep regret throughout the Mohawk Valley. The failure was immediately brought about by Mr. Dolge's inability, owing to the Cuban difficulty and the uncertainty existing in the money market, to secure the necessary amount with which to meet notes due April 1 and May 1, some of which are already under protest. The liabilities will reach \$1,000,000, and the assets in Dolgeville are estimated as approximating \$1,500,000. Mr. Dolge, the elder, is interested in a number of large enterprises at Dolgeville and neighborhood, one of his latest being the High Falls Electric Light & Power Company, the completion of whose plant was celebrated by an elaborate banquet on the 15th of January last, noticed at the time in this journal.

WANTED FOR THE UNITED STATES NAVY.

Qualified men for the ratings of ELECTRICIAN. Applicants must be capable of performing all duties pertaining to the care, preservation, and manipulation of a ship's electric lighting plant and its appurtenances, together with all other electrical appliances; they must also be physically qualified. First enlistment is made in the rating of Electrician, second class, (\$35 per month,) with possibility of future advancement to Electrician, first class, (\$40 per month,) and Chief Electrician, (\$50 per month). In addition to the pay stated, there is a ration allowance of 30 cents per day. Enlistments in this rating are made only at the Navy Yard, Brooklyn, N. Y.

RECENT COMPANY ELECTIONS.

Consolidated Street Railway Company, Grand Rapids, Mich.—Directors: V. Shaw Kennedy, M. D. Cummings and O. S. Gaither of Chicago; Jacob Kleinhaus and G. Stewart Johnson of Grand Rapids.

Edison Light & Power Company, La Crosse, Wis.—President, F. A. Copeland; secretary and treasurer, E. R. Bentley; directors: Col. F. A. Copeland, J. J. Hogan, E. E. Bentley, R. Y. Hyde, James McCord, A. Hirschheimer, G. Van Steenwyk.

Manchester & Goffstown Electric Railroad Company, Manchester, N. H.—President, Eugene S. Whitney, Manchester; vice-president, F. A. Condon, Goffstown; secretary, Rev. A. W. Sibley, Goffstown; treasurer, Alderman O. D. Knox, Manchester; directors: Dr. C. F. George, George W. Colby, Goffstown; H. H. Simons, Riverdale; H. Pinard, Manchester.

Suburban Street Railway Company, Montgomery, Ala.—President, Alexander Troy; vice-president, Edward A. Graham; secretary, Francis G. Caffey; treasurer and manager, H. S. Jones.

Topeka Street Railway Company, Topeka, Kan.—Directors: M. A. Low, J. N. Monecker, Charles Blood Smith, W. H. Roslington, H. C. Spicer, Charles S. Gleed, P. G. Noel, L. Wason, F. G. Willard, Samuel T. Howe, C. K. Holliday, J. M. Patten, C. C. Baker.

Willow Grove & Hatboro Street Railway Company, Hatboro, Pa.—President, S. J. Garner; vice-president, William Hallowell; secretary, O. E. O. Robinson; treasurer, James Van Horn; directors: James Van Horn, John H. Fow, O. E. O. Robinson, S. J. Garner, William Hallowell, J. F. Cottman and O. F. Ehrenpfort.

COMMERCIAL PARAGRAPHS.

The Noxall Fan Motor.

An exceedingly handsome fan motor now on the market is the 1896 model "Noxall," manufactured by the Vance Electric Company of 136 Liberty street, New York. This fan motor combines art and symmetry, and its design is based on true mechanical principles without the essential element of perfect design being lost sight of. The motor is mounted on a heavy base, thus ensuring rigidity, and at the same time admits of an adjustment of 30 degrees. The motor proper is secured to the base by two dolphins of a grotesque design and of the proper length in order to give the fan and guard the necessary clearance from the base. The two supports admit of and provide ready means of adjusting the inclination of the motor. This adjustment also allows the converting of the fan from a pedestal to a bracket type and vice versa, proper means being provided in the base to secure the fan to the wall. The Vance Electric Company will supply a revolving base for a slight addition in price.

The pole pieces of the motor are of mild steel, all exposed parts being highly polished and nickel-plated. The arma-

NOXALL FAN MOTOR.

ture is of the iron-clad, slotted, Paccinotti type. The commutator is constructed of hard-tempered copper, several features in the same securing long life and reducing the possibility of sparking to a minimum. The bearing case at the commutator end carries the brush holders, the carbons used securing even contact and self-lubrication. The journals are long and self-lubricating, there being enough grease in the cups to last one season. A six-blade fan is used, with extra large spider carefully secured to the shaft by set screws. The guard is heavy and strongly made, and easily removed from the motor frame, if desired. The switch is mounted on hard rubber across the pole pieces, on the top of the machine, and allows of three speeds, namely, 900, 1,400 and 1,800 revolutions per minute. Lower speeds are also supplied, if desired, on special order.

All fans have exposed parts, except base, which is oxidized bronze, nickel-plated, which gives them a very rich appearance. The efficiency of the fans is of the very highest, the following figures showing efficiency of the

various sizes: Twelve-inch fan at maximum speed, 43 watts; 14-inch fan at maximum speed, 70 watts; 16-inch fan at maximum speed, 96 watts.

Educate Your Bowels With Cascarets.

Candy Cathartic, cure constipation forever. 10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

The Warren Alternator.

The General Electric Company have, as is well known, been striving for years to construct an induction machine, but for some unaccountable reason have never seemed to "strike the combination." As long ago as 1892 they illustrated in the *Electrical World* a single-phase double magnetizing coil induction alternator which was heralded in the reading matter columns as the "final triumph." It, too, sank into oblivion and is doubtless resting tranquilly among the other stars once so luminous in the electrical firmament.

The true induction alternator has finally triumphed, as exemplified in the Warren Alternator manufactured by the Warren Electric Manufacturing Company of Sandusky, Ohio.

The greatest possible attention has been paid to the bearings of the Warren Alternator, and it is confidently asserted that the bearings used on this machine have no equal. They have been designed especially for the severe work expected of them in a machine built for practically continuous runs in a service where stoppage from any cause occasions great annoyance and damage, frequently to entire communities. The best bearing heretofore constructed has not met every requirement in the exacting service of electric lighting. In all bearings heretofore made, the slightest wear or derangement due to belt strains, magnetic pulls, centrifugal action, etc., necessitates shutting down and adjusting something. The Warren bearing is self-aligning, self-oiling, but more than all, is adjustable in every direction while the machine is in motion.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

INCORPORATIONS.

The People's Electric Light, Heat & Power Company, Gettysburg, Pa. Capital stock, \$2,000.

The Bidwell Trolley Car Company, Chicago, Ill. Capital stock, \$50,000. Incorporators: Benson Bidwell, Rose Bidwell and Byron Bidwell.

The Decatur Gas & Electric Company, Decatur, Ill. Capital stock, \$400,000. Incorporators: W. C. Jones, G. C. Danforth and Joseph Housum.

The Farnham Electric Company, Chicago, Ill.—to do an electrical manufacturing business. Incorporators: E. W. Farnham, H. Burkholder and G. E. M. Pratt.

The Williams Electric Company, Cleveland, O. Capital stock, \$25,000. Incorporators: J. A. Williams, Will G. Meade, F. J. A. Keller, B. J. Chamberlin and George Gebhard.

The Sayreville Electric Light & Power Company, Sayreville, N. J. Capital stock, \$1,000. Incorporators: Peter Fisher and Edwin A. Fisher of Sayreville, and James R. Sayre, Jr., of Newark, N. J.

The La Salle Electrical Power Company, Buffalo, N. Y.—to deal in real estate, etc., in Erie and Niagara counties. Capital stock, \$50,000. Directors: M. C. Spratt, R. O. Palmer and C. A. Pooley, of Buffalo.

The Point Breeze & Gibson's Point Railroad Company, Philadelphia, Pa. Capital stock, \$18,000. Directors: Malcolm Lloyd, M. W. Harkness, C. E. Bushnell, Edward P. Cooper, H. S. Muston, John W. Lieberton and William D. Cotton, Philadelphia.

The Peekskill Traction Company, Peekskill, N. Y.—to operate a street surface electric road between Peekskill and the towns of Cortland and Yorktown, including also a line to the State Camp. Capital stock, \$150,000. Directors: Charles Mason, James A. Haight, Frank Frye, Charles N. Wells, Jay R. Decatur, Matthew Clune, James F. Martin, Hanford Smith of Peekskill, and Jacob Larssch of New York City.

The E. A. Perkins Electrical Company, Torrington, Conn.—to manufacture electrical engines, supplies, etc., and also to do a general electrical business. President, W.

W. Mertz; secretary, E. C. Franklin; treasurer, E. A. Perkins; directors: George Reynolds, W. W. Mertz, E. A. Perkins and E. C. Franklin.

The Monongahela Street Railway Company, Pittsburg, Pa.—to build and operate an electric railway from the city line on the north side of the Monongahela River, on the Pittsburg & Homestead Bridge, to Schenley Park Bridge, five miles. Capital stock, \$30,000. Incorporators: L. G. Woods, F. M. Ross, C. T. Marsh, C. F. Farren and W. S. Mitchell.

The Chicago, Waukegan & North Shore Railway Company, Chicago, Ill.—to build and operate a railway from a point in the township of Benton, Ill., to a point within the city of Chicago. Capital stock, \$100,000. Incorporators and first board of directors: James H. Van Vliet, John E. Colton, Frank Read, William C. Finroth and Louis F. Nafis, all of Chicago.

The Army Post Electric Street Railway Company, Little Rock, Ark.—to build and operate an electric street railway. Capital stock, \$85,000, of which \$25,000 has been subscribed. Incorporators: Dod G. Gibson and Andrew F. Browne of St. Louis; R. J. Sejourner of Little Rock. The company has purchased the franchise recently secured by Maxwell Coffin and his associates and will construct the line contemplated by the original parties.

The Maryland Electric Railway Company, Baltimore—to construct and maintain a railway in Baltimore City, Baltimore County and Harford County for the transportation of passengers, freight, etc., the cars to be propelled by electricity or any improved motive power other than steam. Capital stock, \$1,000,000, with the privilege to increase to \$3,000,000. Directors: Ex-State Comptroller Marion DeKalb Smith, Henry I. Lohr, Harrison Cassard, Isaac Lobe Strauss and Leopold J. Stern.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 12, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 602,142. Supply System for Electric Railways. Percival J. Pringle, London, England, assignor of one half to Julian Money Vernon Money-Kent, same place. Filed Oct. 27, 1896.
- 602,204. Electric Block System. Franz Burger, Fort Wayne, Ind., assignor of three-fourths to Henry M. Williams, same place. Filed Aug. 2, 1897.
- 601,339. Aerial Railway. Martin A. de Palacio, Madrid, Spain. Filed Dec. 20, 1897.
- 602,281. Track-Welding. Richard Eyre, Johnstown, Pa., assignor to the Johnson Company, Lorain, O. Filed Sept. 22, 1897.
- 602,335. Conductor and Contact Device for Electric Railways. Alvaro S. Krotz, Springfield, O., William P. Allen, Chicago, Ill., and Oliver S. Kelly, Springfield, O. Filed May 28, 1897.
- 602,133. Car-Fender. Frederick A. Harris, Andrew M. Cupples and Michael McCann, Tyrone, Pa. Filed June 26, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 602,303. Manufacture of Reflectors. Sherard O. Cowper-Coles, London, England, assignor to the Reflector Syndicate, Limited, same place. Filed June 10, 1897.
- 602,380. Electric-Arc Lamp. Edgar Weber, Paris, France, assignor to Paul Mersch, same place. Filed Sept. 11, 1897.
- 602,401. Electric-Arc Lamp. John Mueller, Cleveland, O., assignor to the Duplex Hanger Company, same place. Filed Aug. 27, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 602,182. Dynamo for Electric Car-Lighting Systems. Edwin J. Preston and Arthur B. Gill, London, England, assignors to J. Stone & Co., same place. Filed Feb. 25, 1895.
- 602,218. Electric Transformer. Ludwig Gutmann, Pittsburg, Pa. Filed Oct. 31, 1890.
- 602,113. Automatic Device for Removing Resistance in Starting Electric Motors. George H. Whittingham, Baltimore, Md., assignor to the Automatic Switch Company of Baltimore City of Maryland. Filed Sept. 9, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 602,174. Telephone-Transmitter. Herbert E. Shreeve, Boston, Mass., assignor to the American Bell Telephone Company, same place. Filed Aug. 26, 1897.

BATTERIES.

- 602,172. Secondary Battery. Friedrich W. Schneider, Triberg, Germany, assignor to the Electricitäts-Gesellschaft Triberg, Gesellschaft mit Beschränkter Haftung, same place. Filed June 10, 1897.
- 602,176. Storage Battery. George A. Washburn, Cleveland, O., assignor to the Ohio Storage Battery Company, same place. Filed May 22, 1897.
- 602,302. Suspending Batteries on Carriages. Reginald T. D. Brougham and Walter C. Bersey, London, England, assignors to the Electrical Vehicle Syndicate, Limited, same place. Filed Dec. 13, 1897.
- 602,361. Galvanic Battery. Walter Rowbotham, Birmingham, England. Filed Dec. 16, 1895.

MISCELLANEOUS.

- 602,212. Process of and Apparatus for Electrodepositing. Emile L. Dessolle, Epinay sur Seine, France. Filed Aug. 25, 1897.
- 602,235. Electric-Cord Adjusting Device. Francis N. Lawton, Summit, N. J. Filed April 5, 1897.
- 602,323. System of Electrical Propulsion for Vessels. Jean J. Heilmann, Paris, France. Filed Dec. 3, 1895.
- 602,408. Apparatus for Manufacturing Carbureted Hydrogen. William H. Russell and George E. Russell, Hasbrouck Heights, N. J. Filed Sept. 14, 1897.

The General Electric Company owed on January 1, 1898, \$1,389,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

TELEPHONE AND TELEGRAPH.

Newark Express Companies Aid the Monopoly.

The Washington Star comments as follows on the attempt being made in Newark, N. J., by the express companies to aid the Bell monopoly: "In those cities where competing telephone companies have obtained a foothold the branches of the Bell Company have gone to all lengths to crush out the opposition and so preclude, if possible, the chance of a reduction of rates such as usually follows rivalry. In the city of Newark, N. J., a rival company recently obtained such a large number of subscribers by offering low rates and excellent service that the original corporation was driven to the straits of enlisting the sympathetic co-operation of other large concerns. The express companies were brought into the war, and lately notices were served by the agents of the three large express companies in Newark requiring that the instruments maintained by the rival telephone organization be removed forthwith, according to orders from the various headquarters. The merchants of that city are concerned in this move, for it takes from those who subscribe to the rival telephone service the opportunity to communicate speedily with the express offices in the transaction of their business. There is some talk of court proceedings in the name of the patrons of the express companies, but this does not seem to be well founded. The best remedy for the situation is to apply such pressure on the local council or the State Legislature as to create new legal conditions that will force the old company to bring its rates down to the point of reason. It is experience, however, that the devices for crushing out opposition such as the Bell Company has just employed in Newark operate as often to stimulate the rivalry as to check it. The patrons of the telephone service are quick to discern signs of inequality, and if there is a material discrepancy between the two scales of rental prices there can be no permanent postponement of the day when the patronage of the cheaper service will greatly outnumber that of the more costly and will successfully withstand the squeezing processes so frequently invoked by the old corporation."

Three hundred boards of trade and other commercial organizations in every large city in the United States have been asked to take action on an important question, which is tantamount to a demand for a reduction in telegraph rates charged by the Western Union and Postal Telegraph Companies. The movement was started by the Quincy (Ill.) Freight Bureau. Instead of asking that the tolls be lessened, the proposition that will be submitted to the management of the two companies will be to increase the number of words that can be transmitted without extra charge from 10 to 20. The average cost of sending a commercial message anywhere in the United States is 30 cents. Only 10 words can be sent for that sum, additional words being charged for at so much per word, according to the destination of the telegram.

The Mutual Telephone Company of Des Moines, Ia., is getting so many subscribers that it has been forced to increase its switchboard facilities. At present the company has more patronage than it can handle readily, and is making contracts for new connections subject to delay. The Des Moines Leader states that J. W. Hill, H. E. Teachout, M. McFarlin and others interested in the exchange intend to organize a company to build a toll line in connection with the Mutual exchange. It will extend from Des Moines to Ottumwa and will have about thirty-five stations. Ultimately it will be extended north through the central part of the State, making connections with independent exchanges in all the principal cities.

The common council of Norfolk, Va., has decided to grant a franchise in the city to the Southern Bell Telephone & Telegraph Company. The franchise grants the ordinary rights and without any provision with reference to maximum rates, and provides that no poles or fixtures shall be placed in the downtown section of the city. Ten 'phones, free of cost, are to be placed at the disposal of the city; 3 per cent. of the gross earnings are to be paid to the city, and the books of the company shall be subject to inspection. The franchise will be sent to the select council for its approval.

A special from Bristol, Tenn., states that the Bristol Telephone Company expects by next fall to have Bristol in telephonic connection with various points in Tennessee and Virginia. A line will be built to Abingdon, giving connection with Wallace, Wyndale, Emory and Saltville. Later the service will be extended from Gate City to Big Stone Gap, thus connecting with Clinchport, Duffield, Stonega, Norton and Wise, Va.

The board of supervisors of St. Clair County, Ill., have granted franchises to the Pope-Downey Company and the American Telephone & Telegraph Company of Illinois. The Pope-Downey Company may operate a telephone business in the county on certain conditions, one of them

being that they furnish five telephones for use by county officials. The American Company is restricted to telegraph and a long-distance telephone business. If the company should embark in local telephone business, it is to pay the county \$250 a year.

The Canton Co-operative Telephone Company has been organized by the business men of Canton, S. D., with the following officers: President, C. E. Judd; vice-president, M. L. Syverud; secretary, F. H. Bacon; treasurer, C. M. Seely. A local exchange will be put in the city immediately and a line will be run to Moe, Alcester and Beresford. The company secured the franchise for Canton ahead of the Northwestern Telephone Exchange Company.

The Interstate Telephone Company of St. Joseph, Mo., has just completed arrangements to extend its line to Nebraska City, Neb., where the business men have taken \$2,500 worth of the company's stock. The company proposes to extend its line to Omaha, Lincoln and the principal cities in southwestern Nebraska. The rates of the Bell Telephone Company will be cut in half.

The Bell Telephone Company has decided that it will exhibit at the Trans-Mississippi Exposition at Omaha a complete set of instruments showing the first telephone inventions that were used, the gradual improvements made, and the later growth and development of telephone instruments.

A new telephone company is soon to be organized at Stillwater, Minn., an ordinance granting the company a franchise being now before the council. Among the Stillwater people interested in the new venture are Otis Staples, R. H. Bronson and James Mulvey.

The county commissioners of Jefferson county, Col., have granted a franchise to J. D. Babcock, of Golden, to build a telegraph and telephone line in the county, to start at Morrisson and run up Bear Creek canyon to Evergreen.

The council of North East, Pa., refused to grant a franchise to a Bell company by a vote of 5 to 1. The independent company now operating there is giving good satisfaction and its prices are reasonable.

A new telephone company is being organized at Terre Haute, Ind., and it expects to start an exchange there by using a franchise obtained several years ago for a district telegraph service.

The Southwestern Telegraph & Telephone Construction Company is setting the poles for a telephone line connecting Wharton, Tex., with Houston and Victoria.

The council of Atlantic, Ia., has refused to grant the exclusive franchise asked for by the Iowa Mutual Telephone Company.

The new State Telephone Company is constructing a line connecting Oxford and Lapeer, Mich.

New Companies Incorporated.

The Tuscarora Telegraph & Telephone Company, Mifflintown, Pa. Capital stock, \$3,000.

The Long Distance Telephone Company, Chicago. Capital stock, \$2,500. Incorporators: E. C. Cleveland, W. X. Latimer and W. B. Jarvis.

The Standard Telephone Company, Newtown, Bucks County, Pa. Capital stock, \$10,000.

The West Plains Telephone Company, West Plains, Mo. Capital stock, \$20,000. Incorporators: D. W. Reese, Charles H. Gale, F. O. Hines and others.

The Wickwire Telephone Company, Grafton, W. Va. President, Dr. Alex. Leeds; vice-president, Richard Wood; secretary, Z. B. Knotts; general superintendent, Edward Luzatter.

The Atlantic Coast Telephone Company, Atlantic City, N. J. Capital stock, \$100,000. Incorporators: Edwin L. Reinold of Marietta, Pa. Lewis Kuehnle and James B. Reilley of Atlantic City.

American Electric Telephone Company, Chicago. Capital stock, \$100,000. Incorporators: C. C. Buckley, W. D. Latimer and W. B. Jarvis.

The Morrow County Telephone Company, Mt. Gilead, O.—to construct and operate a telephone line from Mt. Gilead to Butler, Richland county, Ohio, with branches extending into Delaware, Marion, Crawford and Knox counties. Capital stock, \$12,000.

The Mutual Telephone Company, Pueblo, Col.—to introduce a mutual telephone system in which the cost of operation will be pro-rated. Capital stock, \$55,000, divided into 1,000 shares. Directors: G. F. Stodghill, John H. Olmes, W. H. Thompson, J. G. Chapman, F. L. Cuddeback, E. E. Hubbell and Francis I. Meston.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Company and City & Suburban Railway Company.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h 500 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.
 i 200,000 of stock owned by North Chicago Street Railroad Company.
 j Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 k 95% per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company.
 l Majority of stock owned by Chicago West Division Railway Company; 5% on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 m Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 6% on stock.
 b Leased to New Orleans Traction Company at 8% on stock.
 c Leased to Central Crostown Railroad at 8% on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway.
 f Leased to Metropolitan Street Railway at 8% on stock until Oct. 1, 1897; thereafter 9%.
 g Leased to Metropolitan Street Railway for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 h Leased to Metropolitan Street Railway for 18% on stock.
 i Leased to Met. St. Ry. for 99 years from April 20, 1892; 8% first 5 years, 8% thereafter.
 j Leased to Metropolitan Street Railway for \$145,000 per annum.
 k Leased to Metropolitan Street Railway for 18% on stock.
 l Controlled by Third Avenue Railroad by purchase.
 m Dividends of 1½% yearly guaranteed by Consolidated Traction Company.
 n Controls by lease the Allegheny, Cent. Citizens, Duquesne, Fort Pitt and Pitt's Trac. Co.
 o Leased to Consolidated Traction Company for 8% per annum on par value of stock.
 p Leased to Fort Pitt Traction Company for 6% on \$8,000,000 capital stock.
 q Leased to Consolidated Traction Company for 4% on capital stock after October.
 r Leased to Consolidated Traction Company for 7% on capital stock after October.

The Consolidated Traction Co. of Pittsburg, has declared a dividend of \$1.59, payable May 5.

A dividend of 1 per cent., payable May 2, was declared on the 18th inst. by the directors of the Columbus (O.) Street Railway Company.

Among the securities listed at the New York Stock Exchange last week was Union Elevated Railroad Company of Chicago—\$5,000,000 capital stock.

The annual stockholders' meeting of the New England Telephone & Telegraph Company will be held May 3 in New York. Books closed April 1 will reopen May 3.

The directors of the Springfield (Mass.) Street Railway Company have voted to ask the Railroad Commissioners for permission to increase the capital stock of the road by \$300,000.

The board of directors of the Sprague Electric Company of New York have declared a dividend of 3 per cent. on the preferred stock, payable on May 2 to shareholders of record on the 18th inst.

The Massachusetts Railroad Commissioners have approved an issue of \$50,000 additional stock to the Globe Street Railway Company of Fall River for the exchange of 500 shares of the Fall River Street Railway Company.

The bill to give the Gas and Electric Light Commission supervisory powers over telephone companies in Massachusetts was defeated in the House by a vote of 84 to 77, and by a heavier vote on the 13th inst. it refused to reconsider.

The Municipal Assembly of St. Louis has passed the franchise granted to the Central Traction Company over the mayor's veto. It is announced that application will be made for a writ of quo warranto to vacate the franchise.

A Philadelphia press special says: "Traction interests throughout the country continue to show gratifying gains in earnings. Such gains are very welcome to Philadelphia financial interests which have been pioneers in nearly all leading street railway systems in the country outside of Boston."

Two deeds have been filed in the Register of Deeds office, Kalamazoo, Mich., conveying all the property, equipments and franchises of the Citizens' Street Railway Company to the Michigan Traction Company. The Michigan Traction Company assumes the \$60,000 bonded indebtedness of the old company.

The Private Bills Committee of the Ottawa (Can.) Legislature has passed the bill increasing the capital stock of the Hamilton and Lake Erie Power Company from \$1,000,000 to \$3,000,000. The power is to be obtained from the Welland river to furnish power and light to Hamilton, Brantford and others places in Canada.

The directors of the North Chicago Street Railroad have decided to issue \$1,320,000 stock, increasing the amount outstanding from \$6,600,000 to \$7,920,000. The total authorized stock issue is \$10,000,000. This additional stock will be offered at par to stockholders of record April 25th. It will be used to retire outstanding certificates of indebtedness.

Oscar Johnson of Corona, N. Y., got a verdict of \$20,000 against the Brooklyn Heights Railroad Company in the Supreme Court in Long Island City on the 17th inst. He sued for \$25,000 because of injuries received on January 8, 1897, when a wagon which he was driving was run into by a trolley car and he received injuries which will make him a cripple for life.

The proposed route for a street railway between Elizabeth and Plainfield, N. J., is being surveyed and property lines secured. The franchise will be advertised and sold to the highest bidder at an early date. The offer of \$100,000 by John Kean is the first on the list. It is believed that the bids will reach \$200,000. The route will be twelve miles long and will parallel the Central Railroad tracks.

A dispatch from New Haven to the New York "Commercial" intimates that the Consolidated Road has under consideration a plan to equip the railroad between the cities of New Haven and Derby with electricity. The road is about ten miles long and connects Ansonia, Derby and Shelton with New Haven.

The directors of the Albany Railway, Albany, N. Y., at their monthly meeting on the 15th inst., elected William J. Walker, of the firm of Walker & Gibson, a director in the place of J. Irving Wendell. The directors at the same meeting declared the regular quarterly dividend of 1 1/2 per cent., payable May 2. Books close on April 21 and reopen May 3.

At Detroit, Mich., on the 12th inst. Circuit Court Commissioner Hurst sold twenty bonds of the Detroit Motor Company under an order of the Supreme Court. The bonds were bid in by J. Hudson, receiver of the Third National Bank, at 30 cents on the dollar. There were also sold 20 interest coupons of other bonds, which brought \$180. These were all held as security for some notes at the time Mr. Hudson was appointed receiver of the bank.

It is understood in Philadelphia that the owners of the Northern, West End and Southern Electric Light companies, the only remaining independent companies in that city since the Pennsylvania Heat, Light & Power Company consolidation, have agreed to go into the consolidation. They will form part of the Pennsylvania Manufacturing, Light & Power Company, which has taken over the consolidated company. The terms are said to be favorable. Holders of the Northern were offered, it is stated, \$16 cash or \$12 in the Hamilton Company bonds and 25 shares of Hamilton stock at \$1. The Hamilton Company was one that went in under the former consolidation. The Northern is in some respects the most important of the three companies named.

Gov. Black has signed Assemblyman Eldridge's bill extending from ten to fifteen years the time within which certain railroads must complete their roads. The bill apparently applies only to the South Brooklyn Railroad & Terminal Company, of which John W. Ambrose is president, W. Bayard Cutting treasurer, and Francis H. Bergen secretary, all of New York City. The company has built that part of its road, about a mile long, running from New York Bay at foot of Thirty-eighth street to Ninth avenue, which is operated by the Brooklyn, Bath & West End Railroad Company, which in turn is operated by the Nassau Electric road in Brooklyn. The South Brooklyn Company also has the right to construct about eight miles of road through the former towns of New Utrecht, Flatbush, Flatlands and the Twenty-sixth Ward of Brooklyn to the westerly line of Jamaica. The time within which this part of its road should be completed has expired, and under this bill is extended.

The Kings County Traction Company of Brooklyn went out of existence on the 11th inst. by a unanimous vote of its stockholders that it be dissolved. Its assets will be sold and the proceeds will be divided among the stockholders. The company five years ago organized and purchased on a capitalization of \$4,500,000 the property of the Brooklyn Traction Company, which consisted of the capital stocks of the Atlantic Avenue and Brooklyn, Bath & West End Railroads. These roads were in April, 1896, leased to the Nassau Electric Railroad Company for 99 years for \$150,000 annually, to 1898, and \$180,000 thereafter, all charges to be paid and \$500,000 improvements to be made by the lessee. The Kings County Traction Company had since then received the rents and distributed them among the stockholders, and saw that the conditions of the lease were carried out. This accomplished, it was, in the wisdom of the board of directors, expedient to dissolve the corporation.

EDITORIAL NOTES.

An Electrically Propelled Cruiser.

The Navy Department is said to have under consideration plans for a cruiser which, so far as speed is concerned, it is thought will outclass anything afloat. The inventor of this new form of vessel, Mr. Richard B. Painton, claims that by the aid of electricity he will be able to propel such a cruiser at the rate of forty knots an hour. The general details of this invention have as yet not been made public, but it is known that electricity will be the motive power, and instead of using a triple screw, as is now customary, Mr. Painton proposes to employ anywhere from ten to sixteen independent propellers. Moreover, the plans which are now in the hands of the Navy Department call for a cruiser about 600 feet in length. In an ordinary vessel of the above dimension the propeller shafts would necessarily be in the neighborhood of 300 feet long, and consequently the vibration something terrible, to say nothing of the possibility of a break occurring, as frequently happens in the case of ocean liners. With a view to overcoming this objection, Mr. Painton proposes to use exceedingly short lengths of shafting, independently operated, so that in the event of one or more becoming disabled through any mishap there would still be a sufficient number of propellers in working order to drive the vessel through the water at a moderate rate of speed.

It is to be regretted that the details of the electrical machinery by means of which the inventor proposes to obtain such high speed has not been made public.

Up to the present, electricity has scarcely been thought suitable as the principal motive or propelling power for the larger type of vessels. This is undoubtedly owing to the fact that for a given horse power a triple or quadruple expansion steam engine would take up less space, and probably weigh less than an electrical installation of equal power. Storage batteries are out of the question for such uses, although persons not well up in electrical subjects frequently wonder why our ocean grayhounds are not propelled by some such method. It may interest some of our readers to know that a vessel requiring an average of 10,000 horse power to propel it across the Atlantic would be obliged to carry, were storage batteries alone made use of, 324,480,000 pounds of such batteries, or in other words, the motive power alone would weigh 162,240 tons. The storage battery unquestionably has its sphere of usefulness, as for instance in regulating the pressure in central stations during fluctuations in the load, or as a means of meeting sudden extra demands for current which might unexpectedly

arise, but as a propelling power for the larger class of vessels at the present state of the art the storage battery is prohibitory. A detailed description of Mr. Painton's electrical equipment will therefore be looked for with interest.

* * *

Early Applications of Electricity to Submarine Mines.

At the present time when electrically-operated submarine mines and torpedoes have reached a high state of perfection, it may interest our readers to know that probably the first instance of a submarine mine being exploded by the aid of electricity occurred on the Potomac some fifty-six years ago. As Robert Fulton was undoubtedly one of the first, if not the first, to improve the torpedo then in use, so Samuel Colt, the inventor of the well-known revolver, was the first to make use of an electric battery in firing a mine located under water. In the summer of 1842 the United States Government was prevailed upon to place an old schooner at Mr. Colt's disposal to be experimented upon on the Potomac. In the presence of a large number of high Government officials, among whom was General Winfield Scott, Mr. Colt successfully destroyed the schooner by means of a current of electricity from an observation tower located on the bank of the Potomac, a distance of five miles from the mine. In those early days of electricity, this feat was considered something unparalleled, and attracted considerable attention in scientific circles both in this country and abroad. After the successful completion of the test, the inventor asserted that he could explode a shell under water by practically the same methods at a considerably greater distance. With a view to enabling him to carry on his experiments, and perfect his apparatus, President Taylor, who took great interest in such matters, caused an appropriation of \$17,000 to be made to Mr. Colt, with the understanding that a more extensive trial of the invention should take place at an early date. On October 18, 1842, therefore, a well-arranged mine was electrically fired by Mr. Colt in New York harbor, with equal success, in the presence of a large gathering of people. The *Evening Post* of October 19, 1842, described this interesting event as follows: "A vast multitude assembled yesterday afternoon to witness the explosion of Colt's submarine battery placed under a vessel of 260 tons. The North Carolina, seventy-four, about 4 o'clock gave a salute of thirteen guns. Immediately afterwards the signal for the explosion was given. The vessel rose bodily out of the water and then separated into fragments which were thrown about 70 feet into the air. The next moment nothing was seen of her except a few pieces of the wreck which were floating

on the water and of which the boats lying near hastened to possess themselves. The Secretary of War was present in Castle Garden."

Conference of the Union for the Protection of Industrial Property.

The Patent Office in Washington has received through the State Department a full report of the Conference of the Union for the Protection of Industrial Property which was held at Brussels in December of last year. The report was prepared by Hon. Bellamy Storer, Minister to Belgium, and Mr. Francois Forbes, the United States delegates to the conference, and is of marked interest. There were present at the conference not only delegates from fifteen of the states of the union, but delegates also from seven states which have not as yet joined the union, among them being Germany and Japan. From the active interest which these delegates took in the proceedings, it is evident that the aims of the union are universally recognized as of the highest importance.

Propositions for amendment of the convention, submitted by the United States, looking toward reciprocity in the matter of fees and the requirement of working and the matter of invention belonging to certain classes which are patentable in the United States but not in various other countries, were held by the conference to be contrary to the general spirit of the convention, but several solutions of the difficulties complained of were suggested which would not be obnoxious to the convention, such as requiring of any inventor who has applied for a patent in a foreign country before applying in the United States, first, the payment of the same fees in the United States as are required in the foreign country in which application was made; second, the limitation of the patent granted in the United States to the invention protected by the foreign patent, and third, providing that the patent granted in the United States be within the time within which working is required in the foreign country.

As the fees exacted in many foreign countries for the grant and annual taxes on patents, and the requirements of working the invention in each country in which it is patented are extremely onerous upon our inventors and manufacturers, it is believed to be but right that foreign inventors who take out patents here should not be permitted to obtain these patents under easier conditions than they can in their own countries.

The proposition submitted by the United States for the purpose of removing any question as to the effect upon the right of priority of the amendment of an application found necessary in the progress of the examination into the novelty of the invention was favorably received, but was not incorporated into the convention for the reason that it was believed unnecessary, it being the opinion of the conference that it was "incontestable that the restrictions given to the original description during the preliminary examination cannot prejudice the right of priority established by Article 4." This is of importance, as it had been generally understood that a United States inventor seeking to secure the benefits of the "delay of priority" of seven months under the convention must file in the foreign countries the application as originally filed here instead of the application in the amended form in which it became a patent. Under the present understanding of the convention, the United States inventor having filed his application here may at once offer his invention for sale in a foreign country or otherwise bring it to the notice of manufacturers there, and yet on making application at any time within seven months from the date of his application here obtain there a valid patent.

A proposition to so amend the convention that patents granted in the several countries shall be mutually independent, that is, that a patent granted

for fourteen years in one country shall not shorten the term of a patent subsequently granted in another country in which the normal term is seventeen or twenty years, received the support of the United States delegates and was adopted by the conference.

The proposed extension of the "delay of priority" to one year, the proposition that patents worked to the extent required in the country of origin should not be forfeited for non-working in other countries for at least three years from the grant of the patent, and certain propositions relating to trademarks, were discussed very fully, but had to be left to be settled by correspondence.

With the report is a statement of the inventions excluded from protection in a number of foreign countries, and a statement of the requirements as to working the invention exacted in certain other countries. In some countries the failure to manufacture the invention in the country within one year invalidates a patent granted on the invention. In others two years, or even three years, are allowed, and importation of goods made under the patent is prohibited. This means that the manufacturer of an American invention must establish factories in each of these countries or give up patent protection in them, which, as can readily be seen, is a very onerous requirement.

In relation to the matter above referred to, Representative Hicks, chairman of the House Committee on Patents, has introduced a bill authorizing the President to appoint three commissioners whose duty it shall be to revise and amend the laws of the United States concerning patents, trade and other marks, and trade or commercial names, which shall be in force at the time such commission shall make its final report, so far as the same relate to matters contained in or affected by the convention for the protection of industrial property concluded at Paris, March 20, 1883, the agreements under said convention concluded at Madrid, April 14, 1891, and the protocols adopted by the conference held under such convention at Brussels, 1897, and the treaties of the United States and the laws of other nations relating to patents, trade and other marks, and trade or commercial names. The commission is to report to Congress at once, and the report shall be so made as to indicate any proposed change in the substance of existing law, and shall be accompanied by notes which shall briefly and clearly state the reasons for any proposed change. The report shall also be accompanied by references to such treaties and foreign laws relating to patents, trade and other marks, and trade or commercial names, as in the opinion of the commission may affect citizens of the United States. The work of this commission should interest every inventor and manufacturer in the United States.

Under the Searchlight.

Notes and Comments on Various Topics.

MR. WILLARD E. CASE, vice-president of the New York Electrical Society, has addressed a letter to Prof. F. B. Crocker of Columbia University which is worthy of prompt consideration. The letter is as follows:

In view of the fact that the efficiency of electrical lighting equipments on land and sea will form a vital factor in the present war, I would submit to you as the representative of the Electrical Department of Columbia University and as a member of the council of the American Institute of Electrical Engineers, the following suggestion: That the professional and skilled electricians of our universities, colleges and electrical societies shall form themselves into a body which shall supplement the electrical corps engaged in active work on the water and in the field, to be available to the Government for expert advice in all matters relating to the utilization of electricity in naval and military operations, thus adding to the present regular expert electrical resources of the Government.

* * *

It is stated that an Electrical Trust is now being formed at Geneva, Switzerland, backed by German

and English capitalists. Let us hope this new combination will be run on principles very different from those of our own Electric Trust.

* * *

We Told You So.

In our April 6 issue we published the following under the heading of "War on General Electric":

"A leading official of the General Electric Company says: 'It is true that we have received some contracts from the Government for special work, but the amount of money involved does not begin to compensate us for the loss of contracts which we undoubtedly would have received if there were no disturbance to general business from the Cuba trouble. Where we get one contract from the Government I may say we lose ten from syndicates which were contemplating new work of various kinds.'—Boston News Bureau.

"If the rumor of war is affecting the business of the General Electric Company, as the above statement leads one to believe, the holders of the preferred and common stock will be obliged to gird up their loins for another long and patient wait if war actually breaks out. Such an event would make an excellent excuse for postponing the rumored settlement indefinitely."

The New York Commercial of April 22 now says:

The stockholders of the General Electric Company will hold their annual meeting in Schenectady on May 10. Transfer books closed April 13 and will reopen May 11. It is reported that the plan for financing the accrued dividends on the company's preferred stock would be laid aside for the present and not come up at the meeting.

The above bears us out in our statement of April 6, and, as we correctly prophesied, another long wait would seem to be in order. What a fortunate thing it is—for some people—that war broke out!

* * *

ELECTRIC fountains are no longer the exclusive features of summer parks and summer resorts, but the public are to be treated to their beautiful effects in the everyday walks of life. Paris has taken the initiative and is installing electric fountains in several of the most frequented parks, says the *Pittsburg Dispatch*. The fine fountains in the Place de la Concorde and those which mark the entrance to the Avenue de l'Opera, Place du Theatre Francaise have just been fitted with lamps transforming them into luminous fountains. The latest trials have shown that it is sufficient for good results to put in the bottom of the fountains water-tight boxes with glazed openings containing from 1,500 to 2,000 candle-power of incandescent lamps, the light from which is converged and thrown upward by lenses. The glass covers are colored lightly with a golden yellow. The result given is said to resemble a cascade of diamonds and topazes lit by the summer sun.

* * *

THE following notice has been posted in the General Electric Works in Schenectady. It will be noticed that it is more guarded in its promises than in its grammatical construction:

If employees of the company are called by the Government for service it will be the intention and desire of the company to re-employ them at the expiration of their term of Government service if they shall not then be incapacitated for duty.

New Electric Incandescent Lamp.

The following is an extract from a letter of Dr. Johannes Horowitz, from Vienna, in the *N. Y. Times*:

Another great success appears likely to be scored by the inventive spirit which of late years has been busying itself with the discovery and utilization of new sources of light. In learned circles in Berlin almost a year ago it was reported that a Goettingen professor had succeeded in producing incandescent light in an entirely new manner. Further details of this discovery made by Prof. Nernst have come to hand, and he is said to have sold his rights to Messrs. Siemens & Halske for 5,000,000 marks. In his new lamp the professor uses, not a thin carbon thread which is made to glow in a globular glass vessel, as has always been the case with glow lamps hitherto, but so-called "bad conductors," such as magnesium, lime, zircon, etc. These bodies will bear very high temperatures without melting; but heat greatly increases their conductive power. Prof. Nernst's invention is based on these quali-

ties. The incandescent body is a hollow cylinder about 8 millimeters long and 1 millimeter broad, consisting of burned magnesium, which is connected with an alternating current of low voltage that causes it to emit light. This new lamp is said to produce far more light in proportion to the consumption of electricity than do the lamps now in use. With the Nernst lamp one watt suffices to produce a light of 1.04 candle power, whereas with an ordinary incandescent lamp one watt produces only 0.40 candle power.

* * *

Electric Lighting in Cuba.

From all accounts the electric lighting and gas companies have been among the worst sufferers in Cuba. The Spanish Government is conducting its operations almost entirely on credit, and as a result money is very scarce throughout the island. In the cities the gas companies and the electric light companies can collect nothing. If they press for payment, their plants are threatened by the Government with confiscation.

* * *

Omitted the Dynamo.

The Columbus, O., *Journal* is responsible for the following rather remarkable statement:

Bids for equipping the new municipal electric light plant were opened by Secretary Fanning of the board of public works Wednesday afternoon. There were 23 of them, for various portions of the machinery. Most of the interested companies were represented. There were bids for boilers, engines, poles, wire and everything else that goes to make up the equipment of an electric light plant but the one thing more important than all—the dynamo.

Mayor Black and Director of Public Improvements Jacobs were not a little surprised when no bids for a dynamo were received. And the bidders for the rest of the equipment were, or professed to be, at a loss to account for it. There were representatives of several electrical manufacturing companies present during the opening of the bids, but they remained on the fringe of the crowd and were merely onlookers.

The city administration thinks the reason no bids for a dynamo were received is because the electrical companies have combined and entered into a conspiracy to prevent the equipment of the plant and the inauguration of municipal electric lighting in Columbus. But, however this may be, the administration does not intend to be balked in the consummation of the project. An advertisement for bids for a dynamo will in all probability be published, and then in the event there is no response, the purchase will be made through other channels, of which the electric combine, if there is really such a thing, will be in ignorance.

American Institute of Electrical Engineers.

The 124th meeting of the Institute will be held at 12 West 31st street, New York City, on Wednesday, April 27, at 8 o'clock P. M.

A paper will be presented by Prof. W. E. Goldsborough of Lafayette, Ind., entitled "An Economy Test of a Central Station." Also a paper by Charles J. Reed of Philadelphia, Pa., on "A Novel Form of Thermo-Electric Battery." This paper will be accompanied by experiments with the apparatus described.

Applications have been received from the following candidates for associate membership, and will be acted upon by Council at its meeting May 17, 1898: Felix L. Cadon, Washington, Ind.; Johnston Livingston, Jr., Islip, N. Y.; Thomas Dempster, Schenectady, N. Y.; Wallace R. Turnbull, East Orange, N. J.; D. B. Heilman, Reading, Pa.; James H. Winfield, New Glasgow, N. Y.; Fred. W. Wood, Los Angeles, Cal.; Howard Joslyn, Seattle, Wash.; Irving A. Taylor, Brooklyn, N. Y.; Paul Lethenle, Schenectady, N. Y.; J. J. Mahony, New York.

Members who desire to present papers for the General Meeting, Omaha, Neb., June 27-29, are requested to communicate with Mr. Herbert Laws Webb, 15 Dey street, chairman of the Committee on Papers and Meetings, or with Secretary Ralph W. Pope.

Demonstrating the Use of Submarine Mines.

Mayor H. J. Smith, of Pompton, N. J., one of the best known experts in the world in submarine explosives, mines, etc., has very kindly tendered his services to the Electrical Exhibition management

for the demonstration in a special tank of the manner in which harbors are protected, ships blown up, etc., and some of his ingenious apparatus has been loaned for this interesting work by Mr. C. McLaughlin, of J. H. Bunnell & Co. This will probably be one of the most attractive features of the show.

Personal.

Mr. W. F. Osborne, who is well known in the electrical field as the Eastern manager of the *Western Electrician*, announces that on May 1 he will sever his connection with that publication to accept the position of business manager with the *National Provisioner*, a leading weekly newspaper devoted to the large packing, refrigerating, cotton-seed oil manufacturing and tannery interests of the country. We heartily wish Mr. Osborne success in his new undertaking.

THE ELECTRICITY SUPPLY OF LONDON.

Before the Institute of Civil Engineers, London, on April 5, a paper was read by Mr. Arthur H. Preece, of which the following is an abstract:

The supply of electricity on a commercial scale had been started in London after the passing of the Act of Parliament in 1888 which amended the Act of 1882, principally by extending the date for compulsory sale to the local authority from 21 years to 42 years. In 1888 many companies applied for Provisional Orders, and, in determining which were to be granted powers, and the districts over which the powers were to extend, the Board of Trade decided that competition would be advantageous to the public, and that it was advisable to allow one direct-current system to compete with one alternating-current system.

There were now in London eleven important companies and five Vestries supplying electricity, and three other companies and three Vestries were taking steps to start works. The capital invested in the industry amounted to £6,000,000, and plant was installed to the extent of 80,000 HP., the equivalent of 2,000,000 8 CP. lamps being connected to the mains. The total annual revenue was £800,000 and the total annual expenditure £450,000.

Of the systems for supplying electricity in London, the alternating current was applicable to large areas where consumers were scattered, and it enabled the generating works to be established by the riverside, or where land was cheap and coal was easily unloaded. The undertakings using this system were the City of London Company, the Metropolitan Company, the London Electric Corporation, the County of London Company, House to House Company, Hampstead Vestry, Islington Vestry and Hammersmith Vestry. The direct-current systems were divisible into two classes, the high pressure and the low-pressure. In the former rotary transformers were used to reduce the high pressure to a low pressure, while the latter produced and distributed electricity at the same pressure at which it was supplied to consumers. The direct-current systems were applicable to compact areas, and, with the use of high pressure, to scattered or isolated compact areas. The chief advantages of the direct-current system were the possibility of using storage-batteries, which could not be employed with the alternating-current systems, greater efficiency in distribution and greater adaptability to motive power. The undertakings using the system were the Chelsea Company (high pressure), Charing Cross and Strand Corporation (high pressure), the Westminster Corporation, the St. James's and Pall Mall Company, the Kensington and Knightsbridge Company, the Notting Hill Company, the St. Pancras Vestry and the Metropolitan Company (at one works).

The generating works of the several undertakings in London contained many interesting features. No

less than twenty different works had been erected. The boilers used comprised the water-tube, marine, Lancashire, and miscellaneous types; but the preference for the water-tube boiler was very marked. The works were liable to sudden demands through fogs, and the quick-steaming properties of this type of boiler were of great advantage. The boilers were fired chiefly by hand with Welsh coal, but in the works of the City of London Company and the County of London Company mechanical stokers and cheaper coal were used. The use of extensive systems of steam-pipes was now being dispensed with. The multiplicity of valves was unnecessary, and the number of valves was being reduced, and arrangements were made as simple and with as few joints as possible.

The present tendency was towards engines of the marine type for large outputs. The high-speed engine was not used for larger powers than 750 HP. Some engineers, however, found engines of 350 HP. sufficiently large and the most convenient unit to adopt. The dynamos were similar in most works, and were always connected direct to the engines. Storage by secondary batteries was not extensively employed in London, as their maintenance had hitherto proved expensive. But a few works used them entirely for maintaining the supply after midnight, and in the daytime in summer. The author gave the results of a test of a small marine engine and alternator, showing the combined efficiency to be 85.5 per cent. The question of vibration had been of great importance in many works; no cure had been found effective when once vibrations were set up. High-speed engines must have three cranks to be free from appreciable vibration.

The favorite methods of distributing electricity were to transmit current at a high pressure in heavily-insulated cables in iron pipes, and current at a low pressure in insulated cable in stoneware conduits or in cables heavily armored and laid direct in the ground. Rubber was now little used, paper and jute, impregnated with insulating compounds, having been extensively adopted.

The industry was growing so rapidly that most undertakings had to seek new sites for generating works, and the tendency was to erect large works on the outskirts of London, where coal could be conveniently brought to the site, and where water could be obtained for condensing. The powers granted under Provisional Orders were limited as regards the compulsory purchase of land, and further powers were being sought by some companies from Parliament, so that they might be placed on the same footing as railway companies. No less than 40,000 HP. is now being installed in London in order to meet the demand for electricity in the immediate future.

A 100-Mile Transmission Scheme.

According to the *Frankfurter Zeitung* a scheme has been worked out in Stockholm for the utilization of part of the 100,000 HP. running to waste in the waterfall of Elfkärlaby, 100 miles from that city. The idea of transmitting a part of this power to Stockholm has exercised the minds of the citizens for some time past, and has within the last few months assumed a more practical form, several engineers and electricians having been commissioned to work out a detailed scheme. This project is now ready. It is proposed to utilize in the first instance "only 20,000 HP." of that available, and the estimated cost of the installation works out as follows: Power station, including all the necessary works and machinery, £178,000; transmission line, £237,000; buildings and transformers in Stockholm, £29,000; making a total of £444,000. A loss of 5,000 HP. is estimated so that 15,000 HP. would be available in Stockholm. This is to be sold at 4½s. 5d. per horse-power per year, making an aggregate revenue of £33,300 per year. Without making any allowance for working expenses, our contemporary naively remarks that this yearly revenue capitalized at 4 per cent. is equivalent to £833,000 and that there is a consequent gain of nearly £400,000 to the State.—*Electrician, London.*

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XVIII.—Antimony, Chromium, Magnesium and Nickel.

In this chapter it is proposed to give some account of the processes that have been used, or are now being used, for the production upon an industrial scale of the four metals named above.

Only two of these metals—antimony and nickel—are of much commercial importance, and in the case of the other two, one manufactory could easily supply the present world's demand; but the electrolytic methods for the production of these metals are still of interest as exemplifying the point, often noticed in previous chapters, that it is the greater convenience, and purity of the products, of the electrolytic methods, rather than their greater economy, that has caused them in many cases to supersede the older methods.

Owing to the secrecy which is always observed when a process is worked in one or two places only, and to the absence of all inducements to publish details of the apparatus or procedure used, the facts given in this chapter will necessarily be less full and complete than has been the case in the preceding chapters of the series.

Antimony.—One of the earliest attempts to separate this metal from a solution of one of its salts by electrolysis was made by Gore in 1858. An aqueous solution of antimony trichloride containing excess of hydrochloric acid was used as the electrolyte, with a cathode of copper and an anode of antimony. In place of the metallic deposit which he expected, he obtained a compound of antimony and antimony trichloride, known as "explosive antimony" on account of its property of decomposing with explosive force when rubbed. The deposition of metallic antimony from its solutions upon a commercial scale remained in abeyance for many years after this date, and it is only recently that the appearance upon the market of thin plates of the metal of extreme density has proved that some of the difficulties in the production of metallic antimony by electrolytic methods have been overcome. These plates, according to Borchers, have been made by the Austrian branch of Siemens & Halske, but no details of the place of production, or the quantity produced, have yet been made public. The process patented* by Siemens & Halske for the electrolytic extraction of antimony from its ores has most probably been used for the production of these plates, and the following brief account of it may therefore be given.

The process depends upon the solubility of antimony sulphides in solutions of sodium or potassium hydrosulphide, and the use of the electric current to deposit the antimony as metal from such solutions.

The chemical and electrolytic reactions which occur are as follows:

1. $\text{Sb}_2\text{S}_3 + 6\text{NaHS} = 2\text{Na}_3\text{SbS}_3 + 3\text{H}_2\text{S}$
2. $\text{Na}_3\text{SbS}_3 = 3\text{Na} + \text{SbS}_3$
3. $6\text{Na} + 6\text{H}_2\text{O} = 6\text{NaOH} + 6\text{H}$
4. $\text{SbS}_3 + 6\text{H} = \text{Sb} + 3\text{SH}_2$
5. $3\text{NaOH} + 3\text{SH}_2 = 3\text{NaHS} + 3\text{H}_2\text{O}$

The solution of the antimony sulphide by the solvent, represented by equation (1) takes place in a leaching vat, in which the crushed ore is treated with the solution of sodium hydrosulphide.

The solution is then separated from the residuum in a filtering vat, and is run into the electrolyzing vat where it is subjected to electrolysis.

Equation (2) shows the direct products of the electrolysis, while equations (3), (4) and (5) show the secondary reactions which immediately follow, and produce as a final result—antimony at the cathode and sodium hydrosulphide at the anode. If desired, the electrolysis can be carried out with a

solution of sodium chloride in the anode chamber of the depositing cell. In this case, free chlorine will be obtained at the anode, and by suitable arrangements it can be collected and used for opening up refractory ores.

Borchers, who has designed an apparatus for depositing antimony from the same solution, states that an EMF. of between 2 and 2½ volts is sufficient to give a current density of from 4 to 5 amperes per square foot.

The greater number of antimony ores can be easily dealt with by the present furnace methods of reduction, and it is only in connection with refractory ores, or with furnace mattes, that the electrolytic method is likely to develop. At present it is hardly of any industrial importance; and it has only received mention because electrolytic antimony has been put upon the metal market in Europe.

Chromium.—This metal was first obtained by electrolytic methods by Bunsen in the year 1854. He used a solution containing both chromous and chromic chlorides, and he was surprised to find that by varying the current density employed he could obtain either hydrogen, chromium, sesquioxide, chromium trioxide, or metallic chromium at the cathode. This historic experiment showed the important part played by the current density in determining the final products of the electrolysis. More recently Moissan, the distinguished French chemist, has obtained chromium by a method that is purely chemical in character, though electricity has been used to produce the heat required. Moissan heated chromium sesquioxide with carbon, in his electric furnace, and in this way obtained reduction of the oxide by the carbon, and the production of metallic chromium.

The metal is now produced commercially by the "Elektro Chemische Werke," Bitterfeld, but no details of the process or apparatus used have been published. The writer believes, however, that it is produced by a method based upon that of Moissan, though doubtless the details of the process and of the furnace construction differ from those used by Moissan himself. It may be added that the honor of the discovery of the fact that all oxides could be reduced by carbon at the temperature of the electric furnace is shared with Moissan by Borchers, though it was Moissan alone who systematically investigated electric-furnace reactions.

Chromium is of importance, not only as the metal which possesses the highest melting point (it cannot be fused in the oxy-hydrogen flame) but also because it confers great hardness upon metals with which it is alloyed. Though an electrolytic method of depositing chromium from mixed solutions of its sulphate and potassium sulphate has been patented by MM. Placet & Bonet (U. S. A. patent No. 526,114) it is probable that the demand for metallic chromium in the arts will be wholly met by the electro-metallurgical method that has been described.

Magnesium.—In the year 1832 Becquerel, one of the early experimenters in electro-chemical science, is stated to have obtained metallic magnesium by electrolysis of a concentrated solution of magnesium chloride. Magnesium is one of the metals which cannot exist as such in the presence of water, but under certain conditions small quantities of the metal can be obtained at the cathode from aqueous solutions of the chloride.* There is no doubt however that in 1848 Wohler prepared large quantities of magnesium by electrolysis of the fused chloride, and Bunsen in 1854 repeated the experiment, substituting however a mixture of ammonium and magnesium chlorides for the latter salt, on account of the greater ease with which it could be prepared. Matthiessen later used a mixture of potassium and magnesium chlorides for the electrolysis; and this is the method now followed at the "Aluminium und Magnesium Werke" at Hemelingen in Germany,

carnallite, a natural product (of the composition $\text{MgCl}_2 \cdot \text{KCl} \cdot 6\text{H}_2\text{O}$), being substituted for the artificial mixture suggested by Matthiessen. The carnallite is fused in a metal or porcelain pot, by external heating, and the fused mass is electrolyzed with carbon anodes and metal cathodes. The magnesium as it separates at the cathode collects into globules, and falls to the bottom of the vessel in the molten state. Reducing gases are led into the pots during the electrolysis through openings in the covers, but according to Borchers this is an unnecessary precaution. An EMF. of 7 to 8 volts will suffice to produce a current of 90 amperes per square foot through the molten carnallite. In addition to the factory at Hemelingen, magnesium is produced at "Grabau's Aluminium Werke" at Trotha, near Halle, and at the "Elektro-Chemische Werke," Bitterfeld. Though no details of the process or apparatus used at these works have been published, there cannot be any doubt that in principle the process resembles that used at Hemelingen, though the apparatus in which it is carried out doubtless differs in each works. Oettel states that in consequence of the adoption of electrolytic methods the price of magnesium has dropped 70 per cent.; in this case, therefore, the gain has been not only in convenience and purity of the product, but also in economy.

Nickel.—This metal was first obtained as a deposit upon the cathode of an electrolytic cell by Gabn, in the earliest years of the century, before even Davy had discovered potassium and sodium by electrolysis of their fused hydrates. Nothing further was done in connection with the electrolytic deposition of nickel until 1862, when the two Becquerels published the account of their researches upon the best conditions for obtaining adherent and homogeneous deposits of many metals, nickel being one of the number. The solution which yielded the best result in their hands was a neutral nickel sulphate solution. The progress of electroplating, in which for nickel deposits solutions containing nickel and ammonium sulphates were employed, led to great improvements in the coatings of nickel obtained by electrolytic methods, but it was not until recent years that the production of nickel for commercial purposes was attempted by means of electrolysis. The delay in further development was caused by the inability to produce coatings of the metal of any considerable thickness; scaling and other evils always occurred when a certain point was exceeded. Foerster has recently shown that if the electrolyte be heated to between 60° and 90° C., tough deposits of nickel of any desired thickness can be obtained, without the exhibition of any tendency to scale.* In Europe, so far as the writer is aware, there is only one firm producing electrolytic nickel, namely "Gustav Menne u. Cie." of Siegen, Germany, but in America the "Orford Copper Company" and the "Canadian Copper Company" are both producing nickel by electrolytic methods. In all these cases the principle of the process used is the same. A matte or regulus containing copper and nickel produced by ordinary metallurgical methods is used as anode; and a deposition of the one metal is effected while the other remains in solution. At Siegen, the writer understands that they are using a regulus containing 40 per cent. copper and 30 per cent. nickel, and the electrolyte is believed to be a solution of copper or nickel sulphate. If acid, copper alone is deposited, while if the solution be neutral, the nickel will be deposited also. This difference has been made the basis of an analytic method for the separation of copper and nickel, so its effectiveness for obtaining a separation of the two metals upon an industrial scale is assured. Nickel is one of those metals for which there is a steady and growing demand in the arts, and since the separation of copper and nickel is not easily effected by furnace methods of procedure, there would appear to be a highly successful future before the electrolytic nickel industry.†

SOME RECENT IMPROVEMENTS IN ACCUMULATORS AND THEIR APPLICATION TO TRACTION ON COMMON ROADS.*

BY J. T. NIBLETT.

(Continued from page 231.)

FAURE, OR PASTED CELLS.

Camille Faure, appreciating the inconvenience incidental to Planté's electrolytic method of producing battery plates, conceived the idea of accelerating the operation by applying a layer of chemically-prepared oxide of lead to their surfaces, and then converting it into active material by the action of an electric current. With this end in view he thinly coated lead plates with red lead made into a thick paste by the addition of acidulated water. After being thoroughly dried these prepared plates were placed in a bath of dilute sulphuric acid, and were then subjected to the action of an electric current. To prevent the disintegration of the lead salts he interposed between each of the plates a layer of porous felt or cloth. After passing the electric current through such a combination for some time, Faure found that the oxide of lead on the positive plate was converted into peroxide of lead, while the salt on the negative had been reduced to finely divided or porous lead. Owing to the defects which speedily developed in Faure's original plates, they never came into commercial use. It was found by repeated charging and discharging the loose lead salts permeated through the pores of the porous separating medium and thereby induced the formation of what is known as "lead trees," which short circuited and ultimately destroyed the elements. The inert porous separating medium therefore had to be abandoned, and the difficulty was overcome by leaving a clear liquid space between each plate. Much ingenuity has been exercised by various workers in devising methods of holding active material, and many of these devices have been made the subject of patents.

Messrs. Sellon, King, Volkmar, Philippart, Parker, Swan and others have each devised methods of holding active material on grids, frames or plates. These methods, combined with Faure's original discovery, constitute that group of inventions owned by the Electrical Power & Storage Company, and are well known shortly as the E. P. S. patents. The elements as originally made and largely used by the above company were perforated with a large number of square apertures, tapered inwards from both surfaces, thus forming a double dovetail. Owing to their peculiar shape, the pellets of active material tend to key themselves firmly into the countersunk holes. The metal frames are cast in a metal chill or mould, and when cleaned up the frames are filled in with the material to be rendered active. The positive frames are filled or "pasted" in with red lead made into a paste by the addition of a solution of 1 part sulphuric acid to 8 parts of water. The material used for the negative element is litharge mixed with sulphuric acid, 1 part added to 20 parts water. When dry, the plates are placed in a bath containing dilute sulphuric acid, where they are partly formed, or what is known as "hardened," by means of an electric current. After being hardened, the plates are removed from the bath and placed in a suitable frame, and their connecting lugs are lead-burned together. When treated as above, the elements are fit for sale purposes. In all cases the actual forming is done by the purchasers.

Of late years improvements have been made in the original E. P. S. plates. The King-Faure plate, now much used, has a series of ledges cast upon it on both sides, and these ledges are filled in with the active material. Plates made on this principle are much

thicker than those originally made, and are said to give a greater capacity per pound of plate. The accumulators made by the E. P. S. Company, and so extensively used for electric light purposes, are so well known that they scarcely need further description here. We shall, however, have occasion to again refer to this company's traction cells later on.

Since the year 18-0 considerably over a thousand applications for British letters patent have been made for improvements in secondary batteries, chiefly of the Faure pattern, and of these some hundreds have developed into fully published patents. The great majority of the suggested improvements are of a mechanical nature and refer more especially to: (1) Methods of accelerating formation; (2) devices for preventing disintegration of the active material; (3) attempts to construct a mechanically solid cell; and (4) means to prevent that great bugbear of all lead accumulators—the warping and buckling of the plates or grids.

It is not within the scope of this communication to investigate all the attempts made to overcome the above-mentioned difficulties, and only a few of those batteries now on the market will be considered. In addition to the improvements noticed here much has been done in this country by Sir Edward Frankland, Messrs. Reekenzann, Drake, Gorham, Barber-Starkey, Pitkin, Bristol and others. On the Continent, Messrs. Reynier, Tommasi, Gadot, Hagen, Jacquet, Payen, Laurent-Cely, Pollak and Blot are each credited with improvements; while Messrs. Brush, Eickemeyer, Ernst, Carpenter, Knowles, Hering, Gibson, Currie, and Winkler, in America, have modified with some amount of success either Planté's or Faure's original inventions.

A form of accumulator which has been received with much favor on the Continent is known as the "Tudor." Of late years this form of cell has been introduced into this country, and is now manufactured by the Tudor Accumulator Company. The elements are not of the grid form, but consist of lead plates deeply grooved, made by being passed between a pair of suitably-made rollers. The grooves in the negative plate are narrower than those on the positive. When prepared in this way the plates are coated by electrolysis with a thin layer of peroxide, and the interstices are then filled in with the usual paste of lead oxide. The reason for treating the plates in this way is to prevent the formation of sulphate of lead at the junction of the metal holder and the active material. After the above treatment the plates are allowed to dry and are passed through smooth rollers. This last process closes up the grooves and tends to key the active material in.

According to Prof. Kohlrausch, who made some tests of the original Tudor cell, he found that a capacity of 1.6 ampere hours per pound of plate was obtained by a cell of the following dimensions: The weight of the elements was 29.3 lbs., the total active surface of the positive plate was 1.29 square feet, the amount of electrolyte was 6 pints. Such a cell was stated to have an internal resistance of 0.015 ohm when charged, and 0.02 ohm when discharged. The best charging rate was found to be 5 amperes, and the discharging rate 6.5 amperes. As a mean of six ordinary charges and discharges a current efficiency of over 90 per cent. was said to be obtained. We believe that since the above test, and owing to improvements made, far better results have recently been obtained.

A material for making the elements of secondary batteries quite distinct from any of those already considered is known as lithanode. The credit of devising lithanode is doubtless due to Mr. Desmond FitzGerald, whose labor in the field of electro-chemistry is well known. Batteries, with improvements made on Mr. FitzGerald's original invention, are now made by the Lithanode Electric Storage Company.

Lithanode is not compressed peroxide of lead, as is sometimes supposed; for, however strongly this lead

peroxide may be compressed, the resulting mass will disintegrate when immersed in a liquid electrolyte. It is produced from litharge made into a pasty mass with a solution of sulphate of ammonia, which causes the material to "set," so that it will no longer disintegrate when placed in a fluid. The "forming," according to the original idea, was performed in a bath of sulphate of magnesia. In ordinary practice the elements are made up of a number of small slabs of lithanode, whose outer edges are V-shaped. These slabs or pellets are arranged in a casting mould of any suitable dimensions, and are placed at such a distance apart and from the edges of the casting frame as to allow of sufficient space for the requisite quantity of metal to run in and impart adequate mechanical strength to the completed element. After the pellets have been arranged in this manner, an alloy of lead and antimony is run into the interstices, and thus a complete plate is formed.

Before being cast up the positive pellets are converted into peroxide of lead in a forming bath; those for the negative plate are simply dried and cast up direct, the lithanode in the latter case being reduced to a condition of spongy lead by the ordinary electrolytic method.

Where lightness is a desideratum, as in the case of a traction cell, the pellets in the positive plates are made larger, while the negative plate is constructed of lead gauze, having its outer edge strengthened by a rim of lead. The gauze is filled in with the prepared litharge, which entangles itself in the thin lead wire, and thus produces a plate of great lightness and one little liable to fall to pieces.

Lithanode may be obtained in varying degrees of porosity. For high discharges it is made of a highly porous nature, the porosity being produced by incorporating in the material crystals of some salt which is practically inert and which is dissolved out during the forming operation.

The rate of discharge obtainable from lithanode batteries varies between very wide limits, and is regulated by the character of the lithanode, whether made hard, medium or soft. The ordinary working rate of discharge is one-fourteenth of an ampere per square inch of lithanode plate, but owing to recent improvements very much higher rates of discharge can be obtained.

The electrical capacity of lithanode, when discharged at the above rate, is almost exactly one ampere hour per ounce, so that in a lithanode element weighing 1 lb. a current capacity of 16 ampere hours is obtained. In practice, however, this high capacity is never reached.

Thinking it may be of interest I have prepared the following particulars taken from one of the company's most popular types of portable battery:

Data of Complete 30 Ampere hour Lithanode Batteries, including Wood Cases.

No. of cells.	Outside dimensions of battery.			Open EMF. of battery.	Approximate gross weight of battery.
	Length.	Width.	Height.		
	Inches.	Inches.	Inches.	Volts.	Lbs.
1	3.75	7.00	6.37	2	8½
2	5.12	7.00	6.37	4	16
3	7.27	7.37	7.00	6	22½

Detailed Particulars of Cell.

Vulcanite containing cell, 6.25 inches long, 2.12 inches wide, 5.2 inches high, 10 ounces weight; positive element (two plates in each cell), 5.9 inches long, 3.9 inches wide, 0.5 inch thick, 1 pound 1½ ounces weight; negative elements (three plates in each cell), 5.9 inches long, 3.9 inches wide, 0.13 inch thick, 11½ ounces weight. Weight of connectors, 3 ounces. Weight of cover, vent plug, sealing and separators, 2 ozs. Quantity of electrolyte, 15.5 fluid ounces.

* Paper read before the Self-Propelled Traffic Association, Liverpool Center, Eng., March 29, 1898.

Gross weight of complete cell, 6 pounds 7 ounces.
 Normal charging rate, 3 amperes.
 Normal discharging rate, 3 to 4 amperes.
 Maximum safe discharging rate, 9 to 12 amperes.
 Approximate internal resistance, 0.015 ohm.

The data given will give a fair idea of what is obtained in actual working with this form of cell. Other batteries of larger capacity are, of course, made, and as the capacity increases, the proportional weight and bulk slightly decreases. These batteries have been used extensively for lighting vehicles, actuating coils for X-ray photography, and for propelling electric launches and light forms of motor cars.

The Chloride Electrical Storage Syndicate make their accumulator plates on a somewhat similar plan to that adopted by the Lithanode Company. In this case, however, instead of using litharge, chloride of lead is employed to make the pellets. The method of making chloride plates is somewhat as follows: Litharge is dissolved in acetic acid, which gives the resultant compound of acetate of lead. By adding hydrochloric acid to this solution, chloride of lead is precipitated. The precipitate is next passed through a filtering press, which squeezes out the acetic acid and leaves the chloride of lead in the shape of cakes. The cakes of chloride of lead so prepared are dried and put into melting pans with a small percentage of zinc. When melted the salt is run into a suitable mould, the result being the production of small hexagonal pellets. The pellets are next arranged in a metal chill, and an alloy of lead and antimony in a molten state and under pressure is forced into the interstices. The next process is to reduce the chloride. This is done by placing the plates in a reducing tank, alternately a cast plate and then a plate of zinc. The zinc combines with the chlorine, forming chloride of zinc and reducing the lead salt into pure spongy lead. Originally both the positive and negative elements were made in this way, the spongy lead in the positive plate being converted into peroxide by the usual electrolytic method. Now, however, following out the prevailing fashion, the chloride plate is only used as the negative element, the positive is of different construction and is of the Planté type. The positive plate, which is cast in a mould, has a large number of holes in it. These are about three-quarters of an inch in diameter, and slightly tapered outwards on both sides of the plate. Into the cast holes are pressed small rosettes of lead. These, which exactly fit the holes, consist of lengths of pure lead strip gimped and rolled up in the form of small coils. When all the apertures are filled in the plates are submitted to pressure in a hydraulic press, which operation keys in the rosettes. The formation is effected by joining up the plates to dummy negatives and peroxidizing in an electrolytic bath in the usual manner.

Chloride cells are well known and largely used for traction purposes in America, and they are very well received in this country also.

A form of cell which is just now exciting much attention on the Continent is known as the "Marschner" cell. The Marschner battery is at present being used on the Dresden tramways, and it is said to be behaving in a very satisfactory manner. The plates are stated to consist of the ordinary oxides of lead, incorporated with powdered amber and an essential oil. This mixture is said to "set" very hard, the resultant plate being of a tough metal-like nature. On the Dresden car 144 cells of this type are being used. Each cell contains 13 plates, and is said to weigh only about 28 lbs. The weight of the complete battery is given as 5,290 lbs. Its efficiency is stated to be over 90 per cent., and if discharged at its normal rate—that is, 65 amperes—an energy capacity of 13 watt hours per pound of cell is obtained.

When devising cells for traction purposes many difficulties have to be overcome. Owing to their high initial cost, a small number of cells should be made to suffice, and these should be so con-

structed that they will run a vehicle for a reasonable number of hours with one charge. They should be capable of being charged and discharged at rapid rates. Above all, they should be able to withstand the jolting and jarring incidental to their being run over rough and uneven roads. The cell should be so constructed that the wash of the electrolyte does not remove the active material.

There is at the present moment an enormous field for an inexpensive cell which will combine large capacity with small weight and great solidity. Some form of mechanically solid cell seems to offer the best solution for this problem. Some little time ago great hopes were entertained that the solidity problem had been solved by the introduction of Dr. Schoop's solid electrolyte. This so-called solid electrolyte was made by adding silicate of soda to the ordinary solution, which caused it to set and become of a gelatinous nature. In this country some practical tests have been made with Mr. Barber-Starkey's method of making solid cells by substituting for the electrolyte a mixture of wood sawdust and plaster-of-paris, which when set was moistened with dilute sulphuric acid.

The accumulator known in America as the "Hatch" is of a mechanically solid nature. In this case metallic frames are not employed for supporting the lead salts, as they are held within a porous earthenware grid serrated on one side and having small square recesses on the other. Plain lead plates are used as conductors, and these are bedded on the moist lead salts. According to this arrangement there is no clear liquid space between the elements, as the serrated earthenware plates touch one another and are so placed that the ridges on one plate are placed at right angles to those on the other. Wooden clamping plates with india-rubber bands placed around them are fixed on the outside of each end element, and these serve to give the requisite elasticity. The "Pumpelly" cell is another American production, and in this case the mechanical solidity of the cell is arrived at by inserting plain, thick, porous earthenware plates between the elements. In this case, however, the plates are placed horizontally instead of vertically as in the "Hatch."

One great drawback to the employment of a viscous, gelatinous, or semi-solid electrolyte arises from the fact that when such substances are interposed between the plates no free circulation of the liquid is possible. In all secondary batteries, as already shown, the activity of the elements depends entirely upon chemical action, and as the electrolyte is a medium through which all these reactions occur, it seems highly probable that anything which prevents its free access to the active material, or in any way impedes its circulation, must be detrimental, and consequently lead to loss of efficiency and capacity.

Some few years ago, having in view the advantages likely to be derived from the employment of a mechanically solid cell, for traction purposes, the author gave some attention to this particular form of battery, and a number of cells were constructed having this object in view. In most cases the elements consisted of a highly cellular mass of active material, which was capable of absorbing a sufficient quantity of electrolyte for the due performance of all the necessary chemical actions. Between each mass of active material was inserted a thin, highly porous, inert diaphragm, which was not found to materially increase the internal resistance, and served to complete the solid character of the cell. A large number of different combinations with various kinds of active material were tried. Owing to the cellular nature of these elements the liquid contained in the mass continually circulated, the slight evolution of gas which occurred during both the charging and discharging operations being quite sufficient to effect this. The active material was in all cases so placed that it could not be dislodged. It was found that the cellular character of the electrodes gave them a

peculiar power of regulating their own internal resistance, for if the cell was being charged at too high a rate, or when it was on the point of being fully charged, the gas generated tended to drive the liquid out of the pores of the electrodes and remained imprisoned therein, thereby greatly increasing the resistance and stopping the flow of current. On the discharge, the occluded gas appeared to re-enter into the chemical combination and allow the liquid to refill the pores, thereby exposing more active surface. Little or no commercial use was made of this plan of construction, as at the time the author's attention was diverted into other channels, and the matter was dropped.

Probably no individual type of secondary cell will be found to answer for the very varied and ever-increasing purposes to which this class of apparatus is now being applied, and it follows that some form of specialization must occur.

For central electric light stations, or for such work as leveling up the loads on electric tramways, where moderately constant work is required, a battery whose weight is large, or whose bulk is great, may be safely used. For self-contained electric light installations, weight and space occupied by the battery is of some moment; and where intermittent charging only is resorted to, absence of local action is desirable. The battery, under these circumstances may have to stand idle for considerable periods, and it would not do for it to lose its charge while thus waiting. For traction purposes, where charging each day, or even several times per day, may be practised, local action is not such an objection, and the loss sustained thereby may be neglected. For some forms of vehicles, such as broughams, dog-carts, tricycles and the like, which may be only occasionally required, and may have considerable waits between the periods of use—waits which may extend over days and even weeks—the absence of local action is essential. A fifth class of apparatus in which storage batteries are now playing a most important part is that of self-contained portable electric lamps, so largely used for medical and other purposes. In this case absence of local action, lightness and compactness, together with great mechanical strength, is absolutely essential. In many cases such lamps are required to hold their current for many months, and this can only be obtained where there is little or no local action. Again, as the plates used in these small batteries are of small dimensions the form of construction may be such as is not permissible in any other class of apparatus.

"Local action," it may be explained, is the term given by electricians to that frittering away of energy which frequently occurs while a cell is at rest. This wasting is experienced in nearly all forms of primary cells and in many types of secondary cells. In the case of secondary cells it is due to the establishment of voltaic couples between the metal support and molecules of lead salt when in the presence of sulphuric acid and water. This troublesome complaint leads to the destruction of the peroxide and the formation of sulphate of lead, and it not only reduces the capacity of the cell, but it frequently leads to its ruin. In the Planté cell, with its large metal surface and thin layer of active material, local action is far more prevalent than in the Faure, with its comparatively smooth and small metal surface and thick masses of lead oxide.

(To be continued.)

Electric Lighting of Trains in India.

The Jodhpore-Bikanir Railway is setting an example in this matter. The manager's reserved carriage was fitted up some time ago with Stone's system of electric lighting, which has worked satisfactorily. Urged by this success the railway is going to use the above system on a whole train, the dynamo and accumulators being placed in the brake van.

WIRELESS TELEGRAPHY.*

BY W. J. CLARKE.

DISCUSSION.

(Concluded from page 229.)

Mr. Knight—What would be the practical outcome of the application of this invention?

Mr. Clarke—My idea is that it would be used largely for transmission between ships and the shore, and I think in the near future we will have a system of telephoning without wires for private use. In fact that is almost a certainty at the present time.

Mr. Hamblett—In the case of communicating from ships to the shore, suppose two steamers were fitted with the apparatus and undertook to operate together, how would you distinguish between one message and the other? Would there not be an interference in that case?

Mr. Clarke—That is something we will have to overcome. It may be that by tuning our apparatus properly there will not be any interference to any great extent; and if there is, I think that American ingenuity will overcome it.

Dr. Pupin—You cannot tune it effectively. I think you said this before the American Institute, that it works as well whether you tune it or do not tune it. It is as effective in one case as in the other. Is there any proposition made as to the method of tuning?

Mr. Clarke—I have read of a great many experiments that have been made in that line, but I agree with you in the fact that none of them have produced very good results.

Dr. Pupin—Have they proposed any method of bringing that result about, or are they groping in the dark?

Mr. Clarke—They are groping in the dark, so far as I can see.

Mr. Knight—In what way would this system be introduced in telephoning without wires?

Mr. Clarke—That at present cannot be divulged, but I might say in regard to transmitting signals, when there is much outside noise the telephone receiver is much to be preferred to the ordinary sounder.

Mr. Dunn—I believe Mr. Preece made some experiments some years ago, and found that telegraph circuits could be read by telephone when the circuits carrying them were forty miles apart. Such a system of telephoning would be useless unless the tuning is successful.

Mr. Clarke—There are two ways of looking at that. If a system of telephoning of that kind is devised, it will be used probably between a place of business and a residence. We will say that Mr. A. has a telephone in his residence and one in his place of business, and Mr. B. another; but they will be so far separated that they will not affect one another.

Dr. Pupin—You have six balls in the small arrangement and only two in the other?

Mr. Clarke—This transmitter was constructed when the announcement was made that Marconi used balls four inches in diameter. I had an idea that the small balls would be sufficient if there were enough of them. We find that we get fully as good results by using three instead of six, or two large ones.

Mr. Mailloux—In winding these relays with two or more windings in multiple, has the experiment been tried of using windings of unequal resistances or numbers of turns? The expediency of using multiple windings for the purpose of reducing the sparking is old, and is found quite successful. It is due to the fact that the two coils have different time-constants; that is to say, the ratio between the number of turns and the resistance is different for the two coils. At the time the current dies out it dies out in one coil before the other, and that coil be-

comes a short-circuit path for the other to some extent. Some years ago a telephone system was devised (known as the Gillette system) which depended upon having induction coils with several windings connected in multiple in the same way. I was interested in knowing, in this case, if the effect of a definite difference in the ratio of the inductance (that is to say, the number of turns,) to the resistance in these coils has been tried to accentuate that difference in the time-constants as much as possible.

Mr. Clarke—We have not tried it that way. All our windings have been of the same resistance.

Mr. Mailloux—They are probably not equal in the number of turns. There would inevitably be a difference in winding, it being almost impossible to wind two coils alike with fine wires. This would make a difference which I think is the reason to which the spark-killing effects noted must be ascribed. If you were to accentuate that difference by increasing the resistance of one coil, or increasing its number of turns, I think you would find you will get a still better result. When the coils are being magnetized or energized it will make very little difference, because the one having the greater time-constant will simply force more current through the other at first. When the exciting current is out off, the coil having the smallest time-constant is discharged first, and it then serves as a shunt for the other coil or coils. The greater the difference between the time-constants, the greater must be the spark-killing effect.

Dr. Pupin—Does Mr. Marconi always connect one terminal of the induction coil and one terminal of the coherer to the ground?

Mr. Clarke—No, not always. He frequently places the transmitter high in the air, and also the receiver, and uses wings on the coherer out to a proper length, to be in what we might call "tune" with the transmitter.

Dr. Pupin—Then I should say that there is a radical difference between the two methods by which he transmits signals between two stations. In the case of grounded circuits, it is not so much the action of the waves transmitted through the air that affects the coherer as it is the ground currents running between the two plates indicated in your diagram by C, because these two plates are actually the plates of a condenser which is being charged by the induction coil, and the charging current causes the resistance of the coherer to diminish. It is in fact the same thing as wabbling the charge of the earth, which Mr. Tesla proposed some time ago. In this case it would be more or less of secondary importance whether we employed excessively rapid or, comparatively speaking, slow vibration, and in fact I should think that the coherer would operate even if a spark between the terminals of the secondary of the induction coil did not take place.

Mr. Clarke—We find that for very short distances the coherer will operate even when a spark is not passing across the terminals of the induction coil, but when operating for a considerable distance we find it is absolutely essential to use the plates in the air, and Mr. Marconi claims to find that the greater the heights of the plates in the air, the greater the distance to which he can transmit his signals.

Dr. Pupin—As far as I can see, Mr. Marconi's apparatus does not represent the solution of the most important problem in connection with long-distance signaling without wires, or rather long-distance signaling by means of electrical waves. This problem can be stated as follows: To construct an electrical oscillator of very short period, say one hundred thousand million vibrations per second, the vibrations having a small decrement, that is to say, the vibrations having once started should continue for a considerable number of periods, say five or six hundred periods. Vibrations of this kind are necessary it seems to me. They should have very short wave lengths, so as to enable us to construct reflectors of reasonable size which could focus them, and

they should have a small decrement, so as to be capable of producing powerful resonating effects, for without that selective signaling becomes impossible. So far as I know, nobody has been able yet to produce electrical waves of excessively short period and at the same time possessing small decrement, because to produce these rapid oscillations it is necessary to connect small conductors to the terminals of the induction coil, and in such cases the radiation of the electric waves is so enormous that the waves die out very rapidly so that after the first half wave there is hardly anything left. This was the trouble, for instance, with the waves produced by Prof. Lodge and others. It was on that account that successful experiments on the reflection and the interference of electrical waves became almost an impossibility. In a recent discussion given by Prof. Lodge, and published in the *London Electrician* I think, this difficulty has been emphasized more or less forcibly. Now as Mr. Marconi offers no suggestion in the line of solving this problem, and without the solution of this problem selective signaling by means of electrical waves will be made an impossibility, I think the commercial utility of the system will remain more or less small. Mr. Marconi does mention, to be sure, that he has been successful in tuning the receiver to the transmitter, but he does not state whether in this case he employed excessively short electrical waves or waves of considerable length. In fact the electrical reflectors play a rather unimportant part in his operations, and I should very much like to know whether he ever succeeded in tuning the receiving to the transmitting apparatus when he employed excessively short wave lengths, so short as to enable him to use reflecting mirrors of reasonable dimensions.

Mr. Clarke—I have not as yet tried selective signaling in any way. Lieut. Squires, of Fortress Monroe, tells me that he has produced some very successful results by the use of a Tesla coil, which is, of course, of much higher frequency than the one we have been using. My experience however has been, that up to a distance of half a mile, when the apparatus is in perfect adjustment, it is only necessary to simply open and close the primary circuit of the induction coil once in order that the receiver will respond. Now in regard to reflectors, we have been informed by those who have visited Mr. Marconi that he does not use a high-frequency apparatus, his best transmitter being equipped with an ordinary induction coil fitted with a comparatively slowly working make-and-break arrangement. He however claims to have used reflectors with excellent results. For my own part I have tried reflectors in every conceivable way, and found that they were no benefit whatever. I have taken the transmitter and receiver without being grounded in any way, and separated them just a sufficient distance to prevent the receiver from responding to the transmitter. I have then tried various sizes and shapes of reflectors, in order to ascertain if they would again bring the apparatus into operation, but to no purpose. I have also endeavored to follow up Mr. Marconi's idea of getting the transmitter and receiver in tune, and I have also signally failed in this direction. I presume, however, that this was due to the fact that the transmitter which I have used is not at all of high frequency.

Dr. Pupin—I am afraid that you did not exactly catch my meaning of the expression frequency. I refer not to the number of makes and breaks of the induction coil, for that really is immaterial, but to the electrical oscillations which are set up between the principal spheres after each passage of the electrical spark between them, and that frequency does not depend upon the size of the induction coil, nor on the potential with which it operates, but simply on the size and number of spheres and the distance between them, and also on the dielectrics separating them. Say, for instance, if we use spheres 30 centimeters in diameter, and separated from each

*Paper read before the New York Electrical Society.

other one meter, also having a rod running from one sphere to the other, with an air gap in the middle of it, the number of oscillations per second would be about one hundred millions. Now by diminishing these spheres continuously, and decreasing the distance between them gradually, we would increase the number of vibrations to anything we pleased. Say, for instance, the number of vibrations between two pin-heads, at a distance of say one hundred millimeters between them, would run into hundreds of thousands of millions per second, and the wave length would diminish from one meter down to the fraction of a millimeter, it is evident that with these shorter wave lengths we could employ small mirrors, for a reflecting mirror to act satisfactorily must have its dimensions large in comparison to the wave lengths of the waves which it is to reflect. As far as I know, neither Mr. Marconi, nor anybody else for that matter, has tried to adjust the dimensions of his reflecting mirrors to the dimensions of the wave lengths, and I venture to suggest that in this respect Mr. Marconi has been more or less negligent.

Mr. Clarke—We find that many of our experiments tend to confirm the correctness of your arguments. We began our experiments some months ago by using the same form of transmitter that Mr. Marconi used, consisting of two 4-inch solid brass balls, separated by about $\frac{1}{10}$ of an inch, and two small balls on the outside of the larger ones and separated from them by about an inch and a half, the inner hemispheres of the larger balls being immersed in a bath of oil. We certainly found excellent results from this arrangement, and we began gradually to decrease the size of the balls until finally we found that balls of only one-eighth of an inch in diameter were sufficient to operate the receiver at a considerable distance, but we found that when we substituted points for the balls we got no results whatever, and as we increased the distance between the transmitter and receiver we found it absolutely necessary, in order to make the receiver respond, to increase the size of the balls. In fact we have found, as far as we have gone, that the greater the distance, the greater must be the size of the balls upon the oscillator.

THE KINGSLAND SYSTEM OF ELECTRIC TRACTION.*

The designers of contact systems of electric traction using projecting contacts in the surface of the roadway are many, and as yet have not achieved much commercial success. This is largely due to the cost of their systems, and also to the number of the contact points required. In fact, the projecting contact and long collector, which has to make connection at all points of its length, is, in our opinion, the chief objection to the system from the local authorities' point of view. In Mr. W. Kingsland's system the number of contact points is less than in either of the two systems advocated by the leading American engineers. This is due to the fact that he uses the current from the power circuit to operate the automatic switches and that a subsidiary accumulator circuit is not used. Mr. Kingsland has a model of his line at work at the Faraday House, where we were able to inspect it and to glean the following details: The main feature of the electrical connections appears to be the fact that the current to every stud is controlled by two switches, of which one is operated by the car moving in one direction, and the other if the car moves in the opposite direction. Thus the switch-gear under one contact controls the supply of current to contacts on either side of it. The connections possible are many, and in his patent specification Mr. Kingsland describes these at length.

The arrangement preferred by the inventor con-

sists essentially of an electromagnet with two pole-pieces between which is a soft-iron armature rigidly attached to a spindle which is free to turn. At one end of the spindle is the main commutator switch, which is also free to turn independently on the spindle and is controlled by a quadrant-shaped boss. Fixed to the spindle is also a counterweight which normally keeps the spindle and armature in one particular position. The main commutator switch consists of a cylinder of insulating material on which are fixed two metal plates which cover approximately one-half of the cylinder, with a small space between the two, so that they are insulated from each other. The main commutator switch is in contact with four contact brushes or springs, connected respectively with the main conductor. At the opposite end of the spindle, and free to turn on it, is a small commutator switch operated in the same manner and at the same time as the main commutator switch. The metal plates on this smaller commutator, however, differ from those on the main commutator in that the insulating cylinder is entirely covered with metal with the exception of the upper half of, say, the end portion. There are three springs or brushes making contact with this smaller commutator, one being in contact with that part of the commutator which is covered with metal all round, and this will always be in electrical connection with it, while the other two brushes are arranged so as to make contact alternately as the switch is turned to the right or to the left, and the contact is broken with one just before it is made with the other. The small commutator serves to control the action of the electromagnet in the following manner: One end of the circuit on the field magnet is permanently connected to one contact brush and the other end to earth or to the return conductor. The other contact brushes are connected to the sectional rails on either side of the apparatus, consequently a current applied to either of the sectional rails will find its way to earth through the electromagnet, provided the small commutator is in the right position.

Supposing that a vehicle is passing over one sectional rail and is about to enter another. As the vehicle is traveling over the first this sectional rail will be in connection with the main conductor through the main commutator and two contacts. When the collector on the vehicle makes contact with the second sectional rail, which it does before leaving the first, the current will flow from the first section to the second through the collector, and from the second it will pass to the contact brush of the small commutator and thence through the field magnets to earth. The effect of this will be to act upon the armature of the electromagnet and turn the spindle, which latter by its attached sector-shaped parts will operate the large and the small commutators simultaneously, so that the contacts will be changed. If two branches of the switch are already connected, then the vehicle can collect the current from the second sectional rail, but if the switch should have been turned in the opposite direction, by reason of the previous passage of a vehicle in the same direction, then at the moment that the collector makes contact from the first to the second sectional rail a current will flow through the contact of the small commutator, and operating the electromagnet will alter the connection of the commutator from one pair of brushes to the other, and so in conjunction with the former two contacts of the switch will permit the vehicle to collect the current from the second sectional rail.

From the above description it will be seen that as soon as the contact bar touches two contacts in the roadway the rear one is disconnected from the main and put to earth through the shunt coil of the regulating switch-gear under it. This switch-gear work on the model was full size, and from what we could see would not be expensive to make. In it no springs whatever are used, and gravity is relied on for the return of the various counter-weights. The use of

an unwound Siemens armature as the moving part of the electromagnet is good, and the design arranged for placing the armature a little out of the central position, first in one direction and then in the other, is exceedingly ingenious. Certain details of this switch-gear and its case are yet to be devised, but we have no doubt but that Mr. Kingsland will be able to complete these satisfactorily. The use of the full 500 volts on the shunt winding of the electromagnets and the breaking the circuit repeatedly is perhaps the part of the system most likely to give trouble. Otherwise it is a well-thought-out system, and we trust it will obtain a practical trial.

NEW METHOD OF MEASURING THE INTENSITY OF MAGNETIC FIELDS.*

BY E. BOUTY.

I have recourse to the induction, reciprocal of that employed by M. Lippmann in his mercurial galvanometer. A liquid conductor, which may be simply river water, flows at right angles to the field to be measured. The constant electromotive force induced between two opposite faces of the stream is determined by means of a capillary electrometer; whence, knowing the flow, we can deduce the intensity of the field. To take a simple case, suppose the velocity of the flow, v , to be uniform over the whole section of a rectangular stream of depth, e , measured in the direction of the lines of force, and of width, l , measured in a direction perpendicular both to the lines of force and to the stream. The induced electromotive force is constant, and has a value E , where

$$E = H v l. \quad (1)$$

The flow is

$$D = v e l. \quad (2)$$

Whence

$$H = \frac{E e}{D}. \quad (3)$$

We have to apply this very simple formula.

Equation (1) shows that the induced electromotive force is independent of the nature of the liquid conductor. I employed at first solutions of sulphate of copper, both saturated and very dilute, flowing through a rectangular conduit or tube of ebonite. Two electrodes of copper .01 meter long and of a width, e , exactly occupy the side surfaces of the tube between the back and front faces of the stream. Having ascertained that the electromotive force measured is perfectly independent of the concentration of the solution, I was able, without making any other change, to substitute water from a tap for the sulphate of copper, the facility of making measurements remaining the same. Polarization of the electrodes introduces no disturbance.

Using water as the liquid conductor, high velocities of flow can be employed, and the sensitiveness of the method indefinitely increased.† With velocities varying from .5 meter to 17 meters per second, I have proved that the electromotive force is exactly proportional to the speed, and have detected fields of the order .5 C.G.S. unit. I see no reason to think that I have reached the limit of possible sensitiveness.

For comparative measurements neither the depth, e , of the tube nor the rate of flow, if it be kept constant, need be measured, and the tube may have any convenient form; but perfect insulation of the electrodes is absolutely necessary. For absolute measurements, a standard tube must be procured in which e is of such a size that the value of v may be treated as sensibly uniform over its sectional area, as we have supposed to be the case in the equations.

The copper electrodes of width, e , the depth of the tube, must be inserted into the walls so far from the inflow‡ that the velocity of the stream may be uni-

* Translation of a note presented to the French Academy of Sciences, January 17, 1898.—From *Electrical Review*, London.

† It is only limited practically by the maximum stream at one's disposal.

‡ Five cm. at least for tube of 5 mm. in depth.

* From the *Electrical Engineer*, London.

form over the area between them. Moreover, a correcting coefficient is required, differing however but little from unity, for the reduction of speed near the walls of the tube. For tubes from 1 to 6 millimeters deep, I find an expression $e + .13 \text{ mm.}$, representing the effective depth, may be substituted for e in equation (3).

Since the electromotive forces measured with different conduits are rigorously proportional to the field and to the stream velocity, one may determine by comparison with a standard tube the effective depth of any other tube, which may be extremely shallow, and afterwards use the latter as a secondary standard.

In cases where the electrometer is inconveniently sensitive, a large condenser, say of 2 or 3 microfarads, may be charged by the induced electromotive force and discharged through a ballistic galvanometer. Fields of 50 C.G.S. units may be readily recognized in this way.

I have already used my method in the study of the curves of saturation, and of residual magnetization of electro-magnets, and propose to apply it in other ways.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For *Electricity's* Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and wherever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all theses submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we should like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not thoroughly clear, we will be pleased to answer any inquiries relating to this matter.

LONDON NOTES.

[From our London Correspondent.]

Gaseous Matter in Crookes Tubes.

On March 25 Mr. A. A. Campbell Swinton read a paper before the Physical Society in London on "The Circulation of Gaseous Matter in a Crookes Tube." He stated that the stream lines within a Crookes tube are investigated by observing the direction and speed of rotation of a mica radiometer mill mounted on a sliding rod so that it can be moved along a line at right angles to both these lines. If the mill is adjusted to a position between the flat plate and the cup electrodes, with its axis sufficiently low to prevent equal and opposite simultaneous action on the top and bottom vanes, it rotates always in the direction indicating a stream from cathode to anode. The speed is greater when the flat plate is the cathode. If, however, the mill is now moved below this line, a point is reached at which rotation ceases, and below this neutral point the rotation is suddenly reversed. Reversal is only to be observed with high degrees of exhaustion; the rotation is never so rapid here as in the first position. The mill rotates, and the reversal may be observed whether cup or plate is made cathode, and the direction of rotation below the neutral point is always opposite to that in the position above it. A small Wimshurst machine is as effective as an induction coil in producing these effects. The experiments were intended to establish the existence, at high degrees of exhaustion, of a true anode stream, i.e., a stream that travels from anode to cathode just in the same manner as the cathode stream flows from cathode to anode. This anode stream is charged positively; it is exterior to the cathode stream; its velocity is less than that of the cathode stream, but its velocity increases as the vacuum is improved. It seemed probable to Mr. Swinton that, at high vacua, some portion of the positive electricity passing through the tube was carried by the positively charged atoms or particles that constitute the anode stream. At lower degrees of exhaustion, the discharge passes through the tube chiefly by interchange of charges from molecule to molecule—a Grothian chain. At the very high vacua, however, when the mean free pass is considerable, there may be, to some extent, a regular and complete circulation of positive and negative atoms, some of which pass from anode to cathode and vice versa, and deliver up their charges, not by interchange, but by direct convection, to the electrodes of opposite sign.

Thermo-Electric Pyrometers.

In a paper read before the same Society by Mr. A. Stansfield, the author said that very serious discrepancies existed between the indications of couples having nominally the same composition; they are too great to be attributed to accidental differences in the constitution of the alloys. Although with platinum alloys coupled with platinum 10 per cent. of iridium gave a more powerful couple than 10 per cent. of pure rhodium, the partial substitution of iridium for rhodium very considerably lowered its thermo-electric power. That result suggested that the change in the thermo-electric power of a metal depended upon the extent to which it was saturated with the alloying metal; thus 10 per cent. either of rhodium or iridium would, per se, more completely saturate the platinum than would 10 per cent. of a mixture of the two metals. The author, after discussing a series of curves derived from his experiments, concluded that thermo-electrically there may be two classes of metals: (1) the ordinary metals, for which the curve representing the first differential of EMF. with respect to temperature is a straight line, and (2) the platinum metals, together with a few, such as nickel and cobalt, for which the curve of that differential multiplied by the absolute temperature is a straight line,

ELECTRICAL EXHIBITION NOTES.

PERSONAL.

Mr. Chas. Chamberlain has been placed in charge of the Press Bureau of the Electrical Exhibition.

HISTORICAL TABLEAUX.

A series of eight illustrative and historical wax tableaux (designed to mark some of the successive stages of electrical development), prepared by Dr. Park Benjamin, Prof. F. B. Crocker and Mr. T. C. Martin, executed and arranged by the Eden Musee Company, will be a feature in the Concert Hall.

The series will include the First Recognition of an Electric Effect, when the Syrian woman, centuries before our era, wonderingly perceived light objects flying to her amber spindle; the Mariner's Compass, ascribed to the Chinese and Italians, but probably to be credited to the Finns, in the eleventh century; the Earth a Great Magnet—William Gilbert explaining the Terrella to Queen Elizabeth, 1600; the First Conductors or Circuits—Stephen Gray, a Charter-House pensioner in London (1720), experimenting on the Conduction of Electricity; the Leyden Jar, showing the bottling of electricity and the terrible shock to Dean von Kleist, canon of the Cathedral in Cumin, in Pomerania, 1746; the Identity of Lightning and Electricity—when Benjamin Franklin drew down the lightning from the skies, 1752; the Beginnings of the Modern Primary Battery or Voltaic Cell, with Galvani's famous frog experiment, 1791, and the Beginnings of Modern Dynamo-Electric Machinery, showing Michael Faraday's famous experiment, 1831.

These tableaux are accompanied by a selection from Dr. Park Benjamin's celebrated library of early philosophical, technical and electrical books, each illustrating some feature or stage of electrical evolutions.

EXHIBITORS SECURED SINCE PUBLICATION OF LAST LIST.

Am. Mutoscope Co., 837 Broadway, New York.
Ashcroft Mfg. Co., 111 Liberty st., New York.
Boston Blower Co., Hyde Park, Mass.
Berlin Iron Bridge Co., East Berlin, Conn., and 95 Nassau st., New York.
Consolidated Safety Valve Co., 111 Liberty st., New York.
Electric Vehicle Co., 1684 Broadway, New York.
Hayden & Derby Mfg. Co., 111 Liberty st., New York.
Kaufman & Alexandre, 1133 Broadway, New York.
Ward Leonard Elec. Co., Bronxville, N. Y.
Montauk Multiphase Cable Co., 100 Broadway, New York.
Mergenthaler Linotype Co., Tribune Bldg., New York.
Manhattan Elec. Storage Battery Co., 636 Broadway, New York.
National Photo. Mach. Co., 85 Beaver st., New York.
National Phonograph Co., 26th st. and Broadway, New York.
Nonpareil Cork Mfg. Co., Gerken Building, New York.
Sims Dudley Defence Co., 120 Liberty st., New York.
Sheridan, T. W. & C. B., 2 Rade st., New York.
Stanley & Patterson, 32 Frankfort st., New York.
Thomson Press Co., John, 253 Broadway, New York.

EXHIBIT OF HEBREW TECHNICAL INSTITUTE.

For some time past, the Hebrew Technical Institute has made a great success of its instruction in the technical branches of electricity as distinguished from the mere teaching in a manual or trade school. Evidences of the ability of the students under Mr. Ker will be given at the Exhibition, where opportunity is being afforded for an excellent display of the electrical engineering skill of the boys. Not only will a number of instruments be entered for the model-making competition, but these will be supplemented by other instruments and apparatus built by them to illustrate principles and phenomena. There will also be a complete small plant in operation, lighting a small house. A collection of blue prints and photographs will also be included.

The New York Electrical Society.

In consequence of the illness of Prof. Sidney H. Short, and the fact that so many of the members of the Society are engaged in active work on the Electrical Exhibition, it has been decided to give Prof. Short's lecture on "The Outlook of Heavy Electric Traction" during the Exhibition.

At the Electrical Exhibition there will be various demon-

strations of scientific phenomena and principles by means of models and apparatus, which will be in more or less continuous operation. As the Society has been entrusted with a great deal of the work of this kind it would like to secure from among its members the help of volunteers to take charge of various features from time to time; the duty will not be heavy, but will be made as light as possible. The first applications will be selected, preference being given, as far as possible, in case there is a large number of applicants, to students of educational institutions. The assignment to duty will be in the hands of a committee of the Society and the Exhibition Company, and the work of such members will be publicly recognized.

Henry Electrical Society.

The 102d meeting of the Henry Electrical Society will be held on Friday evening, April 29, at Columbia University, 116th street and Amsterdam avenue, in the Engineering Building, Room 302.

On this evening Prof. F. B. Crocker will address the members of the Society on "The Design of Circuits for Electrical Distribution," the questions of regulation being illustrated by numerous experiments.

Electric Railway Projects Abroad.

U. S. Consul Schumann writes the State Department from Mainz that it is proposed to change the motive power of the local tramways from horse to electric power, and to extend the trolley to the suburbs. The company contemplating the change also thinks of running a line to Wiesbaden. The Consul says the estimated cost of effecting the change, including the laying of new steel rails in place of the old ones, and erecting and equipping the power station for supplying power for the local lines and for the new lines, is placed at \$400,000. It is further estimated that the cost of maintaining those cars which are to be equipped with the storage system will amount to about \$250 each per annum.

Consul Jackson writes from Cognac: "Proposed electric lights and electric tramways at Angouleme. Communications should be addressed to MM. P. & M. Durand & Co., Lyons, France.

"Proposed electric lights and trolley line for the city of Cognac. Communications should be sent to M. Jules Brisson, Maire de la Ville de Cognac, Charente, France."

Consul Lyon writes from Hiogo (Kobe) Japan: "There are three electric railways projected in this consular district. One is to be 15 miles in length, extending from Kobe to Amagasaki. The company has a capital of 300,000 yen (\$149,000), and the work is to be completed within two years. The time for beginning the work is not fixed. Another line is to be between Amagasaki and Osaka, 5 miles. The company is to have a capital of 300,000 yen (\$149,900). The charter has not yet been granted. Another road is projected to run from Kobe to Arima, 15 miles. The capital is 300,000 yen (\$149,900)."

Machinists' and Engineers' Pocket Manual.

Messrs. Laird & Lee, of Chicago, have just issued in their admirable collection of technical reference books a "Machinists' and Engineers' Pocket Manual," edited by D. B. Dixon, which is the most complete as well as compact work of the kind ever placed on the market. It includes a compilation of rules and solved problems pertaining to steam engines, steam boilers, steam pumps, etc., based on plain arithmetic, and free from algebraic difficulties, together with necessary tables and data of highly practical value in the machine shop, mechanical drawing room and steam power plant. It embraces a Dictionary of Terms used in Steam Engineering and Electricity; the Construction and Operation of Dynamos and Motors; Artificial Refrigeration and Ice-Making; Treatise on the Steam Engine Indicator, Gearing, Shafting, Lathes, Screw Cutting, etc., etc. This illustrated volume of 371 pages, printed on excellent paper and bound in leather, in pocket form, is sure to meet with wide and immediate recognition, as it has been edited by a practical engineer for practical artisans and mechanics, and is up to date in every respect. Leather, with rubber band, and pocket, \$1.00.

LEGAL NOTES.

Judge Smith, at Los Angeles, Cal., on the 15th inst., sentenced A. W. R. Blackman to ten years in San Quentin prison for embezzling \$3,333 from the Los Angeles Electric Company.

The Electric Supply and Construction Company of Savannah, Ga., has been placed in the hands of a receiver by Judge Falligant, on application of the National Bank of Savannah which held a mortgage to cover an indebtedness of \$3,050. There are other mortgages outstanding. Joseph G. Walker was appointed temporary receiver, and for the present the business will be continued under direction of the court.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Baltimore, Md.—The Baltimore City Passenger Railway Company has completed the work of equipping the most important portions of its system, the Red and the White lines, for operation by electricity. A time for the cable cars on these lines to give way to electric cars has not been definitely fixed, the question of power being still under consideration.

Brooklyn, N. Y.—The Brooklyn Elevated Railroad Company has decided to equip its roadbed with the third-rail electric system, in connection with bridge crossing, from the bridge terminal to Bridge street station of the Myrtle avenue line. This will give about 3,000 feet of electric trackage and will be all that the company will do for the present in regard to the change from steam to electricity as the motive power. Power for the operation of the cars will be supplied by one of the trolley companies.

Chattanooga, Tenn.—The Chattanooga, Rome & Southern road officials are figuring on operating electric cars over their line between this city and Chickamauga Park.—The Chattanooga Rapid Transit Company has completed its line as far as Rossville, Ga., and expects to have the line in operation to the park by May 10. This will be the first rapid transit line to the park.

Cincinnati, O.—Charles H. Kilgour of the Consolidated Street Railway Company purchased the Main street line at the sale on the 14th inst., his bid being \$278,000. The road will be re-equipped and put in first-class shape.

Dover, Del.—The Delaware Electric Railway Company, composed of the Dover & Milford Company and the Dover & Bay Shore, has about closed a contract to build a trolley road between Milford, Dover and Woodland Beach. It is expected that work will begin immediately. The entire route, as surveyed, will be 38 miles in length, including turnouts. It will begin at Milford and pass through Frederica, Magnolia, Rising Sun, Camden, Dover and Leipsic, the terminal being at Woodland Beach, where connections will be made with a line of steamers to Philadelphia and Wilmington.

Georgetown, Ky.—The Georgetown Street Railway and ice plant, sold under court orders, has been purchased by C. H. Williams of this city for \$29,000.

Grand Rapids, Mich.—The Consolidated Street Railway Company has awarded a contract to a car fender company in Providence, R. I., to furnish 140 fenders of their make for the company's cars in this city. All the cars will be equipped with them. Manager Johnson states that his company investigated 400 designs of fenders before choosing this kind for use on the cars.

Idaho Springs, Col.—It is reported here that a proposition is on foot for the building of an electric line up Fall river via Alice and Twelve Mile, to connect with the Colorado & Northwestern, building out of Boulder. Henry I. Seeman, with offices in the Equitable building, Denver, is said to have the promotion of the scheme, and with him as a backer George W. Crocker, the railroad magnate.

Indianapolis, Ind.—The "Sentinel" says: "The Michigan, Indiana & St. Louis Electric Railway Company, with headquarters in Chicago, has planned to begin work within two weeks on the construction of a line of electric railway eighty miles in length in the State of Indiana. Construction is to be started at Monticello and is to progress both ways toward the terminal points, which are to be about forty miles from Monticello. The road is projected to do a general passenger and freight business. The principal freight traffic expected is transportation of farm products raised in the territory along the line. A capital of \$275,000 is represented in the investment. The power houses will be at Winamac and Monticello."

Jefferson, O.—A fifty-year franchise has been granted the Pennsylvania & Ohio Railway Company to build and operate an electric line from Conneaut westward, connecting with the Cleveland, Painesville & Eastern. The road must be finished by July 1, 1900, and it must pay the county \$500 annually for crossing the high level viaduct at Ashtabula.

Martinez, Cal.—The supervisors have granted J. S. Bullock of the Blue Lakes Electric Company a franchise to erect poles and wires for an electric road in this county. The line will run to Oakland and San Francisco.

New York.—The Metropolitan Street Railway Company intend to change the motive power of the Broadway line from cable to the underground trolley as soon as they can get the consents of a majority of property owners. The system used will be the same as that now in operation on the Madison, Lenox and Amsterdam avenue lines.

Norfolk, Va.—The Norfolk & Ocean View Railway which was recently acquired by the Norfolk Street Railway Company, passed into the hands of its new owners on the 16th. The purchase price of \$329,000 was paid in full. The road was later reorganized, J. Lancaster Williams, of Richmond, being chosen as president.

Oshkosh, Wis.—The war scare has brought the Oshkosh-Neenah interurban electric road affairs to a standstill and the outlook for securing any interurban electric road connecting with Oshkosh is somewhat dubious. J. K. Tillotson says that the unsettled condition of the bond and stock market is largely responsible for the delay in the construction of the contemplated roads.

San Bernardino, Cal.—The street car company has thrown up its franchise and will, it is said, make a present of the tracks to any one who wishes to take them. It is understood that C. R. Lloyd of San Francisco will get possession of the tracks and utilize them for an electric car line.

San Antonio, Tex.—The San Antonio Street Railway Company has posted a notice that any employees of the company who may enlist in active volunteer services will, upon their return from the war, have their positions, and during the time they are in actual service their wages will continue, and will be paid to their families or dependent ones.

St. Louis.—The ordinance granting a franchise to the Central Traction Company which was passed over the mayor's veto authorizes that company "to construct, operate and maintain a single and double track passenger railroad on, over and along and across certain streets, avenues, highways, railways, bridges and city blocks, in the city of St. Louis, and to operate its line of railroad by electric power, and to run over the tracks of other roads, and to acquire and convey by lease, purchase or sale its own property and franchises, or the property and franchises of other street railway companies, in the city of St. Louis, and to operate same."

Wilmington, Del.—President Clarence M. Clark, of the trolley systems of Wilmington and Chester, Pa., says that the right of way for the connecting link between the two cities has been secured, and laying the tracks will begin this week. When completed this will connect Philadelphia and Wilmington by trolley.

LIGHTING PLANTS.

Atlantic City, N. J.—J. Rothermel, of Reading, Pa., was awarded the contract to furnish 175 or more electric lights to the city for a term of five years. He bid \$105 per lamp against \$127 by the company at present holding the contract. Rothermel gave the city a certified check for \$2,000 as an evidence of good faith, and also agreed to enter a bond to erect and have an electric light plant in operation in the city within 90 days.

Columbus, O.—When bids for the equipment of the municipal electric light plant were opened on the day set it was found that there were no bids for a dynamo, and it was suspected that there was some understanding among the bidders in the interest of the local light company. The board of works held a meeting last week to discuss the matter and a number of representatives of electrical companies who were present assured the board that bids for a dynamo would be submitted when the contract is to be awarded, May 4.

Evansville, Ind.—The People's Electric Light & Power Company has installed a power plant to furnish current for motors, fans, etc., in addition to the lighting plant.

Flint, Mich.—The receiver of the defunct Fenton State Bank has been authorized by the court to sell the Fenton electric light plant to Fayette L. Thompson of Lansing for \$7,000.

Greensboro, N. C.—S. H. Houghton of New York has offered to build an electric street railroad here and operate it, provided he can get the contract for furnishing electric lights.

Grand Forks, N. D.—The temporary injunction brought to restrain the city from buying and operating an electric light plant for street lighting purposes was dissolved by Judge Fisk in the district court April 15. An appeal will be taken, but the electric plant will be completed at once.

Helena, Mont.—The power plant of the electric light company at White Sulphur Springs was burned on the night of the 11th inst. It was in the hands of a receiver and was to be sold on the 12th. What was left of the plant was sold for \$200.

Houston, Tex.—Blake Dupree, receiver for the Citizens' electric light plant, says that while negotiations of settlement between the light company and the insurance companies have not been definitely closed, the general terms of settlement have been agreed upon, and that when the compromise is consummated the electric light company will proceed to construct in this city a very much superior plant to the one that was recently destroyed by fire.

Hudson, Mass.—This town owns a municipal lighting plant, but has concluded that it cannot sell electricity to consumers at a price on which it can make a profit, and so has petitioned the Gas & Electric Light Commissioners for permission to sell for less than cost. Its present price is twenty cents a kilowatt hour.

Middleport, O.—The council has granted an electric light franchise to George Cowie of Middleport and George Pfarr of Pomeroy.

Pasadena, Cal.—Owing to insufficient publication of advertisements for the sale of the electric light and power franchise, the opening of the bids was forbidden by the city attorney. The city clerk was ordered to readvertise the franchise, bids for the same to be received up to noon on May 16.

Randolph, Vt.—Amid the booming of cannon, the ringing of bells and the blowing of whistles, the electric lights for this village were turned on for the first time on the night of the 14th inst. There was a large crowd of people present from surrounding towns.

Rogers City, Mich.—At a meeting of the village council last week a franchise was granted to S. Baker & Co. for an electric light plant. It is to consist of twenty-two lamps or more of thirty-two candle power and is to continue for ten years.

Tiffin, O.—The city gas plant, which a few months ago was bid in by the Northwestern Gas & Electric Company, is again in the hands of the city, the company failing to pay the \$80,000 at which they bid it in. The Northwestern Company claim to have been unable to secure the money on account of pending war clouds. This is the second time the plant has been bid in and then not taken and it will undoubtedly be readvertised.

Washington, D. C.—An amendment to the Naval Appropriation bill providing for an electric light and power plant at the naval station, Port Royal, S. C., at a cost of \$20,000, was adopted in the Senate on the 21st inst.

Winoski, Vt.—There is earnest talk here of establishing an electric light plant and operate it from a neighboring water power.

TRANSMISSION PLANTS.

Charlestown, W. Va.—J. C. Hanger and R. F. Thompson of Pennsylvania were here a few days ago with a view of purchasing the power of the Harper's Ferry Paper Company at Harper's Ferry to establish an electric light plant to light that place, Charlestown and other towns in Jefferson County. It is said that 5,000 horse power could be developed.

Columbus, Ga.—The Columbus Power Company has practically closed a contract for the construction of a dam at Lovers' Leap, on the river. The contract is an important one and will call for an expenditure of over \$100,000. The work will be pushed rapidly during the summer while the river is at its lowest stages. Immediately following the completion of the dam, the finest electric plant ever constructed in the South will be put in, furnishing almost unlimited power, which will be sold to manufacturing enterprises in large or small quantities. The building of this plant is likely to insure the construction of several large manufacturing plants in Columbus.

MANUFACTURING, ETC.

Boston, Mass.—By a fire on the 19th inst., in the Tilden block in which the General Electric Company had a quantity of electric supplies stored, that company's loss was between \$3,000 and \$4,000.

New Orleans.—Correcting a statement of the "Times Democrat" that there was not a sugar house in the State using electric power, a correspondent of that paper writes from Baton Rouge to say that Cinclare plantation, in West Baton Rouge, is using electricity. It has two electric hoists that handle 25 tons each, and the bagasse blower, four 30-inch centrifugals and the laundry are run by electricity. Next season the mill will be fed by means of electrical apparatus.

Pittsburg, Pa.—The "Times" states that "the contract for an electric power transmission plant for the falls of Monte Alto and Tlalnepanla rivers, near the city of Mexico, has just been awarded to G. & O. Braniff & Co., representatives of the Westinghouse Electric & Manufacturing Company in Mexico. The plant will be the largest and most important power transmission project ever contemplated in the republic and all the electrical machinery will be manufactured in East Pittsburg."

COMPANY MATTERS.

St. Cloud, Minn.—The stockholders and the bondholders of the Water, Light & Power Company of this city, having reached a satisfactory agreement, the properties concerned have been taken out of the hands of the receiver, Charles S. Benson, and the old officers will resume the management of affairs until the stockholders meet to elect a new board of directors.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—Elaborate and beautiful designs have been completed by Commissioner Isaac G. Perry for electrical fixtures in those portions of the Capitol which have been completed. This includes electroliters for the eastern and western approaches, for the north and south porticoes, for the grand western staircase and for lobbies in the building. Those for the exterior will be of bronze and the interior of brass. The eastern approach will be standards of massive design, each holding fifty incandescent lights. On the second landing of the steps the electroliters will be symbolical—eagles, the coat of arms of the United States and of the State of New York, the seal of the State and other designs. On the third flight of steps all the fixtures will be very graceful in design, carried out in the Romanesque, and arranged for thirty lights. On the new western approach, bronze electroliter standards with forty lights each will surmount the newel posts; handsome foliage figures will adorn the whole, which will be strictly in keeping with the rest of the work. One of the most noticeable features will be the lighting of the staircase by large clusters of incandescents to be hung over the balustrade. When lighted the display will far surpass any ever designed for any public building and will make the Capitol a perfect blaze of light.

Schenectady, N. Y.—The General Electric works has presented \$100 to each of the military companies in Schenectady for furnishing the quarters at the armory which is now being constructed.

PERSONAL AND MISCELLANEA.

The directors of the Columbia Railroad Company, Washington, D. C., have elected Nathaniel Wilson president of the company to fill the vacancy caused by the death of R. F. Baker.

The Chicago "Inter-Ocean" states that a hospital car, to cost \$10,000, is being built for the Missouri, Kansas & Texas. The car will be provided with a drug store and operating room and will make regular trips over the different lines of the system for the purpose of bringing sick and wounded patients to the hospital at Chicago.

Hermann S. Hering, associate in electrical engineering in the Johns Hopkins University, Baltimore, is conducting the graduating class in the electrical department on a tour of inspection through several large electrical plants in New York State, New Jersey and Philadelphia. The students are taken on a similar tour each year.

Dr. Emma Sutro-Merritt, eldest daughter of Adolph Sutro, will probably be elected director and president of the Sutro Electric Railway Company of San Francisco. O. F. Von Rhein, the present manager and president, has resigned. Dr. Merritt is a graduate of Vassar College and the Toland Medical College.

Rychnowski, an electrician of Lemberg, Austria-Hungary, claims to have discovered an electric fluid, which he calls "electroid." He obtained it by electrolysis; but it is not identical with electricity. Its effects are declared to be startling, producing light and causing Geissler tubes to emit fluorescent rays. It works photochemically, rotates objects in mid air, produces whirlpools in water and kills bacteria. Metal and glass can be charged with electricity by it and the magnetic needle changes direction under its influence.

Otto Bahr, one of the engineers at the Mead electric light plant at Marion, Ind., resigned suddenly a few nights ago, and it was impossible to get a man to take his place. To keep the plant running and supply the city with light, Mrs. Zack Parvis, the wife of the other engineer, stepped into the breach. She did the work with the same accuracy as her predecessor, and many noticed the unusual brilliancy of the Mead lights. It was because a woman was running the engine that drove the dynamo. Mrs. Parvis has observed her husband at work, and as a result is almost as good an engineer as he. If pressing household duties did not require her attention Mrs. Parvis would likely accept a permanent position as assistant engineer in the light plant.

Perhaps one of the oddest things in all Southern California is a street-car in Ontario, San Bernardino county, says the San Francisco "Call." This car is not run by electricity or steam, nor is it drawn by a cable. Every morning it can be seen standing near the depot of the Southern Pacific Railroad waiting for the incoming train. It is long, broad, and filled with little seats, such as are found in steam cars, and a broad aisle down the center. Two mules are harnessed to the front of the car. In comes the railroad train and off goes the car up Euclid avenue, the principal thoroughfare of Ontario. Euclid avenue is 200 feet wide and along the sides are rows of pepper and palm trees. Directly in the center of the street is the car track. On each side is a broad strip of green, bounded by a row of trees. This avenue is seven miles long and it is a true grade. The altitude at the head of the avenue is 1,400 feet above the foot of the avenue. At the terminus of the road the driver pulls from under the back of the car a square platform, places the mules upon it, releases the brake and away goes the car down the long, gentle grade, moving only by gravity, thus giving these two tired mules a free ride, which they enjoy as much as any of the passengers. The grown people as well as the children crowd out upon the back platform and feed the happy-looking mules with grass and candy.

RECENT COMPANY ELECTIONS.

Market Street Railway Company, San Francisco, Cal.—President, H. E. Huntington; vice-president, Charles Holbrook; second vice-president, Alvinza Hayward; treasurer, N. T. Smith; secretary, J. L. Wilcutt; directors: H. E. Huntington, Charles Holbrook, Alvinza Hayward, Charles G. Lathrop, I. W. Hellman, George Crocker, F. S. Doughty, N. T. Smith and J. L. Wilcutt.

Port Deposit Electric Light Company, Port Deposit, Md.—President, R. E. McClenahan; secretary, John McClenahan; treasurer and superintendent, D. G. Wilson.

Raleigh Street Railway Company, Raleigh, N. C.—President, William J. Andrews; vice-president, A. A. Thompson; secretary and superintendent, Charles C. Johnson; directors: J. H. McAden of Charlotte, J. H. Outler of Boston, A. A. Thompson, William R. Tucker, Julius Lewis and Robert T. Gray.

COMMERCIAL PARAGRAPHS.

Educate Your Bowels With Cascarets.
Candy Cathartic, cure constipation forever.
10c, 25c. If C. C. C. fail, druggists refund money.

We are in receipt of the latest illustrated catalogue and price list of the Lunkenheimer Company of Cincinnati, O. As is well known, this company manufactures a high grade of brass and iron valves, injectors, whistles, lubricators, oil and grease cups, and steam specialties in general. Only the very best of materials enter into the construction of their goods, whose unequalled design, combined with unexcelled workmanship, bespeaks for them the patronage of all users of first-class articles. During the year many important additions have been made to their plant, so that at the present time the Lunkenheimer Company has unequalled facilities for manufacturing the various articles in its line and also special work of a like character. Their New York office is situated at 26 Cortlandt street and their office in London, Eng., is located at 8 5 Great Dover street.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c. If C. C. C. fail to cure, druggists refund money.

The Electric Appliance Company, Chicago, have increased their line of enclosed Upton Arc Lamps by the introduction of a new enclosed lamp for alternating work. This lamp is giving very satisfactory results and gives promise of being equal in every respect to the direct current enclosed lamps. The Electric Appliance Company have one of these lamps burning in their store and it has been commented on favorably by all who have watched its operations.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

INCORPORATIONS.

Holcomb & Green Electric Company, Springfield, Ill.—to operate electric light plant, manufacture electric machinery, etc. Capital stock, \$5,000. Incorporators: Eugene Holcomb, H. S. Green and C. F. Adams.

The Farmington Electric Light & Ice Company, Farmington, Mo. Capital stock, \$21,000. Incorporators: D. O. Johnson, Charles E. Schwarz and O. R. Webb.

The Syndicate Construction Company, New Brunswick, N. J.—to construct and operate trolley lines in Middlesex, Somerset, Union, Mercer, Burlington and Camden Counties, N. J. Capital stock, \$40,000. Incorporators: Gottfried Krueger, Edward H. Kadel and Andrew Kadel.

The Carnegie & Washington Street Railway Company, Carnegie, Pa.—to build a trolley railway in Carnegie to connect with the Pittsburgh, Union & Massachusetts Street Railway. Capital stock, \$18,000. President A. S. Maxwell, Allegheny; directors: H. K. Harlow, A. M. O'Brien, G. C. Pugh, R. H. McLarn, Pittsburg.

The Standard Electric Magnetic Power Company, Martinsburg, W. Va.—to operate an electric plant. Capital stock limited to \$5,000. Incorporators: R. Miles Robinson, W. L. Teter, F. S. Seaman, M. L. Ritter and F. C. Stalnacker.

The Toronto Electric Motor Company, Toronto, Can.—to acquire the business now carried on by the Toronto

Electric Motor Company and the Thompson Electric Company of Hamilton. Capital stock, \$50,000. Incorporators: John Campbell McLaughlin, Hiram M. Albertson, George McLaughlin, John W. Thompson and William A. Turbayne, of Toronto.

The South Bend Electric Company of South Bend, Wash., has filed articles of incorporation at Olympia. Capital stock, \$40,000.

The Highland Grove Traction Company, McKeesport, Pa., to build a short trolley road. Capital stock, \$12,000. President, T. H. Bowman, McKeesport; directors: S. M. Bowman, Arthur B. May, McKeesport; W. O. Cronmeyer, Monts Wolf Demmler.

The Pelton Construction Company, Alexandria, Va., to buy and sell real estate, buy and sell machinery, furnish power for railroads, corporations, etc. Capital stock, \$50,000. President, J. H. Ingram of New York; agent in Alexandria, Gardner L. Booth.

The Syracuse, Skaneateles & Moravia Railroad Company to construct an electric road forty miles in length through the counties of Cayuga and Onondaga, with the village of Moravia as its southern terminus and the city of Syracuse as its northern terminus. Capital stock, \$1,000,000. Directors: Wing T. Parker, Thomas W. Downing, John Andrews and Joseph Parker, of Moravia, and Henry J. Hibbard, of Skaneateles.

The Herkimer County Light & Power Company of Herkimer, N. Y., with a capital of \$100,000, has been formed by the consolidation of the Herkimer Gas Light Company of Herkimer, the United Gas & Electric Light Company of Little Falls and the Ilion & Mohawk Gas Light Company of Ilion. The directors are William F. Cochran and Alexander S. Cochran of Yonkers, George E. Weed, Maitland F. Griggs, Thomas E. O'Shea, Henry Stanton, Robert P. O'Shea and James P. O'Shea of New York City, and Thos. Ringwood of Ilion.

The Intercolonial Hydraulic Company, New York City, to develop, lease and sell hydraulic and electric properties. Capital stock, \$50,000. Directors: Henry F. Whalen, Russell H. Landale, Ernst W. Cooke, New York; S. F. Smith, York, Pa.; James M. McCarthy, Montreal, Can.; Archibald K. Cook, Quebec, Can., and Charles E. Hathaway, Providence R. I.

Redfield Brothers, New York City, to do general printing, electrotyping and engraving. Capital stock, \$50,000. Directors: Taylor I. Redfield of New York, Judd H. Redfield and Charles M. Redfield of Brooklyn.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 19, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 602,495. Electric Contact-Shoe. William M. Brown, Johnstown, Pa., assignor to the Johnson Company, Lorain, Ohio. Filed Nov. 14, 1897.
- 602,584. Electric Railway. Hosea W. Libby, Boston, Mass. Filed Dec. 10, 1894.
- 602,678. Traveling Contact for Underground Electric Railways. Griffin B. Coleman and Joseph W. Duggan, Washington, D. C. Filed Nov. 2, 1897.
- 602,746. Street-Indicator. Edgar J. Hall, St. Louis, Mo. Filed Nov. 8, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 602,557. Alternate-Current Meter. Clarence P. Feldmann, Cologne, Germany, assignor to the Helios Electric-Licht-Actien-Gesellschaft, same place. Filed Dec. 21, 1897.
- 602,596. Electrical Apparatus. Horace H. Eldred, Brooklyn, N. Y., assignor to Henry B. Metcalf, Pawtucket, R. I. Filed April 4, 1896.
- 602,709. Apparatus for Reducing Electric Currents and Voltage. Alexander F. Vetter, Long Island City, N. Y., assignor, by mesne assignment, to the Meyrowitz Manufacturing Company, Ridgefield, N. J. Filed Sept. 8, 1895. Renewed Nov. 13, 1897.
- 602,757. Electric Switch. Arthur G. McPherson, Highland Park, Ill. Filed May 1, 1897.
- 602,781. Apparatus for Controlling Electric Motors. Arthur J. Stropher, London, England, assignor to the Siemens Brothers & Company, Limited, same place. Filed Feb. 16, 1898.

SIGNALS AND SIGNALING APPARATUS.

- 602,484. Signaling Device for Railway-Cars. Frank W. Diehl, Detroit, Mich. Filed Sept. 28, 1897.
- 602,792. Railway Signaling System and Apparatus. Henry Bez-r, New Rochelle, N. Y. Filed Dec. 3, 1895. Renewed Feb. 25, 1898.

MISCELLANEOUS.

- 602,463. Trolley-Wire Hanger. William A. McCallum, Cincinnati, Ohio. Filed Aug. 16, 1897.
- 602,527. Electrical Measuring Instrument. Herbert W. Sullivan, London, England. Filed Nov. 6, 1896.
- 602,548. Electric Controller for Gas-Regulators. William K. H. Williams and Paul Selter, San Francisco, Cal. Filed May 13, 1897.
- 602,564. Insulated Pipe-Coupling. George Peeples, Philadelphia, Pa. Filed June 19, 1896. Renewed Oct. 5, 1897.
- 602,576. Bracket for Insulators, etc. John R. Fletcher, Dayton, Ohio. Filed Jan. 4, 1896. Renewed Feb. 2, 1898.
- 602,747. Process of Smelting Phosphorus. Charles K. Harding, Chicago, Ill. Filed April 5, 1897.
- 602,815. Electric Furnace. George G. Clarke, Galveston, Tex., assignor to Sylvain Blum, Hillary Eldridge and Daniel Johnson Clark, same place, and Sam Lazarus, Sherman, Tex. Filed Feb. 8, 1897.

WANTED FOR THE UNITED STATES NAVY.

Qualified men for the ratings of **ELECTRICIAN**. Applicants must be capable of performing all duties pertaining to the care, preservation, and manipulation of a ship's electric lighting plant and its appurtenances, together with all other electrical appliances; they must also be physically qualified. First enlistment is made in the rating of Electrician, second class, (\$35 per month,) with possibility of future advancement to Electrician, first class, (\$40 per month), and Chief Electrician, (\$50 per month). In addition to the pay stated, there is a ration allowance of 30 cents per day. Enlistments in this rating are made only at the Navy Yard, Brooklyn, N. Y.

TELEPHONE AND TELEGRAPH.

At a recent meeting of the joint committee of the public order, health and police and public building committees in New Orleans, a communication from the People's Telephone Company was read, in which they accepted the privileges and franchises under ordinance No. 10,752, C. S., and stated that they intended to avail themselves of the provisions of the ordinance. They obligate themselves to begin the actual construction of their telephone system within sixty days, and to complete it between Julia and Esplanade, Delta and Basin streets within one year thereafter. They have already secured the plans and specifications for the work, and are ready to begin at once. The communication was accompanied by a map showing the territory through which the proposed system will pass, all of which were referred to the city attorney and city engineer.

A number of Barnesville, O., people recently witnessed a novel and unusual scene in the deliberate destruction of nearly \$3,000 worth of property by its owners. A bonfire was made in that town of 157 telephones, formerly the property of the independent telephone company of Barnesville, which a few weeks ago sold out to the Bell people, who have adopted the policy of thus destroying the telephones and apparatus of rival independent companies who have fallen into their clutches. A big crowd was on hand to see the novel bonfire, and the Bell officials were offered all sorts of prices for the telephones. They flatly refused all offers and applied the matches. The boxes were worth about \$18 each.

The Iowa Telephone Company expects to put in this summer new copper metallic circuits over nearly 900 miles of territory. The longest new line scheduled is from Dav enport to Des Moines via Washington, Oskaloosa and Indianola. Other lines planned are: Burlington to Ottumwa, 72 miles; Grinnell to Oskaloosa, 81 miles; Waverly to Charles City, 30 miles; Slouss City to Orange City, 45 miles; Independence to Decorah, 74 miles; Marion to Monticello, 35 miles; Webster City to Ames, 14 miles; Osceola to Afton, 26 miles; Wayland to Mt. Pleasant, 25 miles; Den nison to Missouri Valley, 55 miles; Pringhar to Cherokee, 35 miles; Cherokee to Washington, 20 miles.

The St. Paul *Globe* says: "The jobbers' union of St. Paul is interested in the question of telephone competition and at a meeting held a month ago a committee was appointed to look into the affairs of the Mississippi Valley Telephone Company and ascertain whether it was a company meriting the confidence of the business community. At a meeting of the union Saturday, the committee endorsed the company in a report which was presented to the union and adopted."

We learn from the Des Moines, Ia., *Leader* that the recently organized Central Telephone Company will at once begin the construction of a line from Des Moines to Oskaloosa. The incorporators of the new company are all interested in the Mutual exchange in Des Moines, and arrangements have been made to operate its lines in conjunction with it. Manager Bartlett, of the Mutual, has resigned his position to engage actively in the telephone construction business. He will be succeeded by W. K. Hind, of Fairfield, a telephone man of wide experience.

It is reported that some of the leading interests in the Metropolitan Traction Company have become interested in the new telephone company in opposition to the existing telephone company in New York, and that the work of laying subways will soon commence. It is said to be the purpose of the company to construct an extensive system of subways. The new company is said to already have applications enough for the lease of wires to form a considerable part of its proposed revenue.

The Standard Telephone Company of Newtown, Pa., organized with a capital stock of \$10,000 for the purpose of transacting local business, proposes to erect a line connecting Newtown, Doylestown, Bristol and other points in the county. The officers are H. C. Worstall, president; Watson P. Church, secretary; Edward T. Hicks, treasurer. The board of directors is composed of the officers named and Harry A. Smith, Thaddeus Kenderdine, Clayton Keller and George C. Worstall.

The Automatic Telephone Service Company has made application for a franchise to the city council of Rochester. It asks for the right to establish and maintain a system or systems of telegraph or telephone for public or private use in the city of Rochester, and to construct conduits, erect poles, place wires, conductors, cables and all appliances necessary to the successful conduct of its business.

The men interested in the Philadelphia Standard Telephone Company are disposed to go on with the suspended work in Philadelphia if means can be obtained. The

company has a valuable franchise and considerable work has been done in the construction of conduits, etc., but funds are lacking, and efforts are to be made to interest capitalists in the enterprise. The war, however, interposes an obstacle in this direction which it will be difficult to surmount.

After the Railroad Commission made an order reducing telegraph rates to 15 cents for a ten-word message over the Western Union lines in North Carolina, that company secured an injunction and filed complaint. The Railroad Commission then filed its answer. The Western Union Co. on the 15th inst., at Raleigh, filed a replication in the United States Circuit Court saying the answer made by the commission through its attorney is "scandalous and impertinent" and begs the court to rule the answer out.

The Standard Telephone Company has completed its main underground conduits at Atlanta, Ga. The work of constructing the plant is being done by the Southern Standard Telephone Construction Company of Philadelphia. The officers of the Atlanta Standard Telephone Company are: President, Simon Baer; secretary and treasurer, Joseph S. James. Among the directors of the company are Charles G. Wetter, Philadelphia; G. F. Baer and J. W. Nelms of Atlanta.

The Bunker Hill (Ill.) Telephone Company has organized with the following board of directors: Adolf Bumann, Charles E. Drew, C. J. Jacoby, James Jencks, John Neil. The officers are: Adolf Bumann, president; C. J. Jacoby, vice-president; Charles E. Drew, secretary and treasurer. The company expects to have the line open for business June 1.

The Chester County Telegraph and Telephone Company has been chartered at Harrisburg, Pa., and will open exchanges in Malvern, Coatesville, West Chester, Oxford, Phoenixville and other places. Over one hundred subscribers have already been secured at Phoenixville. Low rates will be a feature of the new company.

The Citizens' Long-Distance Telephone Company was organized at Lansing, Mich., on the 13th inst., for the purpose of building a line from Lansing to Flint. The incorporators are Peter C. Burns, of Chicago; Samuel C. Higgins and Frank Marsh, of Saginaw, and Marsellies L. Joslyn, of Woodstock, Ill.

Judge Simonton has signed the decree ordering the sale of the Mutual Telephone & Telegraph Company, which was organized as a rival of the Bell in Charleston, S. C. The sale is ordered to take place on May 8. The upset price is \$15,600.

A special committee of the city council of Chattanooga, Tenn., has under consideration the petition of a Mr. Coleman, of Columbia, Tenn., for a franchise enabling him to establish a telephone exchange in Chattanooga.

The Supreme Court of the United States has granted the application for a writ of certiorari in the case of the city of Richmond, Va., against the Bell Telephone Company. It may be two years before the case is reached.

The capital of the New Ulm (Minn.) Telephone Company is to be increased to \$20,000 and its lines extended so as to include Mankato, Morgan, Redwood Falls, Lamberton and Tracy.

The line of the Nebraska Telephone Company to Tecumseh has been completed and connections made with Omaha and Lincoln.

New Companies Incorporated.

The Lake County Telephone Company, Libertyville, Ill. Capital stock \$2,500. Incorporators: James Turnock, Joseph A. Seyl and T. Degen.

The Somerset Telephone Company, Madison, Me. Capital stock, \$2,000. President, T. H. Spear.

The Gapland Telephone Company, Gapland, Md.—to build and operate telephone and telegraph lines. Incorporators: John Ahalt, Hamilton W. Shafer, George C. Huffer, George S. Huffer and T. B. Biser.

The New Long-Distance Telephone Company, Indianapolis—to build lines connecting Indianapolis with the independent lines throughout Indiana. Capital stock, \$1,000,000. Incorporators: S. P. Sheerin, Indianapolis, president; A. H. Nordyke, D. M. Parry and Harry B. Gates, Indianapolis; Alexander F. Ramsey, Crawfordville; Daniel E. Dougherty, Louisville, Ky.; George W. Beers, Fort Wayne, Ind.

The Sabetha Telephone Company, Sabetha, Kan.—to establish a telephone system in Sabetha connecting with adjacent towns. Capital stock, \$1,800. Directors: D. D. Doolittle, G. M. Bunker, Harry Reding, Elizabeth Doolittle, Annie M. Bunker and Helen E. Reding.

APRIL 27, 1898.]

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Company and City & Suburban Railway Company.
 b Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikesville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 c Leased to Boston Elevated Railroad Company.
 d Owned by Brooklyn Rapid Transit Company.
 e Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.
 f Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 g Stock owned by Kings County Traction Company; road leased to Nassau Electric Ry.
 h Owned by Atlantic Ave. RR. and leased to Nassau system.
 i \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$50,100 of stock owned by North Chicago Street Railroad Company.
 j Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 k 75% per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$35,100 of stock owned by West Chicago Street Railroad Company.
 l Majority of stock owned by Chicago West Division Railway Company; 5% on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 m Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex div.
 a Leased to New Orleans Traction Company at 6% on stock.
 b Leased to New Orleans Traction Company at 8% on stock.
 c Leased to Central Crostown Railroad at 8% on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Railway at 8% on stock until Oct. 1, 1897; thereafter 9%
 h Leased to Metropolitan Street Railway for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 i Leased to Metropolitan Street Railway for 18% on stock.
 j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6% first 5 years, 8% thereafter
 k Leased to Metropolitan Street Railway for \$145,000 per annum.
 l Leased to Metropolitan Street Railway for 18 per cent. on capital stock.
 m Controlled by Third Avenue Railroad by purchase.
 n Dividends of 1% yearly guaranteed by Consolidated Traction Company.
 o Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitt's Trac. Co.
 p Leased to Consolidated Traction Company for 8% per annum on par value of stock.
 q Leased to Fort Pitt Traction Company for 6% on \$8,000,000 capital stock.
 r Leased to Consolidated Traction Company for 4% on capital stock after October.
 s Leased to Consolidated Traction Company for 7% on capital stock after October.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 12½c.; casting, 11½c.

The directors of the Chicago Edison Company on the 19th inst. declared the regular quarterly dividend of 2 per cent.

The court has authorized the receivers of the Brighton Beach Railroad Company, Brooklyn, N. Y., to issue \$50,000 of receivers' certificates.

The Colonial Trust Company has filed at Richmond, Staten Island, a mortgage of \$1,000,000 against the New York & Staten Island Electric Company.

Emerson McMillin has resigned the presidency of the Columbus (O.) Street Railway. Robert E. Sheldon has been elected by the directors to fill the vacancy.

The West End Electric Company of Philadelphia has declared a semi-annual dividend of 5 per cent. on its capital stock, payable May 2. Books reopen May 2.

The gross earnings of the Edison Electric Illuminating Company of New York for March were \$263,975, an increase of \$56,105, and net \$113,223, an increase of \$18,805.

No agreement has yet been reached between the surface railroads and the Brooklyn Bridge Commissioner in regard to the proposition to increase the trolley tolls on the bridge.

The Woburn (Mass.) Light, Heat & Power Company has been given the privilege of issuing \$110,000 stock and \$175,000 bonds. Of the latter \$85,000 will be used to retire outstanding bonds.

The Market Street Railway Company of San Francisco is paying a quarterly dividend of 60 cents per share for the first three months of this year. The aggregate sum is about \$112,800.

There has been no decision made yet by the Attorney General of New York in the application made to him by the minority stockholders of the Kings County Traction Company of Brooklyn for a receiver.

The New Harrison Telephone Company has been incorporated at Columbus, O., with a capital stock of \$100,000. The incorporators are George W. Hull, H. T. Hull, L. C. Cunningham, D. W. Morris and John P. Manton.

The reported deal between the Edison Electric Illuminating Company of Brooklyn and the Municipal Company of that city has not yet been closed, but the negotiations that have been going on for some time are likely to have an early termination.

The Milwaukee, Racine & Kenosha Electric Railway Company has called in all of its old bonds and issued another series of 375 bonds of \$1,000 each to the Savings & Trust Company of Cleveland, O., bearing interest at 6 per cent. and running thirty years.

"The statement is made," says the Boston "Commercial Bulletin," "that no plan for a settlement with General Electric preferred stockholders and correction of capital impairment will be submitted to stockholders at the annual meeting of the company, May 10, as was proposed."

A Chicago special says there is a rumor in that city that the General Electric Railway Company has an unimpeded right to begin construction and that C. T. Yerkes will be an important factor in the organization. It is said that Mr. Yerkes has already an interest in the company and that he will arrange to finance the company to the extent of furnishing the funds with which to complete construction.

J. B. Speed, president of the Louisville Railway Company, has presented his resignation to the directors of the road. The resignation will take effect May 1. The Louisville "Courier Journal" says Mr. Speed will remain in the directory and on the executive committee, and expects to devote much time to the affairs of the road, though not so much as formerly. He is a large stockholder and expects to retain his present interests. Mr. Speed will be succeeded as president by General Manager Minary, who will combine his old duties with the presidency for the present.

Schedules of the American Range Finder Company, New York, show liabilities of \$58,129; nominal and actual assets, \$2,500. There are only three creditors: Samuel D. Davis & Co., \$50,167, for cash advanced and on a note; Western Electric Company, \$5,396, and D. W. McWilliams, \$2,566. The assets consist of the right, title and interest of the company on various patents subject to a contract with Bradley A. Fiske. There are eighteen United States patents and thirty-one foreign patents for range finders, position finders, electrical signaling system, telescopic sights for guns, etc.

A Chicago paper says: "It is announced that in all probability the Illinois Central will not attempt to change its motive power for suburban trains from steam to electricity this year. It will await the result of the experiment of the South Side Elevated with the Sprague motor. It is said also that the Westinghouse Electric Company is anxious to build a few locomotives for the use of the Illinois Central, though it is hardly expected that an electric locomotive will have the advantages of the Sprague system."

The directors of the Holyoke (Mass.) Street Railway Company have authorized the issuance of the \$100,000 worth of new stock recently recommended by the stockholders and which was sanctioned by the State authorities. The matter of increasing the machinery at the power house with a view to bettering the efficiency of the service the directors left with the officers of the company.

The board of freeholders of Union County, N. J., will probably find it more difficult to sell the franchise for the trolley road between Plainfield and Elizabeth than was anticipated. John Kean's offer of \$100,000 is the only one yet made although the sale takes place May 5. It is believed that at least \$250,000 will be required to widen the county road between the two places and this must be done according to the plan for the trolley line.

The Albany (N. Y.) Railway Company in its report to the Railroad Commissioners for the quarter ending March 31 shows an increase of \$20,207 in the gross earnings as compared with the same quarter of 1897 and an increase in the net income of \$11,244. The figures for the 1898 quarter are: Gross earnings, \$145,584; operating expenses, \$96,393; net earnings, \$49,190; other income, \$734; gross income, \$49,925; fixed charges, \$24,963; net income, \$24,961.

The annual meeting of the Citizens' Street Railway Company of Indianapolis will be held May 10. A number of stockholders have issued a circular asking for proxies to be sent to E. D. Toland for the election of the following gentlemen as directors for the ensuing year: W. W. Kurtz, W. Jay Turner, R. H. Rushton, Dr. Joseph S. Neff, William C. Houston, B. M. Gaskill and J. Levering Jones. The circular says: "At the present time there is one vacancy in the board of directors and the office of president is vacant. Mr. W. W. Kurtz, the vice-president, has acted efficiently as president in the interim. The property is a valuable one if completely extricated from the unusual legal and local complications which surround it. These complications, if the interests of stockholders are to be adequately protected, should be earnestly and energetically dealt with by a full board, representing substantially and equitably all stock interests, headed by a president devoting his entire time to the development of the property and the solution of the problems surrounding it. The board above proposed will be able to make strong alliances in Indiana. This plan this board, if elected, can pursue as the first necessary step towards an adjustment of the difficulties. All the gentlemen recommended represent large holdings of stock of the company and leave no substantial interest unrepresented."

ELECTRICITY.

Vol. XIV.

NEW YORK, MAY 4, 1898.

No. 17.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	\$2.50
IN CLUBS OF FIVE OR MORE, -	2.00
FOREIGN COUNTRIES, -	4.50
SINGLE COPIES, -	10 cents

ADVERTISING RATES:

As **ELECTRICITY** reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application. Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

THE TRADE SUPPLIED BY
THE AMERICAN NEWS COMPANY.

EDITORIAL NOTES.

The Sixth Annual Report of the General Electric Company is out and will be found in full elsewhere in this issue. As usual, it puts a sorry figure as a sample of the prosperity and business methods in the electric business. We shall analyze this carefully at the proper time, as has always been our custom, but in the meantime a few points regarding it may not be out of place.

Patents are still carried at \$8,000,000, but hints are given that this account needs revaluation. Gross earnings for the fiscal year ending January 31, 1898, are given as \$12,524,938.07, which is \$295,457.80 less than those of the year previous.

We have frequently stated that no manufacturing concern in the electric business should have a capital in excess of the amount of its gross yearly earnings. In other words, it should turn its capital over at least once a year. Therefore the capital liabilities of the General Electric Company should not exceed (allowing liberally) \$13,000,000. According to the Sixth Annual Report they are:

Common stock.....	\$30,460,000
Preferred stock.....	4,252,000
Debentures.....	6,000,000
	\$40,712,000
Add accrued interest on preferred stock.	1,339,380
Total.....	\$42,051,380

It will be seen that the debentures and preferred stock, with accrued interest, are obligations which must be paid in full and amount to \$11,591,380. Now if this amount is deducted from what we believe to be a proper capitalization of the company—\$13,000,000—it would leave only \$1,408,620 for the common stockholders, and as there are 304,600 shares of this stock issued the value of General Electric common stock would be about \$4.63 per share on this basis of figuring.

* * *

Opening of the Electrical Exhibition.

The Electrical Exhibition, which is being held under the auspices of the New York Electrical Society, was formally opened Monday evening in the presence of a large throng of people. Madison Square Garden was probably never more attractive, brilliantly lighted as it was by thousands of incandescent and arc lights. The exhibits as a whole were tastefully and attractively arranged, incandescent lights playing an important part in the decorative arrangement and producing an extremely harmonious and pleasing effect. Although it is too

early to record anything of the accomplishments achieved through the untiring energy of the management, and especially through the unceasing efforts of Mr. Marous Nathan, the general manager, it is safe to predict that this Electrical Exhibition will far surpass in point of interest any previous efforts in this line. Not only has the management succeeded in securing exhibits and attractive features of interest to the savant and theoretical experimentalist, but the layman and practical worker have by no means been lost sight of, many popular features of various kinds having been provided.

From the auspicious opening it can be readily foreseen that the Electrical Exhibition is destined to be an overwhelming success. The management has thoughtfully provided a large number of interesting events and competitions which will take place on different evenings during the Exhibition period, and should go far toward making the Exhibition most enjoyable. For instance, the telegraphic tournament, which is looked forward to with much interest, and in which a large number of operators are expected to compete, will take place May 13 and 14. Later on it is the intention of the officials of the Exhibition to offer suitable prizes for essays on the show. Elsewhere in this issue will be found in detail an account of the opening night, including a description of the most prominent exhibits and principal features of interest. As the Exhibition progresses an account of the various events will be found in our columns.

In closing these remarks it is but just to the managers to say that they have more than fulfilled their promises, and deserve to be warmly commended for the fine showing they have made in every department of the Exhibition.

* * *

Electro-Magnets and Sunken Vessels.

The lifting power of electro-magnets is well known, as such devices are extensively used in various iron works throughout the country for moving heavy plates or pieces of metal from one point to another. Lately, in England, a scheme has been suggested for lifting the steel battleship Victoria, which lies in 450 feet of water off the harbor of Tripoli. It is proposed to place a fleet of wrecking pontoons over the spot where the Victoria lies, and from the sides of these let down large electro-magnets attached to chains. When these magnets come in proximity to the sides of the steel ship, they are supposed to take hold. The weight of the wreck is said to be 7,000 tons, consequently a large number of magnets would be required. It is thought that 70 would be sufficient, each having a pulling force of 100 tons. This would mean that each magnet would require to have a magnetized face of seven square feet. A delicate electrical dial on the pon-

toon would record the depth to which the magnet had sunk, and the power with which it had attached itself to the battleship would be shown in the same way. If the force of the magnetic influence is not great enough to stand the strain that will be put upon it when the work of raising the ship begins, it is proposed to loosen the magnet's hold and move it until a firm grip is obtained. When all the electromagnets have taken hold the work of raising the wreck will begin. On the pontoons are to be powerful hydraulic rams and motors which will do the lifting. Each lifting cable will be attached to the pontoon by means of a sheave on the head of a hydraulic lifting ram having a stroke of twelve feet, which would give an effective lift of twenty-four feet. It is proposed to connect all the hydraulic cylinders together, and a balancing accumulator would prevent any rope getting more than a normal strain of 100 tons. The wreck would gradually be lifted by stages of twenty feet until within a short distance of the surface, when it would be towed into shallow water.

A practical test of this method of raising a sunken vessel is said to have been tried recently in England on an experimental scale. In the demonstration the depth of water, the lifting capacity of the magnets and all other things were relatively the same as those of the actual undertaking. Although such a trial might give satisfactory results on a small scale, it is very questionable whether any such scheme could be made to raise the Victoria. In the first place a magnet to take a good hold should rest on an even and level surface, a slight roughness materially decreasing the pulling power, and it is only natural to suppose that a ship that has lain for several years under water would by no means offer a clean surface for a magnet to grip.

Furthermore, electromagnets powerful enough to lift 100 tons would be exceedingly bulky and unwieldy, and it is extremely doubtful if they could be properly managed from pontoons subject to the action of the waves. The attempt if ever made will undoubtedly be watched with interest, but it will be surprising if it succeeds.

* * *

Effect of War on the Electrical Industry.

Now that hostilities have actually begun between Spain and this country, the question that is anxiously asked by members of the trade is, what effect the war will have on the electrical industry? This happens to be one of those questions easily asked but well nigh impossible to answer with any degree of certainty, principally owing to the fact that as far as the electrical line is concerned we have had no precedent to judge by. At the time of the Civil War electricity was little known outside of the laboratory, and furthermore, in view of the fact that conditions then were very different from what they are at the present time, it would be utterly useless to point to the effect the war of '61-'65 had on any existing trade at that time and say that the electrical industry of to-day would be affected in a similar manner. A civil strife is always far more disastrous to the business interests of a nation than war with a foreign power.

The uncertainty of the past few months has unquestionably caused a number of contracts for electrical apparatus to be withheld that would otherwise have been given out, but on the other hand, and to offset this, the Government has been a large purchaser of electrical supplies. The electrical industry as a whole during the past few years can scarcely have been called prosperous, and if the present unsettled condition of the country should have a tendency to keep in abeyance large enterprises for any great length of time, it would be a serious matter to the majority of electrical manufacturers. It scarcely seems likely, however, that the struggle in which this country is at present engaged will be a protracted one. The manufacturers of power for lighting and street rail-

way purposes should be affected but little, if at all, as it should be borne in mind that owing to the war thousands of persons who otherwise would have gone to Europe will remain at home, and the money that would have been spent abroad, amounting, it is claimed, to one hundred millions a year, will necessarily be spent in this country. Of the above amount it is only reasonable to suppose that at least a small portion will be spent for luxuries in the electrical line, such as illumination, trolley riding, etc.

During the past fiscal year the United States exported electrical apparatus to the amount of \$3,054,453, and there would seem to be no reason why the above amount should not be exceeded during the present fiscal year, as there undoubtedly is a growing demand for our electrical machinery abroad. As all goods exported would presumably be in ships covered by neutral flags, they would likely go through safely, in spite of the fact that these vessels would be subject to the right of search. This would simply entail an extra cost of insurance. Secretary Gage is probably very nearly correct when he states: "I think after the first flush of excitement is over all our domestic affairs will go on about as they have gone on for the last several months."

Under the Searchlight.

Notes and Comments on Various Topics.

THE Boston, Mass., *Advertiser*, a paper usually very friendly to the General Electric Company, sizes up the Sixth Annual Report of that company as follows:

The full report of the General Electric, of which a brief summary was given yesterday, shows a disappointing year's business though in partial excuse of this the annual report says that heavy orders given in 1897 were unfilled at the time of the making up of the yearly statement.

The showing for the year is an infinitesimal profit considering the unwieldy bulk of the inflated capitalization of the company. In dollars and cents it amounts to the equivalent of 7 per cent. on the preferred stock and about 3 per cent. on the thirty odd million of common.

The process of buying back the debenture 5s continues, \$2,000,000 having been bought and cancelled during the period of the report while \$240,000 more have been acquired since the report was made up. These bonds were not, of course, bought from money made on the business for the year, but has been simply the converting of assets into a reduction of the debt of the company. Probably the choicest of the stocks and bonds of other companies held in the treasury were disposed of to cancel these bonds as the price received was nearly the par value.

The matter of paying off the debentures seems to be merely acquisition of the marketable quality of the securities held as treasury assets, and it is probable that with those sold to the Street Railway & Illuminating Trust and those disposed of privately about all the best have been marketed. The total debentures bought in now amount to \$4,290,000 of the total \$10,000,000 issue, and if all are to be eventually cancelled, it will likely have to be from earnings of the company in a greater degree than in the past.

As there is now 3 1/4 per cent. cumulative dividends still due on the preferred stock it can be seen that when the knife goes into the company under any reduction of capitalization it will have to go deep to be effectual.

The report treats the loss of the Van Depoele trolley patents in a rather gingerly manner, and hopes, naturally, that a court of higher resort will reverse the decision against the company.

The point is made:

"In view of the fact that nearly all of the railway companies in the country that would be likely to use the overhead trolley system are now electrically equipped, and that the third rail and underground conduit methods are being rapidly adopted for the important new enterprises, an adverse decision in this case will have but slight effect upon the business of your company."

This is all very well, but no marking off of patent valuation is made on the balance sheet, the \$3,000,000 standing as heretofore. This will be heavily cut in any reorganization of the company, of course. Mr. Collin intimates this when he says "the question of a revaluation of patents is one to which consideration should be given at the proper time." What expense is now entailed in acquiring new patents and in patent litigation is now written off to profit and loss. This is the small concession made thus far to the \$3,000,000 patent valuation—that no additions are being made. As has been the case for several years, General Electric common stock has no intrinsic value to speak of at present,

and at the rate of business last year will not have for some time to come whether reorganized or not.

* * *

PRESIDENT KILGOUR of the Cincinnati Street Railway Company has received from a Chicago damsel a letter that he probably treasures more than any of the tender missives of his youthful days, for it has relieved him of a perplexity that he despaired of removing after having tried all the arts and arguments of his astute managerial intellect. The letter explains itself:

"Chicago, Ill.

"To President Kilgour.

"Dear Sir: Having just read in the *Cincinnati Enquirer* that so many ladies had waited on you, and found fault with the car conductors for eating onions, I thought I would give you a little recipe of my own that I have never known to fail, as I am very fond of the fruit myself at this season when the markets are full of young green fresh vegetables, and I like to see other people enjoy them also. I find that a sprig of fresh green parsley, with salt, eaten after onions, removes all bad odor of the breath. Yours,

A CHICAGO GIRL.

"P. S.—Give your conductors this recipe, and let them enjoy the privileges of free American citizens, and eat all the onions they want and oblige

A. O. G."

* * *

COMMODORE DEWEY must have been within hearing of Farragut when he exclaimed "Damn the torpedoes—go ahead!" and he bettered the instruction at Manila.

* * *

HERE is a stave about electricity which tells its own story:

"In olden times we took a car
Drawn by a horse, if going far,
And felt that we were blest;
Now the conductor takes the fare
And sticks a broomstick in the air
And lightning does the rest.

"In other days, along the street,
A glimmering lantern led the feet
When on a midnight stroll;
But now we catch, when night is nigh,
A piece of lightning from the sky
And stick it on a pole.

"Time was when one must hold his ear
Close to a whispering voice to hear,
Like deaf men—nigh and nigher;
But now from town to town he talks
And puts his nose into a box
And whispers through a wire."

* * *

A LOCAL daily says: "Mr. Nikola Tesla announces to humanity that he thinks he knows how to convey an electric spark to the interior of a distant Spanish magazine and explode such magazine neatly. Mr. Tesla's duty is clear. He should retire now from the public prints and all his favorite haunts and work like a beaver. He should reappear prepared to prove his idea with a genuine test, or frankly to announce his failure. A man with an idea as important as Tesla's has no right to sit about talking of it. If a hen came along and said, 'I think I contain a diamond egg,' we should say to her, 'Get on your nest and don't come off until the egg is laid.' We give similar advice to Mr. Tesla."

* * *

ANOTHER gambling scheme has been set afloat in Boston. A bill permitting the placing of bombardment insurance has been rushed through the Legislature.

* * *

THE Atlanta *Constitution* gives publicity to the following:

A Georgia man who is interested in a small vessel lying in Northern waters telegraphed home:

"The Revill is fast in the ice."

The Revill was the name of the vessel, but the telegram, as delivered, read:

"The Devil is fast in the ice."

An old negro, an employee, was present when the message came, and asked:

"What does Mars Tom say in dat telegram?"

"He says," replied the man to whom it was delivered, "that the devil is fast in the ice."

"Halleluyer!" shouted the negro. "Halleluyer! I hope ter God dey'll keep him dar!"

Opening of the Electrical Exhibition.

President McKinley Starts the Machinery by Touching a Golden Key in Washington.

CHAUNCEY DEPEW ELECTRIFIES THE CROWD.

Fine Display of Electrical Machinery and Kindred Apparatus—Interesting Historical Exhibits.

No less than six thousand persons attended Madison Square Garden on the evening of May 2 to witness the formal opening of the Electrical Exhibition which is being held under the auspices of the New York Electrical Society.

President McKinley, by touching a golden key in the White House, gave the signal for the starting of the machinery. A congratulatory telegraphic message was also received from the President, as follows:

"It gives me great pleasure to open the Electrical Exhibition in Greater New York, and to participate in this wonderful demonstration of the latest method of recording and publishing by means of electricity. I congratulate you upon the achievements of American genius. I am glad to know that the resources of the wonderful electrical arts have already been so far advanced in the United States that American electrical goods are welcome the world over."

Vice-President Hobart addressed the audience by telephone in the following strain:

"I respond with pleasure to the invitation of the New York Electrical Society to assist in opening the Electrical Exhibition held under its auspices at Madison Square Garden, and beg to express my wishes for its success as a means of promoting further advances in the great electrical and engineering arts with which our national fame is already so proudly associated. I congratulate the citizens of the Greater New York that they have this opportunity of studying all that is latest and best in the science to which Franklin, even in the midst of patriotic duties and cares, gave his transcendent genius."

The Vice-President's message was received on a phonograph cylinder, which kept repeating it over and over again the whole evening.

Chauncey M. Depew was the central figure of the evening. With his usual versatility he kept the vast throng interested in electricity and enthusiastic on the subject of the war and our recent victory. At the close of his address he touched a button which caused a gun to discharge by means of Hertzian waves, firing into the air and directly over the heads of the assembled multitude a long projectile which ultimately exploded scattering a large number of small American flags in all directions. The band meanwhile played the "Star-Spangled Banner," and there was great enthusiasm.

The remarkable success attending the opening of the Exhibition and the excellent showing made, in spite of the fact that many of the exhibits were still unplaced and a number of interesting features were not on hand owing to delay in transportation, the railroads being busy rushing troops to their rendezvous, are due to the untiring energy of the following gentlemen, the officers of the Exhibition: C. O. Baker, Jr., President; F. W. Roebing, Vice-President; Geo. F. Porter, Secretary and Treasurer. The Executive Committee is made up of the following well-known men: H. H. Harrison, L. F. Requa, C. O. Baker, Jr., ex officio; Prof. F. B. Crocker, consulting engineer; Marcus Nathan, general manager; Thomas A. Edison, Jr., Committee on Decorative Effects; Max Osterberg, Construction Engineer.

FEATURES OF INTEREST.

Probably one of the most interesting features is the vacuum tube light invented by D. Macfarlane Moore. A number of these tubes are located in a specially designed chapel and are so arranged as to conform to the groins of the arches. The light diffused is unquestionably wonderfully soft and pleasant. Mr. Moore's system of vacuum tube lighting has been perfected since the Electrical Exposition of 1896.

The tubes used in the illuminating of the chapel are the first designed for such work, and it is safe to predict that the chapel will be the center of attraction throughout the month, especially as it is equipped with an electric church organ and the management intend to have it played upon by some well known artist.

Perhaps in the way of the spectacular the eight historical wax tableaux, illustrating the successive developments in electrical science, should take first place. These tableaux are located in eight niches in what is known as the Concert Hall, and around them it is proposed to group the old electrical books and pictures that relate to the subjects touched on. As will readily be seen, this latter exhibit should prove of value from an educational standpoint.

Another exceedingly interesting feature of the Exhibition is the model of Mr. Edison's ore milling machinery. This and a large number of other apparatus are to be shown in operation just as soon as possible. A feature of the Exhibition in which popular interest centers at the present time is the tank located in the middle of the Garden, and in which on the opening night a miniature ship was blown up by means of an electrically-operated submarine mine. When Dr. Depew touched the button a crash was heard and the model disappeared in a column of spray which shot high up in the air.

The management has provided a large number of other interesting and attractive features of which we shall make mention and describe in a subsequent issue.

COMPANY EXHIBITS.

The exhibit of Thomas A. Edison, Jr., which is located on the main floor, near the Madison avenue entrance, consists in a handsomely decorated booth with innumerable lamps of Mr. Edison's manufacture arranged in circles on the wall at the rear. A number of switches enable any circle to be either lighted or extinguished. When all these circles of varied colored lamps are lit the effect is very pleasing.

The Ward Leonard Electric Company exhibited various styles of their automatic magnetic circuit breakers in sizes from a few amperes up to 2,000 amperes. They also have on exhibition a variety of automatic rheostats, one especially being a very neat style of rheostat for small ventilating fans. An interesting feature of their exhibit is a new type of underload and overload rheostat which is known as the SK type, and which has many novel and valuable features. The compact size and simplicity of this automatic, and its reliability in action, will commend it to the electrical trade. The Ward Leonard

Company also exhibited various forms of the well-known Carpenter enamel field rheostats, and a large variety of the porcelain lined outlet boxes and switch boxes, etc., which have become standard for recent high grade wiring installations in New York City.

The Faries Manufacturing Company's exhibit is located on the 27th street side of the Garden, on the promenade just above the main floor. This company is exhibiting their well-known Universal electric lamp-holders, aluminum and steel lamp shades and a line of fire and water tube boiler cleaners.

The Weston Electrical Instrument Company's exhibit is on the main floor on the 26th street side of the Garden. This company is displaying a complete line of measuring instruments and appliances. Prominent among them are their laboratory standard voltmeters and ammeters, alternating and direct current voltmeters, wattmeters, ground detectors, commercial iron-cased station voltmeters and ammeters, galvanometers, etc. A feature of their display is a well-arranged assortment of parts of instruments which affords an excellent opportunity of studying the construction of the numerous types of instruments manufactured by the company. They also afford an object lesson illustrating the care and exactness with which every detail, however minute, has been worked out.

Mr. H. B. Coho is exhibiting, as agent for the Warren Electric Manufacturing Company of Sandusky, an improved Warren alternator of 75 kw. capacity, and intends to operate same with an Eddy direct current motor. This alternator is connected for double voltage, half the capacity of the machine to deliver current without the use of transformers direct to 110-volt lamps, the other half connected up for a potential of 1,100 volts on current to be reduced by transformers. The machine when in operation will be excited by a lately improved Warren direct current dynamo, which is a bi-polar machine, over-magnet type, and is of an entirely new design, combining many elements of extreme simplicity with exceptionally high efficiency. The alternator will be operated at a speed of 800 revolutions per minute, contains no brushes, collector rings or revolving armature, the current being taken from a stationary element of the machine.

The exhibit of Henry R. Worthington, located on the main floor at the Madison avenue entrance, consists of a fine display of pumps of various sizes and types. Worthington electric pumps are also made use of in the basement for feeding water into Babcock & Wilcox boilers, and another Worthington electric pump is employed to keep water in the basin in which the submarine mine experiments are made.

The Fort Wayne Electric Corporation are exhibiting an unusually large amount of fine machinery. Among other things there is a "Wood" arc dynamo of 80 2,000 candle-power arc lamps capacity, fitted with self-oiling and aligning bearings, improved armature and new reversible regulator, same directly connected to 4-pole direct current motor. The current generated by the dynamo is utilized to operate a bank of arc lamps of the latest styles manufactured by the Fort Wayne Corporation. Another machine on exhibition is a 37½ kilowatt compound wound low-frequency alternator (60 cycles) operated by direct current motor. This alternator operates a 5-horse-power self-starting single phase alternating current synchronous motor, arc lamps and recording meters. Besides the apparatus on the main floor the Fort Wayne Corporation has a dynamo in operation in the basement.

The exhibit of the National Phonograph Company attracted considerable attention on the opening night. A throng was constantly congregating before this handsomely decorated booth to hear some popular melody or speech being reproduced.

The department of railway exhibits is particularly strong at this Exhibition, one reason being on account of the unlimited floor space available. A full

size electric car, with all the latest improvements in the way of motors, electric heaters, etc., is on exhibition near the Fourth avenue side of the Garden.

The Sprague Electric Company, whose exhibition booth extends along the Fourth avenue side of the Garden, has an exceedingly nicely gotten up exhibit, consisting of electric fans and various other apparatus for which this company is well known.

The Electric Storage Battery Company of Philadelphia and New York is the neighbor of the Sprague Company and shares with them the honor of occupying all the space at the east end of the main floor.

The Safety Insulated Wire & Cable Company has considerable space in the way of an exhibit located along the north side of the promenade. Samples of their cables and wires were to be seen tastefully arranged. The company was also giving away attractive little souvenirs of cardboard showing the various coverings of an armored cable.

The Bossert Electric Construction Company of Utica, N. Y., are exhibiting on the 26th street side of the main floor a collection of their high grade steel outlet, out-out and switch boxes.

The beautiful exhibit of the Marconi wireless telegraphy apparatus which is in the hands of Mr. W. J. Clarke, located on the 27th street side of the promenade, attracted considerable attention.

As many of the most interesting features of the Exhibition were not in operation on Monday evening, as previously stated, a description of these will appear in a later issue, as well as a further description of various other leading companies' exhibits.

SOCIETY MEETINGS.

The New York Electrical Society propose to hold a meeting once a week, in a room specially set apart for them in the Garden, at which a technical paper will be read. Elaborate arrangements have also been made for the meetings of about fifty associations of the National Association of Stationary Engineers.

These associations, it is expected, will come from New York, New Jersey, Pennsylvania, Massachusetts, Rhode Island and Connecticut. Several rooms suit-

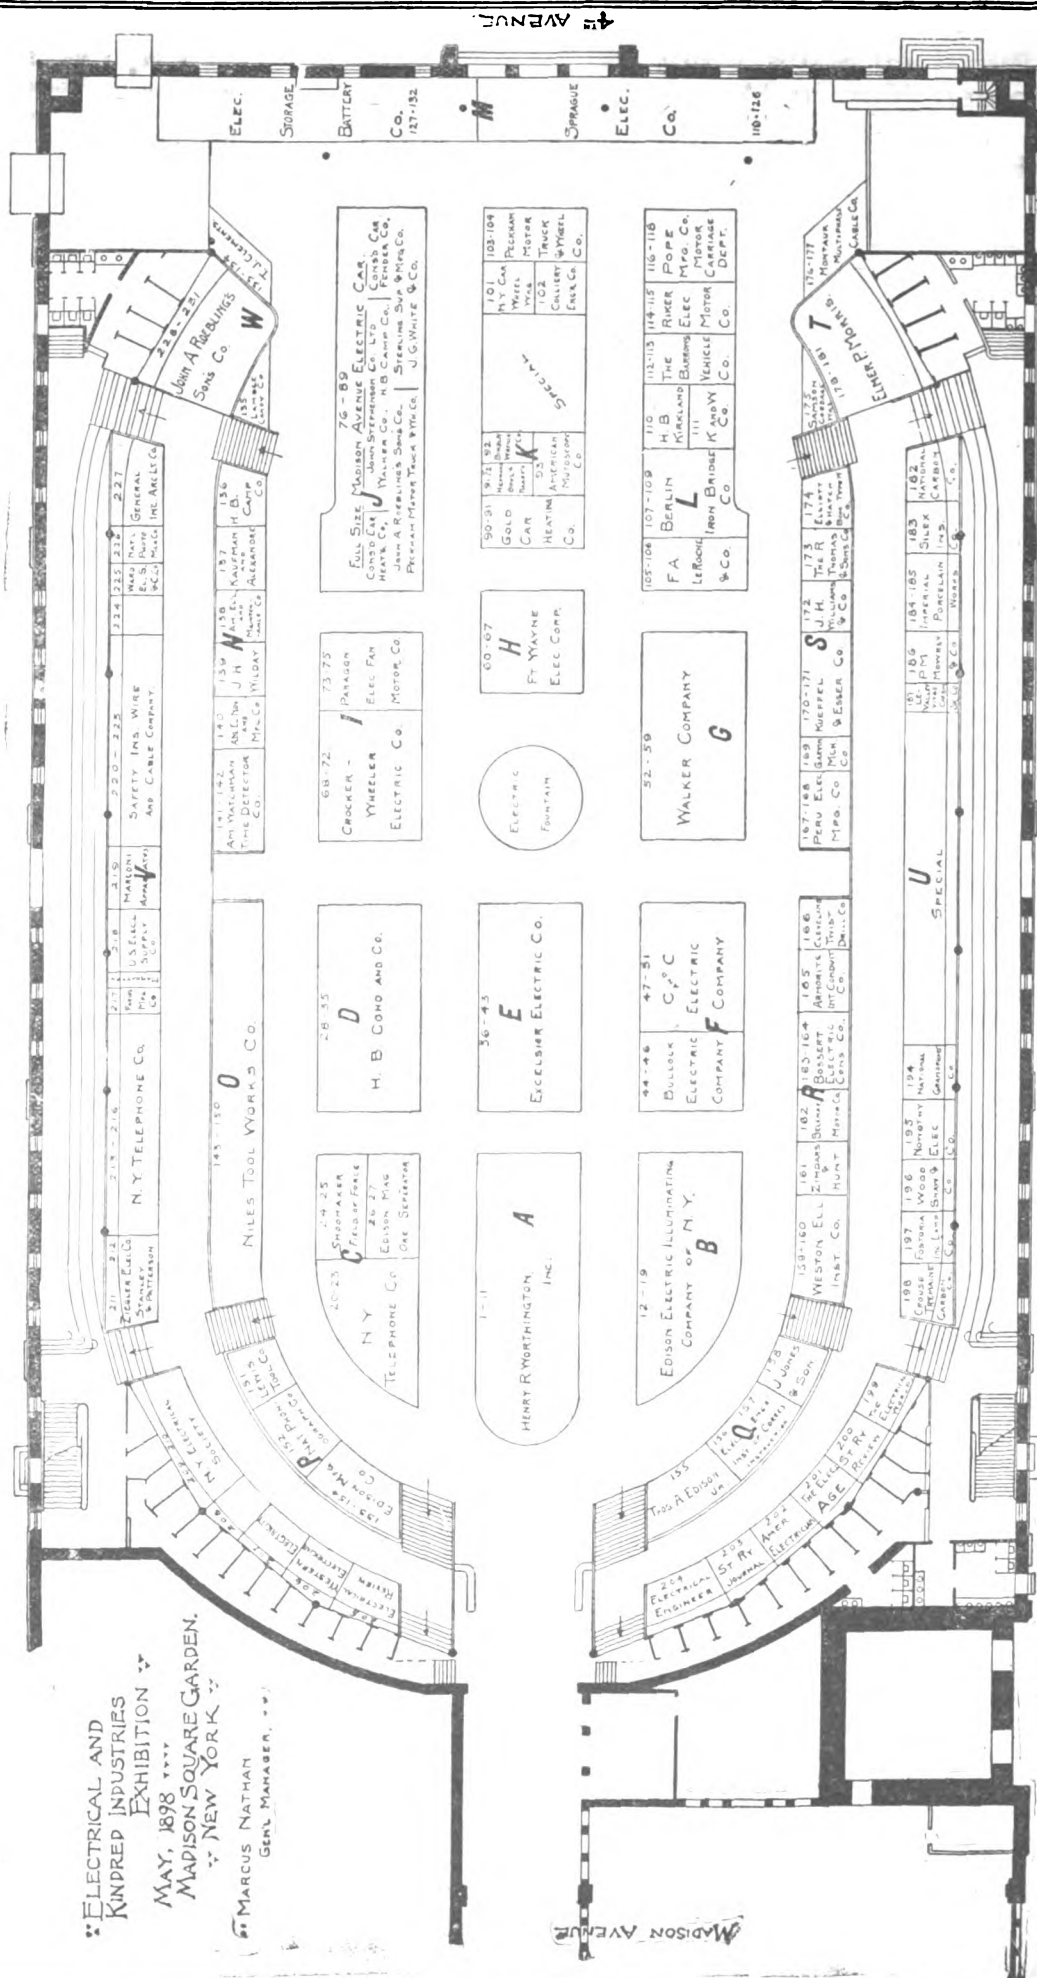

It is expected that there will be an attendance of at least 5,000 practical engineers (two lodges every evening). The Exhibition management has thought-

fully arranged a registry system with bulletin boards in different sections of the building so that the exhibitors may know just what associations of engineers are present and what plants they are connected with.

The Brooklyn Polytechnic Institute and Dr. Samuel Sheldon, its Professor of Physics and Electrical Engineering, have kindly loaned the Electrical Exhibition several interesting units and standards upon which precision in electrical measurements is based. Even the electric public, while it bears a great deal of such standards rarely sees them, and this exhibit is therefore of technical and popular interest. The exhibit includes especially some standards from the German Imperial Physico-Technical Institute (Reichsanstalt), whose celebrated work has been done under the guidance of such men as Helmholtz and Kohlrausch, and it is probable that these standards have never before been exhibited in this country.

Dr. Sheldon will show the Reichsanstalt form of the standard Clark cell, the Reichsanstalt pattern of photometer, with Hefner amyloacetate lamp and Lummer-Brodhun contrast screen, standard .01 ohm for carrying heavy currents, large standard compensation set for the precise comparison of voltages .01 to 1,200 volts and currents of any magnitude, standard Wheatstone bridge, Thomson's double bridge for conductivity measurements, standard Carhart-Clark cell, etc. The exhibition of such apparatus and the explanation given as to its use will do much to bring electrical measurements within the comprehension of the

public, and to demonstrate the wonderful refinement of accuracy that modern electricians aim at in their apparatus. It should be especially appreciated by electrical students.

able for meetings have been provided, and various lodges will hold their meetings there on their regular meeting nights as the guests of the Exhibition Company.

General Electric's Sixth Annual Report.

EARNINGS FOR THE YEAR LESS THAN THOSE OF LAST YEAR.

A "DEAD SEA APPLE" FOR STOCKHOLDERS.

The Press Bureau's Rosy Statements Turn Out to be Baseless Fabrications.

The following is the full text of the General Electric Company's Sixth Annual Report—for the year ending January 31, 1898:

PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 25, 1898.

To the Stockholders of the General Electric Company:

The past year witnessed a revival in business which increased rapidly in activity and volume during its latter months.

In the last annual report attention was called to the fact that your company began the year with less orders on hand than previous seasons. As a result of this, the actual output of your works has been slightly smaller than in previous years, although the orders received during the period have shown a marked increase. This increase will be reflected in the shipments of the ensuing year.

A careful scrutiny of the assets of your company, other than its patents, leads to the belief that previous values were conservatively fixed, and no changes of any significance have been necessary.

The patent account of the company has been kept at substantially the same amount on its books since the organization of the company. The question of a revaluation of patents is one to which consideration should be given at the proper time.

BUSINESS OF THE YEAR.

Gross earnings.....	\$12,524,938.07	
Less expenses.....	10,727,692.02	\$1,797,246.05
Interest and discount, and interest and dividends received on securities owned.....	\$389,789.16	
Less:		
Interest on debentures.....*	833,838.85	56,455.81
		\$1,838,701.86
Deduct amounts written off:		
Sundry losses and allowances for possible losses.....	\$79,220.42	
Patents and patent expenses...	333,334.68	
Inventories and consignments..	89,665.70	
Reserve for extensions to factory plants.....	250,000.00	
	\$752,220.80	
Less:		
Profit on securities sold and debentures cancelled.....	130,371.81	621,849.49
Reduction of the deficit of previous years...	\$1,231,852.37	

*On \$3,000,000 for four months and on \$6,000,000 for eight months.

In addition to the purchase of \$2,000,000 of debentures referred to in previous annual reports, your company has purchased during the year just ended \$2,000,000, and the entire \$4,000,000 have been destroyed. Since the books were closed \$290,000 additional have been acquired, and are now held in the treasury of the company.

An increase is shown in the amount received from interest and dividends from securities owned. It is expected that the income from this source will still further increase from year to year, unless considerable sales of such securities should be made by the company.

The growth of your business has made it necessary to make further expenditures for additions and

changes at your factories and in acquiring much additional machinery.

Plans have been prepared and contracts partially closed for a new foundry and a large and important machine shop, the largest buildings yet erected by your company.

In anticipation of the investment in the construction and equipment of these new shops, which it is estimated will cost about \$500,000, the sum of \$250,000 has been deducted from the profits of the past year and carried to factory reserve account.

It has been the practice of the company to write off the amounts expended for additional factory facilities. It is thought that these allowances are not more than are required to properly provide for depreciation in all your factory plants taken as a whole.

At the annual meeting of the stockholders, held four years ago, the question of reducing the company's share capital in the manner prescribed by law was referred to the directors. Since that time the matter has had the earnest attention of your board, and it is their hope that a plan will be submitted for your consideration at an early date, designed to provide for a suitable reduction of the share capital of the company, with a view to the resumption of dividends.

THE PATENT SITUATION.

The patent situation has not materially changed since the last report to the stockholders. The company has secured many important patents during the year, by inventions of its engineers and experts and by purchase.

One of the Van Depoele trolley patents which had been uniformly sustained by the courts up to last summer has been adversely passed upon by the Court of Appeals for the Second Circuit. This decision was on a motion for preliminary injunction and is not final. The invention was an important contribution to the electric railway art, and no court has questioned its great merit. There is reason to believe that the technical objections to the claims of the patent, upon which was based the decision of the Appellate Court overruling that of the Circuit Court in favor of the patent, will be found upon full consideration at final hearing to be insufficient to defeat the patent.

In view of the fact that nearly all of the railway companies in the country that would be likely to use the overhead trolley system are now electrically equipped, and that the third rail and underground conduit methods are being rapidly adopted for the important new enterprises, an adverse decision in this case will have but slight effect upon the business of your company.

Many other cases based upon patented inventions of great value, including a number on the overhead trolley system, are being pressed against infringers, in which early and it is believed favorable decisions are expected.

THE DEPARTMENTS OF SALES, MANUFACTURING AND FINANCE.

Your careful attention is called to the reports of

the Vice-Presidents having these departments in charge.

Your directors desire to express their appreciation of the valuable services of your admirable engineering and commercial staff, as a result of whose ingenuity and vigilance the company has more than maintained its position of pre-eminence in the varied and constantly increasing applications of electricity.

By order of the Board of Directors.

C. A. COFFIN,
President.

FIRST VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 19, 1898.

C. A. Coffin, Esq., President General Electric Company.

Sir: I submit herewith a condensed report of the operations of the Sales Department for the fiscal year ending January 31, 1898.

Total sales (amount billed to customers).....	\$12,896,098
Cost of goods sold, general expenses and taxes, including sundry losses and allowances for losses.....	10,896,578
Profit on sales.....	\$1,499,515

From this profit should be deducted debenture interest, etc., as shown in the report of the Second Vice-President.

I stated in my last report that "the orders actually booked in 1896 were considerably less than the orders secured in 1895." As a result, we entered upon the last fiscal year with less unfilled orders on hand than usual. Our orders during the first six months of the year were far from satisfactory; the second six months showed a very marked increase in orders, and as we were not able to increase our output to such an extent as to fill these orders within the limits of the fiscal year, we enter upon the present year with a larger list of unfilled orders on hand than ever before. "Sales" include the total billed amounts for goods actually shipped. "Orders" include business secured, and become sales only when the material is shipped and billed. Our sales for 1897 are somewhat less than our sales for the previous year, while our orders are considerably in excess of the orders secured in 1896. The following figures are based on orders secured and not on sales.

LIGHTING DEPARTMENT.

We have received during the past year orders for 60,826 kilowatt capacity of arc and incandescent lighting machines as against orders for the year 1896 of 57,476 kilowatt capacity, an increase of 5.8 per cent.

Among the important lighting contracts secured during the year may be noted the equipment for the new station of the Brooklyn Edison Company and the equipment for the new station of the Boston Electric Light Company.

RAILWAY DEPARTMENT.

Orders received (money value) for railway apparatus has shown an increase of 33½ per cent. over 1896.

Orders for railway generators aggregated over 60,000 kilowatts.

The average size of the railway motor has increased to 34.7 HP., while the average railway generator for 1897 was 484.3 HP., as against 356.3 HP. in 1896.

Among the important railway contracts secured during the year may be noted the equipment of the Metropolitan Street Railway of New York City, the large motor order for the additional service of the Boston Elevated Railway (lessees of the West End Street Railway), and the contract for the substitution of electric traction for cable traction on the entire system of the Capital Traction Company of Washington, D. C. The development of interurban electric railway service has been a marked characteristic of the past year. This is well illustrated in the Cleveland and Lorain, the Akron, Bedford and

Cleveland, and the Cleveland and Eastern roads, each of which is equipped with powerful motors operated at speeds up to and at times exceeding 60 miles per hour.

POWER AND MINING DEPARTMENT.

The growth of business in the class of electrical apparatus handled by this department is strikingly shown by the following comparison of orders received for various years past:

Orders for 1893 were	36 %	in excess of orders for	1892
" " 1894	126 %	" " "	1893
" " 1895	10 %	" " "	1894
" " 1896	60 %	" " "	1895
" " 1897	60 %	" " "	1896

Orders for direct current and induction motors aggregated 19,531 HP. as against 15,171 HP. in 1896. Orders for multiphase generators aggregated 49,902 HP. as against 25,007 HP. in 1896.

Total transmission lines installed in connection with G. E. apparatus, 326 miles as against 232 miles in 1896.

SUPPLY DEPARTMENT.

The Supply Department has handled 114,229 separate orders during the year, or 43 for each working hour. The "orders received" in 1897 exceeded by 20 per cent. the "orders received" in 1896.

The supply stocks carried at our local offices have been decreased about 7 per cent. during the year, and of the present total 90 per cent. consists of active supplies, a great improvement over previous years.

The following are some of the principal articles handled by the Supply Department:

Wattmeters.—Total number ordered during the year 36,874, an increase of 42 per cent. over 1896.

Measuring Instruments.—Total number ordered during the year 3,369, an increase of 38 per cent. over 1896.

Transformers.—Total number ordered during the year 11,499, an increase of 36 per cent. over 1896.

Arc Lamps.—Total number ordered during the year 24,158, an increase of 75 per cent. over 1896.

Sockets and Receptacles.—Total number ordered during the year 2,357,649, an increase of 36 per cent. over 1896.

FOREIGN DEPARTMENT.

The orders of the Foreign Department have shown a gratifying increase over the orders for 1896. Several notable contracts have been placed with us by our foreign companies—the equipment of the Central London Underground Railway, and the equipment of the street railways in several European cities.

INCANDESCENT LAMP SALES.

The incandescent lamp orders for the year aggregated 6,857,239 of which 6,706,624 were shipped. This is an increase of about 10 per cent. over the year 1896.

The success of the Sales Department is, in a great measure, due to the administrative ability and untiring energy of the department managers, and I desire to particularly commend their good work to your notice.

Respectfully submitted,

EUGENE GRIFFIN,
First Vice-President.

THIRD VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 19, 1898.

C. A. Coffin, Esq., President General Electric Company.

Sir: I submit herewith a report on manufacturing and engineering for the fiscal year ending January 31, 1898:

MANUFACTURING.

The percentages added by the three factories to their raw material and labor in estimating factory costs have been found ample to cover all items of general expense, including a proper allowance for depreciation. The inventories have been taken with great care and counted and valued item by item.

The stock is in excellent condition and covers only apparatus and material for which the demand is constant and active.

Financial statistics relating to factory investment are given in the report of the Second Vice-President.

The press shop mentioned in my last report as nearing completion, was finished and occupied early in the year and its use has resulted in economies which more than justify the cost of its construction.

It was found necessary to increase our testing, assembling and shipping facilities by adding to our existing building an extension of 36,000 sq. ft. floor space, admirably adapted to the purposes for which it was built. The main bay is served by an electric crane of 40 tons capacity, permitting the economical loading of our apparatus directly upon the cars, which enter the building by a spur direct from the tracks of the N. Y. C. & H. R. R. and the D. & H. R. R. This addition has enabled us to concentrate our finished stock and gives the best facilities for the economical and prompt shipment of apparatus.

We have added to our Schenectady plant about 87 acres, a portion of which was covered by buildings which we are now using for manufacturing and storage purposes.

The growth of our business, together with the demand for electrical machines of increased capacity, has made inadequate our present facilities for the production of iron castings, and we are now constructing a new iron foundry containing 94,000 square feet, which should be completed during the present year.

The demands upon our engineering and drafting force have required increased facilities, which have been provided in a new drafting room, of ample size, thoroughly lighted and complete in all its appointments.

Our increased business in foreign countries has disclosed the fact that in design, cost and efficiency our machinery compares most favorably with that of European manufacturers.

Valuable data, drawings, patterns and tools necessitated by the large amount of special apparatus which we have successfully designed and manufactured in the past, are now frequently available in the construction of new apparatus, thus reducing the cost of developing such apparatus.

Our manufacturing plants at Schenectady, Lynn and Harrison have been maintained in first class physical condition. Labor-saving devices, special machinery and improved tools have been, as heretofore, added liberally whenever an improvement in the quality of the product or increased economy of manufacture would result.

ENGINEERING.

The number of undertakings requiring machinery of large capacity and special design has increased materially during the past year. This has been due largely to the application of electricity to the operation of underground, suburban and interurban railroads, and also to the concentration of power in large units due to the demonstrated economy of our three-phase machinery and the rotary converter mentioned in previous reports. A most notable and important installation is that of the underground Central London Railway which we are equipping with three-phase generators, rotary converters and thirty-two large electric locomotives.

Another remarkable undertaking is that of the mammoth new station of the Metropolitan Traction Company of New York. From this station enormous electric generators will operate, through the medium of rotary converters and other machinery of our design and manufacture, the electric street cars throughout nearly the entire borough of Manhattan.

In my last report I called attention to the value of our rotary converter, a species of connecting link between the alternating and continuous current systems, which enables existing continuous current plants to add the advantage of alternating current

generation and economical transmission to the simplicity and effectiveness of the continuous current distribution. The economies which thus result from the substitution of a single large alternating current power station for a number of small stations is well illustrated in a notable installation of such apparatus made during the past year by the Brooklyn Edison Company, using our three-phase generators, rotary converters, synchronous motors and other appliances.

The number of long distance transmission plants has greatly increased during the past year, so that we have now a total generating capacity in such plants of over 100,000 HP. and among these some 20 installations are operating at potentials of over 10,000 volts and transmitting a total of some fifty thousand horse-power to distances varying from 10 to 40 miles. The 5,000 HP. plant at Ogden, Utah, has been in operation for nearly a year, transmitting power to Salt Lake City, a distance of 36½ miles, at a potential of 16,000 volts. We have now under construction apparatus intended for the transmission of over 4,000 HP. from a distant water power 80 miles to the city of Los Angeles, Cal., at a pressure of 33,000 volts. The St. Anthony Falls plant, mentioned in my last report, has been completed and is now in regular operation, furnishing power to the street railways of Minneapolis and St. Paul, Minn.

In the city of New Orleans, La., we shall soon have in operation a novel plant of some 4,000 HP., which will be used to operate pumps for the drainage of the city. Three-phase machinery will be employed.

The driving of all machinery in cotton mills and factories by electric motors is increasing rapidly, even where the original source of power is a steam engine located in or near the mill or factory itself.

The United States Navy is adopting the electric drive in place of steam or hydraulic machinery for ventilating, pumping and hoisting on shipboard and for lowering and elevating guns and for turning turrets on the warships. This is in addition to the recognized use of electricity for lighting and small power work.

We shall soon be operating our Schenectady works from a distant water power. We have contracted for a supply of 2,000 horse-power from the Falls of the Hudson River at Mechanicsville, 19 miles from Schenectady. A novel feature of this transmission is that the generators, each of 1,000 horse-power, have been constructed by us to produce directly a pressure of 12,000 volts, thus saving the cost of the usual intermediate step-up transformers.

Our older transmission plants, such as Portland, Oregon, and Fresno, Cal., operate with great success and have largely increased their capacity, demonstrating the advantages of our system and apparatus in the electrical utilization of water powers.

There has been a great improvement in the efficiency and quality of our numerous small articles of manufacture, such as arc lamps, transformers, meters, switchboards, etc., many features of novelty and value having been developed by our engineers. Our business in this line has shown a gratifying increase.

We have continued to protect our new and important engineering designs as far as possible by application for letters patent.

The efficient work of the factory managers and the unequalled ingenuity, skill and industry of our engineers are worthy of special commendation. Respectfully submitted,

E. W. RICE, JR.,
Third Vice President.

SECOND VICE-PRESIDENT'S REPORT.

SCHENECTADY, N. Y., April 15, 1898.

C. A. Coffin, Esq., President General Electric Company.

Sir: The balance sheet and statement of profit and loss, herewith transmitted, include the assets and liabilities and profit and loss accounts of the

Edison General Electric, Edison Electric Light and Thomson-Houston Electric Companies (which, for convenience of bookkeeping, are consolidated with those of the General Electric Company) at January 31, 1898; and when "the company" is spoken of all the above mentioned corporations are included.

In explaining what each item on the balance sheet represents, the language of previous years is again used.

ASSETS.

PATENTS AND FRANCHISES.

During the year there was expended for acquiring new patents and in patent litigation, \$333,334.68, all of which has been written off to profit and loss, leaving the patents, franchises, good will, etc., of the company standing unchanged at \$8,000,000.

FACTORY PLANTS.

This account represents the real estate (lands and buildings); machinery, tools, appliances, etc.; patterns, drawings, etc.; and sundries (fittings and other small property accounts) of the manufacturing plants at Schenectady, New York; Lynn, Massachusetts; and Harrison, New Jersey.

The lands of all three plants now amount to about 160 acres and the total factory floor space of all their buildings is approximately 1,600,000 square feet.

All are free from mortgage or other lien.

These plants being a permanent investment, all expenditures for their maintenance and repair, plus an allowance to provide against depreciation, are charged to operating expenses.

A summary of the changes in this account since the last annual report is as follows:

	Book value Jan. 31, 1897.	Cost of addi- tions.	Written off for depre- ciation.	Book value Jan. 31, 1898.
Real estate.....	\$1,795,000	\$164,715.35*	\$102,670.70	\$1,857,044.65
Machinery.....	1,605,000	183,879.85	245,924.50	1,542,955.35
Patterns.....	1	71,450.87	71,450.87	1.00
Sundries.....	1	18,874.06	18,874.06	1.00
Totals.....	\$3,400,002	\$438,920.13	\$438,920.13	\$3,400,002.00
	Jan. 31, 1897.			Jan. 31, 1898.
Book value of Schenectady plant	\$2,157,000.90			\$2,300,000.90
" " " Lynn	993,000.80			900,000.80
" " " Harrison	250,000.30			200,000.30
Totals.....	\$3,400,002.00			\$3,400,002.00

*Includes full payment for 87 acres of land adjoining the Schenectady plant; cost of erecting at Schenectady a new brick and steel building 100 x 200 feet—with an annex 33 x 162 feet—for packing, storage and shipping; and cost of completing the erection (begun last year) of a brick and steel punch press shop 100 x 236 feet at Schenectady.

Includes office furniture and fixtures, horses and trucks, shop fixtures, benches, steam fitting for heating system, sprinkler system for fire protection, electric wiring of buildings, etc., etc.

REAL ESTATE.

(Other than factory plants.)

This account represents the investment in the Edison Building, 44 Broad street, New York City; also sundry parcels of land in various places, mostly improved and rented, which have been acquired at various times, chiefly in payment of debts; also a large building covering five lots on the corner of Avenue B and 17th street, New York City, which was acquired from the General Fixture Company in 1895 subject to a mortgage of \$40,000. This mortgage has been paid off during the past year.

All will be sold when opportunities offer.

STOCKS AND BONDS.

No changes of last year's figures have been made in the book valuations of stocks and bonds.

Those having a market value are carried under the price of reported sales. The book value of those not readily salable was fixed on January 31, 1897, after careful examination of their worth.

I believe the actual present aggregate value of all these securities is equal to the total amount at which they stand on the books, viz., \$7,455,872.96.

Schedule A, annexed hereto, contains a list of the most important of the company's holdings of stocks and bonds. They are carried at an aggregate book value of.....\$7,195,471.42

In addition the company owns various other securities. As their present

Amount brought forward.....\$7,195,471.42
value is doubtful and their future value speculative they are not set forth in the schedule. They are as follows:

Stocks and bonds of local lighting and street railway companies wholly owned.....	196,941.77
Sundry small holdings.....	63,327.77
Miscellaneous securities of many underlying, manufacturing, selling and patent owning corporations, and also of street railway and lighting companies, carried at one dollar for each lot—in all.....	132.00

Total book value of all stocks and bonds, as per balance sheet.....\$7,455,872.96

Sales of Stocks and Bonds.

Pursuant to the established policy of selling securities which there is no special reason for holding permanently, various stocks and bonds have been sold since the last annual report.

Their total par value was \$1,224,650.

They were sold for.....\$1,038,054.80

They were carried on the books at.....921,698.86

Profit.....\$116,355.94

The cash thus received was used towards the purchase of \$2,000,000 of the company's debentures.

CASH.

The policy of the previous three years has been adhered to and sales maintained on a basis of cash or short credit to desirable customers.

None of the money realized from the sale of assets was required for the current business of the company during the year.

NOTES AND ACCOUNTS RECEIVABLE.

This account represents the total amounts now due the company by its customers.

They appear in the balance sheet at an estimated realizable value (i. e. their face, less a total allowance of \$662,614.66 for possible losses) which I believe to be a fair one.

They may be classified approximately as follows:

	Face values.	Face values.	Face values.
Current notes.....	\$987,685.56		
" " accounts.....	2,522,554.95		
		\$3,510,240.51	
Slow notes.....	921,779.71		
" " accounts.....	583,094.63		
		1,504,874.34	
			\$5,015,114.85
Due from local lighting and street railway properties wholly owned by the company..			184,544.69
Total face value*.....			\$5,199,659.54

*In addition, there yet remain—of old notes and accounts receivable which two years ago were written off to profit and loss, except the nominal book value of one dollar for each debtor—notes and accounts of 256 debtors aggregating \$1,724,614.18. These stand on the books at \$256, and are being liquidated as rapidly as possible. The total amount realized from settlements of similarly valued notes and accounts during the past year was \$84,354.17. Total face value as above \$5,199,659.54 + "Dollar" notes and accounts \$256 — allowance for losses \$662,614.66 — total book value, as per balance sheet, \$4,537,300.88.

WORK IN PROGRESS.

This account does not include outlays for anything in process of manufacture; but represents expenditures outside of the factories for labor, material, etc., on 229 installations of manufactured apparatus delivered at various places.....\$363,487.85
Less partial payments thereon, received under the terms of the contracts as work progressed.....79,655.86

Balance.....\$283,831.99

None of the estimated profit to be derived from these installations is included in the earnings of the year, and no allowance is made thereon for possible loss.

INVENTORIES.

These accounts represent raw materials and goods manufactured and in process of manufacture at the factories; manufactured goods in storerooms of local offices and on consignment; office furniture, fixtures,

instruments, etc., in the general office and in local offices; tools and materials in local repair shops; and also shipments in transit to local storerooms.

All have been counted and valued item by item.

Raw materials have been valued at the market prices prevailing on January 31, 1898; active selling finished and partly finished apparatus and supplies at factory cost; inactive or slow selling apparatus and supplies at about 50 per cent. of factory cost; obsolete apparatus and supplies at scrap value; and tools, instruments, furniture, etc., at present value.

On the above basis, the inventories of the factories showed an excess over book value of \$275,097.72, which is not taken as a part of the year's profit, but is retained as a reserve.

All other inventories showed a shrinkage from book value of \$79,238.39, which has been written off as a loss for the year.

Goods are taken in and out of local office inventories at factory cost at the time being.

The bulk of the above shrinkage is due to factory costs at January 31, 1898, being lower than at January 31, 1897, and to writing down the book value of slow selling apparatus and other personal property.

CONSIGNMENTS.

Finished apparatus for novel uses has been delivered to various concerns, subject to purchase if its operation is successful. The greater part of this account represents such contingent sales, and the remainder represents apparatus on exhibition or loaned to regular customers for temporary use by them.

All the above apparatus is charged, at factory cost, to this account at a total of.....\$80,771.48
Less allowance for depreciation.....28,036.69

Net book value of consignments.....\$52,734.79

LIABILITIES.

The company has no notes payable, nor is any paper bearing the company's endorsement or guaranty under discount.

All purchases have been paid for in cash.

It has not been necessary to borrow money, nor has the company's credit been used during the year either by issuing notes, endorsing customers' paper for discount or lending its name in any way.

DEBENTURES.

During the year the company has purchased and canceled \$2,000,000 of its own 5 per cent. gold coupon debentures due June 1, 1922, at an average cost of 99.30 per cent.

ACCRUED INTEREST ON DEBENTURES.

This account, as its name implies, is the full amount of 5 per cent. interest accrued to January 31, 1898, on the company's \$6,000,000 outstanding debentures.

ACCOUNTS PAYABLE.

This account includes all unpaid audited indebtedness.

At the close of business on January 31, 1898, there were no unpaid vouchers on hand.

The amount of accounts payable shown in the balance sheet, \$263,525.75, represents expenditures belonging to the year, vouchered between January 31 and February 26, the date of closing the general books. The amount of vouchers which have to be carried over in this way monthly, owing to keeping the books—other than the cash book—open a sufficient time to include expenditures of a particular month in that month, is usually about \$500,000.

RESERVE FOR EXTENSIONS TO FACTORY PLANTS.

This account represents \$250,000, set aside, from the profits of the business of the past year, toward the cost of erecting and equipping at the Schenectady plant an iron foundry and a machine shop which are estimated to cost about \$500,000.

Contracts for the iron foundry have been let and work under them has begun. The plans for the machine shop are being prepared.

Respectfully submitted,

J. P. ORD,
Second Vice-President,

We have made a critical examination of the books and accounts of the General Electric Company, the Edison General Electric Company, the Edison Electric Light Company and the Thomson-Houston Electric Company, for the two years ended January 31, 1898, and hereby certify that the consolidated in-

cautions taken to enter all existing current liabilities on the books at the time of closing, and are satisfied that all known accounts payable of the company are included in the balance sheet.

We have read the explanations of the balance sheet and profit statements submitted herewith by the Second Vice-President and concur therein.

PATTERSON & CORWIN,

Certified Public Accountants.

RIVETING BY ELECTRICITY.*

BY F. VON KODOLITSCH.

Most of the shipbuilding yards and bridge-building establishments are now seriously considering the question of introducing electric transmission of power into their works for the sake of driving each tool by a separate motor. Some of the factories already possess a hydraulic installation for riveting purposes which it would be impossible to convert to the new system. The only way of applying the new system to the existing plant would be to drive the compressor pumps by a separate electric motor. All the defects which belong to hydraulic installation in general would adhere to this, viz., a great outlay of capital, high working expenses, and an enormous cost in the up-keep. For the last two years I have been experimenting on electric riveting machines, and have finally succeeded in bringing out a type of riveting machine quite capable of superseding the two systems already existing, viz., hydraulic and pneumatic riveting. There are a good many firms in this country who have to decide which system of riveting they intend to adopt for the future, in order to keep pace with the rapidly-increasing competition of other firms at home and abroad, and this is the reason that I propose to read a paper on this subject at the present meeting, especially as I have seen that some firms on the other side of the Atlantic are making great efforts to introduce the pneumatic system, and promise gigantic profits to those who decide to adopt it.

Before I proceed to describe the electric riveter in detail, I wish to point out, in a few remarks, why the electric system is, from the commercial and technical point of view, superior to all its rivals. I assume, of course, that the yard adopting the new system already possesses a central station and a system of wires for transmission of power, as is already the case in a good many establishments. If they are driving punching, shearing or boring machines, rolls or mangles, etc., by the electric current, it is certainly logical to utilize this existing current also for riveting. Anyone deciding to rivet by electricity has only to order such a machine and place it where he wants to do his riveting, connect two wires from the main to the riveter, and he can begin the operation at once.

Now let us suppose hydraulic riveting has been decided upon. A pair of expensive compressor pumps have to be installed, a gigantic accumulator has to be put up, pipes must be laid, pipe connections between the riveter and the accumulator have to be made, and a hydraulic riveting machine must be bought and erected. In case of pneumatic riveting the same installations must be made, and almost the same outlay of capital is incurred. What has been said above clearly demonstrates that the initial outlay is far less if the electric system be adopted. Everyone who works a hydraulic or pneumatic installation must know what a heavy item is the keep-up in the total working charges. In case of the electric system, this point only becomes a fraction of the expenditure. As regards the quality of the work, there is not the slightest difference, but as regards the quantity of work done, the electric system is considerably superior. The machine I am describing to-day has closed, for weeks and weeks, 1,200 rivets

in a day of ten hours' duration, requiring the attendance of only three men and a boy.

The electric riveting machines which have up to the present been built can be carried about easily to any place in the yard, but are not made for being suspended from a crane. To the large jaw are attached two platforms at right angles, so that the riveter may be used horizontally or vertically. The system is so very simple that I need not occupy much of your time in describing it. One heavy disk is always rotating by electricity, whether the riveter is closing rivets or not. This disk can become, at the same time, an electro-magnetic coupling, so that when the current is passing this coupling a second disk, keyed on to a screw spindle, may be at once firmly attached to the revolving disk, thus the friction of the screw spindle can be regulated according to the operator's wish. The screw spindle moves a large nut at the end of a knuckle joint, which raises and lowers the die for making the rivet head. Between the already-mentioned disks a conical friction roller can be inserted. By pressing in this roller, the motion of the screw spindle can be reversed, and the nut of the knuckle joint returned to its original position in order to be ready for a new stroke. The pressure on the die must be regulated in proportion to the diameter of the rivet, and this is done by producing more or less friction between the two disks, which difference in friction is obtained by more or less current being admitted to the electro-magnetic coupling. The type of riveting machine which we are building now is made chiefly for shipbuilding purposes, and closes rivets up to 1½ in. in diameter; the output is, as already stated, 120 rivets per hour. When so many hot rivets are required in a short time the question of heating the rivets becomes very important. When we started to rivet by electricity, we could not produce the number of hot rivets required by using a reasonable number of portable forges. For this reason we have made a small fan, driven by an electric motor, to supply air to a number of small furnaces, which considerably reduces the number of boys required for heating rivets.

American Institute of Electrical Engineers.

The 124th meeting of the Institute was held at 12 West 31st street on Wednesday evening, April 27, Mr. H. Ward Leonard in the chair. About 60 members and guests were present. A paper on "An Economy Test of Central Stations" was presented by Prof. W. E. Goldsborough of Lafayette, Ind.; also a paper on "A Novel Form of Thermo-Electric Battery," by C. J. Reed of Philadelphia, which was accompanied by experiments. The discussion was participated in by Messrs. Cox, E. P. Thompson, Mailloux, Reed, Wintringham, Steinmetz, and Mr. W. M. Mordey of London.

At a meeting of the Executive Committee in the afternoon the following associate members were elected:

Wyatt H. Allen, San Francisco, Cal.
Wm. H. Fitzhugh, Bay City, Mich.
John Breckenridge Fleming, Austin, Nev.
Geo. J. Henry, Jr., New York City.
N. S. Hopkins, Schenectady, N. Y.
Robert Lindsay, Cleveland, Ohio.
Fred'k A. Muschenheim, New York City.
Newton L. Schloss, New York City.
Clarence M. Tolman, Silverton, Col.
Ernest Stiles Vinton, New Haven, Conn.

An Important Deal Closed.

We learn that Mr. J. E. Keelyn, President of the Western Telephone Construction Company of Chicago, has just closed a deal for control of the Graham Electric Company's telephone and switchboard business as well as all of its patents. It is said this is the fifth concern that has been arranged for in like manner recently. A strong combination seems to be imminent with Mr. Keelyn as president, and a strong financial syndicate backing it.

LEGAL NOTES.

In the suit brought in Brooklyn, N. Y., by Hugh V. Roddy and Valentine Schmitt to restrain the Brooklyn Heights Railroad Company and the Coney Island & Brooklyn Railroad Company from running their cars which cross the bridge in Washington street, on the ground that the railroad companies had not acquired the right to run the cars under the agreement which they had made with each other, and that the street would be so blockaded by the additional cars that the businesses of the plaintiffs would be injured, Justice Maddox of the Supreme Court has rendered a decision in favor of the railroad companies. Under this decision a railroad company has the right to lease and use the tracks of another company, and to operate cars thereon without obtaining the consent of abutting property owners. At the close of his opinion Justice Maddox says: "My conclusion is that the right of the defendants to contract for the use of their respective roads and to operate cars thereon was a vested right, not dependent for vitality or authority upon any law enacted since the constitutional amendment of 1874, and the exercise of that right is not violative of any constitutional provision."

Judge Mitchell at St. Paul, Minn., has reversed the order of the lower court in the libel case brought by Senator S. D. Peterson against the Western Union Telegraph Company. The syllabus of Judge Mitchell's decision is as follows: "A written message, alleged to be libelous, was delivered to defendant's operator at New Ulm and by him transmitted by sound over the wires to the operator at St. Paul, to be by him reduced to writing and delivered to the plaintiff. Held, that this constituted a publication of the libel. Mere negligence, unless so gross as to amount to positive bad faith, is not a ground for awarding punitive damages. Hence an instruction to the effect that the jury might award exemplary damages if they found that the defendant was negligent in employing the operator who transmitted the message, or in failing to adopt proper rules to prevent the transmission of libelous messages, is erroneous. Order reversed."

Bids Wanted for Telegraph Material.

The U. S. Department of Agriculture has called for bids for furnishing the Department with telegraph material. It is estimated that during the year it will need 6 cable arresters; 1,300 battery recharges for Gordon primary; 30 cells, dry imperial; 1,000 primary Gordon batteries; 25 cells Le Clanche batteries; 500 Nungesser batteries; 500 Edison Lalande; 500 renewals for Edison Lalande batteries; 40 electric bells; 6,000 lbs. blue vitriol; 500 insulator brackets; 50 battery brushes; 50 push buttons; 50 electric buzzers; 200 finished connectors; 500 coppers, gravity battery; 8 dozen cutouts, K.W.; 1,000 screw glass insulators, double petticoat pattern; 200 porcelain insulators; 12 telegraph keys; 200 incandescent lamps; 5 pairs of lanterns, marine signal, electric; 10 box sounding relays; 18 telegraph relays; 6 dozen electric light shades; 5 dozen electric light shade-holders; 10 giant telegraph sounders; 10 plug out-out switches; 10 wooden bore switches; 40 dozen Hort or equal switches; 15 lbs. telegraph tacks; 16,500 feet of wire; 40,980 lbs. of wire, and 525 spelter zincs, and 30 sheets of zinc.

Annual Meeting of the Joseph Dixon Crucible Co.

The annual meeting of the stockholders of the Joseph Dixon Crucible Company was held at the company's main office, Jersey City, N. J., Monday, April 18, and out of a possible vote of 7,345 shares there were 7,042 shares voted for the re-election of the old board, consisting of Edward F. C. Young, John A. Walker, Daniel T. Hoag, Richard Butler, William Murray, Alexander T. McGill, and Joseph D. Bedle. President E. F. C. Young, Vice-Pres. and Treasurer John A. Walker, and Secretary Geo. E. Long were re-elected by the directors. Judge Joseph D. Bedle was also re-elected as counsel.

* Abstract from the *London Electrician* of a paper read at the Institution of Naval Architects.

CANADIAN NOTES.

It is understood that the Consolidated Electric Light Company of Victoria, B. C., are preparing to utilize the water power at Goldstream for the operation of the electric lighting and railway system. The work will cost upwards of \$100,000.

The Hess Metallic Furniture Company have begun the erection of a large factory at Niagara Falls, Ont., and probably will be the first company to use electric power developed on the Canadian side for manufacturing purposes. The Carborundum Company, one of the largest users of electric power on the American side, it is said, are about to close a deal for a building site near the former company, and will begin building before the first of June next.

The Cataract Power Company has made a proposition to pump the water supply of the city of Hamilton, Ont., by electric power. They agree to erect at the beach pumping-house, electric motors and revolving screw pumps of sufficient capacity to pump 10,000,000 gallons per day, and to erect at the high level pumping-house, motors and pumps and supply sufficient power to pump from the mains to the high level reservoir 2,500 gallons per day. The company will keep the pumps in operation for one month, when the city will be expected, if satisfactory, to pay for them at the ascertained price, not to exceed \$25,000. The price to be paid by the city for electric current necessary for pumping the water required is placed at \$13,000 per annum for the first 1,600,000,000 gallons pumped in both reservoirs, and 60 cents for each additional 100,000 gallons. The company claim that their offer will meet the requirements of the fire underwriters, and save the city more than \$20,000 per year.

THE NEWS.

What Is Going On in the Electrical World.

STREET RAILROADS.

Bound Brook, N. J.—The Piscataway township committee has been offered \$5,000 for the franchise to build a trolley road over the route between Bound Brook and Dunellen. The offer was made by Silas D. Drake, in behalf of the Lincoln Trolley Company, which is to be capitalized at \$25,000.

Boulder, Col.—Denver architects are preparing plans for a tabernacle with a seating capacity of 6,000 people to be erected on the grounds of the Texas-Colorado Chautauqua Association near Boulder. Arrangements have been made for an electric street railway line running from the depot direct to the grounds, to be in operation by July 4, the opening day. The entire grounds will be lighted by electricity.

Cedar Falls, Ia.—The city council at its last meeting passed a resolution adopting the Patton motor system as the street car power in Cedar Falls.

Cheboygan, Mich.—Mayor Maloney is a strong advocate of the proposed trolley road from Cheboygan to Petoskey by the way of Dodge's Point, Mullet Lake, Topinabee, Indian River, Burt Lake and Oden.

Chicago.—The "Tribune" says: "At a recent meeting of the directors of the Michigan, Indiana & St. Louis Electric Railway Company it was decided to proceed with the building of the road at once. The enterprise will be financed by an Eastern syndicate, but several Chicago men are interested in it, and the company's office will be located at 59 Dearborn street. William Sear is president and F. M. Gilmore general manager and superintendent of construction. John Moffet, attorney for the company, said the work of building would begin at Monticello, Ind., and proceed both ways from that town, connecting the towns of Rochester, Pulaski, Headley, Buffalo, Norway, Monticello, Chalmers, Brookston, Fowler and Dunnington, in Indiana. The road will be eighty miles long and may be extended later. The road will be equipped with both passenger and freight cars, with powerful electric motors. It is proposed to do a general passenger and freight business, including the handling of live stock."—The North Chicago Street Railway Company has posted notices in its car barns informing the employees that any of them who were desirous of enlisting in the United States service for the war would have their places held open, receive half of their regular salaries and a life insurance of \$2,000.

Columbus, O.—The county commissioners have granted a franchise to Adam T. Grant for an electric railway from Green Lawn Cemetery to Grove City along the Harrisburg pike. The franchise is to run for 25 years.

Hamilton, O.—The Hamilton Belt Line Railway has

increased its stock from \$25,000 to \$50,000, and the immediate construction of the road is determined upon.

Joliet, Ill.—The stockholders and directors of the Joliet Street Railway Company have sold the line to the Joliet Railroad Company for \$600,000. The line includes five branches inside the city and a line five miles long to Lockport. The new company will spend \$100,000 in extensions this year. The officers and directors of the Joliet Railroad Company are: W. F. Milliken, Portland, Me., president; George F. Duncan, vice-president, Portland, Me.; Edward Woodman, secretary, Portland, Me.; Henry P. Cox, treasurer, Portland, Me. Directors: Walter Davies, George F. Duncan, Weston F. Milliken, Edward Woodman, John Burnham, Clinton; L. Baxter, manager, William McKinley, Champaign, Ill.; C. C. Rush, superintendent, Joliet.

Lynchburg, Va.—Arrangements, it is said, have been made to rehabilitate the street railway formerly belonging to the Lynchburg Electric Company.

Milton, Pa.—A trolley road is likely to be built this summer between Danville and Bloomsburg. The matter has been agitated for some time and two separate companies have at different times received franchises and the right of way to build the road, but want of funds blocked the scheme. A Philadelphia party has now taken hold of the matter and will probably carry it through.

Newport News, Va.—The city council has granted a franchise to the Newport News, Hampton & Old Point Railway and Electric Company, permitting it to construct and operate a street railway in this city.

Newport, Ky.—Col. R. W. Nelson is said to be in New York in the interest of the proposed new street railway company which is talked of to operate a line over the Central Bridge, through Newport and Bellevue to Dayton. He is endeavoring to interest capitalists in the new venture, and while the war excitement has greatly interfered with his plans, he expects to succeed.

Oakland, Cal.—The Alameda, Oakland & Piedmont Electric Railway Company has been granted a franchise permitting it to run street cars in specified streets in Oakland.

Shelburne Falls, Mass.—The Shelburne Falls & Colrain Street Railway Company has decided to add \$7,000 to its capital stock and to issue bonds to that amount for the purpose of extending its tracks into the town of Buckland to connect with the Fitchburg Railroad.

LIGHTING PLANTS.

Albany, Ga.—At the special election held here on the 18th ult., for the purpose of determining whether the city should issue \$25,000 of bonds for purchasing and improving the plant of the Albany Edison Illuminating Company, the vote stood—for, 235; against, 23.

Columbus, O.—The system of lighting the streets by arches of incandescent electric lights has proved successful here and a party of Cincinnati business men who visited Columbus lately to examine this method of street illumination were so pleased with it that they have recommended its adoption on Fourth and Fifth streets in their city. The system of arches used in Columbus, on High street, is unique and unlike any other in existence.—Senator Voight's bill authorizing villages to lease electric light plants has passed the House.

Eldora, Col.—Attorney A. B. Tomlin has gone to Colorado Springs for the purpose of meeting the stockholders of the proposed electric light and power company which is to be put in a plant at Eldora soon. The plant purchased has cost about \$62,000 and will have a capacity of 500 horse power.

Decatur, Ill.—A proposition is under consideration to sell the city electric light plant to a local company. The bidder offers to supply the necessary light 10 per cent. cheaper than it is said to be possible for the city plant to produce it.

Gallatin, Tenn.—An election is to be held here on May 7 to get a public vote on the question of electric lights and waterworks for the town.

Hinesburg, Vt.—There is a popular movement here in favor of putting in an electric light plant.

Joliet, Ill.—L. E. Ingalls, who owned a one-third interest in the Economy Light & Power Company of this city, has sold his stock to John J. Mitchell, president of the Illinois Trust and Savings Bank of Chicago. The capital stock of the company is \$450,000.

Manning, Ia.—The city council is in favor of bonding the town for the purpose of putting in an electric light plant, and a special election will probably be called soon to vote on the proposition.

Mingo Junction, O.—A company is to be organized here to put in an electric light plant.

New Painesville, Minn.—At a special election held here on the 25th ult., the proposition to issue \$3,000 in bonds for waterworks and electric lights was carried by a vote of 56 to 31.

Rochester, Minn.—There were 17 bids opened on the 22d ult. for enlarging the electric light plant. The National Electric Company of St. Paul got the contract at \$7,796.

San Francisco.—The supervisors have adopted the plan of the Merchants' Association for lighting the city by districts, but they have also adopted a resolution

prohibiting the erection of additional poles to carry electric light wires. This latter resolution effectually debars competition with the Consolidated Gas & Electric Company, which now has the contract for street lights. Representatives of the Mutual Electric Company appeared before the supervisors and offered to light the streets for \$40,000 a year less than the present cost, provided it were allowed to erect poles in the outside districts.

Stockton, N. J.—The Stockton Electric Light & Power Company have accepted the terms of the ordinance recently passed by the town council, permitting them to erect poles, wires, etc., for supplying the town with electric lights, and will shortly commence work on their new system.

St. Paul, Minn.—Plans for an electric lighting plant for this city have been prepared by Building Inspector Hass at the request of a special committee from the city council. The plant, complete, will cost \$200,000. The building will be 42 x 113 and will contain dynamo and boiler rooms, together with quarters for the superintendent and electrician. There will be six 100-horsepower engines, each capable of producing 100 arc lights of 2,000 candle power. The committee is authorized to advertise for bids for the construction of the plant.

Yale, Mich.—The proposition to bond this village for \$20,000 to put in waterworks and an electric light plant was carried by a good majority at the special election held here on the 20th ult.

MANUFACTURING, ETC.

Allegheny, Pa.—Sealed proposals will be received at the office of the city comptroller until Monday, May 9, 1898, at 12 noon, for furnishing the city of Allegheny with underground cables and accessories for the fire and police telegraph systems. Specifications can be had on application at the office of the superintendent of the Bureau of Electricity. A bond to the amount of \$10,000 must accompany each proposal. The Committee on Public Safety reserves the right to accept or reject any or all bids.

Columbus, O.—Senator Miller has introduced a bill looking to a practical test of electricity as motive power for canal boats. It authorizes the State Board of Public Works to grant a permit to any company to make the experiment upon the Miami & Erie Canal by the erection of poles, wires or other apparatus for the propulsion of its boats. If any other company or person wishes to send boats over the canal by electric power the company having the electric power apparatus shall be able to furnish the power asked for, charging therefor a proper fee. The Toledo "Blade" says it is understood that if this bill passes there is a company that is ready to at once put into operation a line of electric canal boats on the northern end of the Miami & Erie.

Detroit, Mich.—The Ideal Manufacturing Company and the Electric Gas Stove Company have combined and the amalgamated companies will be known as the Ideal Manufacturing Company. The capital stock of the new company is \$250,000. In addition to the lines formerly manufactured by the Ideal Company, the new concern will make electric gas heating stoves, ranges, broilers, gas grates, etc. The officers of the new company are: President, James N. Wright; vice-president, Hiram T. Bush; secretary, Frank T. Dwyer; treasurer, John H. Bissell.

New York.—Elmer P. Morris, 15 Cortlandt street, is said to have received an order for designs for some expensive machines for a large electrical manufacturing plant that has been recently established in Johannesburg, South Africa. These are wanted as samples for future orders.

Rochester, N. Y.—The Federal authorities have placed an order for 200 large searchlight mirrors with the Bausch & Lomb Optical Company of this city, and that company is working night and day to fill the order. The war has had the effect of bringing to notice the fact that lenses sufficiently strong for searchlights could be made in this country. All the vessels and forts of the United States are equipped with searchlights, but the equipment was not sufficient for war.

TRANSMISSION PLANTS.

Oneida, N. Y.—Judson W. Warner has secured control of the water privilege and the old Kent mill near Wampsville, and holds a franchise for a transmission line from that point to Oneida. He intends to develop the water power, erect an electric generating plant and transmit power to Oneida and other places. It is expected that the new plant will be in operation in the early autumn.

Winston, N. C.—The power of the Yadkin river is now being transmitted by electricity to Winston-Salem. It is the only enterprise of the kind in North Carolina. The plants now being operated by this power include Fries' woolen, cotton and flouring mills. The South-side cotton factory, the street railway and electric light plant and Fogle Bros. planing mills will be connected immediately. The development of this enterprise was inaugurated last year by the Fries Manufacturing & Power Company of Salem. The mechanical plans were prepared by Charles R. Makepeace & Co., of Providence, R. I., and the electrical plans by Lewis & Clafflin, of the same place. The present development represents 1,000 horse-power, but the buildings have capacity for another line of eight turbine wheels and another generator of sufficient capacity to utilize the entire water-flow at this point of the river. The electricity is generated and transmitted at 10,000 volts.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—Governor Black has signed the bill of Assemblyman Hoes to incorporate the Jansen-Kill Electric Power Company of Hudson. This company proposes to build and operate a number of dams and reservoirs in Dutchess and Columbia counties for developing and furnishing electric and hydraulic power for manufacturing and other purposes, and transmitting such power to a distance by electricity and other means to Hudson and other places. The incorporators named are: William A. Harder, Jr., Philip M. Harder, and Charles N. Harder. The capital stock of the corporation is placed at \$100,000.

Mechanicville, N. Y.—The Hudson River Power Transmission Company is now placing the dynamos at the new dam. The contracting company expected to start in on a large contract at Augusta, Ga., when they had finished here, but news has been received to the effect that operations will not be begun there until the war troubles are over.

Schenectady, N. Y.—The superintendent of the lighting department of the General Electric Company, S. Dana Greene, is a lieutenant of the New York Naval Reserve, and as such received orders to report at the Naval Reserve ship New Hampshire, at the Brooklyn Navy Yard, for assignment to active duty. Lieutenant Greene, who responded at once, has been assigned to duty on the Yankee as executive officer of the ship, being second in command. The crew of the Yankee consists of 87 men.—William Davis, who is suspected of being connected with the murder of Mr. Blodgett, counsel of the General Electric Company, has escaped from the Washington County jail.

Waterford, N. Y.—The Highway Commissioners have granted the application of the Stillwater and Mechanicville Railway Company for the privilege of laying tracks on the highway. The privilege was granted on condition that the company pay \$2,500 for widening the road. The commissioners granted the request of the railway company to lay T rails part of the distance.

PERSONAL AND MISCELLANEA.

C. V. Boughton, of Buffalo, N. Y., the inventor of the telephotos, was called to Washington a few days ago by the War Department, and after a conference with the officials an order was given him for sets of the telephotos to be erected at the fortifications at New York, Boston, Fortress Monroe, Key West and San Francisco. It is the plan of the War Department to place at each of the fortifications on the coast a set of the telephotos, so that news, instructions and general communications can be transmitted by night as well as by day between the army fortifications, which will be in telegraphic connection with Washington, and the fleets or vessels of the navy which may be under the guns of the forts, or in the adjacent waters.

James E. Morris, a young inventor of promise, died at his home in Chester, Pa., on the night of the 22d ult. Mr. Morris was the inventor of several electrical devices, among them the incandescent arc lamp bearing his name, which a company was recently organized to manufacture.

Miss Sylvia Bidwell, daughter of Benson Bidwell, the electrical inventor, is at the head of a theatrical company now performing in the West. Mr. Bidwell is at present a resident of Chicago, and is patiently awaiting the decision in a long pending suit to determine his claim to the patent covering the electric trolley poles now in general use.

Hon. Frank S. Stevens, of Fall River, Mass., who died at Swansea, Mass., on the 27th ult., was one of the most prominent business citizens of Fall River, and also socially one of the most popular. He was a director in many large enterprises, mills, print works, etc., and was deeply interested in the development of electrical industries, being at the time of his death president of the Fall River Electric Light Company and director of the Dartmouth and Westport electric road, the Union Street Railway of New Bedford, and the Globe Street Railway. The Fall River "Globe" says of him: "Perhaps there is no man whose demise would leave a wider breach in business and social circles in Fall River, and to Swansea the loss will be an irreparable one."

President George A. Fowler, of the Fowler Packing Company, Kansas City, Kan., has offered the State University \$18,000 to construct an entirely new electrical engineering building if the regents of the university agree to provide \$20,000 for new machinery and equipments. The Topeka "Capital" in announcing the generous offer of Mr. Fowler says: "It has evidently not escaped the notice of this successful business man that the University of Kansas is making notable strides to the front of American colleges in its electrical department. Under the direction of Prof. Blake the electrical work of the university has stood second to none perhaps in the United States, and certainly none in the West. It has attracted the notice of the most eminent electricians in other countries as well as our own, and has received distinguished recognition from the National Government."

A special to the Pittsburg "Dispatch" from Butler, Pa., states that the electric machine invented by Frank Flannegan, of Washington, D. C., has successfully been tested in three oil wells at Bruin. The machine boils out the paraffin in old wells that have been clogged and makes them produce all the oil that is in them. The first trial was made at Bruin on three old wells that were producing about one barrel each per day, and one of them

less than that amount. They were all subjected to an intense heat for several hours, with the result that the flow of oil was increased from three to five fold.

COMMERCIAL PARAGRAPHS.

Lubrication of Gas Engine Cylinders.

The proper lubrication of gas engine cylinders has been a very difficult problem. The problem, however, seems to have been very successfully solved by an official of the Pennsylvania Railroad Co. He writes as follows:

"I had a gas engine at Sharon, Pa., running a pump, and the man that had charge of it allowed the lubricator to run dry and cut the piston, piston rings and cylinder. The makers of the gas engine said the cylinder would have to be sent to the shop and bored out and a new piston put in. It was our busy season and we could not do without water. I had some of Dixon's finely pulverized graphite, and I commenced to feed it into the cylinder through the suction pipe with the air and gas with immediate relief. After about two weeks the engine was running smoothly and using less gas than ever before.

"I had this same engine apart last Saturday, and every place that was cut is smooth as glass. This one instance saved us about \$75.00. I have great faith in this graphite and always keep it on hand."

Educate Your Bowels With Cascarets.
Candy Cathartic, cure constipation forever.
10c, 25c. If C. C. C. fail, druggists refund money.

Don't Tobacco Spit and Smoke Your Life Away.

To quit tobacco easily and forever, be magnetic, full of life, nerve and vigor, take No-To-Bac, the wonder-worker, that makes weak men strong. All druggists, 50c or \$1. Cure guaranteed. Booklet and sample free. Address Sterling Remedy Co., Chicago or New York.

Warning to the Trade—Look out for the Label.

Irresponsible parties are offering a lamp to the trade labeled "Warren." We suggest the name "Cuckoo" as a better name as the bird of that name shows the same characteristics as the parties behind this lamp. See that you get what you order. Our lamps are all labeled as follows:

THE WARREN ELECTRIC & SPECIALTY CO.,
Warren, Ohio.

Sixteen Good Reasons.

The Ward Leonard Electric Company are publishing the following sixteen reasons why their Circuit Breaker is the best one:

1. It is the surest to open on overload current, having two independent switches held by independent latches either of which will open the circuit with a double carbon break.
2. It is impossible to close the circuit breaker when an overload condition exists on the circuit. The two sides being closed independently, the switch first closed always automatically opens the circuit if the first switch be closed upon overload or short circuit.
3. No auxiliary knife switch is required in series with this circuit breaker in order that the operator may safely close the circuit breaker without the risk of being burnt.
4. There is no chance of either switch sticking or failing to open because, as soon as the latches are released the switch parts receive a strong hammer blow while the springs are tending to push the switches open. This entirely overcomes the friction of rest under the worst conditions conceivable.
5. There is no chance of the plunger "fleeting" as is met with in the case of the open coil types. With our Iron Clad Solenoid Magnet the magnet pull when the plunger engages the latches is much stronger than in other types. The magnetic section alone, without any hammer blow of plunger on latches, will release the latches in our circuit breaker with much less than the minimum current at which it is rated.
6. The friction of the latch is "rolling friction" instead of the "sliding friction" met with in all other circuit breakers. Our 2,000 ampere circuit breakers can be readily tripped by hand with a light pressure.
7. These circuit breakers require no auxiliary levers to close them even in the largest sizes. The division of the work of closing into two parts, and the perfect smoothness of the switch contact, make it readily possible for any operator to close the largest circuit breakers without effort.
8. There is no chance whatever of the operator or other person being hit by the circuit breaker when it opens, as the circuit breaker is so designed that it does not extend outward from the switchboard any further when open than it does when closed. The maximum distance it extends from the switchboard is about one-half of the distance taken by other makes.
9. The switch contact of this circuit breaker is the most perfect ever produced in any kind of switch. Under all conditions there is perfect flexible contact between surfaces absolutely parallel. There is no "wedge action" as in all "knife-blade" types of switches. The perfection and reliability of contact is unequalled by any other switch. It

is impossible for one blade to in any way affect the contact of any other blade.

10. We allow 50 amperes per square inch of switch contact surface in rating the switches. But because of the perfection of contact in our form of switch 75 amperes per square inch causes no more heating than 50 amperes per square inch in the switch of "knife-blade" type.

11. All parts of these circuit breakers are made to gauge by the highest class of special tools and are absolutely interchangeable. A new part can be put into the circuit breaker by any user. No possible accident will make it necessary to return the circuit breaker to the maker.

12. The switch blades are not "sweated in" as usual, but can be removed by loosening one nut. In the worst possible case of burning of the switch, new switch blades can be sent by mail and inserted in place of the old ones in five minutes after receipt.

13. The circuit breaker can be readily tripped by hand at any time with the greatest ease and with perfect safety.

14. This circuit breaker occupies less room on the switchboard than any other of comparable capacity.

15. The circuit breaker is finished throughout in polished copper and is the handsomest circuit breaker made both as regards design and finish.

16. Last, but not least, this circuit breaker can be manufactured much cheaper than any other, and hence you can buy it for much less money than any other circuit breaker you would consider in competition with it.

To Cure Constipation Forever.

Take Cascarets Candy Cathartic. 10c or 25c.
If C. C. C. fail to cure, druggists refund money.

No-To-Bac for Fifty Cents.

Guaranteed tobacco habit cure, makes weak men strong, blood pure. 50c, \$1. All druggists.

Removals.

The Stanley Electric Manufacturing Company have removed their New York offices from 39 Cortlandt street to the Empire Building, corner Broadway and Rector street, where they have found quarters much more commodious and better adapted to the conditions of their growing business. The new offices are on the tenth floor at the Broadway corner of the building, are very light and pleasant and easily and quickly reached by means of well-managed elevators.

Edward P. Thompson, Solicitor of Patents, has removed his New York office to 81 Fulton street, corner of Gold, where he will be in the same suite as his associate legal counsel, Alfred C. Coursen. As formerly, Mr. Thompson's specialty will be Solicitor of Patents and Consulting Electrical Engineer. Being in the same suite with Mr. Coursen, the business of patent suits will be greatly facilitated. Professor Anthony continues to act for the firm as associate technical counsel.

The firm of Dickerson & Brown removed on May 1 to the Washington Building, 141 Broadway, New York.

Geo. W. Patterson, in a note dated Chicago, April 27, reports that on or about May 1 the two companies he represents—the American Circular Loom Flexible Conduit and the Gordon, Law and Phoenix Batteries—would remove from 1,114 to 1,539 Marquette Building Chicago, and he invites all old friends and customers to come up and have a birdseye view of the city. "The conduit business," he says, "was never so good before, and is increasing, while the merits and especially low prices of the Phoenix batteries are beginning to be recognized in a very flattering manner."

The Packard Mogul Lamp continues to stand alone in the field as the largest successful incandescent lamp. The trade has settled down quite generally to the 300 candle-power size and this is now being used very extensively for lighting where large units are required. It is an interesting fact that a large number of the first Mogul lamps that were made a great many years ago are still burning and giving good service.

Everybody Says So.

Cascarets Candy Cathartic, the most wonderful medical discovery of the age, pleasant and refreshing to the taste, act gently and positively on kidneys, liver and bowels, cleansing the entire system, dispel colds, cure headache, fever, habitual constipation and biliousness. Please buy and try a box of C. C. C. to-day; 10, 25, 50 cents. Sold and guaranteed to cure by all druggists.

WANTED FOR THE UNITED STATES NAVY.

Qualified men for the ratings of ELECTRICIAN. Applicants must be capable of performing all duties pertaining to the care, preservation, and manipulation of a ship's electric lighting plant and its appurtenances, together with all other electrical appliances; they must also be physically qualified. First enlistment is made in the rating of Electrician, second class, (\$35 per month,) with possibility of future advancement to Electrician, first class, (\$40 per month,) and Chief Electrician, (\$50 per month). In addition to the pay stated, there is a ration allowance of 80 cents per day. Enlistments in this rating are made only at the Navy Yards, Brooklyn, N. Y.; Boston, Mass., and Mare Island, Cal.

INCORPORATIONS.

The Old Hickory Electric & Construction Company, St. Louis, Mo. Capital stock, \$50,000, of which one half is paid. Incorporators: Frank F. Sopp, Hiram Cole, J. C. Terry, F. M. Estes and J. H. Roberson.

The Biloxi Street Railway Company, Biloxi, Miss. Capital stock, \$7,500, with the privilege of increasing it not to exceed \$30,000.

The Chicago, Hammond & Western Railroad Company has certified to a consolidation of organization with the Chicago & Indiana Street Railway Company under the name of the Chicago Junction Railway Company. Capital stock, \$2,200,000.

The Maryland Traction Company, Baltimore—to own, maintain and operate any part or all of the railway property and franchises formerly owned and operated by the Columbia & Maryland Railway. Capital stock, \$700,000. Directors: Thomas J. Hayward, Henry A. Parr, Robert S. Carwell, William H. Boehler and Edward P. Hill, of Baltimore.

The Emmitsburg Railroad Company of Frederick County, Emmitsburg, Md. Capital stock, \$50,000. Directors: James A. Elder, John P. Branner, William A. Hines, William G. Blair, Vincent Sebold and James H. Muscan, of Wilmington, Del.

The Brownwood Ice & Light Company, Brownwood, Tex.—to supply light, electric motive power and to manufacture ice. Capital stock, \$30,000. Incorporators: Brooke Smith, John G. Lee and J. W. Shepard.

The Vicksburg Railroad, Power & Manufacturing Company, Vicksburg, Miss. Capital stock, \$250,000. Incorporators: Percival Steele, J. C. Shaffer, J. C. Roberts, R. L. Roberts, Thomas H. Owens, D. R. Lamont, Murray F. Smith and M. J. Mulvihill.

The Sturgis Motor Vehicle Company, Los Angeles, Cal.—to manufacture motors and control motor power. Capital stock, \$1,000,000, of which \$250,000 is subscribed. Directors: Alfred Solano, S. D. Sturgis, W. W. Sturgis, J. W. A. Off and Charles H. McFarland, all of Los Angeles.

The Magnetic Electric Light & Power Company has filed its charter in the Registrar's office at Memphis, Tenn. The capital stock is \$10,000,000, which is divided into 100,000 shares of \$100 each. The company will engage in the making and supplying of light and power by electricity produced by magnet. It will also do any and all business pertaining to electric light and power. Incorporators: M. E. Carter, F. W. Brode, B. M. Stratton, W. O. Bridges and H. F. Robinson.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED APRIL 26, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 602,923. Trolley. James E. Wells, Syracuse, N. Y. Filed May 1, 1897.
603,060. Electric Railway. Charles F. Holtmann and Charles Bergmann, Pittsburg, Pa. Filed Aug. 3, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 603,922. Electric Arc Lamp. Elihu Thomson, Swampscott, Mass., assignor to the General Electric Company of New York. Filed Nov. 4, 1897.
602,933. Electric Luminous Alphabet and Board for Same. Daniel M. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed Dec. 17, 1895.
603,046. Incandescent Electric Lamp. Mark W. Dewey, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed July 22, 1891.
603,112. Electric Lamp. David Misell, New York City, assignor, by mesne assignments, to the American Electrical Novelty & Manufacturing Company of New York. Filed Oct. 9, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 602,895. Electrical Selector. Louis W. Crofoot and Frank E. Granger, Aberdeen, S. D. Filed Sept. 14, 1897.
602,920. 602,921. Alternating-Current Induction-Motor. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Feb. 12, 1897.
602,925. System of Electric Metering. Herbert C. Wirt, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Dec. 31, 1897.
602,968. Distribution of Electric Currents. Elihu Thomson, Lynn, Mass., assignor to the Thomson-Houston Electric Company of Connecticut. Filed Dec. 6, 1896. Renewed Feb. 26, 1898.
603,027. Rheostat. Roscoe W. Ney, New Rochelle, N. Y., assignor to the Zucker & Levett & Loeb Company of New York. Filed Feb. 5, 1897.
603,041. Electrostatic Generating Machine. Adrian H. Hoyt, Penacook, N. H. Filed Aug. 9, 1897.
603,061. Device for Turning Off Commutators of Dynamos or Motors. William H. Jordan, Brooklyn, N. Y. Filed Jan. 28, 1897.
603,063. Rheostat. Harry W. Leonard, East Orange, N. J. Filed July 28, 1896.

MISCELLANEOUS.

- 602,872. Process of Producing Chemical Compounds by Electrolysis. Joseph W. Richards and Charles W. Roepner, Bethlehem, Pa. Filed July 6, 1897.
602,873. Process of Electrolytically Manufacturing Metallic Sulphide. Joseph W. Richards and Charles W. Roepner, Bethlehem, Pa. Filed July 6, 1897.
603,042. Hinge Connection for Electrical Measuring Instruments. Adrian H. Hoyt, Penacook, N. H. Filed Nov. 1, 1897.
603,058. Electrical Retort. Hillary Eldridge, Daniel J. Clark and Sylvain Blum, Galveston, Tex. Filed June 28, 1897.
603,060. Electric Cable. Nathaniel G. Warth, Indianapolis, Ind. Filed Oct. 25, 1897.
603,184. Electropneumatic Piano-Player. Fred R. Goolman, Los Angeles, Cal., assignor of three-fourths to John Weber and John N. Goolman, same place. Filed May 5, 1897.
603,198. Electrically-Propelled Vehicle. Henry G. Morris and Pedro G. Salom, Philadelphia, Pa. Filed Sept. 29, 1896.

TELEPHONE AND TELEGRAPH.

A telephone war is on in Monroe, La. The Cumberland Telephone & Telegraph Company have fired the first shot by making a tremendous cut in the rates of residence telephones and giving all ministers' phones free of charge. They have started a war of extermination with the Monroe Telephone Company as the enemy, and it promises to be a long and hard fought battle, as the directors of the home company have determined to make a valiant stand. When asked by a N. O. Picayune correspondent what position his company would take under the circumstances, President W. B. Reilly of the Monroe Telephone Company said: "Why the same stand we have now—good service and business methods. No, we won't pay any more attention to them than if they didn't exist. They can't take our customers from us and they are simply cutting their own throats. The main reason why such a reduction was made, I presume, was from the fact of our intention of declaring a 25 per cent. dividend to our stockholders. The dividend will be in the shape of a reduction in rates, and if we do as well next year as we have in the past we will further reduce the rate. We are here to stay and mean to give our customers the benefit of the best service in the country."

The New Orleans Times-Democrat of April 22 says: "W. L. Holmes, president of the Detroit Telephone Company, president of the Michigan New State Telephone Company and president of the Detroit Switchboard and Telephone Construction Company, left for his home in Detroit, Mich., last night, after having spent two days in this city conferring with the officers and promoters of the People's Telephone Company. Mr. Holmes, in the capacity of president of the Construction Company, is the man who will from this time back up the New Orleans scheme. President W. L. Curtis, of the People's Company, who has been looking over the situation with Mr. Holmes, said last night that there was an apparent disposition on the part of the public in New Orleans to want to wait and subscribe after the plant has been put into operation. This he considers an entirely wrong spirit, because the Detroit capitalists do not care to come here and invest until the subscriptions will warrant the venture. He says the People's Telephone Company in New Orleans is left entirely with the public. It is for them to say whether or not they will have the new service."

The telephone investigation going on in Washington has brought out some facts in regard to the local Bell company's affairs that are not calculated to render it less objectionable to its disgruntled patrons. In its comments on a hearing before the committee, the Star thus refers to some of the testimony given: "The most important disclosure of the morning session was the admission extracted from the expert that he had found items that should have been charged to the construction account tucked away in the maintenance account. It is notorious that the tendency of this company as of all semi-public corporations with large earnings is to swell to the largest possible point the total of the sums expended for maintaining the service, in order to reduce the ratio of apparent profits. All sums expended in construction are not properly to be thus accounted for, inasmuch as they represent permanent betterments, making for increased earnings in the future."

The city council of Chattanooga, Tenn., has two telephone franchises on its hands for consideration. J. A. Henlin, of New York, represents one of the companies asking for a franchise, and E. W. Coleman the other. The Chattanooga Times says: "There is little likelihood of the adoption of the ordinances in their present form, but a number of the aldermen charge that the telephone rates of the East Tennessee Telephone Company are too high, and it is within the bounds of possibility that one of the ordinances will be adopted in the near future, granting a new telephone franchise."

There seems to be little likelihood of any opposition to the Bell Company in Buffalo for some time, as the petitions of the Western New York Telephone Company and the Buffalo Telephone Company for franchises have been filed away in the slumbering boxes of the Aldermanic Committee, which, as one of the committee acknowledged, is equivalent to a denial. There will be an effort made before the Board of Aldermen on May 9 to have the petitions resuscitated.

The Syracuse Herald states that things are nearly in readiness for opening the Oneida Telephone Company's automatic exchange in Oneida, N. Y. The Oneida Company has had to encounter the hostility of the local Bell company, exerted in every possible way, but has succeeded in getting a footing and starts out with a fair list of subscribers.

The Automatic Telephone Service Company, which has applied for a franchise in Rochester, N. Y., was permitted

to use the council chamber to display its apparatus and show the actual operation of the system. The exhibition made a good impression upon the aldermen and officials and there is every probability that the franchise will be granted. The company promises to supply efficient service at about half the rates charged by the Bell Telephone Company.

At Shelbyville, Ind., a few days ago, the Bell Telephone Company gave notice that after May 1 there would be no rental charged for their telephones. At Wabash, the Bell Telephone Company has established free service between Goshen and Elkhart. The moves at both places are to head off new competing companies.

The stockholders of the Jacksonville (Fla.) Telephone Company, at a meeting on the 22d ult., elected the following officers and directors: President and general manager, W. N. Shine; vice-president, George P. Glenn; directors: W. N. Shine, George P. Glenn, John C. L'Engle, W. M. Bostwick, Jr., C. S. Adams and A. H. King.

The Bell telephone instrument statement for the month ended April 20 shows: Gross output, 29,754; returned, 13,139; net output, 16,125. In the same month in 1897 the gross output was 20,428; returned, 7,245; net output, 13,181. The total outstanding on April 20 last was 977,345; at the same date in 1897 the total outstanding was 819,428.

Durand, Mich., is to have a telephone exchange, the council having granted a franchise to a resident of the village for that purpose. The exchange will be in operation by August 1, and the rates will be \$20 per year for business houses and \$15 for residences.

The Bell Company and the American Long Distance Telephone Company are rapidly extending their lines throughout North Alabama. The latter company proposes to connect every town in that section of the State.

The Delaware County Telephone Company, Chester, Pa., proposes to increase its capital stock from \$25,000 to \$75,000, and has decided to extend its lines until the circuit includes all the boroughs and important towns in the county.

The Minnesota Central Telephone Company has accepted the ordinance granted by the city council of St. Paul, and has filed a \$5,000 bond with the city clerk.

The Home Telephone Company of Sioux City, Ia., is arranging to extend its lines from Merville to Pierson, Correctionville, Waukegan, Rock Branch, Lucky Valley, Anthon, Ote and Smithland.

The Nebraska Telephone Company will open an exchange in Schuyler, Neb. It is said that E. Long will have charge of the exchange.

The Columbia Telephone Company has been granted a franchise to erect its poles and wires and conduct telephone business in the borough of Mount Joy, Pa.

The New State Telephone Company will probably establish an exchange in Carson City, Mich.

New Companies Incorporated.

The Prineville Telephone Company, Prineville, Ore. Capital stock, \$500. Incorporators: T. M. Baldwin and William Wurzwiler.

The following charters have been filed with the Secretary of State at Jackson, Miss.: Vicksburg & Yazoo City Telephone Company; Vaiden Telephone Company, capital stock, \$1,000; Holmes County Telephone Company, Lexington, capital stock, \$500.

The Northwest Telegraph & Telephone Company, Huntington, Ore. Capital stock, \$3,000. Incorporators: J. H. Aitken, B. L. Stayner and J. Millis.

The Montour & Columbia Telephone Company, Bloomsburg, Pa.—to maintain and lease lines of telegraph and telephone. Incorporators: C. P. Hancock, J. H. McDewitt, F. C. Angle, E. C. Corman, W. W. Ryan, J. P. Helfenstein and H. E. Murry.

The Madison Telephone Company, Belleville, Ill. Capital stock, \$20,000. Incorporators: W. H. Johnson, B. L. Behr, E. W. Lazell and J. Wright.

The Telephone Receiver Company, Detroit, Mich. Capital stock, \$5,000.

The Waverly Telephone Company, Waverly, Ill. Capital stock, \$1,400. Incorporators: J. E. Hutchinson, L. D. Foreman and G. E. Pearl.

The Almyra Telephone Company, Almyra, N. C. Capital stock, \$5,000. Incorporators: Will A. Wynne, W. W. Wynne and N. E. Edgerton.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Abbreviations: crt. indb., certificate of indebtedness; coll., collateral; cons., consolidated; const., construction; conv., convertible; com., common; deb., debentures; extn., extension; gen., general; g., gold; guar., guaranteed; inc., income; imp., improvement; pd., paid; pfd., preferred; mtg., mortgage; tr., trust; A., annually; S., semi-annually; Q., quarterly; A. & O., Apl. and Oct.; F. & A., Feb. and Aug.; M. & S., May and Sept.; J. & D., July and Dec.; J. & J., Jan. and June.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Company and City & Suburban Railway Company. Company controls Ottumwa Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikeville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 b Leased to Eastern Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h \$50 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$625,100 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 j 85 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

- * Unlisted. † Full paid. ‡ Outstanding. § Ex div.
- a Leased to New Orleans Traction Company at 6 % on stock.
- b Leased to New Orleans Traction Company at 8 % on stock.
- c Leased to Central Cross-town Railroad at 8 % on stock and interest on bonds.
- d Operating the former Met. Trac. system, that corporation having become extinct.
- e Leased to 28th Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
- f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway.
- g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %
- h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
- i Leased to Metropolitan Street Railway for 18 % on stock.
- j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter
- k Leased to Metropolitan Street Railway for \$145,000 per annum.
- l Leased to Metropolitan Street Railway for 18 percent. on capital stock.
- m Controlled by Third Avenue Railroad by purchase.
- n Dividends of 1½ % yearly guaranteed by Consolidated Traction Company.
- o Controls by lease the Alleg'y, Cent., Citizens, Duquesne, Fort Pitt and Pitt's Trac. Co
- p Leased to Consolidated Traction Company for 8 % per annum on par value of stock.
- q Leased to Fort Pitt Traction Company for 5 % on \$3,000,000 capital stock.
- r Leased to Consolidated Traction Company for 4 % on capital stock after October,
- s Leased to Consolidated Traction Company for 7 % on capital stock after October,

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 12½c.; casting, 11½c.

The West Chicago Street Railway Company has declared a quarterly dividend of 1½ per cent., payable May 16.

The New Orleans Traction Company provided no funds to meet the coupons due May 1 on the \$1,500,000 of collateral trust notes.

The American District Telegraph Company of Philadelphia announces a quarterly dividend of 1 per cent., payable May 14.

The Bell Telephone Company of Philadelphia will meet on June 22 to vote on the question of increasing the capitalization from \$2,000,000 to \$4,000,000.

The Massachusetts Senate has definitely rejected the bill permitting cities and towns to own and operate electric lighting plants for public buildings and parks.

After a hearing on the 28th ult., in the suit of Patrick H. Flynn as a stockholder of the Coney Island & Brooklyn Railroad Company to enjoin the making of a \$1,500,000 mortgage, Justice Johnson reserved his decision.

The fact that stock quotations are seldom based on intrinsic values was never more plainly evident than in the upward jump of several points in the list on Tuesday on the announcement of Dewey's victory at Manila.

The Boston Gas & Electric Light Commissioners have approved an issue of \$110,000 stock and \$175,000 bonds by the Woburn Light, Heat & Power Company; \$85,000 of the bond issue will be used to take up outstanding bonds, the balance of the issue to be used for new construction and equipment.

The Massachusetts Railroad Commissioners have approved the issue of capital stock amounting to \$80,000, and first mortgage bonds to the same amount, by the Norton & Taunton Street Railway Company, the proceeds to be devoted to building the road and the establishment of an electric power plant.

The Philadelphia "Times" of April 27 says: "Frankford & Southwark Passenger Railway stock—par \$50—sold yesterday at \$400, the highest recorded price. The stock now pays \$14 a year. Beginning July 1 next the rate will be \$14.50. After that the amount will increase one dollar each year until it has reached \$18 in 1903, at which it will remain.

A syndicate headed by A. G. Danforth & Sons of Peoria, Ill., it is stated has secured control of the Decatur gas plant, including all the property, franchises and plant of the Decatur Light, Heat & Power Company, and also the Decatur Electric Company. The deeds were made out to Paul M. Bussy of Washington, Ill., who will hold the property in trust until the purchase is completed.

A notice of a mortgage by the Central Union Telephone Company to the Illinois Trust & Savings Bank Company was filed in the Recorder's office at Cleveland, O., on the 28th ult. The mortgage is to cover an issue of bonds aggregating \$1,600,000, on a permitted issue of \$3,000,000. As the company is believed to have no property in Cuyahoga County some surprise was expressed that the paper was filed in Cleveland.

A mortgage securing an authorized issue of \$1,000,000 of bonds against the property of the Cicero & Harlem Street Railroad (Chicago) will run to the Equitable Trust Company of Chicago as trustee. The bonds will bear 5 per cent. interest, running from April 1, 1898. The interest payments will be made semi-annually, on April 1 and October 1. The bonds will mature in forty years.

Directors W. W. Kurtz, William Jay Turner and R. H. Rushton of the Citizens' Street Railway Company of Indianapolis say: "Referring to circular issued by Alfred C. Harrison and others, under date of April 19, 1898, respecting election of directors of the Citizens' Street Railway Company of Indianapolis, we desire to state that our names have been used in said circular without our knowledge or consent. Further, we beg to say that we are not candidates for election as directors of said company, nor shall we serve if elected."

The directors of the Erie Telegraph & Telephone Company at their meeting at Boston on Friday last declared dividend No. 58 of 1 per cent., payable May 16 to stock of record May 7. The stock books will be closed at noon May 7 and opened on Monday, May 16. On account of advancing years Mr. Levi Sprague resigned as president of the company. Mr. Charles J. Glidden, vice-president, was elected president. Mr. Sprague will continue as a member of the board of directors.

A Boston syndicate, of which Messrs. Tucker, Anthony & Co. are the leading spirits, has purchased the Manchester (N. H.) Street Railway, which is capitalized for \$170,000 stock and \$250,000 bonds. Messrs. Tucker, Anthony & Co. also own the Manchester Electric Company, which does a gross business of \$125,000 a year and furnishes electric power to the street railway company. Mr. Saltonstall is president of the electric company and W. A. Tucker treasurer. It is not proposed to consolidate the companies.

The Fort Wayne & Belle Isle Railway Company of Detroit, having been succeeded by the Detroit, Fort Wayne & Belle Isle Railway Company, the new corporation has filed a mortgage for \$1,200,000 to secure 5 per cent. gold bonds due in April, 1927. The new loan will be used in part to refund the \$345,000 of old first mortgage bonds, which have been subject to call at par since October 1, 1897, and in part to meet the cost to the present owners of acquiring the property.

In a recent inquiry into affairs of the Terre Haute Street Railway & Electric Light Company, it was stated that \$500,000 or \$600,000 worth of bonds had been sold, increasing the debt by that amount, but of which there was no entry in the cash books. A committee was appointed, of which Edward Brown of the First National Bank of Chicago is chairman, to proceed with the investigation.

The Brooklyn Heights Railroad Company (Brooklyn, N. Y.) has made a contract with the Brighton Beach Racing Association, under which a complete change will be made in the operation and equipment of the Sea View Elevated Railroad Company. The scheme of the Heights Company to operate the Sea View road as an independent elevated system will be abandoned and the road will be run by electricity. An incline plane will be built east of the Boulevard on property controlled by the Racing Association, and on this portion the trolley cars will run on grade to the terminal at Brighton Beach. The change will be made by June 15. It is intended ultimately to put the entire Sea View road on grade. The Heights Co. contemplates extensive improvements on its Sea Beach route. The Coney Island terminal is in the Sea Beach Palace and a system of loops will be introduced.

A new traction consolidation which includes all the West End lines at Pittsburg, Pa., has been effected, as we learn from the Allegheny "Record." The new company will bear the name of the West End Traction Company and will include the Pittsburg & West End Passenger Railway, capital \$1,500,000 and \$450,000 bonds, with 16 miles of track; Pittsburg, Crafton & Mansfield Passenger Railway Company, capital \$500,000 and \$250,000 bonds; Pittsburg, Neville & Corapolis Passenger Railway Company, capital \$100,000 and \$100,000 bonds; Carnegie & Heidelberg Passenger Railway Company and the Pittsburg & Mt. Washington Railway Company. Improvements costing about \$250,000 will be started at once to extend the lines, bring the system to perfection, to secure better service and make the operation more economical. The capital stock of the new company will be \$5,000,000, half of common and half of preferred stock. The officers are: President, John C. Reilly; secretary, W. V. Callery; treasurer, William J. Burns; directors: James D. Callery, W. V. Callery, Thomas S. Bigelow, John C. Reilly and William J. Burns.

EDITORIAL NOTES.

General Opinion Regarding Sixth Annual Report.

The Sixth Annual Report of the General Electric Company, which appeared last week, is generally looked upon as a great disappointment. The glowing newspaper reports which this company has constantly had published, tending to show its prosperity, and leading the stockholders to believe that an early settlement of back dividends would shortly be effected, has made the truth as set forth in its last annual report all the harder for the keyed-up stockholders to bear. Even the papers that have all along supported the General Electric Company in its, to say the least peculiar, policy are beginning to get their eyes open and are apparently gradually coming to look at the affairs of the company from the standpoint of **ELECTRICITY**. Referring to the Sixth Annual Report, our contemporary the *Electrical Engineer* says:

"We print elsewhere a full abstract of the General Electric Company's report covering the year 1897. The striking feature of this report as compared with that of the previous year is the fact that the gross earnings were less by nearly \$300,000 than those of the year previous, while the expenses were increased by more than \$500,000. This showing is strong evidence of the fact that while the company may have been comparatively busy, the prices obtained must have been low."

For once we heartily agree with our contemporary. There is not the slightest doubt but what the prices obtained must have been low, very low indeed—in fact in some cases amounting almost to a minus quantity. This we have claimed all along. Why attempt to make a fair profit on electrical apparatus when a much greater return can more easily be made by the manufacture of stock!

With a view of giving our readers an idea of what some of the financial papers think of the General Electric Company's Sixth Annual Report, we publish the following from the *Boston News Bureau*, which is usually very friendly to the Schenectady concern:

"The annual report of the General Electric Company is a disappointment as showing a gross business of only \$12,500,000 for the largest electric machinery concern in the world. We figure that if the prices for electrical apparatus that were obtained as late as 1892, or the year following the consolidation and the formation of the present company, had prevailed last year, the gross business would have exceeded \$50,000,000.

"But a beggarly million a month for a \$50,000,000 concern, doing business all over the world, and spending \$100,000 a year for stenography and type-

writing alone, gives a shareholder the consolation only of certainty that the business of the General Electric Company is on bottom at last.

"It was figured when the consolidation was made that net earnings of \$5,500,000 were in sight for the General Electric Company, and that with control, through the patent situation, of the electric apparatus of the United States there would come the control in financing of all street railways, electric lighting and power plants in the country, and that the business of the General Electric Company would in a few years be measured by hundreds of millions and ultimately pass that of the Standard Oil.

"But the financial winds beat upon that ship and top sails were quickly blown away or folded in, while during the 1893 gale anchors, cables and sheets valued at \$12,000,000 were thrown overboard for \$4,000,000 in cash."

But what has occurred since? The *Bureau* says:

"The ship was saved by almost superhuman work and everything is now in good financial trim, but there is no longer thought of rivaling the great industrial concerns of the world, or even of controlling the electric field."

The methods then adopted by the General Electric Company were intended to destroy the prospects of the limited legitimate business that was being done in the electrical industry by underselling all the independent companies, if necessary at a loss, and thus if possible run them out of business, with a view to making a good showing in gross earnings. It has been, however, impossible to carry on a business at a loss, even in conjunction with the manufacture of stocks and bonds, and the true condition of affairs is now apparent. Notwithstanding the aid of manipulators in stocks, and the reckless efforts of importunate agents, the concern has been unable to pay any dividends, and is now in travail on the question of reducing its capital and reorganizing its whole financial system.

Elsewhere in this issue will be found an accurate account of the annual meeting of the stockholders of the General Electric Company, held in Schenectady on the 10th inst. As we all along predicted, nothing of any importance was accomplished, if we except a resolution which was passed to the effect that the interests of the company demanded an adjustment of the impairment of its capital, which means little or nothing. Probably the most important feature of the meeting was the acknowledgment by Mr. Coffin that the value of the patents and franchises, which is placed at \$8,000,000, was excessive and should be revised.

It would seem very much to us as if the "ship" the *Bureau* refers to was now scudding under bare poles in a gale of wind with a high sea running, all conditions pointing to disaster unless some way can be devised for marooning the captain.

Garbage Destructors. In an editorial which appeared in our issue of December 22, 1897, we described in a general way a number of garbage destructor plants now in operation in England. We were indebted for most of the information published at that time to Mr. A. E. Brooke Ridley of San Francisco, a practicing engineer, who had just returned from abroad after having made a careful examination of a large number of these plants. At that time we promised our readers a more detailed description of the leading destructor plants in Great Britain at no distant date. In this issue, therefore, appears an illustrated article by Mr. A. E. Brooke Ridley describing the three leading destructor plants in England, namely that of Shoreditch, Ealing and Oldham. The plant at Shoreditch, which has attracted considerable attention in this country owing to the fact of its being situated in a vestry of London, is run on quite an elaborate and extensive scale, the steam produced by the use of the refuse fuel being utilized to generate electricity for lighting purposes by the aid of what is known as the Halpin thermal storage system, which, as we described in our issue of August 25, consists of large iron cylinders in which water under pressure is heated to a high temperature with a view to storing surplus energy or heat when the load is light to be drawn on during the busy hours.

From Mr. Ridley's article it will be seen that the destructor plants now scattered throughout Great Britain may be divided into three general systems as illustrated by that of Shoreditch, Ealing and Oldham. Several refuse destructors, and among others that of Oldham, have been designed with a view to cremating dead animals that may be found in the streets. In this plant eight tons of town refuse is destroyed per cell every twenty-four hours, generating a heat of approximately 1,400° Fahrenheit.

In the United States a complete investigation would be necessary, according to Mr. Ridley, to ascertain what saving a city would effect by installing a plant of this character. In most of the destructors in England the steam produced by the low grade fuel of a community can be made to generate sufficient electric power to run all the arc lights necessary for illuminating the streets of that community. The labor cost of plants in various towns in England with which Mr. Ridley ends his article should be found extremely interesting, although these figures can scarcely be looked upon as a criterion or of especial value in determining the cost of running a plant in this country, owing to the difference in price of labor in the two countries.

The satisfactory and more or less remunerative method of disposing of garbage now in vogue in a number of cities of Great Britain should prove interesting to the New York authorities now that the question of garbage disposal has come up again, and at a time when there is some suggestion of returning to the primitive methods in use some four years ago, that of dumping the city refuse on Riker's Island to ultimately decompose and become a public nuisance by giving off foul odors. It might pay New York City to carefully examine into the destructor question before again deciding to use Riker's Island as a dumping ground.

* * *

The Northwestern Convention.

As the time draws near for the holding of the summer meeting of the Northwestern Electrical Association, no pains are being spared by the committee having in charge the arrangements to make the gathering a most pleasant and profitable one. Mr. J. M. Hill, chairman of the committee having in charge the summer meeting of the Association, and Mr. Thomas R. Mercein are at present in this city extending invitations to a number of honorary guests in behalf of the cities of Duluth and Superior, in which two cities the Convention is to be held jointly.

Mr. Thomas A. Edison, Professor Thomson, Mr. Frank Sprague, Mr. Nikola Tesla and Mr. Wood of the Fort Wayne Electric Corporation have been especially invited. The three first have already accepted, and while Mr. Tesla and Mr. Wood have the matter still under consideration, it is thought that they will ultimately consent to be present.

As we have already explained, some time ago, a Convention lasting three days will be held on board the spacious and commodious steamer Northwest. The party, including a large number of well known electrical engineers and a number of ladies, will leave Chicago on June 10, calling at Milwaukee for the Wisconsin delegates. The steamer will then proceed to Duluth, stopping on the way at Mackinac Island, Sault Ste. Marie, Hancock and Houghton. Those present at the Convention will have an opportunity of visiting the well known Calumet and Hecla copper mines while the ladies of the party are being entertained by the ladies of Hancock and Houghton.

A unique feature of the Convention on the steamer will be the establishment of a question box in which questions will be dropped and answered by experts during the session. Various topics of importance will be discussed, including arc lamps, lighting, meters, transformers, measuring instruments, boiler furnaces, boilers, engines and mechanical draught—in short almost every topic of interest to the electrical engineer, central station man and manufacturer. Noted experts and specialists who are prominently identified with the devices and subjects under discussion are expected to take part, which will go far toward making the Convention an exceedingly important one from a technical and scientific standpoint. One especially important paper to be read will be that of Mr. W. S. Horry, on "The Reduction of Ores by Electricity," interesting on account of the large available water power at both ends of Lake Superior and owing to the fact that immense deposits of magnetic iron and copper ores are to be found on both sides of the lake.

No pains have been spared by the committee having charge of the Convention to make it not only one of the most instructive but probably the most pleasant and enjoyable meetings of the season. Owing to the large number of ladies who will be present, special entertainment for them has been thoughtfully provided. The accommodations and menu will be of the very best, and in view of the fact that special railroad rates are to be made, the Convention will furnish an opportunity for a most instructive, pleasant and economical outing.

Those desiring to avail themselves of this most enjoyable trip can obtain full particulars and state-room accommodation by addressing Mr. J. M. Hill, 1,240 Monadnock Block, Chicago.

* * *

Another Patent Decision Against the General Electric Co.

On May 5th, Judge Cox of the United States District Court at Utica, N. Y., dismissed the suit brought by the Edison Electric Light Company against the E. G. Bernard Company for infringement of patent No. 264,668 granted to Thomas A. Edison, September 19, 1882, for an alleged improvement in the compound winding of a dynamo. The Edison patent is now declared to be invalidated by a patent, No. 217,677, issued to Charles F. Brush for this same improvement. The object of the Edison invention is set forth in the specification as follows: "The object of this invention is to produce means by which the addition or removal of translating devices in the multiple-arc circuits of a system of electrical distribution shall cause immediately a proper regulation of the current energizing the field-magnet of the dynamo-electric machine supplying such system, and this without the use of adjustable resistances, or of any mechanism whatever except the ordinary circuit controllers of the lamps."

The earliest date assigned for the conception of the

Edison invention is August 18, 1879, whereas letters patent No. 217,677 were granted to Charles F. Brush on the 22d of July, 1879, or almost one month earlier. The machines made under the Edison patent did not operate in a satisfactory manner, and moreover were never a commercial success. Mr. Brush in his specification describes his invention as follows: "My invention relates to dynamo-electric machines and has for its object the maintenance in such machines of a magnetic field while the machine is running, whether the external circuit is closed or open."

The Brush dynamo was principally intended for use in electroplating devices. A number of these machines were built and were successfully operated long prior to the date of the Edison application. The defence set up was lack of novelty and invention and non-infringement. Action was commenced as far back as December, 1893; it was argued February 8, 1898, and was finally submitted March 9, 1898. The record contains some 2,453 printed pages.

The suit in question came about by reason of the E. G. Bernard Company having purchased from the Siemens & Halske Company a plant which they in turn sold to the U. S. Government for use in the Watervliet Arsenal at Troy, N. Y. The suit was defended by the Siemens & Halske Company through their able attorneys, Messrs. Barton & Brown of Chicago, and Mr. Seward Davis of Knox & Davis, New York. Great credit is due the learned counsel for their untiring efforts in hunting up and forcibly presenting the evidence.

The decision just rendered is very far-reaching, as the General Electric Company, which controls the Edison patent, has sought to extend the scope of the patent to include in its broad claims any dynamo having a compound winding of its field magnets, whether separately or self-excited, in combination with any translators in multiple-arc, whether lamps, motors or electroplating baths.

Under the Searchlight.

Notes and Comments on Various Topics.

HUDSON MAXIM, the inventor of explosives, who has offered to the United States Government his free services and all his inventions free of royalty for the building of a torpedo cruiser to cost \$5,000,000, says the boat he has in mind could destroy every Spanish warship which it might encounter. Dewey wants such a cruiser?

* * *

An electrician of Fort Wayne, Ind., is said to have invented a new system of turning down incandescent lamps. The apparatus as described consists of an arrangement of nine resistance coils so fixed that one or more of them may be thrown into the circuit and by increasing the resistance in the outside of the lamp reduce the amount of current passing through the filament.

* * *

THE whole of the Lower Bay can now be illuminated at night by means of a 400,000 candle-power searchlight located at Fort Hamilton. It was tried a few evenings ago for the first time and the light showed up everything, even below Sandy Hook.

* * *

PROBABLY the largest order for cruisers ever placed at one time was recently given by Mr. Marcus Nathan when he instructed a firm to deliver within one week a gross of war ships to be used in illustrating submarine mine explosions in Madison Square Garden.

THE Chicago Times-Herald contends that if Victor Hugo was right in saying "Every man is the son of his own invention" Dr. Gatling must be a son of a gun.

FIRST WEEK OF THE ELECTRICAL EXHIBITION.

MANY NEW AND STRIKING FEATURES ADDED.

Firing Submarine Mines by the Marconi System Attracting Wide Attention—Throngs of People Present—Attractive Company Exhibits.

The Electrical Exhibition which has now been running a week is, like a good wine, improving with age. During the first few days, in spite of the gigantic efforts made by the management, a number of exhibits were unfortunately not in place owing to a combination of unforeseen events, such as strikes, etc. At the present time, however, a large number of special features are in working order and are drawing large crowds both afternoon and evening. An excellent band of music tends to enliven things greatly by frequently playing patriotic airs. This Electrical Show, which by the way is but the second exhibition of the kind ever given in the city, comes before the public with the most complete and extensive display of electrical and kindred machinery and apparatus that has ever been presented in this country. Electricity is here demonstrated in all its uses and advantages, and men of experience are in charge not only of every detail of the Exhibition but are responsible for its success.

Mr. C. O. Baker, Jr., the President of the Exhibition Company, Mr. Marcus Nathan, the General Manager, whose experience in the previous Electrical Exhibition has been the groundwork for the success of the present enterprise, and Mr. T. C. Martin, the Chairman of the Auxiliary and Educational Committee, are all hard workers, and what they do is done with method, precision and earnestness. The New York Electrical Society, the oldest Association of the kind in the country, are sponsors for the Exhibition, as it is given under their auspices, and this Society represents in integrity and progress the vital electrical interests of the country. The Stationary Engineers, of which there are at least 5,000, as stated last week, will make the Madison Square Garden their headquarters and place of meeting during the month, and this organization represents the Western, Middle and the New England States, with intelligent and practical men who are continually in touch with new inventions and the improvements that are being made.

The magnificently illuminated tower high up on the great building is typical in its beauty and radiance of what is spread below, where electricity in its many forms of operation and development appeals to the interest, the taste or the curiosity of the spectator. Here are shown an electrical effect entirely new in the illuminated cascade; the illuminated fountain designed by Thomas A. Edison, Jr.; the tank in which is viewed the explosion of submarine mines and the destruction of boats by the Marconi system; the Edison ore extractor, a working model of which can nightly be seen; the Moore illuminated chapel with vacuum tube light; the exhibit of R. Thomas & Son Co., in which the paradox is exemplified that while 1,700 volts of electricity cause certain death, 100,000 would scarcely produce a tremor; 4,000 electrical fans in operation; a generating plant with a 600 horse-power boiler and engine to match which were installed in less than nine days when similar work ordinarily occupies a month; an exhibition of engines adopted by the U. S. Government; a theatrophone by which visitors to the Exhibition can enjoy not only the performances going on in New York theaters, but those as far off as Milwaukee, Wis. These are but a few of the extraordinary features of the Exhibition. Wherever one turns his eye, it will meet some object of interest. There is so much to be studied and enjoyed that discrimination would be inexpedient.

The generating department is a marvel in its way. The main floor is filled with exhibits which are of special value. The Concert Hall has a remarkable display of historical tableaux designed by Dr. Park Benjamin, and in the Assembly Room the illuminated chapel is shown. There is something for everybody in the building to see and enjoy. The telegraphic contests to take place this week, the lectures on scientific subjects, all make up an exhibition that only New York can support and to which every other city in the Union is glad to pay tribute.

The experiments by wireless telegraphy by the Marconi system and others are a revelation. A year ago but very few people were aware of the fact that it was possible to signal through space without the aid of wires. Last summer however Mr. William Marconi, a talented young Italian, following in the pathway of Lodge, Branly and other experimenters, found that it was possible to transmit signals through space to a distance of over ten miles. Mr. Marconi

inch from each other, and also two smaller balls placed about a half inch from each of the larger ones. The secondary terminals of the coil being attached to the smaller balls the sparks will pass across between all of the four balls, and these sparks passing in this way produce violent electrical oscillations which in turn generate invisible electric waves which go out into space in the form of ever-increasing spheres, something in the same manner as the ripple in a pool of water widening if a pebble is dropped in. These spheres have the power of passing through almost any material, the walls of a building or a crowd of people presenting no appreciable impediment to the passage of the waves.

Located in the center of the north gallery is a Clarke receiver, the most essential part of which is known as the coherer. The latter is a most interesting piece of apparatus and consists of a glass tube in which are fitted two sliding plugs of metal, so arranged that the distance between them in the center of the tube is adjustable, the space between the plugs being filled in with a prepared metallic powder. This powder when lying in its normal condition presents a very high resistance to the passage of the electrical current, often amounting to 20,000 ohms. When the electric waves from the transmitter strike this little coherer its resistance instantly decreases, often reaching as low a point as six or seven ohms. This enormous decrease in resistance allows the current from the single cell of dry battery to pass through the magnet coils of a tele-

WILLIAM MARCONI AND HIS WIRELESS APPARATUS.

accomplished this wonderful result by making some alterations in well known apparatus, and also by using at the transmitting and receiving stations a perpendicular wire suspended from a point high in the air; but while Marconi has accomplished much it has been left for the American inventor to improve and place upon the market apparatus which is suitable for practical use without requiring the constant attention necessary with the Marconi system.

Mr. W. J. Clarke, the well known electrical engineer, is the inventor of this new system, and the exhibit of his company in the Madison Square Garden certainly pays a high tribute to Mr. Clarke's inventive ability and business management.

In the center of the south gallery is placed the transmitter, which is contained in an insulated glass show case, and consists of a suitable storage battery which is connected to a specially constructed induction coil placed immediately above it, the current from the battery first passing through an automatic circuit breaker placed in front of the battery.

The circuit breaker takes the place for exhibition purposes that a telegraph operator would when repeatedly calling.

This, however, does not complete the entire transmitting apparatus, as the secondary terminals of the coil are connected to what is known as the "Clarke Electrical Oscillator," which consists of two large brass balls placed about a quarter of an

inch from each other, and also two smaller balls placed about a half inch from each of the larger ones. The secondary terminals of the coil being attached to the smaller balls the sparks will pass across between all of the four balls, and these sparks passing in this way produce violent electrical oscillations which in turn generate invisible electric waves which go out into space in the form of ever-increasing spheres, something in the same manner as the ripple in a pool of water widening if a pebble is dropped in. These spheres have the power of passing through almost any material, the walls of a building or a crowd of people presenting no appreciable impediment to the passage of the waves.

graph relay which is placed in circuit with the coherer. The relay magnets by their magnetism then pull up the armature, and this armature in its turn makes an electric contact which closes the local circuit of the apparatus, and clicks an ordinary telegraph sounder, rings a large vibrating bell, fires a cannon or mine, starts or stops a steam engine, or in fact can be made to accomplish anything that we wish in this direction. When the waves have acted upon the powder in the tube it still remains at its low resistance point, and therefore it would be impossible to send more than the one signal were it not for the fact that at the same time that the relay armature closes the local circuit it also throws a strong battery current through a pair of magnets which operate a vibrating hammer. This hammer continually vibrates against the glass tube as long as the local circuit is closed. Theappings of these vibrations against the tube tend to shake up the powder and cause it to return to its former high resistance, but as long as the waves are coming in from the transmitter the filings are not perceptibly affected by theappings. The instant, however, the waves cease coming, theappings shake up the filings, and they immediately return to their high resistance, when the local circuit is instantly opened and the telegraph sounder gives its up click, or if a bell is used it instantly ceases to ring.

Mr. Clarke's exhibit is so perfectly adjusted that

GARBAGE DESTRUCTORS.

BY A. E. BROOKE RIDLEY,
San Francisco, Cal.

The providing for the health and well-being of the population in towns and cities places heavy expenses upon the municipality. Among these expenses may be mentioned those for furnishing water and light and the removal of sewage and garbage.

Recently the attention of European municipalities has been specially called to reducing the expenses resulting from the necessity of repeatedly gathering and removing the refuse from households. Health experts finally decided that no method was so satisfactory as destruction by fire, and it was the custom to burn the refuse up immediately, mixing it with some more combustible fuel. It has lately been demonstrated that, providing the furnace was properly constructed, this refuse would burn without the addition of coal or other fuel. It was but a step from this to endeavor to utilize the heat that was going to waste, thus providing power for the operation of sewage pumps or electric light works.

The designers of these plants had to contend with two difficulties, the first of which was the fact that a certain amount of refuse had to be collected and burnt each day, and second, that this regular consumption would necessitate a steady instead of an intermittent production of steam, while, especially in the case of electric light works, a very heavy production of steam would be required for the three or four hours out of the twenty-four and very little at other times. Two methods of minimizing this difficulty were employed: one, that of storage batteries, and the other by a system of storing steam. Both these systems are in use in the Shoreditch plant and the storage battery one in the Oldham plant in England.

There are three principal systems of destructor plants, one system being used at Shoreditch, a district of London, the second at Ealing, and a third at Oldham.

In the Shoreditch plant a destructor cell is placed on either side of the boiler (Fig 1). In this system the refuse brought in by carts is dumped into a trolley car, then raised by an electric hoist (Fig. 2) to a platform on top of the cells, from whence it is run by electricity to the openings of the hoppers and dumped into the cell beneath. This system necessitates the consumption of a portion of the power generated in the operation of the electric power and also two crews of men.

In the Ealing system the boilers are placed back to back and the refuse is taken up on top of the cells on an inclined roadway.

In the Oldham plant the cells are all placed alongside each other, opening into a common flue, the heat from each cell augmenting the heat passing through the flue. At the end of this flue is a heated chamber, in which all particles which may escape from the cells become lodged, and which further, by its intensity, entirely deodorizes the products of combustion. It has the further advantage of consuming anything that is too large to be put into the cells; for instance, dead horses and other animals are entirely destroyed after being a short time in the chamber. From this chamber the heat passes under the boiler or boilers to the stack; and it is worthy of note that no objectionable smell results from this system. A steam injector system is employed to increase the combustion.

The illustration marked Fig. 3 shows a sectional elevation through one cell of the Oldham furnaces. As may be seen, the refuse is brought in by the town carts to an elevated roadway and from this is tipped on to a collecting platform adjacent to the furnace. The door through which the refuse is fed is on this side and opens directly on to an inclined "dead-plate" which in this particular case is of masonry. The door at the other side of the furnace is for

clinkering. The furnace bars form a continuation of the dead-plate and are also inclined to assist in feeding the fires. The dead-plate and furnace bars form the floor of a masonry cell which is arched at

the cells from the back, the fireman in front raking the refuse forward as he requires it.

The success or failure of all these plants is dependent on the cost of operation and the character

FIG. 1.—DESTRUCTOR CELLS AND BOILERS AT SHOREDITCH.

the top and has above it a masonry chamber. The whole is usually constructed of brick or some refractory material, whilst the entire structure is held firmly together by iron buckstaves.

The whole electric system of the town is operated

of the refuse supplied. For instance, where fuel was cheap and the weather was sufficiently cold to necessitate a large number of household fires, the orders collected generated a large amount of heat. On the other hand, a good deal of the vegetable

FIG. 2.—ELECTRIC LIFT FOR REFUSE AT SHOREDITCH.

by this plant, no coal being used, the storage battery carrying the peak of the load. The refuse is brought in on a slightly inclined platform to the back of the cells and is then dumped down and shoveled into

refuse is almost non-heat-producing.

In the installation in any town in America of a garbage destructor plant a complete investigation would have to be made of the conditions ruling be-

fore any estimate could be made of the saving that a city would make in installing a plant of this character.

The practical work at Oldham has proved that eight tons of town refuse, including the market sweepings and dustpan contents, is destroyed per cell in twenty-four hours, and the heat that is obtained is approximately 1,400° Fahrenheit.

The labor cost of plants in various towns in Eng-

land may be given approximately as follows, wages of the men being the same in every case :

Oldham, 6 cells, 19½ cents; Royton, 3 cells, 25 cents; Leeds, 12 cells, 19½ cents; Bradford, 12 cells, 19½ cents; Warrington, 2 cells, 23 cents; Toxteth Park, 6 cells, 25½ cents; Liverpool, 12 cells, 25½ cents; Dewsbury, 2 cells, 27½ cents.

SOME RECENT IMPROVEMENTS IN ACCUMULATORS AND THEIR APPLICATION TO TRACTION ON COMMON ROADS.*

BY J. T. NIBLETT.

(Concluded from page 246.)

To accurately test a storage cell is no easy matter, and unless great care is exercised very fictitious results may be obtained. A laboratory test as a preliminary may be very well, but for practical results such tests should not be relied upon. Testing under actual working conditions and for an extended period is the only reliable means of ascertaining the capabilities of cells intended for traction work.

We have already shown that no one type of cell is capable of doing all the very varied kinds of work accumulators are now called upon to do. Before building up a battery it is, therefore, wise to ascertain definitely the class of work it is intended to do, and construct accordingly.

To obtain a capacity test by discharging through a constant resistance, noting the fall of current and potential, is quite easy of manipulation, and is much used when comparative tests only are required. A more reliable method, however, is to discharge at a constant current, stopping when a prescribed fall of potential occurs. For traction work, where a uniform output for a given number of hours is required, it is very much the best plan to take the capacity of the cell in terms of watt hours. Under these circumstances the discharging rate in watts must be kept constant. Testing for local action, noting the effect of high rates of charge and discharge, are more serious matters and require careful manipulation.

The internal resistance of a cell depends upon the total active surface area of the opposing plates, the nature of the electrolyte and its condition and temperature, and the distance between the plates.

There are many methods for determining the internal resistance of batteries. If the cells be as

nearly as possible of the same dimensions, capacity and state of charge, then two cells may be placed in opposition (poles of like polarity joined together) and their joint resistance may be measured by the ordinary Wheatstone bridge method. If the cells be exactly similar, then one-half the resistance indicated will represent the resistance of each cell.

A far more reliable and accurate means of ascertaining the internal resistance of cells is the differ-

ential method, as expressed by the following formula :

$$r = \frac{D - D'}{D} R$$

where r is the resistance required, D and D' are the values of deflections obtained on a high-resistance sensitive galvanometer, and R expresses the value of a small but known resistance, used as a shunt.

When making tests by this method, a high-resistance potential galvanometer should be used, and one whose scale readings are either of uniform value or whose tangents are strictly proportional to the angle of the deflections. To determine r we have to obtain a deflection, D , when the cell is on open circuit, and then obtain another reading, D' , when the cell is shunted by R , then by the formula given the internal resistance may be ascertained. The shunt resistance R should be small in comparison with the galvanometer coils. Good results may be obtained if the resistance of the galvanometer is, say, 5,000 ohms, and the shunt not more than 1 to 5 ohms.

The total current or energy capacity of a storage cell is the maximum amount of current or electrical energy which it is capable of storing, without reference to any loss that may occur by it being allowed to remain idle, nor does it take into account the rate or manner of its discharge.

The working current or energy capacity is that amount of current, or electrical energy, which can be obtained from the cell at any specified rate of discharge. When estimating this, the discharge is always stopped as soon as the cell ceases to do useful work. The working capacity of storage cells may vary between very wide limits.

The absolute current or energy efficiency of an accumulator cell is the ratio between that amount of current or energy put into it and that obtained by a total discharge, without reference either to its rate of charge or discharge or to the time allowed to elapse between these operations.

The working current or energy efficiency of a storage cell is the ratio between the value of the current or energy expended in the charging operation and that obtained when the cell is discharged at any specified rate.

In a lead storage cell, if the surface and quantity of active material be accurately proportioned, and if the discharge be commenced immediately after the termination of the charge, then a current efficiency of as much as 98 per cent. may be obtained, provided the rate of discharge is low and well regulated. In practice it is found that low rates of discharge are

not economical, and as the current efficiency always decreases as the discharge rate increases, it is found that the normal current efficiency seldom exceeds 90 per cent., and averages about 85 per cent.

As the normal discharging electromotive force of a lead secondary cell never exceeds 2 volts, and as an electromotive force of from 2.4 to 2.5 volts is required at its poles to overcome both its opposing electromotive force and its internal resistance, there is clearly an initial loss of 20 per cent. between the energy required to charge it and that given out during its discharge. The normal discharging potential seldom exceeds 2 volts, and as this pressure is continually being reduced as the rate of discharge increases, it follows that an energy efficiency of 80 per cent. can never be realized. As a matter of fact, a maximum of 75 and a mean of 60 per cent. is the usual energy efficiency of lead-sulphuric-acid storage cells.

What the ordinary commercial man will be most interested in are tests which give him reliable information as to the cost of the up-keep and life of the battery; also data as to the initial cost and as to the mode of it doing its work. Such information cannot be obtained in a laboratory and has to be obtained by actual trials.

Perhaps a short description of one or two of the present applications of secondary batteries for propelling motor-cars will best serve to show the usual method of practically dealing with them.

In this country the vehicles put upon the London roads by the London Electrical Cab Company may be looked upon as a pioneer enterprise, and its development will be watched with the closest interest by all those concerned.

In appearance the London electric cabs are similar to the "coupé" type of horse vehicle. The inside is upholstered in leather, and the comfort of the passengers seems to have been studied in every way. At night the interior is lighted by an electric lamp, while the outside is rendered resplendent by two brilliantly-lighted side lamps.

The driver's seat is in front, and is placed much in the same position as in the ordinary four-wheeler. The dashboard is rounded instead of being flat, and this tends to give the vehicle a less angular aspect than it would otherwise have. Immediately in front of the driver, the starting, stopping and steering gear is placed. The battery used is a special Faure-King type, and is supplied and maintained under contract by the E. P. S. Company. The plates used are thin, and to prevent the active material being "washed" out, the surfaces are covered with a layer of silicated asbestos held in position by thin sheets of perforated vulcanite. The whole of the cells are mounted in a tray, which is slung underneath the cab by four suspending links. These links are supported by springs under compression, and as an extra safeguard against vibration the ordinary carriage springs again support the battery tray. The total weight of the battery is 14 cwt. The total weight of the complete vehicle, including driver and its full complement of passengers, is approximately 30 cwt. The electric motor used is one of the Johnson-Lundell type with double windings on both fields and armatures, and is capable of developing at normal speed about 3 HP. The motor, which is placed in the hind boot, is connected by gearing to a countershaft and thence to the back wheels by an endless chain. This driving chain is of the Renolds laminated type. The sprocket arrangement usually employed is dispensed with, and as the chain runs on the pinion and chain wheels with some side play it is worn evenly and is found to retain its efficiency until it is completely worn out.

The starting, stopping and back driving arrangements are of simple construction. On the left hand side of the driver's seat a lever handle is placed; when starting, the lever is pushed forward and by a stepping-up arrangement the more forward the lever is pushed the faster moves the vehicle. Drawing

* Paper read before the Self-Propelled Traffic Association, Liverpool Center, Eng., March 29, 1898.

back the lever slackens speed, and when drawn beyond a stationary point the carriage runs backward.

One of the chief novelties claimed for these cabs is the double winding of the electric motor. By adopting this system great economy of battery power is said to be effected. The starting lever on its first outward step connects the two armature windings and the two field windings in series, a small resistance being also thrown in. The second step puts the resistance out. The third places the armature coils in parallel, but leaves the field coils in series. The fourth and final step places the field coils in parallel and gives the vehicle its maximum speed. The first step is only used for starting. When the lever is brought to the second, third and fourth steps, the cab attains speeds of 3, 7 and 9 miles per hour respectively. By the employment of the stepping up and down arrangement the cab is brought under complete control, whilst the reversing mechanism, in addition to a foot-brake arrangement which is fitted, enables stopping and backing operations to be more quickly carried out than would be possible in a horse-drawn vehicle.

The current from the accumulators is made to pass through a switch attached to the foot-brake, so that whenever the foot is applied to the brake the current is disrupted, thus avoiding all possibility of damage to the motor should the cab be brought to a standstill while the current is still on. As another safeguard, the driver of each cab is supplied with a special key-plug, which he carries about with him. This plug is used as a switch, and makes or breaks the battery circuit whenever it is inserted or withdrawn, the obvious advantage being that if the driver leaves his cab, taking the key with him, it is impossible for anyone to tamper with or start the vehicle.

The arrangements for taking out, reinstating and charging the batteries are not at all complicated. According to the present arrangements the charging is only done at the company's charging station. The cabs are run over a hydraulic table on which a tray of cells is wheeled, the tray being brought out on a light trolley. The table is now raised until the battery is brought into its right position for attachment to the suspending links. When fixed the table and trolley are lowered and the cab is free to propel itself away. For removing the discharged batteries the reverse operation takes place. When removed the battery is placed on a second trolley and is run into its proper charging position. While charging, one of the conductors runs direct from a common return to the battery. The other conductor carries the current through a variable resistance used for regulating the amount of current flowing, and also through an amperemeter which indicates accurately the rate at which the charge is being given. The batteries in all cases are joined to the charging source separately, and each has its own regulating and measuring arrangements, thus ensuring an effectual charge.

It is said that to remove an exhausted battery and reinsert a charged one does not occupy more than five minutes, much less time than is required to take out and put in a fresh horse in an ordinary cab.

The battery consists of 40 cells, and as previously stated, it weighs complete about 14 cwt. The capacity of each cell is 170 ampere hours at a normal discharging rate of 30 amperes. The electrical pressure at the battery terminals is 80 volts. Thus the battery has a storage capacity of 13,600 watt hours at a discharging rate of 2,400 watts, or about 3½ electrical HP. When fully charged the battery is said to be able to run the cab a distance of 50 miles over the ordinary London streets. The mean current drawn from the battery when on a level road is 30 amperes, on rougher roads from 40 to 45 amperes is required, while climbing steep gradients the cells are called upon to give as much as 120 amperes. The motor, although constructed to give a normal output of 3 HP., is capable of a maximum of 4 HP.

without unduly heating, so that a margin of 25 per cent. is obtained for eventualities.

In New York some electric hansom cabs have recently been put on the roads. The cabs are made by the Electric Carriage & Wagon Company. In some respects they resemble our London hansoms, but the vehicles are fitted with four wheels instead of two. The back wheels are used for steering and the front for driving. The chief feature of this cab is that two motors are used, one for each of the driving wheels. By employing two motors, various variations of speed can, of course, be obtained by running them in parallel or series; and by having each wheel under separate control quicker turning power of the vehicle can probably be obtained. This is doubtless the object the designers of the New York hansoms had in view, although it is very problematic if any real advantage is gained by such an arrangement.

The New York cabs are said to weigh 3,000 lbs. Each motor develops 1½ HP. with 75 volts, and at a speed of 800 revolutions per minute. This represents a speed of 8 miles per hour for the vehicle. The battery used consists of 44 cells placed in trays containing 11 cells in each. The four sections are placed in a receptacle in the rear of the vehicle. No loose terminals are used, contact between the sections and other parts being established by means of plates and contact springs. Each cell contains three plates of the chloride form, and they have a useful capacity of 100 ampere-hours when discharged at 21 amperes—the normal rate. The whole battery weighs 900 lbs. Speeds varying from 4 to 15 miles per hour can, it is said, be obtained with varying battery discharges of from 12½ to 40 amperes.

L'Electricité Société Anonyme of Brussels have recently introduced an electrically propelled dog-cart. In this vehicle, and according to the usual practice, the battery cells are placed underneath the seats. Forty-eight cells of the Planté type, having a capacity of about 75 amperes, are used. The total weight of the battery is 850 lbs. The motor is wound with the coils of the fields and armature in series, and it weighs about 260 lbs. A speed of 1,750 revs. per minute is attained with a battery discharge of 21 amperes. The motor is connected to the driving wheels by reducing gear and chain bands, while differential movements of the driving wheels are obtained by the use of an intermediate clutch.

The dog-cart has four wheels and is made to seat four passengers, including the driver. The carriage, including batteries, motor and gearing, weighs complete about 2,500 lbs. The maximum speed is 10 miles per hour, and at this rate it is stated a distance of from 40 to 50 miles can be traveled with one charge of the battery.

As a means of regulating speed in a self-contained motor-car, actuated by batteries, two methods are at present in vogue. The first is by splitting up the battery into sections by a suitable commutating arrangement, thereby putting the sections either in series or parallel as required. The objection that may be raised to this plan is that the cells may be unequally discharged. A more practical method, and one adopted on the London cabs, as explained, is using the battery as a complete unit, and obtaining the various speeds by commutating the coils in the fields and armatures of the motor. It is possible that some method may be adopted by which the motor may be run at constant speed, while the speed variations in the car are obtained by suitable gearing. According to present practice the motor, when starting the vehicle, is running slowly, and therefore in its most inefficient condition. If the constant speed idea were utilized, the motor might be of smaller power, and it could also be run at a higher and more uniform efficiency.

As regards the prevailing method of connecting the motors to the driving wheels by the system of gearing, probably with our present knowledge it is the best that can be done. Some way of dispensing with gear and running direct will probably be de-

vised. If this could be done, not only would it lead to great economy in working, but it would greatly add to the comfort of the passengers. When riding, for instance, in one of London's electric cabs, in addition to the hum of the motor, which is not at all unpleasant, one's ears are assailed by the clanking and rattling of the gearing and chain. If direct running or some more silent method of gearing could be devised it would be a desirable improvement. Improvements in the wheel tires will doubtless be made, and such improvements would tend to reduce road friction and thereby save power or give increased speed. They would also reduce the depreciation in the working parts and give the battery a better chance.

Methods of electric locomotion on common roads present enormous possibilities. Electrically-propelled omnibuses, broughams, dog-carts and light parcel delivery vans may now be seen running along our thoroughfares. There is no reason why the same plan should not be adopted for driving vehicles for the cartage of goods generally. In the latter case appearance need not be studied to such an extent as in the passenger-carrying conveyances; therefore, in this case the electrical engineer would have a freer hand, and better results might be anticipated.

Methods of recharging will have to be seriously considered. There seems no reason why in all our large towns charging centers should not be established. The ordinary cab is stationary a great part of the day; and there seems no valid reason why the charging operation should not be rendered so simple that a cabman of ordinary intelligence could easily perform it. With an "in-and-out" electricity meter placed on the vehicle in a convenient position on the battery circuit, the driver could see at a glance how much energy had been put in and taken out of his battery, therefore would know when a recharge is required; also, when charging, by reference to the meter he could see when his battery is satisfied. Such a measuring instrument with the small range required need not be an expensive addition. A supply system worked on the penny-in-the-slot principle could easily be arranged. The battery, of course, would not be removed, but would be connected up to the source by suitable flexible mains. Under these conditions the driver could buy his supply of electricity much in the same way as a carman can now buy fodder for his horses.

The form of battery required for driving a self-contained motor-car over common roads may need to be of a different nature to that required in cars running on a permanent way, where the tractive force remains more nearly constant and where there is less jolting and vibration. Possibly some form of mechanically solid cell with a Faure type negative and a Planté type positive element will fulfil the requirements.

As to the probabilities of the self-contained electric motor-car comparing favorably with horse haulage, this will entirely depend upon its economic aspect. However great the convenience of electric haulage, however great its reliability, ease of manipulation, sanitary aspect and general convenience, the question as to whether it is best or not has still to be satisfactorily answered. In its present experimental stage trustworthy figures of the daily or weekly cost of up-keep cannot be expected. It is only by taking the average expenses incurred during months or years that anything like an accurate estimate can be arrived at. The initial cost and cost of maintenance of the batteries employed will, we believe, be the controlling factor. Whatever turn the idea of electrically-propelled motor-cars may take, it must necessarily always involve the use of some apparatus for storing and giving out electrical energy.

The modern secondary battery leaves very much to be desired, but still there are several very good batteries for this purpose obtainable, and these may serve to tide the electric traction man over the period intervening before the advent of the ideal cell which we all wish to see.

SYSTEM FOR PROTECTION OF RAILWAY TRAINS.*

BY EMILE DIRUDONNE.

The catastrophe of Péage de Roussillon is still fresh in the memory of a large number of persons, and although many other deplorable railway accidents have since occurred, this one is vividly remembered in all its hideous sadness. A train for some reason is obliged to stop between stations on an inky black night, while into it plunges another train following the former by ten minutes. The horror of such a situation can readily be imagined.

Where a train is brought to a standstill along the line through some unforeseen casualty, the working rules prescribe certain measures to be taken for the protection of the train against an accident similar to the memorable one just referred to.

Are these frightful misfortunes the price that has to be paid for improvements on the realizations of weak humanity? No sooner does the evil appear before suggestions as to a remedy spring up on all sides. Place on the locomotive, say some, a siren that could make itself heard a distance of several kilometers, overcoming the noise made by a moving train. Others suggest the use of an immense gong.

MM. Chauvin and Baulan, well-known engineers, have carefully studied this perplexing problem, and have devised a protecting system whereby a train stalled at any point along a line would be enabled to immediately communicate the fact to the various neighboring and protecting points such as stations, signal towers, etc. The arrangement permits of the conductor entering into telephonic or telegraphic communication with the operators in the near-by stations or signal towers, or in the event of the operators failing through any mishap to respond, the conductor can, by means of suitably arranged signals, announce to trains approaching from either or both directions the presence of the disabled train.

The system that these engineers have designed consists in a closed electric circuit stretched along the line of the road between the protecting stations and in a service of electric energy carried by each train and which can at will be introduced into the main circuit at any point along the line. The closed circuit controls annunciator apparatuses located in the protecting stations, and as soon as the conductor on the stalled train has cut into this circuit, the source of electric energy carried by the train, the annunciator at the station just behind or just ahead, or both, operate and inform the attendants that it is necessary to protect the train in that block.

The closed circuit may also be made to operate a semaphore or other suitably arranged signals placed at given points along the line, to warn trains in both directions that they are approaching a train at rest.

It will very readily be seen that such a system would prevent or greatly lessen the chances of a collision.

Fig. 1 shows a section of track to be protected, assumed to be guarded by the two towers C and C'. These latter are connected by the closed circuit A B, in which is placed at each tower an electric gong, c and c'.

The circuit may be either of the metallic type or of a single wire with the ground as a return. In Fig. 1 there are two conductors, strung on the telegraph poles D D'. On each of these poles, either one (pole D') or both (pole D) of the wires are carried down, terminating at a convenient height from the ground in a switch. The latter is so arranged as to allow of its being readily opened, and permits the introduction of the battery wires from the train. As soon therefore as a train is obliged to stop, the conductor goes to the nearest pole while unwinding the wires E F (Fig. 1) connected with

the battery on the train. He breaks the circuit A B and attaches the ends of the wires he is carrying to those of the line.

If he connects the two wires E F to 1 and 2 or to 3 and 4, that is to say, to only one of the line wires A or B, the annunciators in both of the stations C C' are simultaneously acted upon. If, on the other hand, he connects the wires 1, 3 or 2, 4—that is to say, to both of the line wires A B—the circuit of the rear tower, or of the tower directly ahead, is a line closed and the bell in one of these towers alone rings.

If only one of the line wires (post D') is brought

FIG. 1.

down to within reach, the two bells c and c' are always operated together, unless, however, the bell at one tower alone is in circuit, which might suffice in certain cases.

This system gives the train to which an accident has occurred the means of blocking itself, or in other words enables it to signal the fact of its being at a standstill to other trains along the line both ahead and in the rear, without its having to pass through the safety towers. It is only necessary for this

FIG. 2.

purpose to establish at equal distances along the line of the track suitable signals to be operated by the train batteries, in the same way that electric semaphore signals are worked. Fig. 2 shows a train that has blocked itself in the rear by moving a series of disk signals by placing its battery in circuit with the line by means of the neighboring pole D.

Several types of annunciator may be employed—optical apparatus, acoustic apparatus or a combination of the two. They may, in the opinion of the inventors, be directly operated by the current which flows along the line, or be only unlatched by this current, the work of operating thus being accomplished by some local source of mechanical or electrical energy.

It is readily understood that instead of simply placing in the closed line circuit a battery, with a view to causing the operation of a bell, the train conductor may place in this same circuit a telephone or telescriptor, which would enable him to enter

FIG. 3.

into communication with the operator in a neighboring tower either to make an explanation or to ask for help.

MM. Chauvin and Baulan think that their system could be employed advantageously as a block signal system.

It would then be necessary to install it in the following manner: The line of the road would be divided into sections of say 10 kilometers in length. Along these 10 kilometers a closed circuit would run, always accessible however, and attached to a series of optical, acoustic or other signals. If at any point a train is obliged to stop, the source of electricity with which it is provided is placed in the main circuit, and immediately the

signals along the line move to the danger position and warn the train which is following.

There would seem to be a defect in the above system, which, however, the inventors have met and overcome. This is where a train is obliged to stop at a point A, Fig. 3, at a distance of less than a kilometer from the beginning of a block or section, M' N' for example. Under such circumstances the train following, not being warned in time owing to the insufficient distance allowed it for stopping, would occasion a collision.

To obviate this danger it was suggested that the line of track be divided, as first proposed, into sec-

tions of 10 kilometers in length, but that the closed circuit be made to operate over a distance of 11 kilometers, or in other words overlap the track section. With such an arrangement (Fig. 3) a train stopping at A would be protected by the danger signals on M' P.

The solution of this difficult problem is extremely interesting. To the best of the writer's knowledge, however, this system has not as yet been tried on a practical scale. After having called the attention of

railway companies to the invention, our next desire would be to see it given a fair test.

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XIX.—Bullion Refining.

In the year 1851 Charles Watt obtained a patent (No. 13,755) to which reference has been made more than once previously in these chapters. This patent may certainly be regarded as the master patent of the electro-chemical industries, for not only did it clearly set forth the conditions necessary for the production of chlorine, alkalis and chlorates from solutions of potassium or sodium chloride, but also the method and details of procedure to be adopted for refining by electrolysis alloys of copper, silver and gold. This patent was of course forty years before its time, and even had it been filed in 1891 instead of in 1851, it is questionable whether it could have been upheld in a court of law; but it is nevertheless of great interest as showing how early the idea of using electricity for the conduct of chemical and metallurgical operations upon an industrial scale was formed.

The principle of the method to be used in refining operations is clearly set forth in this patent of Watt's, and the electrolytic procedures used to-day for refining copper, silver and gold are simply developments of the ideas contained in this patent of 1851. Moebius, who is the patentee of the silver refining process in use in Europe and America at the present date, has of course much improved upon the plant and apparatus suggested by Watt for effecting the separation of silver and gold; and as the validity of patents in the electro-chemical and electro-metallurgical branches of applied science rests upon novelty in design of the plant and apparatus used, and

*Translated from *La Vie Scientifique*, Paris, for *ELECTRICITY*.

not upon novelty of principle, the Moebius patents are doubtless valid.

Gold and silver refining by electrolytic methods is carried on at three works in Europe, two being in Germany and one in Belgium. At Frankfort, the Moebius process is used for refining silver on a fairly large scale. This process is also in use at St. Louis, at Perth Amboy, and at Pittsburg, in the United States, so its main features are no doubt known to many readers of *ELECTRICITY*.

The plant at Frankfort is designed for an output of 35,000 ozs. silver per day of 24 hours. A 25 HP. gas engine drives a dynamo yielding 150 amperes at 100 volts. This current is passed through 60 to 70 cells in series, each requiring about 1½ volts. The vats are of pitch pine, and are coated internally with tar, and each vat is divided into seven compartments. In these are hung three rows of anode plates and four rows of cathode plates; the former are plates of bullion .40 inch thick each weighing 3.3 lbs.; the latter are thin sheets of rolled silver. The anodes are enclosed in linen bags. The electrolyte consists of a copper nitrate solution, containing one-eighth of silver, and during the electrolysis it is kept slightly acid by addition of nitric acid. In order to prevent short-circuiting the crystals of silver are continuously removed from the sheet silver cathodes and are allowed to collect upon a canvas tray suspended beneath the electrodes. They are withdrawn, washed, dried and fused at intervals in order to obtain ingots of fine silver. The refinery at Frankfort, known as the Deutsche Gold u. Silber Scheide Anstalt, is in a flourishing condition, as at the last annual meeting of the company noted by the writer (October, 1896,) a dividend of 12½ per cent. on the ordinary share capital was declared. This company has also an interest in one of the Niagara electro-chemical companies.

The Nord-deutsche Affinerie at Hamburg was one of the earliest, and for many years one of the most successful electrolytic copper refineries in Europe. Copper refining is still carried on at this works, but other electro-metallurgical operations have been taken up. One of the most successful of these is the parting of gold from platinum, which is conducted at this refinery on a considerable scale. This separation is effected by using plates of the gold-platinum alloy as anodes in an electrolyte of gold chloride solution, with thin sheets of gold as cathodes. The platinum under these conditions remains as a dark gray mud upon the bottom of the electrolytic vat. The process and apparatus are patented by German patent No. 90,276 of 1896. Recently some further details of the procedure adopted at Hamburg have been published,* and it is stated that by using a high temperature, an excess of hydrochloric acid and a current density of 90 amperes per square foot, no chlorine gas escapes at the anode, but that all is utilized in bringing the gold of the anode into solution. The gold obtained is absolutely pure, and the process is stated to be superior in all points to the older method of separation.

The third refining process, which may receive mention in this chapter, is one for parting silver from argentiferous lead, and is, according to Oettel, in operation in Belgium,† though he gives no details as to the locality or the extent of the operations.

When zinc is melted with argentiferous lead in order to remove the silver from the lead by the production of a zinc-silver alloy, considerable loss of zinc and silver occurs owing to the oxidation of the former. In the Rossler-Edelmann process this is avoided by adding ½ per cent. aluminum to the melt; the aluminum combines with the oxygen present as oxides of the other metals, and the separation of the fused mass into two layers is more effectual owing to the greater fluidity of the melt. The temperature of the mass before the addition of the alu-

minum should be 500° C. The alloy of zinc and silver obtained in this way can contain up to 20 per cent. of the latter metal. It is cast into anode plates of suitable form, and these are used in an electrolyte of dilute sulphuric acid containing zinc sulphate. The zinc of the anode is dissolved and redeposited at the cathode, while the silver and the small quantity of lead present remain as an insoluble sludge upon the bottom of the vat.

Bullion refining, and the parting of the precious metals such as platinum and gold, can never from their nature become very extensive branches of the electro-chemical and electro-metallurgical industries; but the facts given above show that the use of electricity in this highly specialized branch of metallurgy has already attained considerable development, and the future is certain to be marked by a steady, if slow, growth of the industrial applications of electrolytic methods in parting and refining the precious metals—platinum, silver and gold.

ANNUAL MEETING OF THE GENERAL ELECTRIC COMPANY.

It Was Resolved That Something Ought To Be Done to Adjust the Impairment of Capital!

SCHENECTADY, N. Y., May 10, 1898.

The Sixth Annual Meeting of the stockholders of the General Electric Company was held here at noon to-day, pursuant to notices issued on the 25th ult. The meeting was held as usual, not in the regular office of the company, because that is just outside of the city limits, but in the small lodge or gate-house at the entrance to the grounds occupied by the works of the corporation.

The stockholders were called to order promptly on the stroke of noon. President Coffin was made chairman and Mr. Westover was named as secretary of the meeting. At no time were more than a baker's dozen present. Besides the president there were in attendance Directors Gordon Abbott and Robert Treat Paine, 2d, of Boston, and George Foster Peabody of New York, Vice-Presidents Joseph P. Ord and E. W. Rice, Jr., and Treasurer Henry W. Darling, with G. E. Emmons, manager of the local works. The others present were all employees of the company with the exception of one shareholder from Boston.

The business, as announced in the call for the meeting, was to elect a full board of directors for the ensuing year and to attend to such other matters as might properly come up. Nearly 500 shares of stock were voted by the holders in person and over 210,000 were voted by proxies. Of this latter number Messrs. Abbott, Ames, Ord and Paine held proxies for over 209,000 shares. When we remember that the total number of shares of stock of both kinds is 347,120, it will be seen that these gentlemen had a good working majority, standing in fact at all times over 300,000 votes above the fear of contradiction.

There was but one ticket in the field and it was elected. The directors for the next year are the same as the directors for the last year. Their names are: Gordon Abbott, Oliver Ames, C. A. Coffin, T. Jefferson Coolidge, Jr., C. H. Coster, Thomas A. Edison, George P. Gardner, Eugene Griffin, F. S. Hastings, Henry L. Higginson, J. Pierpont Morgan, Robert Treat Paine, 2d, George Foster Peabody.

The usual routine of business was duly gone through with. There were inspectors of election, who kept the polls open for one hour, though one minute would have been sufficient. All the minutes of meetings and reports, and all the acts of all officers and directors were duly approved, ratified and confirmed. A committee, consisting of Messrs. Felton, Emmons and Dodge, was appointed in the usual way to make the report exacted by the Massachusetts statute.

One departure from routine, however, was made

to-day, and those who were present are not yet done with conjecturing who is responsible for it. If any director knew beforehand what was coming he kept his secret well.

Heretofore after declaring the polls open and doing the other usual things, it has been the custom for all present to adjourn at about a quarter past 12 o'clock in a body for a recess, which has always been spent in discussing a collation spread in the office of the company, in order to assist the passage of time while the slow hour-glass, which had been inverted on the first announcement as to the polls being open, was running its appointed course. To-day, however, there was no recess. Instead there was discussion, which took a wide range and resulted in the most significant vote which the company has taken for four years.

Under the head of miscellaneous business, the president asked if there were any questions or other matters to be brought before the meeting, whereupon a shareholder asked him about the value of the patents and franchises which are carried on the books at \$8,000,000. The answer was that this valuation was excessive and would need to be revised, but such revision could be had most conveniently and advantageously in connection with a proposed reduction of the capital of the company, action as to which could not be much longer deferred.

Some one asked how the \$2,000,000 of bonds reported as bought and cancelled had been obtained—that is to say, whether by allotment or by purchase in the open market—and the answer was that the company had gone as any other buyer into the open market and purchased its bonds where it could get them.

Encouraged apparently by the remark of the chairman that some reduction should be made in capital account, a member said that there should be no half-way measures. Another remarked that the capital should not exceed the gross earnings for one year, but the chairman questioned whether in a business like that of this company the entire capital could be turned over every year, although he admitted that the principle of making capital equal to gross earnings for one year was a sound one in other kinds of business.

To a remark that the two old constituent companies, viz., the Edison General Electric and the Thomson-Houston, which combined to make the present company, had each earned gross nearly as much as the present gross earnings of the General Electric Company, it was said that the times had been bad and prices are and have been low.

It was agreed by all that the assets of the company must be made somehow to balance its liabilities. The \$11,725,000 deficit exists even with patents and franchises standing as an asset valued at \$8,000,000. If this asset alone should be written down very materially, it would almost necessitate the reduction of capital one half to make assets balance liabilities. Then too there are the stocks and bonds held by the company. The situation is a grave one and not to be dealt with lightly.

Just at this point one of the smaller stockholders offered a resolution of a sweeping character. It declared the sense of the meeting to be that no time should be lost in reducing the share capital and scaling down the preferred stock so as to be able to resume dividends.

This resolution was of course voted down, but it had a surprising amount of support. The Boston directors said that they could never get any more proxies from their constituents if they allowed such a resolution as that to prevail, and so their 209,000 votes were thrown against it. It is supposed that Boston holds all but 4,000 shares of the preferred stock.

The influences behind the movement for some expression on this point were, however, too strong to be denied, and they succeeded in having all unite upon a resolution that the interests of the company

*T. Ulke, in "The Mineral Industry" Annual for 1896.
†"Die Entwicklung der Elektro-chemische Industrie," 1897.

demand that the proper and necessary adjustment of the impairment of its capital should be promptly made, with a view to the speedy resumption of dividends. No vote was cast against this resolution, which, if it means anything, means the same thing as the one which Boston would not have.

This vote terminated the proceedings. The hour of adjournment was about half-past 1 o'clock.

It was the liveliest annual meeting that the company has had for years; that of last May was notably dull compared with it.

The New York Electrical Society.

The 187th meeting of this Society will be held in the Concert Hall, Madison Square Garden, on Thursday, May 12th, at 8:20 P.M. There will be a short session for the transaction of current business and at 8:30 Dr. Schuyler S. Wheeler will lecture on "Electrically Driven Machinery."

The lecture will be illustrated by experiments and lantern slides. The evolution of electrical machinery as influenced by the gradual change from belt driving to electric driving will be traced, and the modifications of design making for greater simplicity thus rendered possible will be demonstrated.

Admission to the Garden can be had by the special ticket issued to the members of the Society, which can be obtained—price 25 cents—from the Society's booth at the Exhibition any night from 8 to 9, or on application to the Secretary. Ladies are admitted to the lecture, but each ticket gives admission to the building to only one person.

LEGAL NOTES.

A foreclosure sale will take place at Richmond, Staten Island, at noon on May 26 of all the rights, privileges, properties, leases and franchises of the Staten Island Traction Company, formerly the Port Richmond & Prohibition Park Electric Railroad Company, including its appurtenances, merchandise, dynamos, engines, rolling-stock and all property acquired in the construction, operation and maintenance of its electric railroad. The plaintiff in the suit is the Central Trust Company.

Justice Scott in the Supreme Court has denied the application of Thomas E. Leeman, one of the minority stockholders in the Municipal Electric Light Company of Brooklyn, N. Y., for a mandatory injunction, pending trial, to restrain the Edison Electric Illuminating Company of Brooklyn from carrying out a plan of reorganization, on the ground that the scheme had not been agreed to by two-thirds of the shareholders of the Municipal Company, and that the terms of the agreement to purchase the plant of the Municipal Company were not in accordance with law. Justice Scott holds that the Edison Company has done all that is necessary up to the present time legally to carry out the proposed arrangement.

Maurice McCarthy, 14 years old, through his father, James McCarthy, as guardian *ad litem*, obtained a verdict of \$13,750 against the New York & New Jersey Telephone Company and the Municipal Electric Light Company in the Supreme Court in Brooklyn on the 30th ult. The boy lived in a building the lower part of which the former company occupied and had wires strung in the cellar. While chopping wood in the cellar the boy came into contact with the live wires, and two of his fingers were so badly burned that they were amputated. It was contended that the wires were strung in a careless manner.

On the 6th inst., at Philadelphia, an opinion was handed down by Common Pleas Court, No. 2, in which it sustains the demurrers filed by the respondents in the suit instituted by James Madden and others, stockholders of the Penn Electric Light Company, against John Lowber Welsh, Thomas Dolan and others and the Edison Electric Light Company, to recover damages to the amount of \$500,000 for the alleged mismanagement by the defendants of the Penn Electric Light Company, to the advantage of

the Edison Electric Light Company. This alleged mismanagement was the renting for a nominal sum to the Edison Electric Company of the conduits of the Penn Electric Light Company under a perpetual contract, thus destroying all competition by other companies for the use of the conduits. To this suit the defendants filed demurrers.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Bay City, Mich.—The council has passed an ordinance giving a street franchise to the new Bay, Tuscola & Huron Railway Company.

Chicago.—The court has granted permission to Gen. John McNulta, receiver of the Calumet Electric Street Railway Company, to expend \$60,000 in the improvement of the plant and the purchase of property for a terminal loop.

Chattanooga, Tenn.—A Washington dispatch published here states that the bill permitting the Chattanooga Rapid Transit Railroad to enter the Chattanooga-Chickamauga National Military Park has passed both branches of Congress.

Clinton, Mass.—A number of local business men intend to form a corporation to be known as the Clinton & Hudson Street Railway Company for the purpose of constructing and operating an electric road between Clinton and Hudson, through the town of Berlin.

Detroit, Mich.—The "News" states that "George E. Fisher, president of the Chase Construction Co., has closed a contract in Chicago with J. C. Shaffer for the entire overhead electrical construction of the electric railway from Detroit to Toledo. A million pounds of copper will be required to complete the road, which will be 60 miles long and built for heavy traffic. The road will be known as the Chicago, Toledo & Detroit Railroad. The Chase Construction Company will begin their work in about 60 days."

Greenfield, Mass.—The Legislature has passed the bill and it has been signed by the Governor giving the Greenfield & Turner's Falls Street Railway Company the right to carry merchandise in small parcels, baggage and mails. It does not become operative, however, until it has been accepted by a two-thirds vote of the voters of Greenfield and Turner's Falls at either a special or regular meeting.

Holyoke, Mass.—The Holyoke Street Railway Company will in a few days open Mountain Park for the summer.

New York.—Specifications for fitting the Forty-second street, Tenth avenue and Boulevard surface railway lines with the underground electric system have been completed and bids for the work will be advertised within the next two weeks. It is probable that within a year all the horse and cable lines operated by the Third Avenue company will be turned into underground trolley roads. The main line in Third Avenue will, however, be the last to be so equipped. The company owns between seventy and eighty miles of tracks, and the cost of changing the power and providing new rolling stock will be at least \$5,000,000. Work on the power house which it is proposed to build at Kingsbridge Road and 216th street will be begun next month.

North Tonawanda, N. Y.—The Lockport branch of the Erie Railroad has been leased for a term of years by the Buffalo & Niagara Falls Electric Railroad Company and will be converted into an electric line.

Ottumwa, Ia.—The plant of the Ottumwa Electric Railway & Power Company was sold on the 29th ult. at public auction by the master in chancery, the purchaser being E. E. McElroy, trustee for the bondholders. The price paid was \$190,000. The plant is said to be worth \$500,000.

Plainfield, N. J.—After two years of agitation, a trolley franchise has been granted in Bound Brook, and the last link in the system of the Brunswick Traction Company is completed. The ordinance allows connection to be made with the extension to Somerville and Raritan on the west, and with Lincoln, Dunellen and Plainfield on the east, and South Bound Brook and New Brunswick on the south.

Providence, R. I.—The question of putting the wires of the Narragansett Electric Lighting Company underground was discussed at a meeting of the joint special committee on underground wires a few evenings ago. Representatives of the lighting company were present. They stated that the cost would be about \$500,000 and that three years would be required to do the work, which involved about 16 miles of streets. It was thought probable that the telephone and telegraph companies would agree to use the same conduits for their wires. The committee said they would make every effort to bring about a satisfactory arrangement to all parties concerned.

Putnam, Conn.—The People's Tramway Company organized a few days ago at Danielson by electing officers and directors. The capital stock of the company is \$125,000. A survey of the route between Danielson and Putnam will be made at once.

Rockaway Beach, L. I.—The Nassau Company of Brooklyn proposes to build a roadway across Jamaica Bay which will contain besides the trolley tracks a bicycle path and driveway, if a majority of the residents of Rockaway Beach favor the plan. The Secretary of War has granted permission to cross the bay on this condition.

St. Cloud, Minn.—It is announced that the street railroad property in this city, which was bid in at a bondholders' foreclosure sale a few months ago by Jared How, has been sold to the Benton Power & Traction Company, a new corporation, of which C. M. Hertig of the Merchants' National Bank of St. Cloud is president. The present manager of the line, E. E. Clark, is to be retained by the new company.

St. Louis.—The St. Louis, Clayton & Creve Coeur Lake Railway, supposed to be controlled by the Lindell Company, has secured a franchise from the St. Louis county court covering about 25 miles of extensions. Among other things it will give a line from Clayton to Kirkwood, a line from St. Louis to Creve Coeur Lake, and an extension to the village of Des Peres.—Under a court decision the receivership of the People's Railroad Company of this city has passed from Charles Green to F. B. Brownell, president of the Brownell Car Company, who has filed a bond for \$100,000 and taken charge of the property.

Washington, D. C.—The Capital Traction Company on the 4th inst. began the operation of its Pennsylvania avenue and 14th street lines by electricity from its new power house. The service supplied by the Potomac Electric Power Company has been discontinued.

Waukegan, Ill.—It is announced that the Bluff City Electric Railway has been sold to W. T. Ball, an Indiana capitalist. The road will be completed from this city to Highland Park. Then its name is to be changed and it will be extended to Evanston, there to make some connection for Chicago. It is expected to be extended north from here to meet the Milwaukee, Racine & Kenosha line. A. C. Frost and F. O. Rushing, both of Chicago, will be respectively treasurer and general manager of the new company.

Wilkes-Barre, Pa.—The Wilkes-Barre & Northern Railroad Company's line between this city and Harvey's Lake is to be equipped with electricity at a cost of \$50,000.

LIGHTING PLANTS.

Fayette, Ala.—An electric light plant is among the probabilities and would be welcomed by the people.

Hyannis, Mass.—N. O. Bond has started an active canvass in the interest of his proposed electric lighting company. He expects to be soon able to form a company with a capital stock of \$7,000. He has subscriptions now amounting to \$3,600.

Kershaw, S. C.—Mayor Floyd of this city is very desirous of having waterworks and an electric light plant established, and the city council will act on the question at once.

Columbus, O.—Under an act passed in the closing days of the last Legislature, municipalities are authorized to lease waterworks and electric light plants for a term of years with the privilege of purchasing them at the expiration of the lease. The city of Cuyahoga Falls has just contracted with a Chicago company for a \$70,000 plant under these conditions.

Sacramento, Cal.—The city trustees have appointed a committee of their body, composed of Trustees Tebbets, Devine and Paine, to devise ways and means for securing a municipal electric lighting plant.

Shellsburg, Ia.—The people of this place are agitating the question of electric lights and a public meeting has been called to formulate a plan of action.

Smithsburg, Md.—The propositions for waterworks and electric lights were carried at the election held here on the 2d inst.

St. Louis.—The "Star" says: "One of the proudest boasts of St. Louisans is that within its limits is situated the largest and most complete electric plant in the world. It is the Missouri Edison Light & Power Company. This immense concern is the result of the combination of the Edison Illuminating Company and the Missouri Electric Light & Power Company, both of them establishments of the first class. The aggregate power of the lights furnished from the power houses of the company approximates 12,000,000 candle power. Besides the lights this company furnishes power for innumerable electric fans, bells and other modern inventions. The business, manufacturing, and best residence portions of the city are supplied with light and power by the company."

Two Harbors, Minn.—The council proposes to borrow \$4,000 for the purpose of putting in an electric light plant.

MANUFACTURING, ETC.

Albany, N. Y.—A contract aggregating \$23,000 has been awarded by the State Board of Capitol Commissioners to the E. G. Bernard Company of Troy for electric wiring at the State Capitol. The E. G. Bernard Company has filled many contracts in a most satisfactory manner, not the least valuable of which is that furnished in December last for a vessel which now has made its reputation, viz., the *Mangrove*, whose electrical facilities were made use of by the U. S. Government in the investigations at the wreck of the battleship *Maine* in the harbor of Havana.

Elbridge, N. Y.—A new company for the manufacture of dynamos and electrical supplies has been formed and will be known as the Elbridge Electrical Apparatus Company. The new company will make a specialty of "the Midget," a small dynamo used in schools as a demonstrating apparatus. The company has recently placed on the market a new self-playing piano or organ attachment, "The Maestro," invented and patented by Lewis B. Doman, one of the firm.

Evansville, Ind.—The Evansville Gas & Electric Light Company has been granted a 25-year franchise to supply heat and power. They agree to pay the city 2 per cent. annually of the gross receipts from the sale of electricity for these purposes.

New Orleans.—The corner-stone of the central power station of the drainage system was laid with appropriate ceremonies on the 30th ult. This is the beginning of the grandest piece of work ever attempted by the city. Electricity has been adopted for operating the plant.

Ithaca, N. Y.—The "Journal" says: "An improved electrical apparatus has just been received for temporary use at the College of Agriculture, which it is expected will revolutionize methods of testing soil moisture. By means of this machine it is hoped that finally scientific men will be able to determine exactly the best methods of cultivation of soil which is practically synonymous with the best method of retaining moisture in the soil. With it, it will be possible to determine exactly whether rolling or cultivating or mulching or other method does the farmer's crops the most good."

Pittsburg.—An additional order for about four miles of submarine cables has been received by the Standard Underground Cable Company. It is for use in one harbor on the Atlantic coast and another in the Gulf of Mexico.

Washington, D. C.—The Naval Appropriation bill contains the following items: For addition to electric light system at the Brooklyn Navy Yard, \$15,000; electric plant at the League Island Navy Yard, \$5,500; for improvement of electric plant at Washington Navy Yard, \$16,000; for enlargement of electric plant, etc., at the Norfolk Navy Yard, \$20,000; for electric light and power plant at Port Royal Naval Station, \$20,000; for extension of electric system at the Mare Island Navy Yard, \$15,000; for electric light plant at Puget Sound Naval Station, \$9,800; for electric lighting, etc., at the Naval Academy at Annapolis, \$90,000, and for the installation of electric plants in gunboats numbered 10, 11, 12 and 13, \$40,000.

COMPANY MATTERS.

Yardley, Pa.—The Provident Electric Light & Power Company of this place has been reorganized, and is now named the People's Electric Light & Power Plant. E. W. Maloney has been retained as general manager.

Aspinwall, Pa.—The Aspinwall Electric Light Company has been dissolved by order of the court in response to a petition of the stockholders.

WAR WORK OF THE ELECTRICIANS.

J. H. Murphy of the Indianapolis Electric Company is organizing a corps of electricians for the Government.

The work of laying the submarine mines in the harbor of New York is being rushed. The work is under the charge of Major John G. D. Knight, of the Engineer Corps, at Willet's Point, and Lieutenant Robert McGregor, at Sandy Hook. They have a large force of men at work.

The office forces of the various electrical manufacturing works have been reduced more or less to supply the Government with men experienced in electrical work. The General Electric works at Schenectady have furnished about twenty-five men from the office force for service under the Government.

Henry J. Carr, an electrical expert connected with the Navy Department, has been detailed to inspect the various Baltimore fortifications with a view of perfecting their electrical connections.

Capt. Eugene Griffin has, it is stated, instructed Manager E. W. Mullen of the General Electric Company at Philadelphia to recruit a special battalion of engineers to comprise draughtsmen, artisans, electricians and skilled mechanics. Seven hundred men will be required, and there are already over 300 applicants for enlistment. A recruiting office has been opened at 509 Arch street, Philadelphia. The men will be assigned by the War Department to mining and engineering operations in the harbors.

A recruiting office has been opened in the Equitable Building at Baltimore for men skilled in electrical and mechanical work to form two companies to become a part of the First United States Engineer Corps. The recruiting office is in charge of Dr. Louis Duncan, W. E. Molinar and James E. Hughes. The two companies to be organized in Baltimore become part of a regiment composed of twelve companies, of which Boston will supply two companies and New York eight companies. This regiment, with two similar regiments made up from other cities, will form the First United States Volunteer Engineer Corps.

The Edison Electric Company at New Orleans supplied the Government with a number of electricians

from its regular force for service at Forts Jackson and St. Philip. As the experts were leaving the company's office the manager told them they were now becoming Government men, but they would nevertheless always remain Edison men, and he expected such a report of them as would warrant the dual honor which had come to them. Their answer was so enthusiastic that no one could doubt the loyal service they will perform when called upon.

PERSONAL AND MISCELLANEA.

Electricity is used to operate a newly-invented type-writer, in which the keyboard may be separated from the machine and used to operate several machines, the keys closing circuits connected to magnets which operate the type levers.

The Baltimore "American" draws this sage deduction from the fact that wireless telegraphy is being eagerly investigated: "The electric wire is something like Spain—it has so abused its privileges and presumed on its importance that now it finds the general hand against it, trying to hasten the day when it shall be banished from the face of the earth."

A Lexington, Ky., item in the Louisville "Times" states that Charles H. Stoll, for nine years president of the Lexington Associated Companies, consisting of the Electric Street Railway, Hercules Ice Plant, Central Electric Light Works and several land companies, will resign to go to New York City to practise law.

A Holyoke, Mass., man, Robert Krueder, had charge of the construction of the electric lighting plant in the city of Manila which has been taken by Commodore Dewey's fleet. Mr. Krueder spent five years in Manila, and says it is a city well worth taking.

By means of a recently designed magnetic base the incandescent electric lamp can be practically used in boiler shops and machine plants where a bright light in an out-of-the-way place is frequently demanded. The "Manufacturer's Gazette" says the plan consists of an ordinary lamp with an Edison or other base, so that any style of lamp may be utilized, and in case of breakage or burning out can readily be replaced. The lamp holder is mounted on a stand about 24 inches high and 2 inches in diameter, the holder, which is of brass, inclosing a horseshoe electro-magnet, the poles of which are outside the bottom of the holder, and the magnet winding being in series with the filament, the lighting current passes through it, thus energizing the magnet. The poles of the electro-magnet are made of sufficiently hard iron to retain its magnetism in a measure, thus insuring the safety of the lamp should the current accidentally be shut off for a moment.

RECENT COMPANY ELECTIONS.

Brush Electric Company, Rochester, N. Y.—Directors: George W. Archer, G. C. Hollister, Frederick C. Oak, J. N. Beckley, William Runkle, G. A. Hollister, A. H. Harrie, H. L. Brewster and J. Lee Judson.

Crescent City Railroad Company, New Orleans—President, J. C. Denis; secretary, R. M. Ford; general manager, C. D. Wyman; directors: A. B. Wheeler, F. T. Howard, A. J. La Place, C. D. Wyman, Albert Baldwin, J. C. Denis and R. M. Walmsley.

Dover Electric Light Company, Dover, N. J.—President, D. S. Allen; secretary, I. W. Searing; treasurer, L. D. Schwarz; directors: D. S. Allen, I. W. Searing, L. D. Schwarz, George McCracken, C. E. Olark, Alex. Kanoune and David Young.

People's Tramway Company, Danielson, Conn.—President, F. A. Jacobs; treasurer, Van Wyck Rossiter; secretary, R. L. Warner; directors: C. A. Potter of Brooklyn, William P. Kelley of Danville, O. W. Bowen and F. A. Jacobs of Danielson, A. B. Sprague of Moosup, R. L. Warner of Boston, Van W. Rossiter of New York.

Penn Yan, Keuka Park & Branchport Electric Railway Company, Yates, N. Y.—President, W. S. Reed; first vice president, O. L. V. Tylee; second vice-president, H. R. Sill; secretary, F. H. Vele; superintendent, C. L. V. Tylee; treasurer, W. H. Tylee; auditor, F. H. Vele; directors: the officers and Edward Donahue, C. E. Dresser, D. W. Rugg and G. E. Tylee.

Putnam & Thompson Street Railway Company, Putnam, Conn.—President, George H. Nichols; secretary, R. T. Warner; treasurer, Van Wyck Rossiter; directors: R. T. Warner of Boston, Van Wyck Rossiter of New York, Geo. H. Nichols, William Vaughan of Providence, L. H. Fuller, George A. Hammond, Prescott Bartlett of Putnam.

Rochester Gas & Electric Light Company, Rochester, N. Y.—Directors: J. Lee Judson, William Runkle, Frederick Cook, George W. Archer, Albert H. Harris, Granger A. Hollister, Walter S. Johnson, Harry G. Runkle, R. A. C. Smith, George C. Hollister, Harry L. Brewster, John N. Beckley and George A. Redman.

Rome City Street Railway Company, Rome, N. Y.—Directors: John S. Wardwell, A. C. Kessinger, W. R. Huntington, James H. Searles, Dr. W. L. Kinsley, Hon. John D. McMahon and W. P. Rayland.

South Chicago City Railway Company, Chicago—President, D. F. Cameron; vice-president, D. M. Cummings; secretary and treasurer, O. S. Gaither; directors to serve three years: D. F. Cameron and C. F. Corning.

The People's Electric Light Company, Flint, Mich.—President, F. P. Smith; vice-president, A. H. Gillies; treasurer, Romain Putnam; secretary, A. G. Bishop; directors: the officers and George E. Taylor, J. J. Hurley, W. A. Patterson, C. H. W. Conover and Alex. McFarlan.

The Bolton Falls Electric Company, Waterbury, Vt.—President, G. E. Moody; vice-president, C. O. Warren; treasurer, C. L. McMahon; manager, G. H. Almon; clerk, C. D. Robinson; directors: G. E. Moody, C. L. McMahon, C. O. Warren, G. H. Almon and G. W. Randall.

Westerly Gas & Electric Light Company, Westerly, R. I.—Directors: Edwin Babcock, Peleg Clark, A. L. Chester, George H. Utter and William Segar.

Woonsocket Electric Machine & Power Company, Woonsocket, R. I.—Directors: Dr. A. W. Buckland, Edgar K. Ray, Willard Kent, John J. Heffernan, Charles H. Gorton, George R. Smith, Henry F. Sayles, George Batchelor and Levi C. Lincoln.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

COMMERCIAL PARAGRAPHS.

The De Vries Patent Water-Tube Feed-Water Heater and Purifier.

The De Vries Water-Tube Feed-Water Heater and Purifier, shown in the accompanying cut, contains advantages found in no other. The inventor has had considerable experience in this line and has combined the best qualities of other makes with several entirely new and valuable features.

The method of circulation is such that the feed-water is divided into many small columns and flows through an entire bank of tubes at the same time. This in itself is a great advantage over those heaters in which the water is forced through a coil or from a single tube to another, resulting in considerable loss of power and obtaining the result by friction rather than by heating surface.

The settling chamber is large, and concave in form, so that impurities settle to the bottom from where they may be blown off while pure hot water proceeds to the boiler.

U shaped tubes are used, both ends of each being expanded into the tube sheet. Experience has demonstrated this to be the most practical provision for contraction and expansion.

This is the only heater that can be thoroughly inspected, cleaned, and, if necessary, taken apart for repairing without disconnecting the exhaust pipes. As these are the main connections this feature will be appreciated by those who have had experience with the older types of heaters.

The castings used are extra heavy, especially the tube sheet, which, being subjected to the greatest strains, is made particularly thick and strong.

The heater is sold by F. L. Patterson, 135 Liberty street, New York, who will be pleased to give further particulars and prices upon application.

We would call our readers' attention to an attractive advertisement, which appears in this issue, of Henry G. Allen & Co., the well-known publishers, located at 150 Fifth avenue, New York. This concern is offering sets of the Encyclopedia Britannica at an extremely low price and on easy terms. In order to enable them to make this price, the books have been printed upon high grade but slightly thinner paper than is used in their single volume edition. This enables the publishers to bind two volumes in one without making the books too cumbersome to handle (they being only 2½ to 3 inches in thickness), and thus a material saving in the cost of binding is effected. Including the American Supplement this work is extremely elaborate, containing in the neighborhood of 25,000 pages, over 10,000 illustrations and 700 maps. As the price of this valuable work with the supplement, bound in silk cloth, is but \$30, payable at the rate of \$2 a month, persons having occasion to use an encyclopedia should certainly avail themselves of the opportunity offered.

The American Carbon Company of Noblesville, Ind., the well-known anti-trust concern that has made frequent inroads on the business of the Trust, has lately closed a deal for 500,000 carbons at Washington, D. C. The company claims to be turning out as many carbons as all the other independent companies combined, and the excep-

tionally high quality of their product is evidently appreciated by the trade as shown in the fact that they are closing large contracts daily.

The firm of Stone & Webster, Boston, announce that they have made arrangements with Prof. S. Homer Woodbridge by which his business of heating, ventilating and sanitary engineering will hereafter be intimately associated with their own electrical engineering work.

INCORPORATIONS.

The Chagrin Falls & Eastern Electric Railroad Company, Cleveland, O. Capital stock, \$300,000.

The Standard Railway Equipment Company, East St. Louis. Capital stock, \$50,000. Incorporators: P. H. Murphy, C. F. Lodeberg and W. A. Rodenberg.

The Citizens' Lighting Company, Atlantic City, N. J. Capital stock, \$150,000. Incorporators: John H. Rothermel and J. H. Rothermel, of Reading, Pa., and Rodman Carson, of Atlantic City.

The Fast Greenwich Electric Light Company, East Greenwich, R. I.—to produce, sell, distribute, lease and use electricity for lighting purposes. Capital stock, \$100,000.

The Edmunds Electrical Construction Company, Fort Wayne, Ind. Capital stock, \$2,000. Incorporators: H. M. Edmunds, Chicago; F. W. Edmunds and Harry Bash, Fort Wayne.

The Barnabro Electric Light Company, Barnabro, Pa. Capital stock, \$1,000. Directors: Thomas Barnes, George W. Ziegler, Philipsburg; J. T. Shuger, Chester Hill; John Barnes, Barnabro; Alfred Tucker, Philadelphia.

The Gloucester County Electric Company has filed articles of incorporation with the county clerk at Woodbury, N. J. The incorporators are: Thomas M. Latta and M. K. Trichler, Philadelphia; John Mayhew, Woodbury Heights; Blair Smith, Wendenah; Isaac F. Imhoff, Glassboro; Rudolph McFarland, Monroeville; D. W. Green and Bingham Hood, Pitman Grove, and David O. Watkins, Woodbury. The new company has purchased the plant formerly belonging to the Pitman Grove & Glassboro Company.

The St. Cloud Water Power Company, St. Cloud, Minn.—to build and improve dams, canals, etc., and build and operate railways and telegraph and telephone lines in the State of Minnesota. Capital stock \$25,000, and limit of indebtedness \$150,000. Incorporators and first board of directors: Richard B. Fisher, Clinton B. Wright and William Checkley Shaw, all of Baltimore, Md.; Edward E. Clarke and David T. Calhoun, of St. Cloud.

The Buffalo & Lockport Railway Company, Buffalo, N. Y.—to operate a street surface railroad from Buffalo to Lockport. Capital stock, \$1,000,000. Directors: Burt Van Horn, H. J. Pierce, R. L. Fryer and G. H. Dunbar, of Buffalo; J. A. Merritt, S. Curt Lewis and F. M. Ashley, of Lockport; F. A. Dudley and W. Caryl Ely, of Niagara Falls.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 3, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

603,288. Electric-Arc Lamp. Timothy H. Pettingill, Amsterdam, N. Y. Filed Sept. 7, 1897.

603,383. Electric-Arc Lamp. Alfred W. Knutson, Galesburg, Ill. Filed April 30, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

603,515. Electrical Apparatus. William Stanley, Pittsfield, Mass., assignor to the Stanley Instrument Company of Massachusetts. Filed Jan. 28, 1897.

603,521. Electric Dental-Engine Controller. James J. Coachman, Rio Janeiro, Brazil. Filed Aug. 21, 1897.

603,604. Electric Conveying System. Alvaro S. Krotz, Springfield, Ohio, assignor to Oliver S. Kelly, same place. Filed Dec. 2, 1897.

SIGNALS AND SIGNALING APPARATUS.

603,349. Electric Signal System. Louis C. Werner, Broad Brook, Conn. Filed June 12, 1897.

603,300. Electric Signal System. Louis C. Werner, Broad Brook, Conn. Filed June 17, 1897.

MISCELLANEOUS.

603,263. Process of and Apparatus for Electrolytic Tanning. Edward Davis, Philadelphia, Pa., and Horace R. Mustard, Smyrna, Del. Filed July 27, 1896.

603,270. Automatic Electric Fire Alarm. Walter E. Frost, Lewiston, Me., assignor to Orland S. Ham, same place. Filed June 30, 1897.

603,286. Electroplating Apparatus. Louis Pothoff, Flushing, N. Y. Filed April 22, 1897.

603,331. Electrical Attachment for Gas-Lights. Franklin L. Kellner and George S. Barrows, Philadelphia, Pa., assignors to the Welsbach Light Company, Gloucester City, N. J. Filed Nov. 22, 1897.

603,451. Electric Programme-Clock. James O. Lyman, Waterbury, Conn. Filed April 25, 1897.

603,499. Art of Making Plates for Electric-Battery Purposes. Alfred C. Croftan, Chicago, Ill. Filed Feb. 5, 1897.

WANTED FOR THE UNITED STATES NAVY.—Qualified men for the ratings of ELECTRICIAN. Applicants must be capable of performing all duties pertaining to the care, preservation, and manipulation of a ship's electric lighting plant and its appurtenances, together with all other electrical appliances; they must also be physically qualified. First enlistment is made in the rating of Electrician, second class, (\$35 per month), with possibility of future advancement to Electrician, first class, (\$40 per month), and Chief Electrician, (\$50 per month). In addition to the pay stated, there is a ration allowance of 30 cents per day. Enlistments in this rating are made only at the Navy Yards, Brooklyn, N. Y.; Boston, Mass., and Mare Island, Cal.

TELEPHONE AND TELEGRAPH.

Telegraphy in War.

The Washington correspondent of the *Evening Post* offers some suggestions which it would be well for the Government to heed in the equipment of our naval vessels and land forces. "The battle of Manila," he says, "offers an illustration of the wisdom of having experts in telegraphy and electrical engineering attached to every army or fleet. It ought not to have been necessary to keep the world so long in ignorance of what Commodore Dewey had actually accomplished. If the electrical end of his establishment had been cared for as scrupulously as its strictly fighting end, he could have made his victory even more complete in its moral effect by showing the Spaniards the hopelessness of a war against so ingenious a people as ours. . . . It should be the care of every commander of an army or a fleet to have with him a small corps of men who not only understand the working of the telegraph key and read messages by sound, but are shrewd enough to do a thousand things in the way of repairing and emergency work which may be called for when no outside aid can be procured. These men should understand splicing wire and cable in any condition and amid any surroundings. They should be of trained ingenuity in running down and locating breaks in the connection. They should have enough sobriety of judgment to be able to play the censor if necessary on despatches put into their hands to send. They should be telegraphic geographers, as well as everything else, having at their fingers' ends the directions and junctions of telegraph lines all over the earth, for it sometimes becomes of the very first importance to send a message to the other side of the enemy's country without actually passing through it.

"The use of electricity in warfare has grown very much within the last ten or fifteen years, but the war between Spain and the United States promises to do more to illustrate the possibility of this branch of science than has been dreamed of heretofore. Telegraphy and telephony will both be called into play to do what has formerly been done by wig-wag signals, sending dispatches by courier, etc. Telegraph wire has been reduced so in weight that a man can transport two miles of insulated double conductor as rapidly as a column of cavalry can move. This includes the weight of the reel for paying out the wire, as well as of the wire itself. The flying field telegraph and telephone makes a kit weighing not to exceed thirteen pounds, and this includes a diminutive Morse key and buzzer so that messages can be sent simultaneously from both instruments."

The annual report of the New England Telephone & Telegraph Company for the year 1897 shows: Revenue—Exchange service, \$2,397,735; toll service, \$555,912; private line, \$67,738; messenger, \$37,805; real estate, \$1,000; interest, \$16,132; miscellaneous, \$19,767; total, \$3,097,089; increase over 1896, \$316,437. Expenses—General and taxes, \$388,370; operating, \$491,572; maintenance, \$1,091,607; private line, \$10,047; rental and royalty, \$223,795; messenger, \$34,044; real estate, \$810; interest, \$192,489; total, \$2,130,664; increase over 1896, \$260,947. Net revenue, \$660,425; dividends, \$569,543; surplus, \$90,882, or \$5,873 less than last year. The report states that the addition to the number of exchange subscribers during the past year was by far the largest recorded in any year since the company began business. The expenditure for new construction and properties purchased during the year amounted to \$464,765, of which \$182,771 was for exchange aerial construction, \$129,548 for underground work, \$51,176 for equipment, and \$98,268 for toll lines. The company acquired during the year the property of the Vermont Telephone & Telegraph Company, operating in Montpelier and vicinity.

"News of the fighting in Manila, on the other side of the earth, travels more than 14,000 miles, over a dozen or more cables and three or more overland wires, before it gets to this city," says the *New York Sun* of the 3d inst. "Very few persons, among the thousands who watch the bulletin boards these days stop to think when a Manila dispatch is posted that the message was repeated over and over again as it was sent from cable office to cable office in the long journey from the Philippine port to the American shore. It traveled across seas, gulfs, bays and straits, mountains, valleys and plains. But yesterday the news that Commodore Dewey was ready to bombard Manila was known in this city in thirty-five minutes, in actual time, after the British operator at Manila opened his key. The cables were rushing things."

A special dispatch to the *St. Paul Dispatch* from Chamberlain, S. D., states that representatives of a telephone company which now has lines connecting all the principal towns in the eastern portion of South Dakota are visiting that section of the State to arrange the preliminaries for extending the line to the Missouri river. The line now reaches Madison, and it is the purpose of the company to extend it to Woonsocket, Mitchell, Chamberlain, Yankton, Huron and Pierre, giving these towns telephone connec-

tion with St. Paul, Minneapolis and other outside points, as well as the chief towns of South Dakota.

At the annual meeting of the stockholders of the New England Telephone & Telegraph Company, held in New York on the 2d inst., the following directors were elected: Charles F. Ayer, John H. Cahill, Benjamin C. Dean, William H. Elliot, John E. Hudson, Henry S. Hyde, David B. Parker, Moses G. Parker, Stephen Salisbury, Thomas Sherwin, Winfield S. Hutchinson and Thomas B. Bailey. The old officers were re-elected.

Ten thousand shares of Drawbaugh Telephone and Electrical Appliance Company stock were sold last week in Harrisburg, Pa., at trustees' sale. Daniel Drawbaugh, the inventor and prime mover in the company, was the purchaser at his bid of \$11,600. It is understood that a pool is being formed to get a corner on this stock. Drawbaugh is at work on a device which he claims will be valuable in warfare and mining.

T. B. Dixon, of Henderson, Ky., who claims to have invented a method of sending four messages on one wire at the same time in a way that is a decided improvement on the present quadruplex, has been permitted to put his instruments in the office of the Postal Telegraph Company at Buffalo, where a test will be made with New York over the wires of the company.

The *Journal of Commerce* says: "A prominent firm in the Argentine trade says that as far as power-houses and electrical railroad material is concerned manufacturers in this country can count on the bulk of the business of the Argentine Republic. They should now try and secure a share of the telegraph supplies business, all of which is going to England at prices on many articles in excess of that of the Americans."

The Stromberg Company having brought suit at Webster City, Ia., against the E. H. Mario Telephone Company on an attachment for \$2,000, the latter company has entered a counter claim of \$500 on the attachment bond and an additional claim of \$1,000 for damages.

There has just been installed in the White House at Washington the most complete telegraphic communication not only with every community of the United States but with well nigh every square mile of territory in the civilized world. This can be placed in circuit with our land forces everywhere, and if need be with naval vessels far out at sea.

The Electrical Committee of Councils in Philadelphia, to whom was presented the Drawbaugh Telephone Company's revised ordinance, has referred it to a sub-committee consisting of Messrs. Hetzel, Klemmer, Upperman, F. Stevens and McMullin.

The Omaha *Bee's* Gering, Neb., correspondent states that thirty-five shares of stock have been subscribed for a telephone line from Gering to Kimball by way of Harrisburg, and that considerable more stock will be subscribed at Kimball and Harrisburg.

The druggists of Washington, D. C., have become so dissatisfied with the methods of the local Bell company that they have ordered the "dime in the slot" phones removed from their stores.

Under the new tariff now in operation in Chili, S. A., telephonic and telegraphic instruments, insulators, iron or steel posts and all other special accessories for telegraphs and telephones, with the exception of wooden cross pieces for the posts, are admitted free of duty.

The New State Telephone Company has secured a 30-year franchise from the village council of Inlay City, Mich.

The Board of Education at Los Angeles, Cal., has ordered telephones put in in all of the school buildings.

A telegraph line is to be constructed at once from Vancouver to Dawson City via Skaguay, Dyer and Wrangel.

New Companies Incorporated.

The Eastern Illinois Telephone Company, Kankakee, has certified to an increase of capital stock from \$15,000 to \$25,000.

The Kings Mountain Telephone Company, Kings Mountain, N. C. Capital stock, \$1,000. Incorporators: P. S. Baker, F. Dilling, C. E. Nesler, R. S. Plank and J. S. Manning.

The Freehold Telephone & Telegraph Company, Freehold, N. J.—to conduct a telephone business in and adjacent to Freehold and to connect with other lines. Capital stock, \$10,000. Incorporators: Frederick L. Benzon and R. J. Emory, Jersey City; S. A. Boyd, Brooklyn, N. Y.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 12½c.; casting, 11½c.

The passenger receipts of the Nassau railway system, Brooklyn, N. Y., for the month of April were \$166,797, an increase of \$25,356 over the same month in 1897.

The gross earnings of the Brooklyn (N. Y.) Rapid Transit Company last month increased \$53,988; for the ten months ended with April there was a gross increase of \$233,684.

The Metropolitan Street Railway Company, New York, began operating electric cars on its Eighth avenue line on the 7th inst. The cars run from Fifty-ninth street to Central Bridge, at 152d street.

The annual statement of the Chicago Edison Company makes an admirable showing. The organization earned 9.04 per cent. on the stock; the gross earnings increased more than 8 per cent., while the operating expenses increased less than 4 per cent.

The Baltimore & Washington Transit Company, which is now operating an electric railroad from Takoma to Sligo, Md., has made a mortgage for \$500,000 to the Guardian Security, Trust & Deposit Company of Baltimore as trustee. The Transit Company proposes to extend the road to Sandy Spring, Md.

The Boston "News Bureau" says: "The question having been raised as to whether or not the Fort Wayne Electric Corporation was paying the coupons on its debenture bonds, we find upon investigation that the coupons are not being paid in Boston as usual, but that they are being paid upon presentation at the office of the company at Fort Wayne, Ind."

M. H. Buehler, general manager of the Pennsylvania Telephone Company, on the 4th inst. placed on record at Chambersburg, Pa., a mortgage to the Harrison Trust Company in the sum of \$500,000, on the entire property of the company in the several counties of the State in which it operates. The mortgage is for improvements and big extensions, connecting with new lines in Maryland and Virginia. Bonds have been issued.

The Pittsfield Electric Company has been granted the right to issue \$25,000 additional stock and \$100,000 bonds by the Massachusetts Gas & Electric Light Commissioners. The bonds are to be of the 5 per cent. ten-year variety, and \$75,000 will be issued for the purpose of taking up existing bonds and \$25,000 for new improvements. The \$25,000 stock is to pay floating debts.

The Pasadena & Los Angeles Electric Railway Company's franchises, rolling stock and entire plant were sold on the 28th ult. to Don C. Porter of Pasadena, representing the reorganization committee, for \$150,000. The bonded indebtedness of the road is \$350,000. A majority of the bondholders had previously signed the agreement and those that did not will now have to come in.

The Philadelphia "Stockholder" gives as a reason for the advance in the stock of the American Railway Electric Light Company the understanding that some people identified with the management of a leading railway system have recently caused an exhaustive test to be made of the device of the company for lighting trains by the utilization of the waste power of the wheels, and contemplate the acquisition of control, adding to their holdings with this object in view.

The earnings of the West Chicago Street Railway for four months this year have been \$1,203,774, against \$1,151,757 last year, an increase of \$52,017. The gains have been about 5 per cent. The April gain has been below the average, amounting to only 3.2 per cent., the result of bad weather. The West Chicago system comprises 262 miles of track, and in the month of March carried 6,361,472 passengers.

The stockholders of the Lewiston & Auburn Horse Railroad Company have voted to sell their road to the Brunswick Electric Railroad Company. The latter is a new company, and it is understood will assume the name of the Lewiston, Brunswick & Bath Electric Railroad Company. M. J. Googan and Hon. W. H. Newell, of Lewiston, have been elected directors. The new company will have headquarters at Lewiston, Me.

The Bluff City Electric Street Railway has been sold to a new corporation, the Chicago & Milwaukee Electric Railway Company, which proposes to complete the construction and equipment of the road. The directors of the Chicago & Milwaukee Electric are: George A. Ball, A. C. Frost, George M. Seward, F. S. Reeves and C. E. Loss. Mr. Ball is president, Mr. Frost vice-president and treasurer and Mr. Seward secretary. The new company has a capital stock of \$1,000,000 and it will execute a mortgage securing an issue of \$1,000,000 bonds. It is estimated that it will cost \$750,000 to complete the road, which will then be 31 miles long.

An increase of the capital of the Stillwater & Mechanicsville Street Railway Company from \$60,000 to \$250,000 has been approved by the New York State Railroad Commission. The increase is to be used by the company in the construction of a new line to run from Mechanicsville to Waterford, where it is to connect with the Troy City Railway. This is taken to mean that it is only a question of time when an electric through line will extend from Troy and Albany to Saratoga Springs.

In a suit by Patrick H. Flynn against the Coney Island & Brooklyn Railroad Company and others, the Second Appellate Division has affirmed an order granting a preliminary injunction restraining the company from executing and delivering a trust mortgage to secure the issue of negotiable bonds to the amount of \$1,500,000. The Court holds, in an opinion by Justice Cullen, that the provisions of the stock corporation law of 1892, relative to the power of a corporation to borrow money and mortgage its property, apply to a railroad corporation and limit the amount of a mortgage which it may legally give to the amount of its capital stock or to two-thirds of the value of its corporate property, if that be greater than its capital stock.

John L. Shea, Commissioner of Bridges, submitted to the representatives of the elevated roads of Brooklyn, N. Y., on the 10th inst. a proposition that if the bridge railroad is run in connection with the elevated systems the latter must pay 45 cents a car for each of 1,600 cars a day as a minimum and \$12,153.44 for rent of terminals and repairs, making the total charge \$274,953.44 a year. If the bridges system is leased to the elevated roads, then they must pay 10 cents for each of 2,500 cars a day and \$20,306.28 for terminals, making \$111,556.28 a year. The representatives of the roads did not say whether they would accept the proposition. Under the agreement made with the old bridge trustees they were to pay 12½ cents for each car crossing the bridge.

The Metropolitan Street Railway Company, New York, reports results of its sub-lines' operations for the quarter ended March 31 as follows: Second Avenue Railroad Company, a deficit after fixed charges of \$33,217, a reduction of \$30,382 from 1897, cash on hand \$2,918, and a profit and loss deficit of \$77,586. Twenty-eighth & Twenty-ninth Streets Crosstown, a deficit after fixed charges of \$6,470, an increase of \$8,728 over 1897, and cash on hand \$29,007. Fulton Street Railroad, a deficit after fixed charges of \$1,268, a decrease of \$28 from 1897, and cash on hand \$9,277. Thirty-fourth Street Crosstown, a balance after fixed charges of \$21,112, a decrease of \$19,726 from 1897, and cash on hand \$3,659. The Metropolitan Street Railway Company for nine months has earned 4½ per cent. on the stock. The full year will probably show 6½ per cent. earned. The company's general balance sheet as of March 31 shows: Assets—Cost of road, etc., \$31,898,901; stocks and bonds, \$14,891,472; other permanent investments, \$9,782,409; supplies on hand, \$272,930; open accounts, \$378,870; cash on hand, \$2,562,857; total, \$59,787,441. Liabilities—Capital stock, \$30,000,000; debenture certificates, \$6,000,000; funded debt, \$8,900,000; general and collateral trust mortgage bond account, \$12,500,000; interest, \$48,358; dividends unpaid, \$590,268; profit and loss surplus, \$1,748,814; total, \$59,787,441.

EDITORIAL NOTES.

The Proposed Pan-American Exposition.

On the 29th of April a bill was introduced in Congress for the purpose of securing Governmental and Presidential recognition for the proposed Pan-American Congress which is to be held in 1901 at Cayuga Island on the Niagara frontier. The Exposition, in the opinion of the Committee on Ways and Means, will be of great value as an object-lesson to the people of the New World, showing them in what degree they have aided and participated in the development of industries during the past 100 years. The Committee in their report say: "It will also serve as a valuable reminder of those principles which were voiced in the utterances of the Monroe doctrine in the earlier days of the republic of the United States, and which have been emphatically reiterated in the reciprocity views of late days. The history of the United States and of many of the countries of North and South America practically began 100 years ago, and the accomplishments in various branches of human progress during the century have far surpassed those of any other period of the world's history."

In the opinion of the Committee, the Exposition should greatly stimulate the commercial relations between the countries of North and South America. They think that the Niagara frontier is peculiarly suitable for the requirements of such an Exposition, being the center of the largest population on the North American continent. Within a radius of 500 miles there is a population of 38,000,000, having unparalleled transportation facilities, both land and water. The Committee report continues:

"The Niagara frontier, intersected by the famous Niagara River, flowing from Lake Erie over the still more famous falls through the picturesque gorge to Lake Ontario, is a location of vast historical importance and great natural interest. At the inlet of the Niagara River is the thriving city of Buffalo, the gateway through which ebbs and flows a vast tide of traffic by land and water between the far West, the Northwest, the Dominion of Canada, the Atlantic seaboard, the great mining and industrial territory of Ohio and Pennsylvania, and the New England States.

"The Niagara frontier, being within the borders of the State of New York, can, with especial force, request recognition from Congress on account of its location, because recognition has already been extended to other sections of the United States. Expositions at which important Government exhibits have been made have already been held at New Orleans, Atlanta and Nashville in the South, at San

Francisco on the Pacific slope, at Omaha in the West, at Chicago in the middle West, and Pennsylvania was honored at the Centennial in 1876. An Exposition on a large scale, such as is now contemplated, has never yet been held within the borders of New York or the adjacent New England States."

It was originally intended that the Pan-American Exposition should be held during the summer of 1899, but owing to the more or less unsettled condition of the country it was deemed advisable to postpone the date. The year 1901 is said to have been selected to avoid any seeming discourtesy to the Paris Exposition of 1900. It is moreover thought that many valuable lessons may be learned and exhibits secured from the French Exposition.

A number of well known New Yorkers prominent in financial and mercantile circles are the organizers of the Pan-American Exposition Company. This organization was the outcome of the action taken by the American Exhibitors' Association at a meeting held at Atlanta, Ga., during the Cotton States Exposition, deciding that the Niagara frontier was a most suitable place for a big Exposition to be held if possible in 1899, and pledging the Association to support the enterprise should it be undertaken by responsible people.

Upon examination of various points suggested along the Niagara frontier, Cayuga Island was selected for the purpose.

This island contains some 200 acres of land, and is separated by a narrow stream called the Little Niagara from the mainland. Cayuga Island is situated between the cities of Buffalo and Niagara Falls, and is easily accessible from all the great trunk lines from east to west. The Exposition is to be Pan-American—that is, especially devoted to the interests of the countries of North and South America.

The joint resolution is similar in its scope to that adopted for the Chicago, Atlanta, New Orleans, Nashville and Omaha Expositions. It would seem that the great section of the country east of Chicago and north of Atlanta deserves recognition at the hands of the National Government. It simply authorizes the President to call the attention of the Governments in the Western Hemisphere to the intent and purpose of this Exposition after he has been fully satisfied that the financial resources of the company are fully assured. It also contains the usual clause permitting the exhibits of foreign countries to enter free of duty for exhibition purposes only, with the usual clause for the protection of the revenue, and requiring the company to pay all the expenses, including the salaries of customs officials in charge of the exhibits.

An Exposition such as the Pan-American Exposition Company proposes to hold should certainly benefit the electrical industry at a time when most of the

countries of South America are gradually awaking to the importance of electricity as a motive power. Being in the same hemisphere with South America, and its near neighbor, it is only natural to suppose that when a large demand has been created for electrical apparatus in that section, the United States will be the country that will do the largest amount of exporting. By helping to create a demand for electrical machinery and other manufactured products in South American countries, the proposed Pan-American Exposition should prove of immense benefit to our own manufacturers and of profound interest to all those associated in any way with the material advancement of the Southern republics.

* * *

An Electric Fire-Engine. An electric fire-engine has recently been invented by a resident of Indianapolis that will do away, so it is claimed, with many of the objections attending the use of the existing fire extinguishers. The device consists of an annular reservoir of metal, supported on suitable wheels, which goes to make up the main frame of the wagon upon which the rest of the apparatus may be mounted. The reservoir when not in use is kept empty. It is provided with a number of openings with nipples to each of which may be attached a line of hose. The openings are all equipped with suitable valves, enabling at any time a line of hose to be either attached or detached without in any way interfering with the operation of the engine. A large rotary pump is mounted upon the reservoir, and forces water directly into the latter, supplying from it all the lines of hose which may be attached. The pump is operated through a set of gear wheels by an electric motor. The conducting wires are wound on a reel mounted near the motor in such a way as to enable them to be readily drawn off and attached to any suitable source of power such as trolley wires, electric light wires or established stations that every city would be obliged to put in on adopting electric fire-engines. The rotary pump is so arranged that it may draw its water supply either from a cistern, river or directly from the ordinary fire plugs.

There are several advantages claimed by the inventor for the electric fire-engine over the steamers now generally in use. It does away in the first place with the reciprocating pump, which is said to be inefficient, and enables the boiler to be discarded. Thus the weight of an electric fire-engine is but 3,600 pounds, considerably less than that of the ordinary type of engine. Furthermore, a number of lines of hose can be successfully operated from the same reservoir in this new device, whereas at the most but two could be attached to the old form of fire extinguisher.

On the other hand there would seem to us to be one serious objection to the electric fire-engine which it would prove difficult to overcome, or at least would take considerable time and missionary work to induce city officials to see it in the proper light. A city in adopting this new device would have to make connections with either underground cables or overhead wires, so as to lead the current to, say, every hydrant or other accessible point where in case of a conflagration an engine could obtain a sufficient amount of current for the operating of the pump. In the case of a sparsely settled district, as for instance the outskirts of a city, this would undoubtedly prove an expensive undertaking.

Another vital point which should not be overlooked in this connection is the danger of a break occurring somewhere in the electric circuit, as frequently happens with both telegraph and trolley wires during heavy storms. Were such an event to take place, and a fire to break out, the electric fire-engine would be useless. Electricity unquestionably has its field of application, but we doubt whether the electric fire-engine would prove a success under existing conditions.

The Electrical Exhibition. As the third week of the Electrical Exhibition opens it is really surprising to note how the attendance is increasing. This is principally owing to the fact that those who have once visited the show explain to their friends the necessity of visiting Madison Square Garden and keeping up to date in electrical progress. Even in the short space of two years, since the last Electrical Exhibition held in New York, electricity has found many new and useful applications which are fully illustrated at the present Exhibition. Causing a bell to be rung through the medium of electricity without the use of wires, over a distance of about 180 feet, or from the south to the north gallery of the Garden, ordinarily fills the unscientific visitor to the show with wonder.

A business man might travel day in and day out on one of the electrically operated lines of the Metropolitan Traction Company without having the most remote idea how the car on which he was riding was propelled. At the Exhibition at the Garden a full sized car is kept moving backward and forward over a short section of conduit; the latter, open at both ends and lighted internally by a number of incandescent lamps, allows the visitor to see exactly how the current is collected and delivered to the motors. The management are constantly striving to make the show not only attractive but instructive as well, and needless to say, they are succeeding beyond their fondest expectations. It is not saying too much to state that the show now going on in Madison Square Garden is a liberal education in itself. From the beautifully arranged wax figures in the Concert Hall, representing the birth of electricity, to the operating dynamos in the basement, which embody the highest state of the art we have yet reached, there is an immense amount of valuable information to be gathered.

Under the Searchlight.

Notes and Comments on Various Topics.

THE following from the *Boston Commercial Bulletin* of May 14 sizes up in an excellent manner the situation in regard to the methods of the General Electric Company. The last paragraph is especially true, and the only way it can be accounted for would seem to be in the fact that there is a fool born every minute:

General Electric also received some special attention for the first time in several weeks. The rumors accompanying the two or three point advance were of the familiar type, the flat statements being made on Wednesday that arrangement had been made with rival concerns, that a scaling of capital and paying off of accrued dividends on the preferred stock were in contemplation.

All this was taking the future pretty abruptly in hand. But the truth is, that in this, as in other stocks, the purpose of manipulators seems to be merely to take advantage of a general upward tendency in prices, and having bought on reactions in the market, to get the best price obtainable through circulation of some such bullish "rumor." The outside public is on the whole rather quick to bite at such bait.

* * *

A VERY compact electric plant is said to have been installed in a Chicago commercial house, in which one dynamo is made to do the work of two. This machine has a double set of armature windings and two commutators, being so designed that both 110-volt and 220 volt circuits can be run from the single dynamo. Each commutator gives 110 volts, and for lighting purposes the circuits are so grouped as to maintain approximately an equal number of lights on each side of the machine. For running the elevator motors, which require 220 volts, the two 110-volt sides are connected in series, thus giving the required pressure. This connection is carried out by a special arrangement of switches on the switchboard, each commutator of the machine being connected to a double pole single-throw switch, which is connected to half of the 110-volt incandescent lighting

system. Each commutator is also connected to a three-pole switch for the power circuit. When this switch is closed, the two commutators are connected in series, but when open they are entirely independent. Over 600 incandescent lamps and 46 incandescent arc lamps are run from this machine, in addition to two electric elevators, one for passengers and one for freight.

* * *

THE Boston, Mass., *Advertiser* refers to the rumor that the General Electric Company contemplates doing something in the way of a settlement of its accumulated dividends as follows:

The alleged "plan" of settling with General Electric preferred stockholders by giving them new stock for their accumulated dividends and reducing the dividend rate to 5 per cent. is amusing. This would make about \$10,000 difference in dividends per year and would put the preferred shares on a basis of selling price too low to think about. Well about 60 is the most that could be expected of an industrial stock paying 5 per cent. When it is added that debentures may be reissued, that caps the climax. Probably this preferred plan is not within gunshot of what it will be. But the cutting of the common in two is just as likely as the other is improbable.

* * *

AFTER several weeks of hard labor General Superintendent Baker of the Telephone Company has discovered the cause of an interruption of the telephone service in the borough of Stonington, Conn. For a long time the subscribers in Stonington have been annoyed by the failure to get "Central" by repeated ringing. The central office for Stonington is located at New London. The service was all right during the day up to 9 o'clock at night, but after that hour communication was out of with the outside world. Efforts were repeatedly made to discover the cause of the mischief, and finally linemen were sent out from New London and outside of the city they tapped the main wire. It was found that the trouble lay somewhere near the railway station, and by testing from post to post it was located at a railroad crossing where the arm of a safety gate was found to be resting against the wire, grounding the current and shutting off communication. The arm was removed and "bellos" immediately began pouring into the ears of the New London operator like a rush of water from a canal when the gates are opened.

* * *

Mr. Coffin Becoming Esthetical.

(From the *Schenectady Union*.)

All of the many acres of land owned by the General Electric Company will not be used for commercial purposes, for in a short time a large plot at and about the main entrance of the works will be converted into a bower of beauty.

The land is now being sodded and in time numerous flower beds will be laid out. The work is under the supervision of a noted Rochester landscape artist, and he promises to create the most beautiful spot in Schenectady.

The garden is being made at the personal suggestion of C. A. Coffin, president of the company, and he is taking much interest in the work.

* * *

AMONG the prominent citizens of a certain town are the Blanks, who are said to have made a large fortune through a well-known electrical invention, and whose luxurious home is fitted up with all the electrical improvements that make life worth living. Wealth has not spoiled Mrs. Blank, however. She still continues the most simple-hearted, old-fashioned and conventional of women. Not long ago a friend of Mr. Blank paid his first visit to the house. "By the way," said the host, as he bade his guest good-night, "when you want your bath in the morning you needn't take the trouble to go to the bathroom. Just press this button and the tub will come to you." The guest, accordingly, did as he was bid, and when he wanted his bath the next morning he merely pressed the button. Sure enough, a secret door flew open in regular Arabian Night style, and the tub sailed in. But evidently there had been some miscalculation, and they hadn't counted on the guest wanting his bath at just that hour. For in the tub was—Mrs. Blank.

SECOND WEEK OF THE ELECTRICAL EXHIBITION.

An Unusually Large Attendance—The War Bulletins Produce Patriotic Demonstrations—Telegraph Tournament a Feature of Interest—Greatest Exhibition of the Kind Ever Held in New York

The Electrical Exhibition in Madison Square Garden is now in full swing, and thanks to the untiring energy and perseverance of the management everything is running smoothly, and the many exhibits and special features of interest are attracting wide attention. The practical uses to which electricity may be adapted for lighting, heating and power purposes are a revelation to those who are uninitiated. A unique and novel feature is the high chandelier, bearing scores of arc lights, which one sees on entering the main hall. This has been appropriately named an "aroclier," and is the first attempt to use arc lights in such a manner. The great electric fountain in the center of the Garden, and on which Mr. Thomas A. Edison, Jr., is said to have spent a great deal of time, is now in thorough working order and is another source of delight to the visitor.

The Moore Chapel, with its vacuum tube lights, continues to attract general attention and to call forth many expressions of admiration. The collection of medals which is to be found in this same apartment, produced by the "galvanoplastic" process, well repays a careful examination. Other reproductions of natural objects, such as leaves, fish, frogs and snakes, obtained in the same manner, are also shown. It is through the courtesy of Mr. H. V. Parsell, the well-known banker of this city, that these interesting electro-depositions have been placed in the hands of his son, Mr. H. V. Parsell, Jr., the electrical engineer, for exhibition. It is doubtful whether any other amateur can show anything approaching this remarkable collection in beauty and interest. While gazing at this collection it may interest some of our readers to know the manner in which the reproduction of live animals is accomplished. In making a galvanoplastic reproduction of a snake, the latter is first etherized under a bell jar, then taken out and greased with sweet oil and replaced in the jar while a sufficiency of thin plaster is mixed with warm water. The snake is then placed on a glass plate and posed. When the plaster is hard it is freed from the sticks and glass plate, and the now defunct reptile is carefully removed, tail first, from his intaglio impression. The plaster cast thus obtained is rendered waterproof by immersion in molten paraffin. A metallic conducting surface must now be given to the interior of the cast. This is done by moistening the surface of the mould with a solution of silver nitrate and by exposure to sulphuretted hydrogen, precipitating the silver on the cast. A conducting wire is fastened around the edge and the mould is carefully suspended in the depositing bath. A good firm coating takes about three days to form, and then the mould is softened in boiling water and carefully broken off.

The Marconi system of wireless telegraphy continues to be made use of for firing the submarine mines. Crowds gather four times a day around the tank and wait patiently to see the miniature men-of-war blown to pieces.

The Telegraphic Tournament that had been looked forward to with much interest was begun Saturday afternoon. The contests were held under the management of Mr. Fred. Catlin, and three classes tested their ability at sending messages from one of the ante-rooms of the Concert Hall into the main auditorium. About twenty-five young women and men holding positions in the largest telegraph offices of the country took part. In the women's class, which required the sending of the greatest number of words in five minutes, the first prize was won by Miss J.

McManus, the second by Miss Emma R. Vauselow.

In the class requiring the sending of 230 words in four minutes, the first prize was won by Charles F. Edney, the second by F. M. McClellie of Memphis, Tenn.

In the 240 words class, J. D. Hinnant won first prize by sending 253 words, and F. M. McClellie won second, sending 243 words.

The most interesting part of the tournament was reserved for the night session. This contest included four classes. The first was the message-receiving class in which fifty messages of the ordinary run of from thirty to thirty-five words were to be received. The time of this contest was about 32 minutes and a-half, decision being reserved, as it was necessary the judges should have an opportunity of comparing each man's work.

In the five-minutes' code-sending class the first prize was won by G. W. Conkling, who sent 345 words in a minute, the second prize going to W. M. Gibbon with 330 words.

In the code-receiving class decision was reserved to give the judges an opportunity to compare the records.

The fourth class, known as the championship event, was the sending contest for five minutes. This was won by William M. Gibson over Fred. Catlin by three letters.

Altogether the results of the tournament were exceedingly gratifying and proved a great drawing card. In the evening Mr. Thomas A. Edison was present and acted as one of the judges.

COMPANY EXHIBITS.

The Babcock & Wilcox Company exhibit under actual working conditions, generating all the steam used in the Exhibition, two of their 250 HP. boilers of the forged steel inclined header type, which were built for the Metropolitan Street Railway Company, being part of an order of 16,000 HP. for the Metropolitan Company's power station at 96th street, New York. These boilers are built entirely of forged metal and are designed to carry 200 lbs. working pressure. This is the standard pressure now adopted by the Babcock & Wilcox Company for their high pressure work, but they are prepared to build on order boilers to carry any pressure in excess of this. In addition to the boilers under steam, the exhibit includes a model showing the interior arrangement and construction of the boilers and several examples of the steel forgings used in construction. These forgings are the result of long experiment, and the forged header especially is an interesting specimen of the high-class work that places the Babcock & Wilcox Company in the lead of builders of high pressure safety boilers.

The exhibit of the Fostoria Incandescent Lamp Company of Fostoria, O., attracts a crowd nightly owing to the brilliancy of several groups of red, white and blue lamps. The intensity of light which these lamps give out is frequently remarked upon and speaks well for the Fostoria "Duplex."

Stanley & Patterson of 32-34 Frankfort street, New York, have a varied and tastefully arranged exhibit located on the north promenade. This well-known concern is exhibiting among other things long distance and exchange telephones, toll line cabinet sets, electric light specialties, switches, electric bells, annunciators, wire, fans, desk lights, shades and Shelby incandescent lamps. The booth is brilliantly lighted by fifty-five 16 CP. incandescent lamps of different colors, nicely arranged, and by two

incandescent arc lamps. A full line of high grade electrical supplies for lighting, bell and telephone appliances may here be seen.

The Safety Insulated Wire & Cable Company of 225-241 West 28th street, New York, have a unique and exceedingly attractive exhibit situated on the north promenade. Among other things a glass tank filled with water in which floats a cruiser is shown, with an imaginary channel marked out by electrically illuminated buoys. Gold fish may be seen playing around the keel of the vessel, and the latter is so arranged that it may be moved forward between the lighted buoys. A miniature electric light also burns on the vessel. Attractive souvenirs are given away by this company showing the various layers of insulation on a cable. Altogether this is one of the most unique company exhibits in the building and attracts large gatherings nightly.

The Baylis Company, engineers and contractors, of 99 Cedar street, New York, are exhibiting jointly with the National Meter Company in the basement a 30 horse power double cylinder "Nash" engine direct coupled to a Walker generator. The Nash engine on exhibition has been especially designed for electric lighting service, and the exhibit is intended to show the developments made in the last few years in gas engines. The exhibit, moreover, shows that it is possible to obtain perfectly steady lights and regulation from no load to full load in a direct connected gas-engine electric lighting unit. Such an arrangement shows the feasibility of installing a complete electric lighting plant in a space where a steam engine and boiler, or even a belted gas-engine, would be prohibitive. A complete electric lighting plant in which a Nash engine is used of 300 lights capacity would occupy a floor space of but 10 x 5 feet. The Baylis Company exhibit may be seen any evening in operation furnishing lights to a portion of the Garden.

One of the most interesting features of the Electrical Show is the booth of the International Correspondence Schools of Scranton, Pa., whose New York enrollment office is located at No. 14 East 17th street. No better proof of the popularity of the methods of instruction employed by this institution could be shown than to watch some of their old students taking their friends away from the spectacular end to have them talked to by representatives of the Schools. The large number of friends they have around them is accounted for by the fact that they have now over 45,000 graduates and students throughout the world. The booth of the Scranton Schools, which by the way is located on the Fourth avenue side of the Garden, is very attractive. A picture of the school buildings 5 x 7 feet in size, surrounded by electric lights, showing the picture off to great advantage, hangs at the back of the booth. All engineers and electricians attending the Exhibition who desire to obtain a technical education in engineering or electricity will find it to their interest to visit this booth.

A very attractive exhibit is that of F. A. La Roche & Co. of 652 Hudson street, New York, the manufacturers of the well-known "Ideal" circuit breakers. This firm has on exhibition one of its modern switchboards, which was recently built for a large drygoods store in this city. On it is mounted the well known "Ideal" circuit breaker and the La Roche self-looking switches. The board is not only beautiful in appearance, being made of Knoxville gray marble, but is extremely substantial owing to its being mounted on heavy angle iron frames with brass pedestals. The bus bar work on the rear shows the high class of work this firm is in the habit of turning out. Another switchboard is also shown containing ten "Ideal" circuit breakers ranging in size from 25 to 2,000 amperes, with both single and double pole. The management report that the firm is extremely busy, it being necessary to run the factory 18 hours a day to supply the constantly increasing demand for their improved circuit breaker. This

company's booth is handsomely decorated and is illuminated by the La Roche alternator and direct current arc lamps. The main panel switchboard which controls the power and light for the entire Exhibition was manufactured and installed by F. A. La Roche & Co. The exhibit of this company at Madison Square Garden is in charge of Messrs. A. E. Wells, F. A. La Roche and J. A. Loutey.

The Riker Electric Motor Company of Brooklyn, N. Y., are exhibiting two of their well known electric motor vehicles. One is a delivery wagon manufactured for B. Altman & Co. of New York, while the other is a handsome victoria. A two-horse-power motor geared to the rear axle drives the delivery wagon, the motor and running gear being enclosed to prevent any accumulation of dust. The battery is located under the driver's seat, extending back a short distance into the body of the wagon. By means of removable side panels the batteries may without difficulty be taken out and recharged. Under ordinary conditions a delivery wagon of this nature will run from 25 to 30 miles

materials for rails and wire and a large assortment of sheet cork insulation for heat and cold. This company's cork steam pipe and boiler covering is used throughout the Exhibition.

SOCIETY MEETINGS.

A large number of lodges that go to make up the National Association of Stationary Engineers have still to hold meetings in the Concert Hall of Madison Square Garden as follows: May 18, No. 39, New York; May 19, No. 23, New York; May 20, Phoenix, No. 24, New York; May 21, No. 3, New Jersey, No. 8, New York; May 23, Nos. 32 and 47, New York; May 24, No. 1, New York; May 25, Nos. 55, 41, New York; May 26, No. 44, New York; May 27, No. 25, New York.

A weekly meeting of the New York Electrical Society will also be held at which papers on various topics of interest will be read. The second lecture of the Society's Exhibition series will be given in the Concert Hall on Thursday evening, 19th inst., at 8:30, by Professor J. Fujioka, of the Imperial Uni-

long exposures, to prevent them being fogged by diffused rays from the back or sides.

"Of the rays which are given off by the platinum plate of a focus tube, those are most effective for producing pictures which leave the platinum at as great an angle as possible, within a limit of 80°. The specific transparency of bodies is greater the thicker the body.

"The ratio of the thicknesses of two equally transparent plates of different material is dependent on the thickness and the material of the medium through which the rays have to pass before they reach the plates. For instance, the ratio of thickness of platinum and aluminum plates of equal transparency will be reduced to one-half if the rays are passed through a thick glass plate before they strike the metal plates.

"Roentgen, like Swinton and others, has shown that the contrast between bodies of different transparencies depends on the EMF. used to excite the tubes. A spark gap in the secondary circuit acts in the same way as an intercalated Tesla transformer; both pro-

VIEW OF THE ELECTRICAL EXHIBITION FROM NORTH PROMENADE.

without the batteries requiring to be recharged. The total weight of the vehicle, including battery, which in itself weighs 1,000 pounds, is 2,900 pounds. This company also manufactures surreys, buggies and traps.

The Gold Street Car Heating Company of Frankfort and Cliff streets, New York, are exhibiting a large assortment of electric heating devices used not only for warming cars and boats but buildings as well. All of the heaters exhibited by this company are fitted with the well known Gold improved resistance coil and support, and are moreover very handsome in design.

The Diesel Motor Company of New York are exhibiting, on the north side of the basement, a 20-horse-power motor which was recently imported from Germany. This motor, which may be seen in operation any evening, is run on petroleum. Thorough tests of this motor will be made under variable loads at the close of the Exhibition.

The Nonpareil Cork Manufacturing Company are exhibiting a full line of their well known insulating

versity, Tokio, Japan, on "Electricity in Tokio and the Kingdom of Japan."

Roentgen on the Roentgen Rays.

"Such a host of investigators have devoted themselves to the development of Prof. Roentgen's great discovery," says the *Electrical Review*, London, quoting from *Elektro Zeit.*, 19, p. 192, "that it would be no matter for surprise if there was nothing left for the discoverer to find out about his own discovery. Some novel properties of the X-rays, however, have been described by Prof. Roentgen in a third communication on this subject to the Berlin Academy. Among these the following appear to be especially interesting. If a fluorescent screen is covered with a plate completely opaque to the X-rays, a slight fluorescence can nevertheless be seen when the tube is in action. Roentgen has shown that this is due to rays proceeding from the air of the room, which emits X-rays wherever it is itself exposed to their action. This fact points to the necessity of placing photographic plates in a sheath of lead when used for

duce more intense and less easily absorbed rays. By the use of a Tesla transformer and wire electrodes in a narrow tube, X-rays can be produced with a vacuum of 3.1 mm., the usual vacuum being, of course, about 0.0002 mm. Hard tubes, as Roentgen calls those tubes which require a very high EMF., can be softened, as is well known, by heating or by readmission of air, or, as is not so well known, by heating limetree charcoal placed in a side tube, or by sending through the tube a very powerful discharge. The composition of the rays given off by the platinum anti-cathode depends essentially on the time change of the discharge current. The quality of the rays is not affected by the change of the primary current, but their intensity is proportional to the strength of the primary current."

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1898.

THE ELECTRO-CHEMICAL INDUSTRIES OF ENGLAND.

ARTICLE I.

(Specially Contributed by JOHN B. C. KERSHAW, F. I. C., London.)

Twenty years ago the industrial applications of electricity in Europe in the domain of chemistry and metallurgy were limited to two manufactures—that of electro-plate, a business in the hands chiefly of the famous Birmingham firm of Elkington Bros., and that of refined copper. The latter industry was carried on upon a very small scale of operations, and the combined output of the Pembrey and Hamburg refineries—the two largest at that date—did not much exceed 1,000 tons per annum, while the total number of refineries in Europe was only six or seven.

Ten years later, electro-plating and copper refining were still the only two electro-chemical industries. But the latter industry had steadily increased in Europe under the stimulus of the demand created by electrical engineering for the purest form of copper, and the electrolytic method of copper refining had been introduced into the United States by the Balbach Company of Newark and by the Baltimore Smelting & Refining Company. At this date there were four electrolytic copper refineries in operation in England, with from eight to twelve scattered over the Continent of Europe.

The progress that has been made since 1888 has however been remarkably rapid, and while ten years ago there were many who believed electricity would have but a very minor rôle to play in the chemical and metallurgical industries, the enormous expansion of the electrolytic copper refining industry, and the marked success which has attended the use of electrolytic methods in the manufacture of aluminum and chlorate of potash, have now reduced the number who hold this belief to a very small minority of the community.

This change in the views of practical men with regard to the possibilities of electricity as an agent for promoting chemical reactions upon a manufacturing scale, is due to the rapid growth of the past ten years.

There are now no fewer than eighteen distinct electro-chemical or electro-metallurgical manufactures carried on in different parts of Europe and America in over 150 manufactories, while the production of one article—electrolytic copper—has increased from between ten to twenty thousand tons in 1887 to over 150,000 tons in 1897—that is, to an amount nearly equal to one-half the total copper production of the globe.

This progress would have been impossible except for the cheapened sources of electricity that are now available when current is required in large quantities.

The experience gained in the period 1880-1890, when electric lighting was absorbing all the attention of electrical engineers, has led to valuable improvements in the efficiency of both engines and dynamos, and the more recent development of large water-powers for manufacturing purposes has still further tended to reduce the cost of electrical energy. This is to-day being produced for manufacturing operations at a cost which twenty years ago would have been considered below the limits of possibility.

Great as the electric lighting industry has become in both Europe and America, there are only few lighting installations in either continent with a dynamo capacity equal to that of some of the larger and more important industrial undertakings of the character now under consideration.

In these electro-chemical industries, single power plants of between 2,000 and 4,000 HP. are common; and the greater portion of the power to be developed from the numerous water-falls of both the New World and the Old will undoubtedly find utilization in these comparatively new industries.

In England, owing to the lack of large natural water-powers suitable for industrial development, the electro-chemical developments that have occurred have with two exceptions had to depend upon coal for their supply of the electric current; and two of these undertakings possess steam plants of the most modern description for generation of their electrical energy.

The writer has been fortunate in obtaining from

tro-Chemical and Electro-Metallurgical Industries of Europe."

The Castner Kellner Alkali Co.—Two views are given of the works of this company at Weston Point, Lancashire. The company was formed in 1896 with a capital of \$1,440,000 and the manufacture of caustic soda and bleach by the first 1,000 HP. installation of plant was commenced early in 1897. The results of the working of this plant have been satis-

ENGINE AND DYNAMO ROOM OF THE CASTNER-KELLNER ALKALI WORKS, WESTON POINT, ENGLAND.

those at the head of some of the more important electro-chemical industries in England permission to use, in these two special Articles, certain photographs which they have placed in his hands. These will, it is hoped, help to convey to the readers of *ELECTRICITY* a more correct idea of the scale of operations than is possible by written descriptions; and they will also, where views of the engine plant are included, show the type of engine that has been

factory, and the extension of the works to the originally designed capacity of 4,000 HP. is now proceeding. The shares of this company were quoted at a premium at the commencement of the present year, a fact that speaks well for the confidence of the investing public in the future of the undertaking. The process depends upon the decomposition of a solution of common salt by means of the electric current, mercury being used as cathode material and

CELL ROOM IN THE CASTNER-KELLNER ALKALI WORKS, WESTON POINT, ENGLAND—CAPACITY 1,000 HP.

adopted for generating these large units of power. Only a brief account of the chemistry of the process or of the apparatus used will be given; readers desiring fuller information concerning these are referred to the previous issues of *ELECTRICITY* in which they have been dealt with at considerable length by the present writer, under the heading of "The Elec-

carbon for the anodes. By a mechanical device the cells are subjected to a periodic tilting movement which brings the sodium amalgam formed at the cathode into contact with water, and, whilst regenerating the mercury for use in the cathode compartment of the cell again, produces a solution of sodium hydrate practically quite free from sodium chloride. The

chlorine liberated at the carbon anodes is conducted away, and is used in the ordinary manner for the manufacture of bleaching powder.* The English Castner-Kellner Company has made a deal with the "Deutsche Solvay Werke Aktien Gesellschaft" whereby the latter company has undertaken to accept delivery of the whole of the bleaching powder produced at Weston Point during three years at a fixed price. This arrangement of course gives stability to the position of the Castner-Kellner Company and ensures a market for its products. Owing to the output of bleaching powder by this company and by the other electrolytic alkali company at St. Helens, the market price of 35 per cent. bleaching powder has already dropped about \$5 per ton, and a further fall may occur during the present year. Some difficulty has arisen, it is believed, in the conduct of the electrolytic process, due to the impurities of the brine pumped from the Cheshire salt mines, and the second 1,000 HP. installation of plant is to be used for the production of caustic potash from Staßfurt potassium chloride. It may interest readers of *ELECTRICITY* to know that this process is now at work at Niagara in the factory of the Mathieson Alkali Company, and 1,500 HP. is now utilized at this spot in the production of caustic alkalis and chlorine products. A minimum royalty charge of \$19,000 per annum is to be paid by the Mathieson Company to the Aluminum Company of Oldbury, England, who at the date of this agreement were the owners of the American rights of the Castner-Kellner process.

ELECTROLYTIC REFINING OF LEAD.†

BY SHEPARD COWPER-COLES, M.I.E.E., A.M.I.C.E.

Lead, when recovered from its ores by smelting, is obtained as a crude metal, the so-called work lead, which has to go through a refining process in order to obtain soft or market lead. Work lead is obtained either by roasting reactions, by reduction, by roasting and reduction, or by the precipitation process. Refining is effected either by oxidation after fusion or by electrolysis. Lead is never obtained pure when smelted from the ore. It is almost always alloyed with all the other metals contained in the ore itself. Apart from the fact that the useful properties of the metal are affected by these other metals, it is, of course, advisable for economic reasons to recover the precious metals present, such as silver.

One of the first processes worked on a commercial scale for the electrolytic refining of lead by electrolysis was that of Keith. In this process the crude or work lead is melted at the lowest possible temperature in iron kettles from which it is tapped into moulds. The anodes thus produced are fastened to metal rods by suitable clamps, and enclosed in close-fitting bags of coarse muslin. The electrolyzing cells are made of wood or iron; the cathodes are thin metal plates attached to rods in a similar manner to the cathodes. The electrolyte is composed of lead sulphate dissolved in an aqueous solution of acetate of sodium; it is made by electrolyzing with lead anodes a mixture of $1\frac{1}{2}$ lbs. of acetate of sodium, 2½ ounces of sulphuric acid, and 1 gallon of water, and is heated to 38° C. The sulphuric acid attacks and the acetate dissolves the lead, zinc and iron of the anodes. The zinc and iron, being electro-positive to lead in the liquid, are less easily reduced to metal and accumulate in the solution, and when dissolved in considerable quantity are, to some extent, deposited as oxide on the cathode, the current density employed being about 1.86 amperes per square foot. The lead which is deposited on the cathode is crystalline in form and separates continually from the plates, a space being left in the cells for its accumulation. When the anodes have been dissolved, the

bags suspended from their supporting rods are carried to a reservoir and the residual solid matter from the plates is washed and returned to the melting kettles. The slimes suspended from the wash water are allowed to settle, the water is drained off, and the residue filtered. The slimes usually contain antimony, arsenic, silver, copper, gold and iron. A process that has been recently tried on a commercial scale is that of Tommasi. In this case, the electrolyte is the double acetate of lead and potassium (or sodium), the anodes are crude argentiferous lead, and two of these are opposed to a copper or aluminum alloy cathode, which is in the form of a disk rotating at the rate of from one to two revolutions per minute.

These disks are about 10 feet in diameter and three-quarters of an inch thick and are half immersed in the liquid. At the upper part are scrapers which serve to detach the small spongy crystals of lead which form during electrolysis. The crystals when removed fall into channels which convey them to a sieve of wire gauze where they are drained and washed, the wash water being concentrated by evaporation to 20 Baume (sp. gr. 1.256) and used again in the electrolyte. The lead is then compressed and mixed with 2 or 3 per cent. of charcoal powder and fused. The silver, with most of the arsenic and antimony, is separated at the anode, and is collected in trays to be fused subsequently with sodium nitrate and a little borax, by which the silver is separated from the arsenic and antimony.* The cost is estimated by the inventor at from 8 to 10 francs per ton of lead when steam power is used. When lead acetate is used as an electrolyte, the resistance is found to be lowered, which is probably due to the prevention of lead peroxide deposits upon the anodes, which must be at the expense of the organic substance itself, which becomes slowly and surely oxidized. The products of the oxidation of acetic acid are carbonic acid gas and water, which are of no intrinsic value. This being the case the acetic acid becomes an expensive electrolyte as it has to be constantly renewed. The lead peroxide formed at the anode is reduced by a portion of the organic acid to oxide, which then dissolves in the acid and becomes finally reduced to metallic lead at the cathode. The impurities present in the crude metal and the oxides on the face of the anodes are usually bad conductors of electricity, and, if they do not become detached from the anodes, they form an insulating coat over a large portion of the anode surface. The natural consequence of this is, that the current passes mainly through those parts of the plate that remain freely exposed, and so the current density becomes greatly increased at those portions, with the result that the anode is rapidly riddled with holes. The addition of fluid carbonic acid when mixed gradually with sulphuric acid and digested for some time at a temperature of from 50 to 100° C. easily converts it into cresol sulphuric acid, which is soluble in water, and is capable of forming soluble salts with lead. These salts have been successfully used for the deposition of lead.

Maxwell Lyte has suggested converting the lead into chloride and electrolyzing it in the molten condition. Crude lead is fused and oxidized by a blast of air in a converter, the oxide is then stirred with hydrochloric acid in earthenware vessels until it is converted into chloride. Any silver compound associated with the lead, salt or oxide treated, is chloridized and is extracted from the mass by the application of strong hydrochloric acid or brine.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

* The arsenic and antimony are oxidized to the maximum and unite with the soda to form scoria.

ELECTRICALLY DRIVEN MACHINERY.

At the 187th meeting of the New York Electrical Society, held on Thursday evening, May 12, in the Concert Hall, Madison Square Garden, Dr. Schuyler S. Wheeler delivered a lecture entitled "Electrically Driven Machinery," a report of which is here given:

"In being called upon to speak, after an interval of a number of years, upon a subject in which I have always been deeply interested, and of which I have been a strong advocate, it is a great pleasure to find in its remarkable progress that my claims and expectations have been more than realized. It is a common saying that electricity has made wonderful strides within the last few years, and I think I need have no hesitation in saying that it is in that department of practical electrical work covered by the subject of this evening that the greater part of this conspicuous advance has been made. A few years ago any suggestion of driving machinery by electric power was received with doubt as to its success; to-day, electric driving is universally acknowledged to be by far the best method, for a number of reasons, and the developing of this new industry has furnished work to keep the electrical factories busy through the past several years of hard times. The savings in the operating expense of factories have been found to be so great that mill owners have purchased electrical equipments in the hardest times as a measure of economy.

"To what is this great success due? It is evident from the rapidity with which electric motors have been introduced, that their advantages must be very marked.

"First, they are capable of direct-connection to the machinery to be operated, which means that their power, however great it may be, and however large the machine, can be transmitted by the shaft instead of requiring a cumbersome belt and a pulley on the driven machine large enough to receive, by the friction of the belt traveling upon it, the needed power. As 1,000 feet of belting one inch wide must pass around a pulley in a minute to transmit one HP., it is evident that the handling of 100 HP. will require a large pulley and a heavy belt, which is not only inconvenient and sometimes dangerous, but occupies considerable floor space and requires that the machine be heavy enough in design to support the large pulley and the strain of the belt.

"Second, motors are capable of regulation and control of their speed and driving power with great convenience, so that electrically driven machines can be started, stopped, reversed or speeded up by the use of small instruments known generally as 'regulators,' which may be placed close to the machine or in any other convenient location, while machinery driven by belting can be merely started or stopped, and then only with a considerable manual effort in shifting the belt, or can be run at other speeds only by bodily removing the belt to a driving pulley of different size.

"Third, motors, when used for driving machinery, are usually attached directly to the machine, and being much less bulky than other means of driving, the entire machine is independent of any line-shafting, and therefore may be located in a convenient position without regard to this limitation, and in many cases can even be picked up and shifted from one place to another as the exigencies of its work require.

"Fourth, electricity permits the saving of $\frac{1}{3}$ to $\frac{1}{2}$ the power otherwise required. This results from the fact that when the tool is stopped the motor is stopped and draws no power, whereas in belt driving when the tool is stopped the belt or one of the belts is simply shifted and continues to run on an idle pulley.

"And last, electricity presents an enormous advantage in the transmission of power. This subject is so large, and has been so well discussed, that I

* For further details of this process, see *ELECTRICITY*, September 8th and 15th, 1897.

† From the *Electrical Review*, London.

will not attempt to add anything to it here, but will give one or two experimental illustrations of what I have already stated. [Illustrations shown.]

"Another illustration is in the use of a motor for operating a lathe. A belt-driven lathe must have a line shaft attached to the ceiling, and the ceiling usually has to be strengthened to support this shaft. It must then be carefully made parallel with this shaft by plumb line and instruments, and then be securely bolted to the floor. A belt of sufficient width to give the necessary friction must be provided, and if the lathe is to be reversed, a second belt, crossed, must be added. The size of the driving pulleys on the shaft on the ceiling must be carefully determined with reference to the pulleys on the lathe to give the desired speed, and then the lathe may be operated provided the line shaft is kept in motion by a steam engine somewhere. But the lathe cannot be moved.

"If the same lathe is provided with an electric motor for driving it, the power may be supplied from any circuit through an ordinary lamp cord, and the lathe may be used in any position. I have here a small engine lathe with a motor built directly on its spindle. The lathe is suspended so as to be swung around in any direction, and will operate continuously while so handled.

"I have one other crude experiment, intended to give an idea of what may be done with an electric drill press, which I will show after describing some views of machinery. The gradual introduction of electric motor driving on machinery has, of course, led to such modifications in the design of machinery as would naturally follow from the differences between belting and motors. I mean, for example, since the motor is small and can be built into the machine close to the cutting tool, or the part which uses the power, that all shafts, gearing, wheels, etc., within the tool, which have been heretofore necessary to receive the driving belt and transmit its power to the tool, may be dispensed with, and then the frame of the machine may be made a different shape, or much lighter, since it does not have these additional parts to support. The attitude of the manufacturers of machinery, during the last five years, who are of course conservative and not stimulated by the interest and confidence in the future of electricity that the electrical men felt, has been interesting. At first they said they supposed their machines could be operated by a motor if the thing would run, and that the purchasers of their machines might try it, but they would take no responsibility. Then they gradually became willing to furnish their machines with brackets and other parts for the ready reception of the driving motor, and now they are anxious to cultivate the electrical trade and to co-operate with its members in bringing out simplified designs of machines with motors incorporated.

[The lecturer here exhibited a number of views of machines combined with motors some of which were of machines especially modified in their construction to suit the new method of driving. He also presented experiments in further illustration of the extreme portability of electric tools, and illustrated the methods now actually in use in shipyards for attaching drills and other tools to the sides of ships.]

"In conclusion, I can think of no stronger or more flattering evidence of the success of electric power as a new industry than the fact that large quantities of American apparatus are now being installed on American plants and according to American methods in other countries, and there are to my knowledge alone at the present time in this country half a dozen engineering representatives of English manufacturers, studying what we have done, and finally leaving orders with us. So that those of us who are not wanted in more aggressive fields of operation at the present time are at least able to contribute for our country an industrial victory."

ELECTRICITY IN THE HOTEL AND HOME.

A Frenchman who appears to have been astonished at the luxurious accommodations he found in the more recently erected hotels and residences in New York has inspired some one to write a very spirited description of the furnishings of some of these palatial establishments which we find in the Philadelphia *Inquirer*. Special prominence is given to the elevators:

Little boudoirs on wings is the appropriate description given by an enthusiastic Frenchman of the elevators he found himself invited to enter on arriving in any of the new and sumptuous houses of his American hostesses. In fact, so agreeable an impression did these lifts have on his receptive appreciative Gallic mind that he is going back to Paris to preach the benefits the elevator will confer in the tall French houses. So far in Paris there is but one of these conveniences known, and that has been recently fitted into the splendid town residence of the Countess Castellane. In the great houses of our American millionaires the elevator is becoming the rule and not the exception, especially so at Newport and in New York City, where a foot of land is worth a small fortune, and the houses are rearing their heads more loftily every year.

The exceeding usefulness and beauty of the private lift has never been more clearly demonstrated than in the great Astor mansion on Fifth avenue, in New York City, especially when an elaborate entertainment is in progress. Now one of the chief beauties of this admirable dwelling is the grand staircase, that sweeps up from the very doors of the marble vestibule to the great hall opening on to the picture gallery. At night when palms and candles shed alternate light and shade along the crimson carpet, silver rods and carved balustrade, this is the very choicest spot on which to gracefully display gorgeous toilets. Therefore, when the women in their wraps and fur boots are set down under the porte cochère, they are led to one side of the vestibule, a grilled door slides back and six at a time are ushered into the snugest little lift ever seen.

Its floor is covered with a velvet carpet of the warmest cerise tone, and being octagon shaped, four of the sides are made of plate glass mirrors framed in gilt and four sides of panels of tufted cerise satin. All the elevator's roof is built of gilded iron, wrought in odd shapes and partially filled in with rose-colored glass, over which a spray of electric lights springs. By this device the interior of the living room is filled with a tender becoming glow that every woman keenly appreciates, as she does also the six comfortable seats the lift contains and the fact that she was saved the necessity of parading in her wraps like a chrysalis up that splendid stairway.

A solemn young man in powdered head and court livery guards the electric lever and the travelers in the elevator, all of whom are landed on the third floor. There they are ushered into a dressing-room, wraps are removed, toilets touched up, and the charming butterflies are ready to meet their male escorts and join the gay procession moving down the great stairway.

Of course, it all depends upon circumstances whether the private elevator shall be a costly or inexpensive addition to the modern house comfortable. Since electricity has come so rapidly into use as a domestic servant for lighting and heating, a small lift, capable of holding three persons, can be fitted into any house at an outlay of about \$300. It is manœuvred by a touch on a button, and is safe indeed. No elaborate interior decorations come for this price, as for instance will be found in the exquisite little basket affairs that some women use in journeys from floor to floor of their home. These are wicker lifts, and hold but the owner and a couple of friends.

On stepping inside a wicker lift, the sensation is of having entered a gorgeous, gigantic waste-paper

basket. The walls are of rattan treated with gilding and enamel paints, the floor covered with a white goatskin rug; against the broad seat upholstered in delicately tinted china silk, pillows are heaped, and the roof is a prettily woven dome of wicker, with a cluster of electric lights falling from the center.

In the rear of the majority of new houses one large lift is arranged for the service of the domestics, and to carry up the coal, luggage, etc., and the tiny affair used by the mistress runs in a shaft that extends from the cellar to the garret. By this means she is able every day to go over every floor in the house if she is so minded.

At regular intervals these private lifts are all most carefully inspected, and though among the wealthy their contribution to comfort is invaluable, it is the women of moderate means who find the growing popularity of the little elevators absolutely destructive to their domestic peace. Not a whit less luxury loving than the mistress is the American servant, who, having once lived in a house where the stairs are scarcely more used than the fire escapes, not only resent, but flatly refuse to hire out in what they call the old-fashioned inconvenient homes. This complication as much as anything else has forced the fitting up of lifts in dwellings, the humble-minded owners of which believed until recently were the very models of domestic luxury.

LONDON NOTES.

[From our London Correspondent.]

Institution of Electrical Engineers.

Before this Institution on Thursday, April 28, a paper on "Earth Returns for Electric Tramways" was read by Mr. H. F. Parshall, and some joint notes on electric tramways by Major P. Cardew, R. E., British Board of Trade, and Mr. A. P. Trotter, Cape Colony Government Electrician. The idea of these papers being read on the same evening appears to have been to raise a general discussion. Mr. Trotter's notes contain a neat graphical method for determining the fall of potential in the return with uniform distribution of current, and the proper points of application of return feeders. Major Cardew contributed a note prepared by him in May, 1894, and sent to the South Staffordshire Tramways Company, advocating the automatic regulation of this fall of potential. Each of the papers was illustrated by means of curves and diagrams.

Cork Electric Tramways.

A combined electric lighting and tramway plant which was commenced in November last for the city of Cork, Ireland, is approaching completion. The lighting part of the work is to start operations the present month and the tramways are expected to start running a month later. There is about 11 miles of tramway track of 3 feet gauge, the rails being 83 lbs. to the yard, and the lighting consists of 94 constant potential arc lamps which are mounted on the top of the trolley poles used for the overhead wire work. Current for lighting is distributed on the three-wire system, with 440 volts across the outers, consumers' supply being 220 volts. For the tramways, side brackets are used for single track and double arms where center poles are employed for double track. The power plant includes three Babcock & Wilcox boilers, each of 2,531 square feet heating surface and capable of evaporating 8,000 lbs. of water per hour, three McIntosh & Seymour side crank tandem compound engines directly connected to 200-kilowatt generators, running at 150 revolutions per minute. In the battery room are 256 Tudor cells, capable of discharging at 110 amperes for 7 hours. A booster of suitable capacity regulates the charge of the cell. The switchboard consists of a combination of lighting and railway panels, the same machines being interchangeable in railway and lighting service. There are to be 18 double-decker cars. They will each carry 44 passengers and be fitted with double motor equipments and series parallel controllers.

WHAT ELECTROLYZED SEA WATER HAS ACCOMPLISHED.

BY W. L. HEDENBERG.

The problem of finding an economical and efficient method of purifying and disposing of the sewage from a community would seem to be growing each year more difficult to solve.

A century or so ago when the first settlers were pushing inland they naturally avoided arid districts and located whenever possible on the banks of some stream. There were two causes which led to their so doing. The land was usually found to be more fertile in such localities, and the population had to rely in those early days almost entirely on water for transportation. As the country developed and the population increased, towns and cities gradually sprang up where formerly settlements had been.

From the beginning all waste matter and refuse was naturally thrown into the neighboring stream as the easiest and quickest method of disposal, and there was no apparent harm in so doing while the settlements were small and scattered. When, however, these communities became good-sized towns or small cities located within a few miles of one another, all discharging their waste into the stream and at the same time drawing their water supply from the same source, diseases and epidemics began to be prevalent.

To remedy this state of affairs and improve the public health, the proper authorities justly insisted on the sewage being at least partially sterilized. There were a number of ways in which this could be accomplished more or less satisfactorily, depending on the thoroughness of the process. Recourse was usually had to mechanical filtration, land filtration, chemical precipitation or to a combination of these methods. Recently, however, two other processes have made their appearance. These latter consist in mixing a disinfecting liquid, obtained by passing a current of electricity through sea or salt water, with the matter to be sterilized.

These two methods, one invented by Mr. Albert E. Woolf in this country, the other by M. Hermite in France, are essentially alike and differ only in their method of application.

Probably the first attempt to sterilize a polluted water supply by the Woolf process was at Brewsters, New York, in the summer of 1893. An electric plant was installed for the purpose, consisting of a 15 horse power engine and a dynamo capable of generating a current of 700 amperes at a pressure of 5 volts. A vat of 1,000 gallons capacity contained the electrodes, which consisted of a platinum zinc couple, the platinum electrode being made up of a copper core with a platinum coating .003 inch in thickness.

The disinfecting liquid which Mr. Woolf calls electrozone was then obtained by circulating sea water through the tank containing the electrodes. This antiseptic was in the experiments at Brewsters allowed to flow into the sewer which emptied into a marsh from which the water supply was taken, and was also sprayed into what is known as Tonetta brook, in the proportion of one part hypochlorite to 100,000 parts of water.

The results obtained by this process from a bacteriological standpoint were exceedingly striking and attracted wide attention. The worst sample of water examined by the New York board of health at the time showed the presence of 22,000 bacteria per cubic centimeter before treatment and but 42 after having been mixed with electrozone in the proportion previously mentioned.

Owing to the striking results obtained at Brewsters Mr. Woolf was shortly afterwards called upon to disinfect Riker's Island, at that time the dumping-ground for a large portion of New York's garbage. This tract of land, comprising some 137 acres, was fast becoming extremely offensive under the heat of a summer's sun, and numerous complaints

made by citizens residing in nearby sections of the city made it imperative that some action towards remedying this public nuisance should be taken.

In June, 1894, therefore, Mr. Woolf installed an electrozone plant on a barge which was towed to Riker's Island and which was capable of generating 4,000 gallons of disinfecting liquid per hour. By means of a 15-horse-power pump the electrozone was distributed through lines of hose to various points where it was sprayed upon the decomposed garbage. In a comparatively short space of time this method of procedure wrought a great change. The obnoxious odors, which formerly could readily be detected at a distance of several miles under favorable atmospheric conditions, were scarcely noticeable a hundred yards distant.

The Woolf process was next tried at Danbury, Conn. The plant consisted of a 40-horse-power engine and a dynamo giving a current of 1,000 am-

PLANT FOR THE DISINFECTION OF SEWAGE AT BREWSTERS, N. Y.

peres at a pressure of 5 volts. In this case it was desired to purify the sewage before discharging it into the neighboring river. The disinfectant was generated in a vat situated above a large tank through which the sewage flowed. The electrozone was made to flow by gravity from the upper to the lower tank, a thorough mixture of the two liquids being effected by means of an agitator. As the mixture rose in the lower tank it overflowed into a line of pipe which discharged into the neighboring water-course.

This plant, according to the opinion of the citizens of Danbury, scarcely accomplished the desired purpose, although the analytical results were exceed-

DISINFECTING PLANT ERECTED BY THE BOARD OF HEALTH, PHILADELPHIA.

ingly good. The objection arose owing to the fact that the heavy part of the sewage was allowed to find its way into the stream, which was considered a public nuisance by persons living along the shores. The writer has suggested elsewhere* a means whereby this objectionable feature could in all probability have been remedied. However after considerable litigation the Woolf process was ultimately abandoned at Danbury for a more expensive method of sewage purification.

The Hermite system, which has been experimented with abroad even more than that of Mr. Woolf in this country, differs from the latter, as previously stated, only in a few minor details in the

production of the disinfectant and in the method of application, which can partly be accounted for in the widely different sanitary arrangements existing in Europe and in this country. For instance, M. Hermite recommends the use of his disinfecting liquid as ordinary water in all lavatories, and seeks in this way to thoroughly sterilize household wastes before they are admitted to the public sewers. In other words, a complete and separate system of piping is necessary. This method of procedure and general arrangement was probably thought necessary owing to the fact that in most European cities the drainage systems are of the combined type, admitting both rain water and sewage. The sterilization of this amount of liquid, especially during a rainy period, would undoubtedly be a very costly undertaking.

The negative electrode in the Hermite system is composed of disks of zinc which when in operation revolve. The positive electrodes consist of glass tubes covered with a coating of platinum, one being located between each pair of zinc disks. The electrodes are usually enclosed in an iron tank connected with a perforated pipe at the bottom through which the electrolyte, consisting of sea water, enters. This system has been tried as a sanitary measure more or less extensively at Havre, Brest, Nice, Paris, Lorient, Monte Carlo, Worthing, Ipswich, and more recently still at Bombay, India.

Probably the experiments at Brest were on the most extensive scale, the sewage of 11,000 persons being treated. The results were apparently satisfactory, as an official report issued by Dr. Pitan and dated Feb. 21, 1894, says: "In a word the experiments which I have made enable me to conclude that electrolyzed sea water is a perfect disinfectant and an excellent antiseptic which very rapidly destroys all microbes, even the most tenacious of life, on the condition that these microbes are brought into contact with the electrolyzed sea water."

The plant at Ipswich* in England seems also to have given fairly good results for what it was intended, it merely being desired to arrest the decomposition of the sewage until it could be carried out to sea. On the other hand the results obtained at Bombay could scarcely be called satisfactory.

The principal objections to both the Woolf and Hermite disinfecting processes would seem to be the fact that the deodorizing fluid is unable to penetrate through the solid portions of the sewage, as was clearly proven by the use of electrozone at Danbury. The disinfectant apparently sterilizes the outer surface of the heavy matter, but leaves the inner portion to decompose and breed disease germs. This defect might possibly be remedied by the use of some form of crusher or beater that would tend to disintegrate the solid portions of the sewage.

As a sterilizing agent for town wastes, electrolyzed sea water has therefore been adopted but slowly in spite of the low cost of this method, and it will be necessary to remedy the serious defect previously mentioned before it can hope to be widely made use of by large communities.

CANADIAN NOTES.

The town of Lindsay, Ont., is to have a new electric light company. The water power to operate the company's plant is to be supplied from the village of Fenelon Falls which is sixteen miles distant from the town.

The representatives of the Toronto city council visited Niagara Falls for the purpose of inspecting the electric power works which have been established on the American side by the Niagara Power Company. Questioned regarding the possibilities of transmitting power to Toronto, Mr. W. B. Rankin, manager of the company, stated that the loss in transmission to Buffalo was 12½ per cent., and a further loss of 6 per cent. was incurred in distribution in the city. What the loss would be in the longer distance to Toronto he did not know, but the electrician of the company estimated that it would be at least 25 per cent.

* For detailed description see article by Mr. J. B. O. Kershaw in *ELECTRICITY*, April 6, 1898.

EFFECT OF THE WAR ON GENERAL INDUSTRY.

The well known banking firm of Henry Clews & Co., New York City, in their Weekly Review publish the following over Mr. Clews' signature. It is dated May 14:

"It is now nineteen days since the declaration of war with Spain. Under ordinary conditions, the beginning of hostilities upon a large scale and with imperfect preparations might be expected to create disturbances of confidence and serious prostration in all our markets. This is no more than has been common in the experience of other nations. But, in our case, war has thus far been attended with a marked recovery of confidence in finance and a revival of activity in trade. The Government is devising plans of heavy taxation and considering the authorization of large loans; but the country finds in all this no reason for contracting its industrial operations, the people no necessity for reducing their expenditures. Labor is well employed, and there is no shrinkage in values to indicate a falling off in demand, but rather a general firmness in the commercial markets and, in some, a material advance in prices. Nor is this rise in values due to any interruption of supplies from other countries, for the Spaniards have so far been unable to check the current of our imports.

"The state of feeling in the financial markets surpasses the most sanguine expectations. In anticipation of the war there was some anxiety among the lenders of capital, which showed itself in a material contraction of the loans of the metropolitan banks and a disposition among the interior banks to draw home deposits from their agents in this city. Money on call was cheap, but only because there was an indisposition to employ it on time loans or discounts. Within three short weeks all this is changed. From the interior all reports show a settled and confident feeling, and currency is flowing hither from the subsidiary financial centers. The note brokers of this city, which in April found it almost impossible to secure buyers for their paper, are now able to dispose of it in about the normal volume. The city banks are discounting quite freely and have reduced their rates on time loans by $1\frac{1}{2}$ to 2 per cent. In brief, credit operations have resumed their normal course. New enterprises, requiring large investments of capital, which have been held in suspense for many weeks in view of the possibilities of war, are now coming to the front again, and bankers in the flotation business seem to be quite hopeful of the prospect of investors supporting meritorious undertakings.

"In the Stock Market the reaction from the ante-war depression exceeds all expectation. In anticipation of the war, the question was not so much whether prices would advance under the influence of hostilities as whether they would not suffer a still further decline.

"Upon 17 active stocks, the rise since the opening of hostilities has averaged about nine points; nor does the upward movement appear to have yet exhausted itself.

"The extraordinary course of things expressed in the foregoing facts deserves to be considered in estimating the probable future course of the securities market. It plainly shows that the possible depression and stagnancy which was deemed possible in anticipation of the war has not been realized. That fact is full of weighty significance. It demonstrates how much Wall Street has learned in the way of estimating complex and disturbing situations since the silver crisis of 1896; how much it has gained in clearness of judgment and in courage to act upon a common sense conviction. It proves that the men of finance have learned where to fix the limit to the legitimate effect of events disturbing the normal current of business. And above all, it shows that Wall Street has, at last, learned the much needed lesson that it needs much more than transient troubles, than even such a war as we have undertaken, to

warrant a surrender of confidence in the steadiness of the vast machinery of production and wealth which constitutes the material greatness of this foremost of all nations. It has taken a war to teach us how much shock and how much sacrifice the United States can stand without suffering or real occasion for winning. The whole cost of the war is a cheap price to pay for this inestimable lesson. It is the greatest contribution to the stability of public confidence and to trust in our commercial and financial framework that has been forthcoming in the history of the country.

"Although, in war movements, there has been an interval of absence of conspicuous exploits, yet preparations are in progress which, at a little later stage, promise great if not decisive results. The Spanish fleet is at last within our easy reach; and, within two or three days, we may witness the great naval conflict which is likely to put an end to the war. So far, our operations have elevated the world's respect for our material resources and left but one opinion as to the final, if not early, outcome of the struggle. Expressing my view in genuine Yankee phrase and spirit, I should say that American citizens have enhanced in the world's valuation at least 50 per cent. through the result of the American-Spanish war, and everything American will appreciate in the same ratio after the war is over. Admiral Dewey marked up American history over 100 per cent. by smashing the Spanish fleet and at the same time silencing Manila's guns in the short, sharp and effective way he did it. It was the American way of doing it, you know, and not Spanish. We can take Manila, Cuba, Porto Rico, the Canary Islands, and bang the Spanish coast all to pieces whenever we want to. We have the naval commanders; we have the gunners; we have the sailors; we have the ships; we have the pluck; we have the skill; we have the weapons; we have the food supplies, and we have the money too to back us all the way through. What, therefore, is the use of Spain pretending to fight such a foe? It is simply an evidence of imbecility."

NATIONAL ELECTRIC LIGHT ASSOCIATION.

Special Rates To and From Chicago.

We have received the following notice for publication from Mr. C. O. Baker, Jr., Master of Transportation, 136 Liberty street, New York:

"The Trunk Line Association, Central Traffic Association, New England Passenger Association, Southern Passenger Association, and the Western Passenger Association have granted a rate of a fare and one-third, on the certificate plan, from all points in their territory to Chicago and return, for delegates attending the Twenty-first Convention of the National Electric Light Association, to be held June 7, 8, 9. Convention hall and headquarters at the Auditorium Hotel; rates—\$3.50 to \$5 per day on the American plan, \$2 to \$4 per day on the European plan, for each person."

The Electric Plant at West Point Academy.

The Government specifications for the supplies necessary for the electric plant at West Point Military Academy contain the following items:

Five doz. cells of Klondike batteries complete, without sal ammoniac; 5 doz. cells of non-polarizing dry batteries, 3 doz. b., 2 doz. c.; 1 doz. Wilhelm double diaphragm transmitters with induction coils and binding posts; 1 doz. Wilhelm telephone receivers; 1 doz. 3-inch iron box bells, nickel-plated; $\frac{1}{2}$ doz. Allen soldering sticks; 1,000 lbs. No. 8 soft iron wire, galvanized; 40 lbs. 18-gauge annunciator wire; 100 lbs. Okonite wire; 6 lbs. Grimshaw tape; 12 lbs. fuse wire; 4 pairs stub pliers; 2 pairs wooden blocks, double sheared; 1 pair Welden climbers; 3 pairs M. Klein & Son's splicing clamps; 1 Klein & Son's tape upreel, Manhattan Electric Co., or equal; 1 lineman's testing magneto bell, 25,000 ohms; 1 magneto generator, 25,000 ohms; 1 Vulcan gasoline torch; 2 Whitney hand drill outfits, with drills; 8 24-inch wood brace drills; 2 eccentric clamps; 150 ohms relay; 1 6-inch skeleton bell; 25 yds. twin wire cord, for telephone switchboard, green, and 2 lbs. white vaseline.

SOCIETY NEWS.

American Institute of Electrical Engineers.

The 15th Annual Business Meeting of the Institute was held at 12 West 31st street, New York, on Tuesday evening, 17th inst. At the close of the meeting, which was brief and given up wholly to business matters, several of the members attended the Electrical Exposition.

Applications were received from the following candidates for associate membership, and will be acted upon by the council at its meeting June 22 next:

Walter C. Allen, Washington, D. C.
Frank Henry Dexter, Ithaca, N. Y.
P. M. Downing, Blue Lakes City, Cal.
Joseph Lyons, Washington, D. C.
George A. Damon, Chicago.

The 15th General Meeting will be held at Omaha, Neb., June 27-29, 1898.

The New York Electrical Society.

The 187th meeting of the New York Electrical Society was held in the Concert Hall at Madison Square Garden on the evening of the 12th inst. The meeting was more than ordinarily interesting because of its close connection with the Electrical Exhibition, then in full swing in another part of the building, and of which the Society is the foster mother. The lecture by Dr. Schnyler S. Wheeler, which will be found on another page, was also an attractive feature. At the business meeting which preceded the lecture the following new members were elected:

Ernest B. Laclain, C. C. Bohn, W. G. Ames, E. M. Saules, Frank A. Wunder, Albin Gustafson, Charles J. Klein, Chester Bayles, James Jones, Jr., F. W. Becker, D. Levy, Richard M. Beard, E. A. Quick, Reinhold H. Wappler, Edward Hyans, George M. Loos, P. H. Klein, E. R. French, J. E. Sayles, James H. Spencer, J. D. Gould, Chas. A. Hanson, C. W. Price, Lucien W. Jenney, P. M. Mourey, Walter S. Levin, Benj. O. Ellis, H. D. C. Richards, C. B. Sterling, D. S. Holcomb, Chas. E. Dressler, M. C. Rorty, Chas. W. Hoffman, Willard S. Bennett, Charles Fred, Many Fred, A. H. Mustard, Harold A. Tileston, Oscar F. Ehrle, Wm. Aus, Elias E. Ries, W. J. Newton, John Barry, Thos. S. Jamieson, S. Clark Harris, R. J. Mulligan, V. J. Mayo, T. W. Kloman, Warren A. Brown, Harry Hilbert Conner, Hugo G. Freund, A. S. Brown, J. Henry Gill, Daniel Von Wien, M. Cushman, John Jacob Astor, Mortimer Nordon, Chauncey M. Depew, L. W. Hildberg, Saml. B. Brewster, George Pugh, Emil Finger, Jos. Solot, Chas. Penina, Francis Gans, Gottfried Gans, Howard D. Black, William Wilson Lightipe, W. M. Logan, Jos. B. Curran, E. R. Esmond, John McLean, Frank W. Hawley, Cyrus O. Baker, A. O. Schoonmaker, W. C. Burton, R. Hoyt, J. E. McConnell, all of New York City.

H. Krantz, Jos. Albaum, Sol. S. Sugar, A. T. S. Clarke, Fred'k W. Schnelle, A. T. Welch, John C. Lott, all of Brooklyn, N. Y.

Harry Hunter, Far Rockaway, N. Y.

E. T. Schoonmaker, Fordham, N. Y.

E. N. Corbin, Walton, N. Y.

Chas. R. Barnes, State Electrician, Rochester, N. Y.

J. Henry Gill, Chas. H. George, Orange, N. J.

Jas. MacMaster, Elizabeth, N. J.

Wm. Darrow, Jr., Summit, N. J.

W. D. Macdonald, Hudson Heights, N. J.

Fred E. Dolbear, Elizabeth, N. J.

W. M. Allen, New Brunswick, N. J.

J. C. Jones, Ampere, N. J.

G. R. Berger, Newark, N. J.

Frank M. Tait, Catasauqua, Pa.

F. L. Meyer, Philadelphia.

Garrett A. Hobart, Jr., Washington, D. C.

George W. Vanderbilt, Asheville, N. C.

M. J. Wightman, New Brighton, S. I.

LEGAL NOTES.

The suit which was brought by the city of New York to decide the rights of the Metropolitan Street Railway Company on Sixth and Eighth avenues, through which a division of the Metropolitan extends, has been closed by the decision of the Circuit Court of Appeals affirming the judgment of the lower courts, who held that the Metropolitan Company was justly entitled to the privileges which it enjoys on the two avenues.

Judge Gordon in Court No. 3 at Philadelphia on the 12th inst. appointed Walter E. Rex receiver of the Holt Electric Storage Company. This action was taken upon a bill in equity filed by William S. Perot, Jr., against the storage company, in which he alleged that the company was insolvent and has ceased to transact business. In its answer the company stated that the allegations made in the bill were true, and joined in the request that a receiver be appointed.

Judges Colt, Brown and Lowell in the United States Circuit Court of Appeals, Boston, on the 11th inst., heard the complainant's appeal in the case of Hart & Hegeman Manufacturing Company vs. the Anchor Electric Company et al. from the decree of the Massachusetts Circuit Court dismissing its bill. It asked for an accounting, and an injunction to restrain the defendants from the alleged infringement of patent No. 11,395, reissued to G. W. Hart on December 12, 1893, for electric snap switches used in making and breaking circuits for electric currents. The court reserved its decision.

Dr. Louis F. Praeger, Brooklyn, N. Y., obtained a verdict of \$15,000 damages against the Brooklyn Heights Railroad Company in the Supreme Court on Friday last for personal injuries received in a trolley car collision in September, 1896. His spine was hurt, causing, as he alleged, permanent injury.

In the Superior Civil Court at Salem, Mass., on the 4th inst., the jury in the case of Charles Melanson against the Thomson-Houston Electric Company of Lynn returned a verdict for the plaintiff in the sum of \$6,242. This was an action to recover for the loss of three fingers of the right hand, the injury having been sustained while operating an alleged faulty machine.

Proposed Increase of Examiners in the U. S. Patent Office.

The patent laws of the United States are receiving considerable attention in the present Congress, and a number of bills amending them have been introduced. The Patent Office has been a potent factor in developing the industries of the country, especially the electrical industry, and the laws governing it have not been perfect. It is hoped that out of the many suggestions offered there will come enactments which will place on our statute books laws which will enable the Patent Office to work more effectively and with a much more careful scrutiny of and guardianship over the rights of inventors.

In this connection it is of interest to note that the Platt bill for revising and perfecting the classification of letters patent and printed publications in the Patent Office has passed the Senate and is now pending in the House with an excellent chance of soon being enacted into a law. The bill carries with it an appropriation sufficient to provide for three additional principal examiners, two first assistant examiners, two second assistant examiners, six third assistant examiners, and five fourth assistant examiners. With this increase in the working force, the work of the office, which is now greatly in arrears, can be brought more up to date.

Our contemporary the *Western Electrician* has removed its New York office from 108 Times Building to 809 Postal Telegraph Building. Mr. Robert J. Parvin is the manager.

THE NEWS.

What Is Going On in the Electrical World.

STREET RAILROADS.

Anderson, Ind.—The Union Traction Company, constructing the gas belt electric railway, has closed a deal for a line from Alexandria to Elwood, connecting with the Anderson-Marion line. This makes the electric road a rival of the Panhandle and Lake Erie as well as the Big Four.

Atlantic City, N. J.—A meeting of capitalists was held here on the 11th inst., when the temporary organization was effected of an electric railroad company which proposes to build a railroad across the State from Camden to this city, to be operated by electricity. The capital stock is \$600,000. J. J. Patterson, of Philadelphia, was chosen president and A. C. Welhouse, of Lancaster, Pa., secretary.

Bloomington, Ill.—By decree of the court the Bloomington City Railway is to be sold on May 31.

Cedar Falls, Ia.—C. W. McElysa has sold the Cedar Falls and Normal Street Railway to a local company for \$25,000.

Cincinnati.—Judge Taft has granted the motion asked for by the first mortgage bondholders of the Louisville Trust Company, confirming the sale of the Cincinnati Inclined Plane Railway to Charles H. Kilgour for \$278,000. The court also orders Receiver Brent Arnold to deliver the property to the purchaser upon the execution of the deed.

Des Moines, Ia.—The six months' experiment of having letter boxes attached to the street cars, which has just expired, has proved a success. Based upon the results of the experiment the street cars in Des Moines with the letter-box attachment would handle in a year 400,000 pieces of first-class mail and 70,000 pieces of second-class mail. The street-car companies will demand compensation from the Government if the system is to be continued.

Kansas City, Mo.—The "Star" states that Charles Francis Adams of Boston, P. A. Valentine of Chicago, C. F. Morse and W. H. Holmes, directors of the Metropolitan Street Railway Company, who represent more than two-thirds of the stock in the company, decided at the recent conference to spend a quarter of a million dollars in changes and improvements on the Metropolitan system this year.

Libertyville, Ill.—The village board has granted a franchise to E. C. Weeks and associates, who propose to build an electric road starting at Libertyville and continuing to the "chain of lakes" in northern Illinois and southern Wisconsin.

New Haven, Conn.—A long contest between the Bridgeport Traction Company and the New Haven Railroad Company has ended in the success of the former corporation, whose application in regard to grade crossings in Bridgeport has been granted by the Railroad Commissioners. The decision provides, however, that the crossings shall be made at the trolley company's cost, that they shall be of an improved character, that trolley-cars must stop before crossing, and that there shall be an improved system of signals.

Peekskill, N. Y.—The Peekskill Traction Company has asked the village trustees for a franchise to build and operate an electric railway on several streets in the village.

Plymouth, Mass.—The new Plymouth & Sandwich Street Railway Company has been organized, and the special charter granted by the Legislature has been accepted. A survey is soon to be made to determine the best location, and the probabilities are that a section, as far as Manomet Bluffs, will be built at once even if the whole line is not undertaken. Subscriptions for upwards of \$10,000 worth of stock have been made.

South Berwick, Me.—The Dover Street Railway Company, in conjunction with Portland capitalists, has purchased the Hale cotton mill at South Berwick, which has a valuable water power that will be utilized in the operation of an electric road to be constructed from South Berwick to Dover, N. H. This will complete an electric circuit connecting Dover, Somersworth and South Berwick.

Standish, Mich.—A railway project under consideration is the building of an electric line to Point Lookout, in Arenac county, which is becoming well known as a summer resort. The proposed road would connect with Standish, Au Gres and Omer.

St. Paul, Minn.—The board of aldermen has passed an ordinance authorizing the St. Paul City Railway Company to construct and operate an interurban line through Como Park. The line is to connect St. Paul with Minneapolis.

Toledo, O.—The "Blade" says: "Parties interested in a proposition to build and equip an electric railway line between Toledo and Detroit will do well to proceed with caution. It comes from direct sources that the executive board of the Vanderbilt interests has for some time been desirous of converting one of the two lines now running between the two cities into an electric road, and using the other as a freight line. This has been opposed personally by Mr. Vanderbilt, who recently announced, however, that should outside parties

undertake to build a line he would immediately agree to the wishes of the board, and favor a prompt equipment of one of the two existing lines as an electric road, and competition would be made so sharp that an independent line would have very rough sledding."

Uniontown, Pa.—The Uniontown Electric Railroad Company has decided to build an extension to Stewart coke plant, Cool Spring Hollow. The branch will connect with the park terminus and will be extended on to Lemont and Youngstown this season.

LIGHTING PLANTS.

Chicago.—The Cicero Light & Power Company's plant was totally destroyed by fire on the 7th inst. The loss is about \$50,000. The company furnished light for Austin, and divided the western territory with the Cicero Water, Gas & Electric Light Company.

Fenton, Mich.—The sale of the Fenton electric light plant to Fayette L. Thompson, for \$7,000, by Receiver C. L. Tinker, has been set aside by Judge Wisner.

Lawrenceburg, Ky.—The franchise and contract for lighting the city with electric lights has been awarded to Geo. W. Dyer of Princeton, Ky., who promises to complete his plant within four months. Eighteen arc lights of 2,000-candle power each are to be used.

Lansdale, Pa.—The proprietors of the Lansdale Electric Light Works and the borough council have closed a contract whereby the light company sells to the borough its entire plant and franchise for street and commercial lighting for \$4,000.

Sidney, N. Y.—At the special election in this place for the purpose of voting on the proposition to raise \$1,540 per year for five years for lighting the streets with electricity, the proposition was carried by an almost unanimous vote.

Springfield, Minn.—The council has decided to put in a new system of electric lights here at once. The change is made necessary by the defective condition of the present system. A complete incandescent system will be put in.

St. Albans, Vt.—The bill permitting this city to issue bonds to the amount of \$150,000 having become law, Mayor Smith has had the necessary papers prepared for acquiring a water power, lands, rights of way, etc., and to construct, maintain and operate an electric light plant.

Watertown, S. D.—A committee of the council has been making investigations looking to the erection of an electric lighting plant in Watertown.

MANUFACTURING, ETC.

Albany, N. Y.—J. E. Powell, U. S. Government electrical inspector, has made examination of the Federal building in this city with a view to changing the system of lighting, and will report to Washington. The old elevator in the building is to be removed and a new and improved one put in.

Chicago.—The American Electrical Works of Providence, R. I., with a capital stock of \$500,000, has been licensed to do business in Illinois with a capital stock of \$10,000.

Detroit, Mich.—The Detroit, Lake Shore & Mt. Clemens Railway Company has closed a contract with the Siemens & Halske Company of America for two generators and a switchboard, amounting to \$14,500.

Denver, Col.—The Walker Company of Cleveland, O., has decided to more fully occupy the Colorado field for electrical appliances, and with that end in view has appointed W. H. Emanuel, the well-known dealer in mining machinery, as its Denver agent.

Miami, O.—The Maumee Valley Railroad Company intends to erect a plant here to furnish power for all the cars on the belt. The new plant will cost about \$38,000.

Portland, Me.—The Portland "Advertiser," in noticing the erection of an electric steel conveyor for the Maine Steamship Company by the Belknap Motor Company pays a high tribute to that company's electrical engineering work.

Washington, D. C.—United States companies engaged in the manufacture of electrical apparatus have been called upon for the installation of a plant in paper works in Brazil and for a large equipment for the San Rafael Mills in Mexico. At San Ildefonso, near the City of Mexico, a plant built by United States manufacturers, with a capacity of 1,000 HP, is soon to be inaugurated. In addition to those named, a number of other modern plants have been and are to be soon established in Mexico. Valparaiso, Chili, has invited bids from several United States companies for establishing a general electric lighting and power plant in that city.

TRANSMISSION PLANTS.

Tacoma, Wash.—The Snoqualmie Falls Power Company has made application to the council of Tacoma for the right to distribute electric power for lighting and manufacturing purposes in the city. The city fathers and county commissioners, who made a trip to the falls, were much impressed with the possibilities of the proposition, the falls being sufficient to generate power enough to drive all the machinery, furnish all the lights and run all the street cars in both Tacoma and Seattle when once the plant, now in process of installation, is completed.

NOTES FROM A CORRESPONDENT.

Albany, N. Y.—Open competitive examinations for merit will be held June 4 in the various cities throughout the State for applicants for various State and department positions, among others chief electrical engineers.

Rensselaer, N. Y.—Willard F. Bowen, engineer at the Kinderhook Light & Power Company's house, was injured a few days since by an electric shock. His condition is serious.

WAR WORK OF THE ELECTRICIANS.

Schenectady, N. Y.—The "Union" says the organization of a volunteer brigade of engineers to number 3,500 men, regularly enlisted and commissioned in the service of the United States, is progressing rapidly under the supervision of Captain Eugene Griffin, First Vice President of the General Electric Company. The proposed brigade is to be composed of three regiments, comprising civil, mechanical and electrical engineers, artisans, draughtsmen and men familiar with all kinds of engineering work. Captain Griffin has received so large a number of letters and offers of service from prominent mechanical, electrical, civil and military engineers throughout the country as to make it certain that there will be no difficulty in organizing the proposed brigade with picked men. Special legislation authorizing the organization of a brigade of engineers from the nation at large is now pending in Congress, and will probably be enacted into law this week. In the meantime, however, it is understood that Captain Griffin is organizing one regiment of engineers at the request of the Secretary of War, which regiment can be afterwards expanded into a brigade when the law permits the organization of such brigade. Speaking of his project to a representative of the "Union," Captain Griffin said: "Like the engineer troops of all armies, the proposed engineer brigade will be armed and drilled as infantry and would be quite ready to take its place in the line of battle in case of necessity. The record of our engineer troops in the last war, and good work done on the line of the Fifth Corps in the Battle of the Wilderness and in other places, shows that the higher technical skill and training exacted of the engineers detract in no wise from their fighting capacity. The fact that they must be drilled as infantry, in addition to the necessary technical instruction and training, makes it especially imperative that the volunteer engineers should be among the first troops to be organized, to the end that time may be given for them to reach the highest possible state of efficiency."

Atlanta, Ga.—The Atlanta "Journal" says: "The officers of the General Electric Company in Atlanta are meeting with much encouragement in their efforts to aid Captain Eugene Griffin, of New York, in securing recruits for his brigade of engineers. Two well-known engineers of Atlanta, Edward Wilson and L. F. Bellinger, have applied for permission to raise companies, and if they succeed in raising 93 men each they will receive appointments as captains, provided the War Department approves. Twenty applications for enlistment have already been received, and also fifty additional letters seeking information about the brigade."

Chicago.—The movement set on foot by Capt. Eugene Griffin in regard to the organization of a corps of electrical engineers for service during the war was eagerly taken up in Chicago and a company of volunteer electrical engineers was at once formed. Prof. F. B. Badt, B. J. Arnold and E. P. Warner addressed a meeting of the Chicago Electrical Association in behalf of the movement and urged that the society offer its whole membership and strength to the Government in the way suggested.

Pittsburg.—The following extract from an item in the "Dispatch" shows that interest in the "electrical corps" movement is extending: "E. M. Sawtelle of Washington, D. C., formerly of this city, is in correspondence with a number of expert electricians of Pittsburg and vicinity with a view to securing 100 volunteers for a proposed electrical engineering corps for the United States Navy. The volunteer corps is the idea of Prof. Duncan of the School of Electrical Engineering of John Hopkins University. He is one of the most widely known authorities in the electrical world to-day. Prof. Duncan has communicated with the War Department relative to his plan, which is the enlistment and equipment of a volunteer force of 3,000 or more expert electricians, the company to serve the Government for two years as a part of the regular Naval Department. The proposition of Prof. Duncan, as far as known, has not yet been definitely accepted by the War Department. Sufficient encouragement, however, has been received to warrant a preliminary enrollment of electricians throughout the United States. Mr. Sawtelle offered his services to Prof. Duncan as far as the Pittsburg field was concerned and has been appointed recruiting officer for Pittsburg and vicinity. The quota of volunteers for this section is fixed at 100."

New York.—While engaged in the work of laying mine cables in the main channel at Sandy Hook on Saturday last, two electricians lost their lives through the upsetting of the boat in which they were at work by the French steamship La Touraine, outward bound. It is supposed that the screw of the steamer came into contact with the cable, a section of which was lying over the bow of the boat the cable men occupied. The men drowned were Victor Passa, an electrician, who lived in Brooklyn, and Robert Middleton, an employee of the General Electric Company, who resided at Orange, N. J. Six others who were in the boat were rescued.

PERSONAL AND MISCELLANEA.

R. Manchester has been granted a concession by the Omaha Exposition Commissioners for the operation at the Exposition of automatic models of a steam ship, locomotive, fire engine and electric light plant. The models, it is stated, are very handsome and cost \$4,000 each.

The native Philippine mothers are said to hush the crying of their children with the word "Castalia" (not Castoria), which means Spaniard. If a white man approaches a native dwelling of either the poor or the well-to-do the cry of "Castalia" is always heard as a warning from some one who may be on watch, and children are taught to flee at the word.

The X-ray apparatus devised by Prof. Reginald A. Fessenden of the Western University of Pennsylvania for the use of army surgeons in the field is no bigger than an unabridged dictionary and weighs twenty-five pounds. It is operated by a gas motor of equal weight.

The United States Patent Office has declared George D. Burton of Boston to be the original and sole inventor of the art and process of heating an electrically conductive body in a liquid, after a contention in the Patent Office, lasting six years, between Edward M. Bentley of New York, formerly of the Thomson-Houston Company, and Lagrange & Hoho, the alleged Belgian inventors. The Patent Office in making its decision states that Burton practised the art and process in 1883 and thereby is awarded priority over Bentley and Lagrange & Hoho, who first used the process in 1890.

The right to use the Edison patent electrical iron ore separator in the States of Minnesota, Wisconsin and Michigan is said to have been sold to a stock company now being organized for the purpose of utilizing it in the Lake Superior iron districts. Mr. Edison is himself, it is stated, heavily interested in the company, and this has directed his attention to the St. Louis river water power at Duluth and the large bodies of magnetic ore in Cook County and elsewhere in Minnesota which are not now merchantable.

Cleveland, O., has a 13-year-old boy who bids fair, says the Cleveland "Press," to astonish the world as an inventor and electrician. This singularly gifted boy's name is Jas. B. Kirby. He is the son of Jas. D. Kirby of Cleveland. Master Kirby is a born electrician. According to the "Press," "he presents the only known instance of a child born with a knowledge of electricity. But a little over a year ago, when the first principles were explained to him, the boy seemed to understand them intuitively. Among the long list of inventions for which Master Kirby is responsible is a telegraph instrument, galvanometer, magnets, induction coil, double carbon electric light and a microphone. It is claimed that the last named instrument will carry the voice 2,000 miles. Young Kirby has just completed a motor which is a complete success, and he is at present engaged upon a 16-cell battery. Young Kirby is known among his friends and associates as the wizard of the West Side."

The Columbus & Grove City Electric Railway will, according to the Columbus "Dispatch," be constructed under peculiar circumstances. "Generally railroads are built by contractors after a public letting, but the Grove City road is being built by the original promoter, Adam G. Grant. Mr. Grant is the 'whole thing.' He originated the idea of constructing a road. He pushed it to a point where the road could be built, and he is now himself building it. There will be no deals in the construction of this road. There will be no stockholders to look to for money. There will be no jobs in the contract. Mr. Grant uses his own money, in effect, to build a road for himself, and he will operate it. The question has been asked whether a company has been organized to hold a charter for this road, but it appears from investigation that there is no need of a company. The county commissioners granted the franchise to Mr. Grant himself; thus Mr. Grant holds the charter, builds the road and will operate it. Mr. Grant has not yet contracted for his cars, nor for the power necessary to operate his road. He expects to arrange these things before the road is constructed."

RECENT COMPANY ELECTIONS.

Camden, Gloucester & Woodbury Electric Railway Company, Gloucester, N. J.—President, J. Willard Morgan; treasurer, William J. Thompson; secretary, Thomas P. Curley; directors: William J. Thompson, Augustus Muller, Henry M. Harley, David Baird, J. Willard Morgan, Thomas P. Curley, John J. Curley, Thad. P. Varney and Henry J. West.

Citizens' Street Railway Company, Indianapolis, Ind.—Directors: W. W. Kurtz, B. H. Rushton, J. Levering Jones, Joseph S. Neff, B. M. Gaskill, W. C. Houston, William J. Turner, all of Philadelphia.

Kenton Gas & Electric Company, Kenton, O.—President, Thomas Espy; vice-president, Henry Price; secretary, W. S. Robinson; treasurer, H. C. Koller.

Missouri Railroad Company, St. Louis.—Directors: Charles D. McClure, Edwards Whitaker, Ephraim Catlin, J. C. Van Blarcom and Charles C. Maffitt. Mr. Whitaker will continue as president.

Nashville Street Railway Company, Nashville, Tenn.—Directors: A. H. Robinson, D. S. Williams, T. M. Steger, J. C. Bradford, N. Baxter, Jr., L. D. Tyson, S. M. Murphy.

Standard Electric Signal Company, Rochester, N. Y.—President, Howard A. Smith; vice-president, Stephen Remington; treasurer, George A. Benton; secretary and manager, Judson B. Loomis; directors: Howard A. Smith, Stephen Remington, W. Frank Carlton, Frank P. Crouch, Wilmot Castle, S. K. Newcomb, George A. Benton, Charles S. Curtice, M. B. Adams and Judson B. Loomis.

COMMERCIAL PARAGRAPHS.

We are indebted to the courtesy of Mr. Foree 'Bain' of Chicago for a neat little handbook of technical information which he has just published. This brochure, which may be conveniently carried in the breast pocket, contains on its first cover page a very useful blank form for personal records that may have to be referred to at any moment. The general contents cover a wide field and include valuable points for practical use; numbers in calculating weights, measures, etc.; dimensions, costs, strength, power, etc., of various articles, including electrical apparatus and materials; methods of solving many problems in practical work, and hundreds of points in regard to lighting, wiring, setting up machinery, etc., that are calculated to save much time and trouble. It also contains the diagrams recently devised by a committee of the Chicago Electrical Association to illustrate designs for electric apparatus in patent specifications, and a great deal of information about patents, domestic and foreign, and about other things that investors, electricians, machinists and others are often puzzled to obtain. A limited number of copies of this useful handbook have been printed for general circulation and will be sent postpaid upon receipt of five 2 cent postage stamps on application to Mr. Bain, 1657-59 Monadnock Block, Chicago.

We illustrate herewith a rheostat for starting a 300 H.P. motor on a 500 volt circuit. This rheostat is provided with a "no voltage" automatic release and was made by the

Ward Leonard Electric Company for the Walker Company, and is used in connection with the electric locomotive installation of the B. & O. Railway at Baltimore.

Attention is called to the advertisement of the De Vries Feed Water Heater and Purifier which will be found on the front cover of this number. This remarkable fuel saver was illustrated and described in an article which appeared in our last issue.

INCORPORATIONS.

The Victor Electric Company, Alexandria, Va. Capital stock, \$25,000.

The Electric Gas Regulator Company, San Francisco, Cal. Capital stock, \$30,000, with \$28,000 subscribed. Directors: C. T. Ryland, W. E. H. Williams, A. P. Seiler and S. C. Denson, San Francisco; W. C. Mahoney, Mill Valley, Cal.

The Hogan Electric Company, Charleston, W. Va. Capital stock limited to \$100,000. Incorporators: Alf. Brittenham, E. A. Botkin, A. G. Vickers, Charleston; John E. Laughlin, G. W. Arbogast, Clay Court House.

The McInnerney Manufacturing Company, Omaha, Neb.—to manufacture electric appliances, gas engines, etc. Capital stock, \$300,000. Incorporators: A. Millard, B. McInnerney, Philip Potter, C. G. Powell and Herbert M. Rogers.

The Des Plaines Valley Electric Railway Company, Chicago—to construct a railroad from some point in the township of Lyons to some point in Chicago. Capital stock, \$100,000. Incorporators and directors: Nelson F. Merrill, Hiram A. Johnson and H. Wallace Perce of Chicago, Henry B. Fargo of Geneva and Samuel S. Carman, Jr., of Oak Park.

The Chippewa Valley Electric Railroad Company, Eau Claire, Wis.—to build and operate the Interurban and Chippewa lines and eventually own and operate the whole system owned and operated by the present Chippewa Valley Electric Railway Company. Capital stock, \$300,000.

President, N. C. Wilcox; vice-president, H. N. Bates; secretary treasurer, A. E. Appleyard.

The Electric Street Railway Company, Bloomington, Ill. Capital stock, \$20,000. Incorporators: W. H. Beaver, J. W. Gray and J. Y. Chisholm.

The Rosseau's Electrical Works, New York City—to manufacture apparatus and appliances for electrical purposes. Capital stock, \$25,000. Directors: David Rosseau, of the borough of the Bronx; I. M. Randolph Molkleham, John Sheaffer Douglas, Charles H. Hart and Frederick W. Douglas of the borough of Manhattan, New York City.

Articles of consolidation and incorporation made and entered into March 21, 1898, between the Oakland Consolidated Street Railway Company, the Alameda, Oakland and Piedmont Electric Railway Company, and the Central Avenue Railway Company, have just been filed with the Secretary of State at Sacramento, Cal. They now become a part of the new Oakland Transit Company, the organization under which all of the Realty Syndicate railroads are being placed as rapidly as possible. The capital stock is \$5,000,000, divided into 100,000 shares of \$50 each. The directors are F. M. Smith, E. A. Heron, F. C. Havens, W. H. Martin, D. D. Harris, John C. Winans, C. R. Bishop.

The St. Louis *Republic* states that several "St. Louis parties, among the number being W. R. Dean, of the commission firm of Block, Dean & Co., are interested in an electric road, articles of incorporation for which have just been filed at Springfield, Ill. The capital stock is placed at \$1,500,000, and the proposed line is to run from Venice, Ill., on the east side of the Mississippi River to Durall, where a connection is to be made with the Chicago & Eastern Illinois Railroad. Freight and passengers will be carried. The incorporators are W. B. Dean of St. Louis, A. A. Barnes of Indianapolis, E. D. Waddle of East St. Louis and J. P. S. Gordon and G. A. Wilson of Collinsville. A spur will be built from the main line of the proposed road to Collinsville."

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 10, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 603,624. Electric Railway. Eben C. Crocker, Bridgeport, Conn., assignor of one-half to Edwin C. Howe, same place. Filed Sept. 17, 1897.
- 603,625. Electric Railway. Eben C. Crocker and Edwin C. Howe, Bridgeport, Conn. Filed Sept. 17, 1897.
- 603,656. Conduit for Railroads. Fred S. Pearson, Boston, Mass. Filed Sept. 14, 1897.
- 603,672. Trolley Device for Electric-Railway Cars. Louis E. Watkins, Springfield, Mass., assignor of one-half to Francke W. Dickinson, same place. Filed April 14, 1897.
- 603,728. Car-Fender. Elisa M. Johnson, Brooklyn, N. Y. Filed Sept. 9, 1897.
- 603,912. Car-Fender. Isaac Macowsky, New York City. Filed Sept. 21, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 603,630. Electric-Arc Lamp. Frederick A. Gilbert, Brookline, and Emil O. Lundin, Beaumont, Mass. Filed July 1, 1897.
- 603,687. Electric-Arc Lamp. John H. J. Haines, New York City, assignor to the Haines Electric Company, Jersey City, N. J. Filed May 27, 1897.
- 603,707. Electric Incandescent Lamp. William J. Phelps, Chicago, Ill. Filed Sept. 7, 1897.
- 603,876. Electric Headlight. Frederick W. Dressel, New York City. Filed Oct. 6, 1897.
- 603,882. Electric Lantern. Frederick G. W. J. Adams, London, England. Filed April 24, 1897.
- 603,883. Safety Incandescent Electric Lamp. Frederick G. W. J. Adams, London, England. Filed May 10, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 603,650. Automatic Electric Feed-Water Regulator. Andrew E. Maccoun and John Noey, Braddock, Pa. Filed Dec. 8, 1897.
- 603,693. Automatic Temperature-Regulating Apparatus. Walter B. Loring, Worcester, Mass. Filed Nov. 5, 1896.
- 603,709. Dynamo or Motor. Ferdinand Schwedtmann, St. Louis, Mo. Filed Oct. 23, 1897.
- 603,722. Electric Condenser. Charles S. Bradley, Avon, N. Y. Filed July 29, 1897.
- 603,778. Starting Device. Joseph P. Stone, Schenectady, N. Y., and Samuel E. Doane, Marlborough, Mass., assignors to the General Electric Company of New York. Filed Oct. 27, 1897.
- 603,786. Electrically-Controlled Switch. Edward M. Hewlett, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 23, 1897.
- 603,849. Switch for Electric Motors. Frank E. Herdman, Winetka, Ill. Filed Jan. 9, 1897.
- 603,875. Electrical Apparatus for Schools. Melvin E. Crowell, Indianapolis, Ind., assignor to the Crowell Apparatus Company, same place. Filed Nov. 23, 1896.
- 603,886. Electrical Steering Apparatus. Harry O. F. Bindemann, Madrid, Spain. Filed June 4, 1897.

ELECTRIC ELEVATORS.

- 603,665. Control Apparatus for Elevators. August Sundt, New York City, assignor to the Otis Brothers & Company, same place. Filed April 24, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 603,681. Throw-Off Switch for Telephones. Nathan Fajlek, San Francisco, Cal., assignor of thirty-one sixtieths to Frederick Hess, Jr., Albert K. Andriano and Isidore Harris, same place. Filed Aug. 17, 1897.

MISCELLANEOUS.

- 603,623. Conduit-Wiring Machine. William E. Cowan, Brooklyn, N. Y. Filed Aug. 27, 1897.
- 603,745. Underground Conduit for Electric Conductors. Charles H. Sewall, Chicago, Ill. Filed May 8, 1895.
- 603,815. Electrotherapeutic Apparatus. Gervaise G. Duke, Chicago, Ill. Filed Dec. 6, 1897.
- 603,890. Primary Element With Regenerable Negative Electrode. Oskar Rothmund Edler von Burgwall and Leopold Ofenschussl, Vienna, Austria-Hungary. Filed Dec. 9, 1896.
- 603,898. Alarm. Ira B. Frazee, Blairtown, Iowa. Filed March 6, 1897.
- 603,991. Cable-Stringer. Frank A. Cannon, Denver, Col. Filed Dec. 3, 1897.

TELEPHONE AND TELEGRAPH.

Telephone Extension in Minnesota.

The *Pioneer Press* of St. Paul, Minn., says St. Paul will soon have telephone connection with a multitude of towns and villages in Western, Central and Northern Wisconsin. "Two Wisconsin companies," it explains, "have combined to build a telephone line from Hudson to this city. These two companies connect with two other Wisconsin companies. The new line will be quickly completed. It must be of advantage to business men of the Twin Cities. The two companies building the line are the Pierce County Telephone Company and the Hudson Electric Exchange Company. The Pierce County line now has offices at Hudson, Rock Elm, Waverly, El Paso, Martell, Ellsworth, Beldenville, Trimble and Moeville. The Hudson Electric Exchange Company binds loquaciously together Hudson, New Richmond, Roberts, Hammond, Baldwin, Hersey, Woodville, Glenwood, Knapp and Menominee. Moreover, the Pierce County Company joins at Rock Elm the Union Telephone line, and thus extends to Maiden Rock, Lake City, Pepin, Ono and Plum City. The Hudson Exchange connects in turn, at New Richmond, with the Wisconsin Valley line, which communicates with all the principal business points in Northern Wisconsin."

A press dispatch from Montreal states that the placing of a new transcontinental telegraph wire between Montreal and Vancouver, B. C., has begun. The Canadian Pacific Railroad is stretching a new line from Montreal to Fort William, from Fort William to Donald, B. C., from Donald to Vancouver, where connection can be made with the new cable being laid from Vancouver to Victoria. In all the wire will be 2,900 miles long, weighing 800 pounds to the mile. Porcelain instead of glass insulators will be used, seventy-five tons of the former coming from Europe for the new line.

A special to the *Milwaukee Wisconsin* from New Richmond, Wis., states that the Bell Telephone Company is making desperate efforts to get into New Richmond, Hudson and River Falls, but it is doubtful if they will succeed. They have poles laid from Burkhardt, fourteen miles south, to the city limits of New Richmond, but cannot secure a franchise to go any further. A. T. Preason, manager of the St. Croix county telephone exchange, is to put in a local exchange in New Richmond this month.

Through the Bureau of American Republics it is learned that the Mexican Government has contracted with the Mexican Telegraph Company for the international service to be effected through the lines of that company and those of the Western Union of the United States. The Mexican Telegraph Company binds itself to pay the Government of Mexico 15 per cent. of the annual profits, guaranteeing that the 15 per cent. shall be not less than \$20,000 gold per annum.

The telephone examination by the House Committee at Washington, D. C., has brought out some interesting statistics. The entire number of telephones in use in Washington is 2,270, of which 443 are used by the Government, the 'phones costing the Government \$98 each. The deadhead 'phones number 59, the company using 84 of these.

The Missouri & Kansas telephone line between Fulton, Mo., and Jefferson City is nearly completed. The company is building a long distance line from St. Louis to Kansas City and will rebuild that part of the line between Kansas City and Sedalia, now in defective operation, so as to put it in first-class condition.

The quarterly report of the Western Union Telegraph Company filed a few days ago at Jackson, Miss., gives the capital stock of the company as \$100,000,000; taxes paid in Mississippi during the quarter, \$337 30; receipts within the State, \$31,143.28; expenses, \$26,937.77; net receipts, \$4,207.51.

Representatives of the New State Telephone Company have made arrangements at Metamora, Mich., for the construction of a line connecting Hadley, Metamora, Thornville, Dryden, Almont, Armada, Berville and Smith. It is to be in operation in less than a month.

A franchise has been granted to the Citizens' Telephone Company of New York by the board of trustees of the village of Lyons, N. Y. The telephone exchange is to be in operation within eight months. The company agrees to furnish the village with two telephones free of charge.

The Central and South American Telegraph Company announces that cable communication with Buenos Ayres and Uruguay via Galveston is not interrupted on account of the war, all the lines being operated as usual.

The Three Rivers (Mich.) Telephone Company, a local corporation, will declare a 20 per cent. dividend this year.

Wireless Telegraphy in England.

Experiments are being conducted on a system for telegraphing without wires between Lavernock Point near Barry Dock to Flat Holm Island in the British Channel, a distance of $8\frac{1}{2}$ miles. The Morse code of signals is used and the messages are read by sound. It is stated that 40 words per minute have been signaled across and read without difficulty. The system is the invention of W. H. Preece, engineer-in-chief of the English General Post Office. The idea of experimenting at this particular point was suggested by the difficulty of maintaining a cable free from accident for any considerable length of time. So many vessels drop anchor in these waters that the cable is frequently dragged about and broken. Mr. Preece's system employs a stout copper wire three-fourths of a mile in length, erected on poles on the mainland, with the ends of the wire running into the sea. On the island a similar wire about half a mile in length, with the ends grounded, runs parallel to that on the mainland. The transmission of the electric disturbances is due to electro-magnetic induction from waves set up in the conductor at the transmitting end. It is of course understood that the term "wireless" has reference to the absence of a metallic conductor connecting the points between which the signals are transmitted.

The Independent Telephone Company has completed its lines from Kalamazoo to Lansing, Mich. There is direct connection with Benton Harbor and as far south as Michigan City. Fort Wayne, Ind., will be reached in a few weeks, and Chicago is to be tapped by the new line.

Work on the telephone line from Sparta to McMinnville, Tenn., which is to be built by the Gainesboro Telephone Company begins this week. The line will connect Quebec with Doyle, Bone Cave, Goodbars and Increase.

At a meeting held in Brenham, Tex., on the 6th inst., a stock company was organized to establish a telephone line from Brenham to Shelby, Austin county, via Greenville and Saturn.

The U. S. Senate has passed a bill authorizing the enlistment of a Volunteer Signal Corps two-thirds of the members of which must be expert electricians or telegraphers.

Ordinances are now pending in the council at Akron, O., granting franchises to the Central Union Telephone Company and to the Citizens' Telephone & Telegraph Company.

The amended municipal license ordinance adopted by the common council of San Jose, Cal., requires each telephone company to pay \$100 per quarter.

An ordinance granting the new Lackawanna Telephone Company a franchise in Scranton, Pa., has passed its first reading in the select council.

New Companies Incorporated.

The Nicollet County Telephone & Telegraph Company, New Sweden, Minn.—to build a line from St. Peter to Sibley. Capital stock, \$3,000. Incorporators: C. O. Nelson, Joseph Peterson, A. L. Strauch, J. H. Housman, Martin P. Quist, Joseph A. Poetz, C. O. Gustafson, Henry A. Burke, August Olson.

The Northeast Telephone Company, Rush City, Minn. Capital stock, \$50,000. Incorporators: A. J. Stowe, C. F. Jacobson, J. D. Markham, of Rush City, and S. A. Nable, C. F. Nelson and N. J. Hoberg, of Danewood.

The Martin Telephone Company, Johnson City, Blanco county, Tex.—to construct and maintain a telephone line in Blanco, Hays, Travis, Burnet, Llano, Gillespie and adjoining counties. Capital stock, \$10,000. Incorporators: David Martin, J. W. Shugart and A. G. Peery.

The Albion Farmers' Telephone Company, Florenceville, Ia.—to operate a telephone line from Oresco to Florenceville, with branch lines connecting with the residences of stockholders. Capital, \$400.

The Mountain State Telephone & Telegraph Company, Charleston, W. Va. Capital stock limited to \$50,000. Incorporators: G. V. Forman, H. A. Forman, H. V. Thomas, of Buffalo, N. Y.; J. W. Penhale and C. B. Couch, of Charleston, W. Va.

The Camden Telephone Company, Camden, N. C. Incorporators: E. Mitchell, W. D. Kellam, P. G. Morrisette, H. T. Greenleaf and P. H. Williams.

The Bergen County Telephone Company—to operate a telephone system in numerous towns in Bergen county, N. J. Capital stock, \$50,000, business to begin with \$17,000. Incorporators: William A. Cullen and Charles L. Raller, of Newark, N. J.; Alfred B. Hopkins, of Montclair, N. J., and Dr. Eugene W. Davis, of New York.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

Abbreviations: ert. indb., certificate of indebtedness; coll., collateral; cons., consolidated; const., construction; conv., convertible; com., common; deb., debentures; exten., extension; gen., general; g., gold; guar., guaranteed; inc., income; imp., improvement; pd., paid; pfd., preferred; mtg., mortgage; tr., trust; A., annually; S., semi-annually; Q., quarterly; A. & O., Apl. and Oct.; F. & A., Feb. and Aug.; M. & S., May and Sept.; J. & D., July and Dec.; J. & J., Jan. and June.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 12c.; casting, 11½c.

The Third Avenue Railroad Company, New York, has declared a quarterly dividend of \$2 a share, payable May 31.

The Cincinnati & Hamilton Electric Street Railway Company has increased its capital stock from \$350,000 to \$600,000.

A leading commission house advises its customers: "The effect of war was discounted in advance of a declaration of war. Take care that you do not discount the declaration of peace."

The gross earnings of the Edison Electric Illuminating Company of Brooklyn for the month of April were \$73,590; net, \$28,713. For the same month in 1897 the gross earnings were \$67,985; net, \$28,568.

The Philadelphia "Stockholder" says it is asserted by a competent authority that the July semi-annual dividend on Baltimore Consolidated Railway will be not less than 2 per cent.

A member of the executive committee of the Western Union Telegraph Company says that the earnings have run considerably ahead of expectations, the gains being attributed to the war excitement and the demand for the rapid transmission of news.

The reorganization committee of the Brooklyn Elevated Railroad Company give notice that the fourth and last installment of 35 per cent. of the amounts to be paid by the security holders is payable at the Central Trust Company of New York on or before June 1.

The Boston "News Bureau" says that people familiar with the situation of the Boston Electric Light Company figure that with the new and improved works at South Boston the company will have improved its position by at least \$1,000,000. At present the company is earning more than 10 per cent. per annum.

The Van Choate Electric Company has commenced two suits for damages against the town of Foxboro, Mass., and attached all the town property. One suit is for \$100,000 damages for failure by the town to carry out and fulfil its agreements with the company in regard to locating its works in the town.

President C. L. Rossiter of the Brooklyn Heights Railway Company has addressed a letter to Bridge Commissioner Shea in which he fully discusses the question of the proposed increase in the tolls for cars of the street railway companies using the Brooklyn Bridge. He intimates that the increase suggested by the Commissioner would not be accepted by the car companies.

Mr. John C. Russell, chairman of the Louisville stockholders' committee of the New Orleans Traction Company on his return from Louisville to New Orleans last week stated that he had been conferring with the New Orleans holders of the stock of the company and found that there was no desire on the part of the New Orleans holders to freeze out the Louisville holders; they are ready to listen to any reasonable plan of reorganization.

The lease of the Consolidated Traction Company of New Jersey by the North Jersey Railroad Company goes into effect on the 25th inst. Among those who will control the lease are Vice-President Hobart, United States Senator Sewell, John D. Crimmins of New York City, E. F. C. Young of Jersey City, Bernard F. Shanley of Newark, N. J., and Stephen B. Elkins and P. A. B. Widener of Philadelphia.

Receiver Uhlmann of the Brooklyn "L" is quoted as saying that unless some unforeseen accident occurred the "L" trains of his company would be crossing the bridge by June 15 next. "Our first shipment of the motor cars from Pullman, Ill., will arrive here in a few days," said Mr. Uhlmann. "The work on the Manhattan end of the bridge is completed and the connections with the bridge at Washington street from Adams is being pushed as rapidly as the men can work. Nearly all our cars are equipped with side doors, and as we have the grips ready we can adjust them very readily. I have every reason to believe we will be crossing the bridge by June 15 sure."

In the suit of the people through Attorney General Hancock to dissolve the Kings County Traction Company, Brooklyn, N. Y., James C. Church procured from Justice Van Wyck, on the 12th inst., an order requiring the defendant to show cause why a receiver should not be appointed. The ground of the application, according to the papers, is a belief that the trustees, under pressure by E. Harriman, at the head of a syndicate proposing the reconstruction of the company, may consent to a call of a loan and the selling out of the property.

A Boston financial paper publishes the following as a special from New York: "The next move to be made in the reduction of the capital stock of the General Electric Company will be a call for a special stockholders' meeting. Just when this meeting will be called is not yet decided. This matter does not legitimately come under the control of the directors for action which must necessarily emanate from the stockholders. Those who held proxies at the recent annual meeting did not feel that it would have been right to take decisive action in this direction unless the proxies had given direct assent for the purpose. The special stockholders' meeting will probably appoint a committee to confer with the preferred stockholders, after which the whole matter is to come before another stockholders' meeting for settlement."

The Brooklyn "Standard Union" says: "The absorption by the Edison Electric Illuminating Company of Brooklyn of the Municipal Electric Light Company will be practically effected at a special meeting of the former company at its offices, 360 Pearl street, at 11 o'clock, Thursday morning, June 2, to act upon a proposition to increase the capital from \$4,000,000 to \$5,000,000. President Doty, in an explanatory letter to the stockholders, says that an issue of consolidated bonds is proposed to carry out the agreement to acquire certain shares of the stock of the Municipal Company, and that the officers of the Edison believe that its acquisition will prove as advantageous as that of the Citizens' a few years since. The Municipal stock receives in the 'deal' \$200 in cash or in Edison 5 per cent. consolidated bonds, the amount necessary to carry out the transaction exceeding \$2,000,000."

Time and again it has been conclusively shown that State control of railroads and municipal ownership of street railway transportation companies proves less satisfactory than when they are managed by private capitalists. This has not only been made patent in this country but abroad as well. A recent report on "Municipal Ownership of Street Railways" refers to the subject in this wise: "The experiment of State ownership of railroads has been tried longer in France than in Brazil and under more favorable conditions. The model road there runs through well-populated districts with large cities as terminals, but the results in France are discouraging. Eighteen years ago a railroad system was constructed which was to furnish cheap rates for passengers, cheap freight for shippers and abundant profits for the State. It has done none of these things. At first the advocates of the enterprise insisted that only time was required to prove the wisdom of the project. Eighteen years have passed and the results may be briefly summarized. Theoretic methods have been abandoned, and the railroad is now managed substantially as are those in the hands of private capitalists, except that its tariff of rates is a little higher and its cost of operation is considerably larger. The last report shows that the net return on the whole capital is 1.35 per cent. The Government has every year a considerable deficiency to settle, and the people who use the line pay somewhat more than they would have done if the enterprise had been left to private capital."

ELECTRICITY.

EDITORIAL NOTES.

As was predicted some time ago, our present struggle with Spain is to a large extent one of mathematics and electricity. The only war that has ever been previously fought upon scientific principles, and in which modern electrical appliances were extensively employed, was that between Japan and China, and that contest can hardly be looked upon as a criterion in view of the little resistance the Japanese met with. It is no exaggeration to say that at the present day the result of a naval battle between two modern fleets might hinge on the rupture of an electrical conductor or on the burning out of an armature. As Lieutenant Bradley A. Fiske said a number of years ago, in an address before the New York Electrical Society, "Electricity is not used in warfare as a convenience, nor is it a fad of theorists—it hoists the ammunition to the deck; it trains and fires the guns; it gives, by means of the range and position finder, the distance and position of the enemy's ships; it gives a means of signaling; it actuates the torpedoes; it lights and ventilates the ship; in fact, it does good, honest, practical work."

It will readily be seen that were any of the electrical apparatus employed in operating these various pieces of machinery to get out of order, a ship in a naval combat would be at a terrible disadvantage.

Probably nowhere in war is electricity of more importance than in the firing of submarine mines. During the past month hundreds of these mines have been planted in the various harbors along the Atlantic coast. Some of the mines thus far laid are what are known as contact mines and are moored a few feet below the surface of the water. These are in circuit with an electric battery located on shore, and are arranged to explode on being struck by a passing ship, which drives in a pin, thus completing the circuit. The greater number of the submarine mines, however, are what are termed buoyant mines. These are anchored to the bottom like the others but can only be exploded from the shore by closing a switch. At Fort Hamilton, for instance, the mine wires all terminate in a bomb proof chamber in which the operator is located.

Considerable trouble has been experienced in keeping intact the electrical connections owing to the carelessness of friendly vessels breaking the connections in passing in and out. A narrow channel has, however, been lately marked out which outgoing and incoming vessels are obliged to take or run the risk of being fired upon by Government patrol boats. It is absolutely essential that ships should keep to this channel, as the continual breaking of the electrical mine connections is not only a

serious but likewise costly matter. Trained electricians are required to keep these mine connections in working order, and it is therefore essential that the Government should have in its employ a large number of trained engineers. At the present time the steps that are being taken toward the formation of several electrical Government corps are to be commended. As Lieut. Fiske correctly prophesied several years ago, the immediate employment of such corps will be in the torpedo defence of the harbors, and the services of men accustomed to difficult electrical work and familiar with the latest methods will be of incalculable value.

The firing of miniature submarine mines at the Electrical Exhibition by the Marconi method has brought up the question as to whether it would not be possible to fire a harbor mine by means of Hertzian waves in the same manner and thus do away with the present complicated system of wiring. In the opinion of Mr. Clark, the well-known electrical expert in wireless telegraphy, this could be accomplished in spite of the fact that a large body of salt water, being a good conductor, might act as a shield to the coherer and obstruct the passage of the electric waves in the same manner that a mass of metal would. To overcome this difficulty Mr. Clark suggests running a wire from the receiving apparatus to the surface of the water and thus furnish a path of little resistance to the coherer. To prevent all the mines in a harbor from being discharged simultaneously by the electric waves it would be necessary to have a large number of transmitters, each differently tuned or in step with its special coherer at a certain mine. For this reason it may be some time before the wireless apparatus is adopted for this use.

The National Electric Light Convention.

The annual meeting of the National Electric Light Association, the most important event in the year in electrical circles, will take place in Chicago on June 7, 8 and 9. The headquarters of the Association will be at the Auditorium Hotel. Preparations are now being made on an elaborate scale for the reception and entertainment of the members, and it is safe to predict that the coming meeting will be one of the most successful yet held both from an intellectual and social standpoint. A number of excellent papers on distribution and lighting are to be read and fully discussed, which should materially add to the existing information on these subjects.

A committee of twenty-five has been appointed to act as a reception committee, composed of representatives of leading electrical interests in Chicago. These gentlemen will receive and entertain the visiting members and unquestionably afford them a good

time, without however interfering with the work of the Convention.

President Insull, on behalf of the Chicago Edison Company, has extended a general invitation to manufacturers and agents having apparatus and supplies of any kind in use in the Edison system to invite friends to inspect these products in actual operation. The Western Electric Company also propose to issue a circular inviting members of the Association and other visitors to inspect their factory during the Convention week. As the delegates from the vicinity of New York are expected to arrive in Chicago on Monday, the 6th, it is proposed to hold an informal reception at the Association's headquarters in the Auditorium on Monday evening, with a view to having the visiting members meet the local central station men and representatives of allied industries. As a large number of ladies are expected to be present, no pains are being spared to make their visit enjoyable. For their special benefit there will be several trips in trolley-coaches about the beautiful parks and boulevards in Chicago while the Convention is in session. Altogether the next Convention should be one of the best attended, most instructive and enjoyable yet held.

* * *

A Would-be Blow at Trusts.

It is surprising how strong public sentiment is getting to be against trusts and combinations. As an example, there is a bill now before the House of Representatives in Washington which seeks to provide among other things that it shall be unlawful for the director of any railroad, telegraph, express, steamship or telephone company, national bank, or any member or officer of any combination or association formed for the purpose of controlling the price of any article of commerce, in other words, a member of any trust, to either hold the office of President of the United States, be a member of the Cabinet, a Senator, Representative in Congress, Judge of any United States Court, or to be the head of any Department or Bureau of the Government. The holding of any of the positions mentioned above would render their election or appointment to any of these named offices null and void. Every officer would be required upon entering on the duties of his office to take an oath, in addition to the usual oath of office, in which he would state whether or not he was a director of any of the organizations mentioned above, and if so he could not qualify. The measure would also operate retroactively in so far as that the present occupants of these positions would be required to answer under oath with reference to these proposed limitations, and if they could not qualify their positions would be declared vacant.

Although it is scarcely likely that this bill will become a law at the present time, it is an indication of the sentiment that is getting to prevail throughout this country. As it is impossible to prevent a man from joining a trust, it is evidently the intention of the father of this bill to strike at the members, or would-be members, of a trust through their political aspirations. This bill is but the first rumbling of a storm which may burst with all its fury later.

The War Revenue Bill.

A correspondent advises us that the Revenue Tax Bill H. R. 10,100, now in the Senate, calls for the placing of a 4-cent stamp on all proprietary articles sold for \$1. This, if we mistake not, is the same tax that was put in force in 1861 and 1862, and means that manufacturers of proprietary articles will be called upon to pay from 8 to 10 per cent. of their gross business. Our correspondent suggests that this tax, amounting to a reduction of from 8 to 10 per cent. of the gross business of many manufacturers, will not only seriously affect the manufacturers, but also the advertising business throughout the country. There is scarcely any busi-

ness that can stand such a tax, and it would result in a loss of at least \$5,000,000 a year to the newspapers of America, and in addition to this, undoubtedly many advertisers will be forced out of business. The proposed bill, as previously stated, imposes a tax of 4 cents on each \$1 worth of goods, and this means from 8 to 10 cents on wholesale prices. This certainly seems to us too great a burden for any class of producers.

It would seem as though this proposed tax could well be reduced to say 1 cent on the dollar, which would not then be so hard upon the proprietary manufacturers and would still net the Government a good return. As we understand it, the proprietary men of America are willing to pay a reasonable tax, but claim that the tax proposed is unjust for the reason that it does not take in thousands of articles sold under arbitrary trade names and trade marks and under patent protection.

Under the Searchlight.

Notes and Comments on Various Topics.

THE *Advertiser* of Boston, Mass., says:

New York, judging from the number of tips sent over to buy, evidently wants Boston to buy some of its General Electric. The talk is for 40 to 45 on this rally. After some inquiry the source of this 45 price was found. It seems that a plan of readjusting the capitalization of the company, which is finding many advocates, is to pay the 31½ per cent. back dividends on the preferred stock in cash if the preferred stockholders will agree to take common shares for their preferred on the basis of 45, the common meantime to be cut one-half. On the aggregate capital of \$17,000,000 or thereabouts, it is likely the company could earn from 6 to 10 per cent., and though it might strike a preferred stockholder as a little rough at first, still it is a plan that would bear looking at, for the preferred has merely a preference in dividends, not assets, and in agreeing to a cut of half in their stock the common stockholders are themselves making sacrifices.

There is not the slightest doubt but what the preferred stockholders, like the owner of the proverbial elephant who ruined its owner by his enormous appetite, are willing to make almost any sacrifice to get even a small dividend on the stock they have been holding as so much waste paper for years.

THE Memorial Day souvenir just issued by the American Electrical Works, Providence, R. I., is an exceedingly life-like engraving of President Lincoln with a fac-simile autograph, accompanied by a handsome card on which is printed in full the famous address of Mr. Lincoln delivered at the dedication of the Gettysburg cemetery. The souvenir is a graceful reminder of the day and adds another to the happily conceived commemorative presentations of the American Electrical Works.

* * *

CONSCIOUS of a lack of descriptive talent in its editorial staff, the *Electrical Review* last week induced a 12-year old school girl to visit the Electrical Exhibition for the purpose of getting her impressions of the show as a basis for a write-up of the various exhibits. The little miss saw a great many things she didn't understand, but this did not affect her availability as a contributor to the paper—she understood enough to speak in ecstatic terms of a little sign stuck up over one of the booths on which was lettered "Electrical Review," and most of her time and attention was apparently given to a study of this strange device. It fairly dazzled her—she seemed rooted to the spot on which she stood when it burst upon her vision, and she remained there for ever so long revelling in the joy she felt in beholding the words—"Electrical Review." The rest of the show ceased to interest her as soon as she clapped eyes on the letters. That was all-sufficient—it was like a delicious dream. The E-l-e-c-t-r-i-c-a-l R-e-v-i-e-w! What was that central canopy with its graceful columns clothed in soft effulgence from a myriad lights—what was the electric cascade and

fountain—the Marconi telegraphy—the Moore chapel—the blown-up cruisers—the great dynamos at work and at rest—the motors, transformers, converters—the heating and cooking apparatus—the railway car and conduit—the switchboards and circuit breakers—the beautiful measuring instruments—the brilliant arc and incandescent lamps and lighting appliances—the phono, kineto and other graphs—the unique galvanoplastic exhibits—the tableaux and medals and pictures, and the thousand and one other attractions of the great show! What were they all?—simply hazy settings of the gem that held this simple little school girl absorbed, transfixed, surcharged with overpowering emotion, the sign of this jaundiced-colored little hebdomadal, the *Electrical Review*! That at least is the inference that would spring to one's mind at once on reading the report of this school girl's observations in the last number of the *Review*, which by the way, for a wonder, had a part of a single column that was worth reading, and that was the contribution of the little school girl. It was a great coup.

The United States *Investor* of May 21 in one of its items hazards the opinion that the Westinghouse Company "would merit the confidence of the public if it would furnish for the benefit of its stockholders statements of earnings." The company evidently takes a different view.

* * *

SAN FRANCISCO harbor has recently been provided with an exceedingly powerful searchlight.

* * *

A CABLE despatch to the New York *Sun*, dated London, May 21, says:

The first reports of the use of the Roentgen rays in warfare was made yesterday at the United Service Institution by Surgeon Beevor, who described the results of their use in the recent frontier campaign in India and gave lantern views. Many important cases consisted of bullet wounds received by officers and men who were injured in the bones, joints and internal organs. Their injuries but for the X-rays would have resulted in the amputation of limbs and probable loss of life. The pictures shown included wounds in the arm, leg, chest, back, finger and other parts. The most remarkable results, perhaps, were a case of a bullet embedded in the backbone, another in the hip, and the case of an Indian soldier who was shot in the foot, pieces of the bullet finally lodging in the back of the heel; also the case of Gen. Woodhouse, who received bullet wounds in the leg and arm at Dargai. In all the instances enumerated the bullets were by the use of the X-rays successfully removed, the men subsequently rejoining their comrades at the front. The portable apparatus weighs 80 to 100 pounds.

National Electric Light Association.

The following is a list of papers to be read, topics of discussion, and lecture at the Convention of the N. E. L. Association to be held at Chicago, June 7, 8 and 9:

PAPERS.

- "Cost of Generation and Distribution of a Unit of Electricity." By Calvin W. Rice.
- "General Distribution from Central Stations by Alternating Currents." By Herbert A. Wagner.
- "General Distribution from Central Stations by Direct Currents." By Louis A. Ferguson.
- "Public Lighting with Relation to Public Ownership or Control." By Alex. Dow.
- "Transformer Economy." By Winder Elwell Goldsborough.

TOPICS FOR DISCUSSION.

- "Legislative Policy as to Public Service Corporations."
- "Prices and Discounts for Electric Current, and Methods of Charging Customers."
- "Standardizing Apparatus for Central Station Use."
- "Standardizing Specifications for Incandescent Lamps."
- "Freight Rates on Electrical Apparatus."

LECTURE.

- "Electricity Direct from Coal." By Joseph Wetzler.

THE ELECTRICAL EXHIBITION.

Interest in the Show Increasing—Crowds of Spectators at All the Machinery Booths—The Submarine Mine Explosions Please the Children—Company Exhibits.

The last week of the Electrical Exhibition is at hand, and before the next issue of *ELECTRICITY* has been distributed to its readers this wonderful show will have passed into history, not however to be forgotten, but remembered as marking an important point in the progress of electrical development.

During the past week interest in the Exhibition seems, if anything, to have grown, as the attendance has been exceedingly large. Among others, hundreds of school children have visited the show in classes, accompanied by teachers, which demonstrates how highly the Exhibition is generally thought of as an educational medium. Of the many features of interest, the submarine mine explosions seem to attract these little ones the most, and the unceasing

COMPANY EXHIBITS.

The Fostoria Incandescent Lamp Company and the Crouse-Tremaine Carbon Company of Fostoria, Ohio, occupy together a double section which forms one of the most attractive exhibits of the Electrical Show. Along the front of the booth there are six white columns, three on either side of the central entrance, surmounted by globes with vari colored Fostoria lamps. The graceful columns themselves are entwined with spiral tendrils lighted by tiny miniature lamps of different colors. When the thousand lamps which go to make up this display are lighted, the booth and vicinity is most brilliantly illuminated. On a large sample board at the back of the booth is shown Fostoria lamps of all voltages and styles, including etched, frosted and corrugated bulbs. The patent lamp "Duplex" is also shown. This lamp has two standard 16 CP. filaments so connected that by turning a switch on the lamp base one of the filaments may be cut out of circuit, thus reducing the intensity of light from 32 to 16 candle

The Sprague Electric Company, as will be seen by the accompanying illustration, has probably the most elaborate exhibit at the show. This exhibit is located at the east end of the Garden, the total floor space of the company being 65 x 12 feet. An electric sign, some fifty feet in length, is constantly displayed. Among numerous other things this company is exhibiting a direct-connected lighting plant with a Case engine, six pole generator of 25 horse-power; special Lundell power motors ranging in size from one-quarter to ten horse-power; Lundell motors with six poles ranging from 15 to 40 H.P. A printing press may be seen operated by a Lundell slow speed direct-connected motor. Probably the most attractive feature of the exhibit however is the organ with the Lundell blowing apparatus. This is regularly played upon by an experienced organist. Another interesting exhibit is the automobile cab motor with Lundell controller. The dental lathe operated by the Lundell motor also attracts considerable attention. A complete line of Lundell

VIEW OF THE ELECTRICAL EXHIBITION FROM SOUTH PROMENADE.

cheering when a miniature war vessel carrying the Spanish flag is blown to atoms speaks well for the patriotism of the coming generation. The other features of interest however, such as Moore's chapel, Edison's ore separator, the disappearing gun, the electrical cascade, the underground trolley, electricity in wax, the electrical forge, the theatrophone, the galvanoplastic work and diamond making, never fail to draw a crowd or elicit exclamations of wonder and admiration. This certainly would seem to testify to the fact that the managers of the Exhibition have done their work well, and that both the exhibitors and the public appreciate their efforts. As there are now but comparatively few days left before this Exhibition—unquestionably the best of the kind ever held in this country—closes, we would strongly advise all those who have not as yet taken in this show, and are within easy reach of New York, to visit it while they have the opportunity.

power. Thus the "Duplex" has virtually double the life of an ordinary incandescent lamp, as after one filament has given out the other may be used. The Fostoria Lamp Company has grown to be one of the largest lamp manufacturers in the United States as a result of turning out a high grade of goods. The company is ably represented at the Electrical Exhibition by Mr. H. Still on Hart, the Eastern representative, whose office is at 726 Broadway, New York.

The Crouse-Tremaine Carbon Company has a complete exhibit of all kinds of carbons. Seventy-two bundles of plain and coppered, solid and cored, are arranged in pyramidal form on the left of the booth. The carbons are also displayed in actual operation in several different makes of lamps about the building, the enclosed carbons especially being favorably commented upon. A complete line of motor and generator brushes is also shown.

ceiling fans and column fans are also shown in operation. An automatic house elevator machine, with buttons for moving the car from one floor to another, is likewise shown in conjunction with the controlling apparatus which prevents the car from moving if the door is open.

An interesting feature of the Exhibition is the exhibit of the Columbia electric carriages built by the Pope Manufacturing Company of Hartford, Conn. These carriages, herewith shown, are the outcome of experiments exhaustively conducted during a period of three years or more, and the manufacturers, desiring to avoid every risk of putting anything of an experimental nature into the hands of purchasers, thoroughly satisfied themselves as to their entirely practical character before placing them on the market. The single seated and double seated carriages are similar with respect to speed, radius of action and general details of operation. In these vehicles

the Pope Company seems to have well realized its hopes and aims in the direction of electric automobilism. Under the most trying conditions the Columbia carriages have proved to be thoroughly satisfactory on roads accessible to ordinary vehicles in all localities where facilities for recharging the batteries are obtainable. The carriages are not

them are their laboratory standard voltmeters and ammeters, alternating and direct current voltmeters, wattmeters, ground detectors, commercial iron-cased station voltmeters and ammeters, galvanometers, etc. One of the principal features of this company's display is a well-arranged assortment of parts of instruments, which affords an excellent

least complex yet offered to the public. This firm is exhibiting one of its modern switchboards recently built for a large drygoods house in this city. On it is mounted the well-known "Ideal" circuit breaker and the La Roche self locking switches. The board is not only beautiful in appearance, being made of Knoxville gray marble, but is extremely substantial

WESTON ELECTRICAL INSTRUMENT COMPANY'S EXHIBIT.

recommended by the manufacturers for extreme long distance work or for touring, but are apparently perfectly adapted for service in the field for which they were designed, and they have given and are giving the highest satisfaction in actual use in this field for all ordinary purposes of business or pleasure.

COLUMBIA ELECTRIC CARRIAGE.

The makers have not confined their experiments and investigations in horseless traction to electricity, but are convinced that at the present stage of motor vehicle development the Columbia carriages, with their practically noiseless action, absolutely safe

COLUMBIA ELECTRIC CARRIAGE.

operation and perfect ease of control, come very near to being the ideal automobiles.

The Weston Electrical Instrument Company's exhibit, located on the main floor to the right of the Madison avenue entrance, as will be seen by the accompanying illustration, is handsomely arranged and attractively decorated. The company is displaying a complete line of its well-known measuring instruments and appliances. Prominent among

opportunity of studying the construction of the numerous types of instruments manufactured by this widely known concern. These parts also afford an object lesson illustrating the care and exactness with which every detail, however minute, has been worked out.

SPRAGUE ELECTRIC COMPANY'S EXHIBIT.

owing to its being mounted on heavy angle iron frames with brass pedestals. The bus bar work on the rear shows the high class of work this firm is in the habit of turning out. Another switchboard is also shown containing "Ideal" circuit breakers ranging in size from 25 to 2,000 amperes, with both

F. A. LA ROCHE & CO.'S EXHIBIT.

An exceedingly attractive and complete exhibit, and one of the first, if not the first, to get in running order at the opening of the show, is that of F. A. La Roche & Co., herewith shown. This company's booth is handsomely decorated and is lighted by the well-known La Roche alternating and direct-current arc lamps, which have the reputation of being not only the most substantial, but the

single and double pole. The management report that the firm is extremely busy, it being necessary to run the factory 18 hours a day to supply the constantly increasing demand for their improved circuit breaker. As we stated last week, the exhibit of this company at Madison Square Garden is in charge of Messrs. A. E. Wells, F. A. La Roche and J. A. Loutey.

A MAGNETIC BALANCE FOR WORKSHOP TESTS OF PERMEABILITY.*

BY PROF. J. A. EWING, F.R.S.

The author believes that the want is felt of a workshop instrument for making tests, in an easy and rapid fashion, of the magnetic permeability of cast and forged metal for dynamo magnets.

His own permeability bridge†, introduced two years ago, and now somewhat extensively used, allows the B-H curve for a given bar to be determined with very much less trouble than is needed to carry out ballistic tests. For the accurate comparison of one bar with another, throughout a wide range of magnetizing forces, the permeability bridge is entirely suitable, and it furnishes as simple a means of performing that operation as can well be had. The author uses it systematically in his own testing, and is thoroughly satisfied with it as a means of determining the B-H curve. But the complete B-H curve is really more than the dynamo builder or the steel founder generally wants to know. For his purpose it would often suffice to find the induction produced by some one (fairly high) value of the magnetizing force. That information is a sufficient index of the character of the specimen to allow judgment to be passed on its suitability for use in the field magnets of a dynamo.

These considerations have led the author to develop another testing instrument, which, while it tells less about specimen than can be learnt by means of the permeability bridge, gives the most useful information in a still more easy way. To use it requires no knowledge of electrical testing, and the results need no working out. The value of the magnetic induction, in the usual units, corresponding to a single stated magnetizing force, is directly read off on a divided scale.

The instrument is a magnetic balance of the traction type, making use of the principle already applied in magnetic testing in apparatus designed by Prof. S. P. Thompson, Mr. Gisbert Kapp and Prof. H. Du Bois. In most apparatus of this kind the specimen has taken the form of a turned bar with a faced end on which the pull due to magnetization was exerted. In the author's balance this facing of the end is not required, the magnetic pull being exerted between the side of the turned bar and a magnet pole which it touches, and from which it is pulled away. The specimen is a turned rod $\frac{1}{2}$ of an inch in diameter and 4 inches long. It lies across the two poles of a U-shaped electro-magnet, which is excited by a constant current of such strength as to produce a magnetizing force in the rod of about 20 C.G.S. units. In one of the poles there is a V notch for the bar to rest in, and the other pole has a slightly convex surface, being curved to form a portion of a cylinder with its axis perpendicular to the direction of the length of the rod. The side of the rod touches this pole at one point only, and the tractive force at this point of contact is the force which is measured. A lever or weigh-beam is applied to pull the rod away from this pole, while the other end of the rod remains in the V notch in the other pole, forming what may be called a magnetic hinge. The tractive force is measured by means of a weight which slides along the graduated weigh-beam.

When the rod is put in place, the current is reversed once or twice, to wipe out any residual effects of previous magnetization. The weight is then moved along the beam until the beam just drops each time it is raised, so as to bring the side of the rod into contact with the pole.

The rod requires no preparation beyond turning it to the proper diameter. Its cylindrically turned side touches the convex pole-face in a perfectly definite manner, and the rod may be taken out and

put back without altering the character of the contact. The lever is arranged in such a way that the rod always touches the same point of the pole-face.

The value of the magnetizing force to be brought to bear on the rods under test was fixed at about 20 C.G.S. units for the following reasons:

At forces much weaker than this the B-H curves of different specimens often cross; in other words, the order of merit often changes when the force is varied. But the author's experience in testing dynamo steel leads him to the conclusion that with forces of 20 units and over there is no serious change in the order of merit of various specimens. If a piece is good when $H = 20$, it remains good under stronger forces; if it is only fair when $H = 20$, it remains only fair; and a specimen that has relatively low permeability under this force does not take a materially better place when the force is increased. On the other hand, any considerably stronger force would be less convenient for testing, especially because the difference between good and bad specimens would become less well marked, and the sensitiveness of the test would consequently be reduced. The author has selected 20 as a force which on the one hand is sufficiently low to make the distinction wide between bad and good specimens, and on the other hand is sufficiently high to make the order of merit substantially the same as is maintained under stronger forces.

From the measured induction at $H = 20$ the probable induction at higher forces can be inferred with some confidence. By examination of the results of tests of a very large number of samples of dynamo steel, including the published tests of Mr. Parshall,* as well as his own tests, the author has prepared the following table, to show the probable approximate values of B at forces of 25, 30, 40 and 50 C.G.S. units, when the value of B at a force of 20 is known. The values of B found for $H = 20$ range, in dynamo steel, from 16,000 in the very best specimens down to 12,000 in specimens of decidedly low permeability. About 15,000 is representative of good dynamo-steel castings, and anything below 14,000 may be pronounced poor:

TABLE I.

Probable Values of Magnetic Induction, B, for Various Amounts of Magnetizing Force, H.

Magnetizing force, H.	Magnetic Induction, B.				
20	12,000	13,000	14,000	15,000	16,000
25	12,700	13,700	14,600	15,500	16,350
30	13,300	14,200	15,100	15,900	16,600
40	14,200	15,000	15,700	16,400	17,000
50	14,900	15,600	16,300	16,900	17,400

The range of the new magnetic balance extends (for $H = 20$) from 12,000 up to something over 16,000. It will test at the top of its range the very best samples that are found, and at the bottom of the range it will test steel of poorer quality than would be accepted for use in dynamo magnets.

The scale is a linear one, in which equal divisions correspond to equal differences in B, for a constant value of H. It is graduated to give by direct reading the values of B for $H = 20$. This uniform graduation is arrived at in consequence of the fact that with different specimens the magnetizing force is not quite constant, although the current in the electro-magnet is constant. A specimen of high permeability increases the induction in the magnetic circuit, and consequently causes a larger share of the magnetomotive force to be used in that portion of the circuit which lies outside of the specimen itself. Hence the induction in the specimen is less high than its greater permeability would imply; in other words, the better specimen is exposed to a somewhat less magnetizing force than the worse specimen is exposed to. The

tractive force increases more rapidly than in simple proportion to the actual induction; but matters are so arranged that the lessening of the induction which comes about in the way just stated compensates for this, and the observed differences of tractive force, as measured throughout the range of the scale, stand in simple proportion to the differences in the values of B which the various specimens would exhibit if the force H were constant. In other words, a scale of equal parts on the weigh-beam corresponds to equal differences of B under a constant magnetizing force, and the weigh-beam is accordingly lettered to read B directly in equal divisions. The readings give B for $H = 20$, although in consequence of the action just explained the actual magnetizing force is barely 20 for rods of very good quality, and somewhat exceeds 20 for rods of lesser permeability. The scale is adjusted by the maker by selecting values of the sliding weight and of a fixed weight on the weigh-beam which will bring the readings into agreement with the known values of B in certain standard rods.

A single standard rod is supplied with each instrument, and the observer adjusts his current until the tractive force on that rod is such that the sliding weight stands at the place on the beam corresponding to the known value of B which a force of 20 C.G.S. units produces in that standard. The standard rod consequently serves instead of an amperage-gauge, and no other current-measurer is required. A rheostat is provided in the instrument for regulating the current, and a single small storage cell forms the necessary battery. The observer puts in the standard rod, and turns the rheostat until he finds that the weigh-beam just drops each time it is lifted, while the sliding weight indicates the known value of B. He then puts in the rod which is to be tested, and finds the position which the sliding weight has to take for it, no change being made in the current. The constancy of the current is checked at the end of the tests by again putting in the standard rod.

The weigh-beam lifts the rod by means of a V-shaped stirrup close to the pole-piece from which it is to be pulled away. When the rod is pulled away the beam comes immediately against a stop which limits the motion. A hinged piece is provided under the far end of the weigh-beam, to hold it up while a rod is being taken out or put in. The weigh-beam can readily be lifted out of the way when it is desired to clean the pole-faces, and care has to be taken to keep them, as well as the side of the rod where it touches them, free of dust and rust.

In the following table a comparison is made, for a number of rods of different qualities, of the values of B known to be produced by a magnetizing force of 20 units with the values as measured by this magnetic balance. The known values of B were determined by means of the permeability bridge, by comparing each rod with a standard whose B-H curve had been found in the first instance by ballistic tests. The range covered by these examples is as wide as is likely to be met with in the practical testing of dynamo steel:

TABLE II.

Calibration of the Balance.

Induction, B, at $H = 20$, determined from Independent Measurements.	Induction, B, read from Balance.
13,300	13,280
13,400	13,400
14,310	14,360
14,350	14,290
14,600	14,470
14,900	14,960
15,100	15,060
15,080	15,150
15,570	15,650
15,800	15,720
16,000	16,000

These tests relate to different specimens, all tested with one constant current in the magnet of the balance. The agreement between the scale readings

* Advance copy of paper read before the Institution of Electrical Engineers, London, May 12, 1896.
† Described in the author's paper on "The Magnetic Testing of Iron and Steel," *Min. Proc. Inst. C. E.*, May, 1896. See also *The Electrician*, May 8, 1896.

* *Min. Proc. Inst. C. E.*, May, 1896.

and the known values of B is satisfactory. The same tests may be exhibited graphically, the readings of the balance being plotted against the known values of B for $H = 20$. They show that within this range of B the values of the induction (under constant H) are fairly represented by the readings on the uniformly divided scale of the balance. Such irregularities as occur lie equally, so far as can be judged, on both sides of the straight line. The readings of the balance may be accepted as giving values of B for $H = 20$ at least as accurately as these are required in the uses which the balance is meant to serve.

THE DISTRIBUTION OF ELECTRICAL ENERGY IN PARIS.

BY J. LAFFARGUE.

The following is a reprint of an article appearing in the Paris supplement of the *Contract Journal* for April 20, 1898:

The distribution of electrical energy in Paris dates only from the commencement of 1889. It was not until the end of 1888 that the Municipal Council of Paris granted concessions to certain companies. At this period, however, there already existed in Paris a certain number of private installations; and in 1887 Messrs. Mildé and Clero had established in the Rue du Faubourg Montmartre distributing works on a small scale which were subsequently absorbed by the Edison Company.

The main conditions imposed upon the concessionaire companies were as follow: The authority to lay cables in Paris was granted for 18 years; the mains were everywhere to be underground. The grantee was free to regulate his own tariffs on condition of not exceeding the charge of 14.4d. per kilowatt-hour for lighting, and 6d. for motive power and various applications. The municipal dues amounted to \$4 per annum for every kilometer or fraction of a kilometer of conduits laid beneath the pathways, and also 5 percent. on the returns, this last to be ascertained either by the amount of the bills or by the indications of the meters. The area to which the distribution was to extend was to have the form of a sector, passing from the center to the circumference. Consequently upon these conditions, adopted by the Municipal Council in 1888, three companies commenced the distribution in 1889—viz., the Edison Continental Company, the Société d'Éclairage et de Force par l'Électricité, and La Compagnie d'Air Comprimé d'Électricité. Simultaneously the city of Paris established, at the Halles Centrales, municipal works for the supply of lighting to the markets and to other subscribers in the district. In 1890 a new company was established under the name of the Society for the Sector of the Place Clichy, and it undertook the distribution in another quarter. Subsequently, in 1892 and 1895, two other companies were formed, that of the Champs Élysées sector and that of the Sector de la Rive Gauche.

At the present time, therefore, the distribution of electrical energy is undertaken within Paris by six concessionaire companies and by the municipal works at the Halles.

CONSIDERATION OF THE VARIOUS DISTRIBUTING NETWORKS.

We will now pass on to review the different distributing networks, while indicating the peculiarities of each.

The Edison Continental Company.—The Edison Company carries out the distribution of electrical energy in one of the finest quarters of Paris, including the Boulevards and the Place de l'Opéra. The distribution is by three-wire feeders in ring circuits, with 120 volts between each, and by continuous currents. The distribution is effected by naked copper cables supported on porcelain insulators fixed in concrete conduits; these latter are lined with slates.

The central stations are two in number—one at

No. 8 Faubourg Montmartre and the other at No. 11 Avenue Trudaine; these two works are connected together. There is also a sub-station for accumulators—38 Rue Saint-Georges. A third station, although specially used for the lighting of the Palais Royal, is also connected to the works in the Avenue Trudaine. When working, these three works are connected in parallel.

The station in the Rue du Faubourg Montmartre contains four Belleville boilers, yielding 1,600 lbs. of steam per hour; also four other boilers of the same type, giving 2,100 kilos of steam per hour at the same pressure—i. e., 210 lbs. The steam-engines are five in number, of which two are Corliss horizontal engines of 300 HP., making respectively 45 and 62 revolutions per minute. Two are vertical triple-expansion Weyher and Richemond engines of 300 HP. at 132 revolutions per minute, and one is a Willans engine of 700 HP. at 300 revolutions per minute. Each of the four 300-HP. engines drives by belting two Edison dynamos of 100 kW., with eight poles, at 130 volts and 350 revolutions per minute. The Willans machine is directly connected to a Fives-Lille dynamo of 450 kW. at 230 volts. At the works there are also two batteries of 70 accumulators of the Société pour la Travail de Métaux,

with a discharge of 700 amperes. These accumulators are charged during the daytime, the number being varied according to the potential difference of distribution. A booster is placed in series with the charging feeder when necessary. This booster consists of a dynamo of 390 amperes at 90 volts, coupled direct to an electric motor of 99 kW., running at 700 revolutions per minute.

The Palais Royal station was originally intended to supply the Palais Royal, the Cour des Comptes and the Comédie Française Theater. The company has laid a cable which allows of their works being connected with those above mentioned by placing boosters in series so as to allow of coupling up in parallel. In these works are located nine Belleville boilers, giving 4,100 lbs. of steam per hour at a pressure of 170 lbs.; also seven vertical steam-engines, yielding 190 HP. These are of the triple-expansion type. Each of these drives by means of belting a dynamo yielding 100 kW. at 130 volts and 390 revolutions per minute.

The Continental Company is one of the most important of those supplying electrical energy in Paris. At the close of 1897 it had an available power of 3,300 kW. in machines and 420 kW. in accumulators. On March 31, 1897, the company had con-

FIG. 1.—INTERIOR VIEW OF ELECTRICITY WORKS AT THE AVENUE TRUDAINE, PARIS.

having a capacity of 3,000 ampere-hours, and a maximum rate of discharge of 1,000 amperes. The switchboard is installed on the first floor, in a room above the engine-room.

The central station of the Avenue Trudaine, as shown in Fig. 1, is by far the most important. It occupies a large area. It includes nine Belleville boilers, of which three give 6,600 lbs. of steam per hour, and six give 8,000 lbs. under a pressure of 210 lbs. The steam-engines are six in number, of which four are by Weyher and Richemond, vertical, triple-expansion, of 300 HP., at 132 revolutions per minute, and two Corliss, Bonjour system, of 750 HP., at 105 revolutions per minute. The 300 HP. machines each drive directly two Edison dynamos of 100 kW. with eight poles, giving 130 volts. The Bonjour engines each work a Brown dynamo with two commutators and two sets of brushes, giving 600 kW. at 130 volts. The dynamos are placed between the two vertical cylinders. Fig. 1 gives a general view of the machine room. The meters and distributing apparatus are placed in a room on the first floor. It is from this room that the feeders proceed.

A sub-station is established in the Rue Saint-Georges at the registered address of the Edison Company. In one of the rooms are two batteries of 74 Tudor cells, having a capacity of 3,000 ampere-hours

neoted 113,346 incandescent lamps distributed amongst 1,812 subscribers. In the course of 1896 it distributed 2,555,550 kilowatt-hours at the average price of 10.3d. On December 31, 1896, it had on only 27 motors of 33 kW. for various uses, and 22 motors for lifts of 65 kW. power.

Société d'Éclairage et de Force par l'Électricité.—This company effects the distribution of electrical energy in Paris by means of sub-stations fed from the general central station of Saint-Ouen, which is outside Paris, and by various stations in the interior of Paris. The central station of Saint-Ouen (Fig. 2) is used to supply continuous current to a certain number of workshops in its neighborhood. It also supplies electrical energy to Saint-Denis and Asnières, and to several feeders for Paris, notably that for the Northern Railway terminus, and that for the Boulevard Barbès. An installation for transmission by two-phase currents is also provided for the supply of the Landy terminus outside Paris, and of the La Chapelle terminus in Paris. The Saint-Ouen central station is furnished with 10 tubular boilers of the Roser type, yielding 4,400 lbs. per hour at the pressure of 170 lbs., and also with four sets of two Leconteux and Garnier horizontal engines of 150 HP., coupled with a single flywheel, and with two

single-cylinder Garnier engines, each of 350 HP. The eight 150 HP. horizontal engines work by various countershafts eight Marcel Deprez continuous-current double-ring dynamos, yielding 72 KW. at 2,500 volts, four Hillairet 30 KW. dynamos for excitation, two Gramme 36 KW. dynamos for excitation, and one 24 KW. dynamo giving 1,200 volts for arc lamps in series. The two single-cylinder engines of 350 HP. each work a Hutin and Leblanc alternator of 250 KW. at 88 volts, with a frequency of 42 periods per second. By means of transformers the outgoing currents are raised from 88 to 6,000 volts.

The continuous current at 2,500 volts is transmitted to the works at the Boulevard Barbès in Paris, where five Marcel Deprez double-ring motors actuate directly 10 generating dynamos, of which six are of the Edison type, of 44 KW. at 175 volts, and four are Bréguet dynamos of 45 KW. at 150 volts. At these works there is also a battery of 70 accumulators of the Société pour le Travail des Métaux, yielding 3,300 ampere hours with a current of 500 amperes. The continuous current from the Saint-Ouen works is also transmitted to a station at 183 Faubourg Saint-Denis, to work two rotary transformers similar to the preceding ones. At the same works are also located two Belleville boilers and one

Desroziere dynamo of 97.5 KW. at 130 volts, at 160 revolutions per minute, and one works by belting a similar dynamo at 260 revolutions per minute; and a Laval turbine of 300 HP. working two Desroziere dynamos. The works contain also a battery of 70 accumulators, of a capacity of 2,000 ampere hours. In the La Villette station there are two Belleville boilers, two vertical steam engines similar to the above-mentioned of 150 HP., two Desroziere dynamos of 97.5 KW., and a battery of accumulators of 70 cells yielding 1,400 ampere hours. The station at the Abattoirs, having machinery of 200 KW. capacity, is specially used to supply electrical energy within the Abattoirs.

The stations of which we have just spoken—those of the Rue de Bondy, of the Rue d'Alexandrie, of the Faubourg St. Denis, of the Boulevard Barbès, and of the Quai de la Loire—are all connected in parallel for the supply of a distributing network of two conductors. From each of the works proceed a certain number of feeders which are connected at various points with the distributing network. The generating machines of the rotary transformers, or the apparatus in connection with the transformers for diphasé currents, receiving the current after transformation, are connected in parallel with the bus

mitted by continuous currents from the St.-Ouen works.

The Société d'Eclairage et de Force has now commenced to adopt another system. It has undertaken the transmission of energy by diphasé currents, using the alternators of Hutin and Leblanc and the special transformers of the same makers. The electrical energy supplied to the Nord and La Chapelle Railways is thus transmitted. We have seen that a similar trial of this mode of transmission has been made at the central station of the Rue du Faubourg Saint-Denis.

(To be continued.)

THE ELECTRO-CHEMICAL AND ELECTRO-METALLURGICAL INDUSTRIES OF EUROPE.

BY JOHN B. C. KERSHAW, F. I. C. (LONDON).

Chapter XX.—The Electrolytic Tin Industry.

The extraction of tin from its ores by electrolytic methods has not yet been attempted on an industrial scale, though several patents have been filed relating to apparatus and processes for effecting such extraction. The electrolytic tin industry is at present confined to the recovery of the tin from tin scrap, and to the production of pure tin from raw tin by an electrolytic refining process, similar to that used for copper.

The recovery of tin from tin scrap is one of those operations for which electrolysis seems to have been specially designed, and one would expect in these modern days, when the profitable utilization of city refuse is considered a subject of primary importance, that any feasible process would meet with enormous success. This is however not the case. Many processes have been patented for the electrolytic treatment of tin scrap, and some of these are now working with successful results in Germany and France, but the number of such works is much more limited than one would have expected, and the difficulty of obtaining large quantities of the raw material at reasonable rates hampers the growth of the industry. Tin scrap contains from 3 to 9 per cent. of tin, the average amount of tin present being 5 per cent. Thus in order to obtain one ton of tin from this scrap, even supposing the whole of the tin is recovered, 20 tons of scrap must be dealt with, and where the collection and delivery of the scrap at the electrolytic works costs \$6 to \$7 per ton (as in some places is the case) the recovery process is burdened with a very heavy charge. In some localities, however, the scrap can be collected and delivered for treatment at one-tenth of this cost, and in such places, and especially in localities where other manufactures lead to the production of great quantities of clippings of tin plate, the electrolytic recovery processes have every chance of success. Three processes are at work and these may now receive brief description.

In Germany, Borchers states that several firms are recovering tin from tin scrap by electrolytic methods, though he does not specify names or localities. It is interesting to note that much scrap is being shipped to Europe from Baltimore, and it is probable that part of the supply of these German works is drawn from this source. The firm of "Goldschmidt u. Cie of Essen a. d. Ruhr" was the first in Germany to attempt the recovery of tin on a commercial scale.

No details have been published concerning the process used in the majority of these works, but it is most probably that patented by Gutensohn and further improved by Siemens & Halske, while in the case of one works in Berlin the apparatus and process patented by Smith is stated to be used. The principle of both Gutensohn's and Smith's process is the same. The tin scrap is packed into baskets made of wooden laths holding each about 140 lbs., and is used as anode in a cell containing dilute sulphuric acid as the electrolyte, and plates of tinned copper as the cathode. The acid of course attacks the iron as well as the tin of the tin scrap, but only the latter metal is deposited at the cathode, and when the acid

FIG. 2.—THE ENGINE ROOM AT ST. OÜEN, PARIS.

Solignac boiler, three vertical Weyher and Richemond engines of 150 HP., and three Desroziere dynamos of 97.5 KW. at 130 volts. Here also we find a battery of 70 accumulators, of 4,000 ampere hours, at 500 amperes, and a Hutin and Leblanc transformer, converting two-phase into continuous currents, fed directly from the Saint-Ouen works.

Among other generating stations in the interior of Paris there are the works at the Rue de Bondy, those at the Rue d'Alexandrie, those at the Quai de la Loire, and those at the Abattoirs. In the works at the Rue de Bondy there are four Belleville boilers, giving 3,300 lbs. of steam per hour; three Belleville boilers, giving 4,800 lbs. of steam per hour; two vertical Weyher and Richemond triple-expansion engines; one horizontal Faroot steam-engine, of 600 HP.; two Laval turbines, each of 300 HP. The different steam-engines respectively actuate two Desroziere dynamos, of 97.5 KW. at 130 volts; one Desroziere, of 400 KW. at 130 volts; and two sets of two Gramme machines, of 100 KW. at 120 volts. A battery of 75 accumulators of the Société des Métaux, having a capacity of 2,000 ampere hours, allows of a discharge of 500 amperes. The works at the Rue d'Alexandrie contain four Belleville boilers, yielding 3,300 lbs. of steam per hour; two boilers of the same manufacturer, yielding 4,400 lbs. of steam per hour; five vertical triple-expansion Weyher and Richemond engines, of which four directly actuate a

bars. The distribution is everywhere effected by means of naked copper conductors supported by porcelain insulators within concrete subways.

The Société d'Eclairage et de Force has plant at its works of 4,110 KW. capacity, of which 3,820 is from machines and 290 from accumulators. At the end of 1896 the number of arc lamps for which current was supplied amounted to 3,257, and the number of incandescent lamps was 60,594. The total length of mains extended to 51 km. The total distribution of energy for the year was 1,584,890 kilowatt-hours; the average price was 6d. per unit. The total power used for lighting amounted to 2,450 KW. The motors for various purposes numbered 134, absorbing a total power of 331 KW.; and the motors for working lifts were eight in number, absorbing a total power of 37 KW. The total power installed for the supply of motors was thus 368 KW. This company possesses in Paris, as we have seen, works of but limited capability and extent. These works were initially established in 1888 and 1889, when it was a question of lighting by electricity the Renaissance, the Ambigu, and the other neighboring theaters. They were afterwards utilized when the concession for distributing electricity was granted in 1889. At that period it was necessary to carry out promptly the electric lighting of the boulevards. At weak points of the sector it was considered sufficient to put up rotary transformers, worked by means of the power trans-

has become saturated with iron, it is run off and worked up for ferric sulphate. According to Smith, and Siemens & Halske, an EMF. of 1.9 volts suffices to provide the necessary current density; and a current efficiency of 50 per cent. is obtained. The remainder of the current is lost, owing to the concurrent action upon the iron of the anode material.

In France the recovery of tin from tin scrap is effected by a process in which caustic soda solution is used as the electrolyte. The advantage of this solvent is that it acts only on the tin, and the iron remains unattacked in the baskets containing the anode material. The disadvantages are that heat must be applied, otherwise only oxygen will be produced at the anode on passage of the current, and that 10 per cent. of tin remains in the electrolyte as sodium stannate, and cannot be deposited at the cathode by the current. The solution used in this process is stated to be a 10 per cent. caustic soda solution containing a definite proportion of common salt.

In England, Smith's process is stated by Ahrens to be at work, and in 1896 a company was registered for operating the process patented by Claus. In this process, tin scrap or any alloy of tin is used as anode material in an electrolyte containing alkaline sulphides. Sodium sulpho-stannate is formed, or the corresponding potassium or ammonium salt, and the deposition of tin from this solution is easily effected. The iron remains undissolved, and as the electrolyte requires heating during the electrolysis, the process closely resembles that in which caustic soda is used as the solvent.

The writer has written to Mr. Claus to inquire how this company is progressing, and learns that the plans are now completed for the commencement of operations upon an industrial scale, and that the process will shortly be at work.

The only factory known to the writer in which raw tin is refined electrolytically is that of Messrs. T. Bolton & Sons, Churnet Valley, Staffordshire, England. The raw tin is cast into plates suitable for use as anodes, and is placed in electrolyzing vats containing dilute sulphuric acid. A high current density is employed, and a very rough crystalline deposit of tin obtained at the cathode. The crystals can easily be detached, and are washed, dried and melted in order to prepare ingots of pure tin, which are used to coat with tin some of the classes of telegraph wire prepared by this firm at their wire-drawing works in the same neighborhood.

The cost of the energy required to produce one ton of tin by these processes can easily be calculated by means of the electro-chemical equivalent for tin, and the data already given. Taking an EMF. of 1.9 volts (for the sulpho-stannate solution this would probably be reduced) and a current efficiency of 50 per cent., the EHP. requisite to produce one metric ton tin per 24 hours will be:

$$\frac{1,000 \times 1,000 \times 1.9 \times 100}{.000,309 \times 60 \times 60 \times 24 \times 735 \times 50} = 193.8.$$

Taking the cost of the EHP. hour at \$.002, the cost of the electrical energy necessary to produce a metric ton of tin from tin scrap or any alloy of tin, will be, $193.8 \times 24 \times .002 = \9.30 .

It is thus apparent that if the raw material can be delivered at a reasonable cost at the works, the processes can be conducted with some degree of success.

Other processes have been patented for the recovery of tin from tin scrap—as for example that of Vortmann & Spitzer, a fusion process, and that of Borchers in which an electrolyte containing sodium chloride is used, but the writer is not aware that these are being worked upon an industrial scale, and therefore a description of them cannot be included in this series of chapters.

The future of the electrolytic tin recovery processes would appear to depend entirely upon the facilities offered for the collection of tin scrap at a low cost, and it is possible that in the future, when the collection and utilization of city refuse is placed

upon a more scientific basis than is at present the case, the industry will develop into one of considerable importance.*

A TRIUMPH OF SCIENCE.

The following account of a method for liquefying hydrogen, which recently appeared in the *New York Sun*, will be interesting to many of our readers:

LONDON, May 13.—The latest triumph of science—the liquefaction of hydrogen—has been briefly announced in the *Sun's* cable despatches. There is already a controversy as to where the credit belongs for first bringing into control this last and most fugitive of the elements. The Polish scientist Olszewski forestalled the discovery a year or two ago by determining accurately the critical temperature and boiling point of hydrogen, but he did not succeed in reducing the gas to liquid form in a really practical way, so that it could be examined and its properties tested. This has now been done for the first time by Prof. Dewar, and most interesting are the discoveries which are certain to develop from experiments made at the inconceivably low temperature of minus 205° centigrade. This is within twenty or thirty degrees of absolute zero, and is a point or condition in which matter undergoes astonishing changes in all its characteristics.

Prof. Dewar explained his latest researches at a meeting of the Royal Society this week, and his disclosures were received with extraordinary interest. Two or three years ago Prof. Dewar showed that a jet of hydrogen could be used to cool bodies below the temperature that could be reached by the use of liquid air; but all attempts to collect the liquid in vacuum vessels failed. The type of apparatus used in these experiments worked well, and it was therefore resolved to construct a much larger liquid-air plant, and to combine with it circuits and arrangements for the liquefaction of hydrogen. On Tuesday a start was made with hydrogen cooled to —205° centigrade, and under a pressure of 180 atmospheres, escaping continuously from the nozzle of a coil of pipe at the rate of about ten or fifteen cubic feet per minute, in a vacuum vessel, double silvered, and of special construction, all surrounded with a space kept below —200° centigrade. Liquid hydrogen began to drop from this vacuum vessel into another, doubly isolated by being surrounded with a third vacuum vessel. In about five minutes twenty cubic centimeters of liquid hydrogen were collected, when the hydrogen jet froze up from the solidification of air in the pipes. The yield of liquid was about 1 per cent. of the gas. Five gallons were produced in an hour. Hydrogen in the liquid condition is clear and colorless, showing no absorption spectrum, the meniscus being as well defined as in the case of liquid air.

The liquid must, in Prof. Dewar's opinion, have a high refractive index and dispersion, and the density must be in excess of the theoretical density—0.18 to 0.12—which we deduce respectively from the atomic volume of organic compounds and the limited density found by Amagat for hydrogen gas under infinite compression. Prof. Dewar's old experiments on the density of hydrogen in palladium gave a value of 0.62 for the combined body. Not having arrangements at hand to determine the boiling point, he made two experiments to prove the excessively low temperature of the boiling fluid. In the first place, if a long piece of glass tubing, sealed at one end and open to the air at the other, is cooled by immersing the closed end in liquid hydrogen, the tube immediately fills with solid air where it is cooled. The second experiment was made with a tube containing helium—a rare gas which has hitherto resisted all attempts to effect its liquefaction. Two years ago, arguing by analogy of the

*The writer has recently learnt that in some large towns old tins are being collected and sold for the manufacture of box clips. This method of utilization will, of course, tend to prevent the extension of the recovery processes.

molecular weights of fluorine and oxygen, Prof. Dewar suggested that the volatility of hydrogen and helium would probably be found close together. A specimen of helium which had been extracted from Bath gas was sealed in a bulb with a narrow tube attached, and was placed in liquid hydrogen, when a distinct liquid was seen to condense.

From this result it would appear that there cannot be any great difference in the boiling points of helium and hydrogen. All known gases have now been condensed into liquids which can be manipulated at their boiling points under atmospheric pressure in suitably arranged vacuum vessels. With hydrogen as a cooling agent we shall get within 20° or 30° of the zero of absolute temperature. No one can predict the properties of matter under zero of temperature. Faraday liquefied chlorine in the year 1823. Sixty years later Wroblewski and Olszewski produced liquid air, and now, after fifteen years' interval, the remaining gases, hydrogen and helium appear as static liquids.

A SPECIAL PRIZE OFFER.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For Electricity's Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and whenever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all these submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we would like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not perfectly clear, we will be pleased to answer any inquiries relating to this matter.

LEGAL NOTES.

Messrs. Enricht and Hirsch, promoters of the Canon City & Cripple Creek Electric Railroad Company, who were arrested at the instance of some of the directors of the company on the charge of embezzlement, and who have been adjudged not guilty, state that they intend to prosecute their accusers. Mr. Enricht publishes the following statement in the Florence, Col., *Refiner*: "We will each bring suit in the sum of \$200,000 against the directors of the Canon City & Cripple Creek Electric Railroad Company, including Mr. J. B. Orman of Pueblo. Our attorneys Messrs. Thomas M. Patterson and J. H. Maupin, are preparing the papers in the case now. We being residents of another State, suit will be brought in the United States Court of Arapahoe county." Messrs. Enricht and Hirsch will also, it is said, ask for the appointment of a receiver for the company.

After hearing argument on a rule to show cause why a writ of certiorari should not be issued, carrying to the Supreme Court the action of the city council of Atlantic City, N. J., in awarding a five-years' lighting contract to John H. Rothermel of Reading, Pa., Justice Garrison decided to grant the writ, making it returnable in June. The ground on which the writ was asked for and granted was that the bids were irregularly received. There are several other reasons to be advanced at the final hearing.

At a crossing of an electric railroad and a steam railroad, the latter is held, in New York & G. L. R. Co. vs. New Jersey E. R. Co., (N. J.) 38, L. R. A. 516, to have the right of way and the right to run at as high a rate of speed as it chooses, while the electric company is subject to the rule applicable to other travelers on a highway requiring them to look and listen for an approaching train.

In the United States Court at Macon, Ga., on the 14th inst., Judge Speer passed an important order with reference to the sale of the electric light plant of the Macon Gas Light & Water Company. Instead of allowing the plant to be sold to the Macon & Indian Spring Street Railroad Company for the \$40,000 which that company offers, the judge orders it sold to the highest bidder in front of the court house door on May 31, and no bid to be considered if less than \$40,000.

The Mutual Electric Light Company of San Francisco, Cal., has asked for a mandate of the courts to compel the Supervisors to accord to the company equal advantages with its rival, the San Francisco Gas & Electric Light Company. The complaint alleges that the Mutual Company has applied for permission to erect poles in order that the necessary wires may be stretched, but that the Supervisors have failed to respond to the petition one way or another; that the yearly contract for lighting streets and public buildings will be let in July; that the plaintiffs are prepared to furnish light at rates that would save the city \$40,000, but that they are prevented from doing this public service because the Supervisors have failed to grant permission for the erection of the necessary poles.

Judge Shipman of the United States Circuit Court of Appeals for the Second Circuit, New York, has handed down a decision in the case of the Sprague Electric Railway & Motor Company against the Union Railway Company. The case was first tried in the Circuit Court for the Southern District of New York, the appeal being taken from that court's decision, which adjudged that the defendants had infringed claims 2, 6 and 9 of Letters Patent No. 324,892, dated August 25, 1895, and issued to Frank J. Sprague, for an improved electric railway motor. The defendants' motor is made in accordance with Letters Patent No. 546,560, dated September 17, 1895, and issued to Sidney H. Short. Judge Shipman held that the Circuit Court's decree should be modified, with costs of the Court of Appeals to the appellants, by limiting the infringement and the accounting to claims 2 and 6, and the case is remanded to the Circuit Court, with directions to enter a modified decree in accordance with the foregoing opinion, with costs of that court.

Judge Townsend of the United States District

Court at New Haven, Conn., on the 19th handed down a decision in the case of the Electric Car Company of America and the Thomson-Houston Company against the Hartford & West Hartford Railroad Company. The plaintiffs claimed an infringement of patent on a controlling switch for electric motors. The decision orders an injunction and an accounting.

SOCIETY NEWS.

American Institute of Electrical Engineers.

At the annual business meeting of the Institute held on the 17th inst., briefly noticed in our last issue, the annual report of the council was presented, including the financial statements of the treasurer and secretary. Officers of the Institute for the ensuing year were elected as follows:

President—Arthur E. Kennelly.

Vice-President—Robert B. Owens, William Stanley, Cary T. Hutchinson.

Managers—Herbert Lloyd, Samuel Sheldon, George F. Sever, Charles P. Steinmetz.

Secretary—Ralph W. Pope.

Treasurer—George A. Hamilton.

At the meeting of the Executive Committee, the following associate members were elected:

Felix Louis Cadon, Washington, Ind.

Thomas Dempster, Schenectady, N. Y.

Paul Lesheule, Electrical Engineer, commissioned by French Government, Schenectady, N. Y.

Livingston Johnson, Jr., Islip, N. Y.

Howard Joelyn, Seattle, Wash.

James J. Mahony, New York City.

Irving A. Taylor, Brooklyn, N. Y.

Wallace Rupert Turnbull, East Orange, N. J.

James H. Winfield, New Glasgow, N. S.

Fred W. Wool, Los Angeles, Cal.

The following associate members were transferred to membership:

Edward Burch, Minneapolis, Minn.

G. A. Redman, Rochester, N. Y.

L. S. Boggs, Ogden, Utah.

Gustave J. Fischer, Sydney, N. S. W.

James B. Scott, Baltimore, Md.

The New York Electrical Society.

The annual meeting for the election of officers of the New York Electrical Society will be held in the Concert Room, Madison Square Garden, on Thursday, May 26, at 8:15 P. M.

At 8:30 Prof. Sidney H. Short will lecture on "The Outlook for Heavy Electric Traction." Prof. Short has devoted himself for many years past to the subject of Electric Traction, and his work constitutes some of its most interesting chapters. On this occasion the lecture will be illustrated not only by lantern slides but by kinetoscope and will serve as a complete summary of the situation.

The Trans-Mississippi Exposition.

The great fair bearing this title will open at Omaha, Neb., at noon June 1. A parade, for which great preparation is making, will precede the exercises at the Exposition buildings. Precisely at noon President McKinley will be placed in telephonic connection with the officials of the Exposition and his message will be read before the assembled people on the grounds. The President will touch the button that will start the Exposition machinery in motion. From all accounts the Exposition will be one of the finest displays of the kind seen in the United States. A great deal of attention has been given to the electrical department, under the supervision of Prof. R. B. Owen, who has labored incessantly for several months to make it fully representative of the electrical industry in its scientific as well as its mechanical developments. Mr. Luther Stieringer has had control of the electric illumination of the buildings and grounds, and is said to have surpassed all his previous efforts in the effects produced.

CANADIAN NOTES.

A deputation from the city of London, Ont., has been in Ottawa to ask the Dominion Government to grant a bonus of \$100,000 to aid the construction of the proposed electric railway from London through Stratford, Arcona and Thedford, connecting with the Canadian Pacific and Grand Trunk railways.

The Eugene F. Phillips Electrical Works of Montreal have been awarded the contract to supply all the trolley, bond and feed wire required in the construction of twenty-five miles of electric railway at Jamaica, W. I.

The shareholders of the Hamilton, Grimsby & Beamsville Electric Railway of Ontario held their quarterly meeting recently. The quarterly financial statement showed an increase of 10 per cent, in gross earnings over those of the corresponding period last year. The directors were empowered to issue debentures to pay off the floating debt of \$20,000. The present debenture debt of the road is \$85,000, payable in thirty years.

The British Columbia Electric Railways Company of Victoria, B. C., are having installed a complete plant for developing the water power at Goldstream, for operating the street railway and the electric light plant. The work is being done under contract by Hasson & Hunt, mechanical engineers, of San Francisco, Cal., and the plant is expected to be in operation by midsummer. The power house will be stationed at Goldstream, about twelve miles from Victoria. The contracts for the electrical and hydraulic machinery have been closed, and the construction is being pushed with rapidity. The electrical apparatus will be of the Canadian General three-phase type, using rotary converters and transformers to distribute over the line as the two-phase with a capacity of 11,000 volts. Two Pelton water wheels will be used, with a capacity of 600 horse power each, delivering 1,000 horse power in Victoria. Provision is also being made for 600 additional horse power if required. The power delivered in Victoria will be sufficient to operate the street railway, electric lighting system, commercial and municipal, and also to furnish considerable power for the operation of stationary motors for manufacturing purposes, elevators, etc.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Argos, Ind.—An effort is to be made to complete the electric railway between Argos and Danville this summer. The line will touch Bourbon, Lake Maxinkuckee and Winamac. Dr. Sears, of Plymouth, is at the head of the enterprise.

Atlantic City, N. J.—"Wars and rumors of wars," says the "Atlantic City Review," "have no effect upon the trolley interests in this State. That syndicate having the heavier purse takes the franchise, however, and the one now operating in Camden, with its \$3,000,000, soon will possess all the roads necessary to make connection with Atlantic City. But this concern was fox; it will not file its papers of incorporation until after it has an option on a necessary territory for the advancement of its system."

Boston, Mass.—The committee on street railways of the Legislature will report a bill embodying substantially all the recommendations of the special committee on the relations of street railways to cities and towns, except the recommendation that the tracks should be owned by the municipality. An important section is that the corporation tax shall be distributed where the track is located instead of where the owners of the stock live.

Chicago.—It is said that when the Illinois Central Railroad Company substitutes electricity for steam on its suburban lines in this city it will adopt the gravity system for stopping and starting trains. By this system the tracks are elevated at all stations, giving a suitable grade, the trains standing at stations with brakes. Upon receiving the starting signal the motorman releases the brake, and the train starts by force of gravity. Approaching the next station when the train meets the incline the motorman throws off the power. The train loses its momentum and is brought to a standstill at the station by the brakes.—The South Side Elevated is now operating one-half of its cars by electricity.

Cooperstown, N. Y.—Ground has been broken and the work begun of building the first five miles of the trolley road known as the Greene County Traction Company line. The ties and poles have been distributed along the route through to West Coxsackie. The road will run from Coxsackie to Middleburg, through Greenville, Oak Hill, Durham and a branch to Windham in

the Catskills. The purpose of the road is for freight and passenger traffic.

Dover, Del.—The Senate has passed a bill requiring trolley companies to deposit \$500 per mile before commencing to build their roads. The trolley roads are to be permitted to occupy public roads by obtaining the consent of the local authorities, and grade crossings are permissible where they are unavoidable.

Greenville, S. C.—J. A. McCullough, attorney, representing himself and others, has applied for a franchise to build a street railway in this city. The council granted an option of sixty days to the petitioners in which to give a guarantee that the road will be built.

Jersey City, N. J.—The North Jersey Street Railroad Company has issued its rates for special cars in anticipation of the opening of the trolley party season. There are a large number of places within the trolley area extending from Jersey City towards all points of the compass, and trolley parties have therefore a variety of routes to choose from.

Lansing, Mich.—The directors of the Lansing, Dexter & Ann Arbor electric road met here on the 17th inst. and placed more of the \$250,000 stock. Arrangements are about completed for commencing work at this end of the line within a fortnight.

Lockport, N. Y.—The Lock City Electric Street Railway will be sold under mortgage foreclosure proceedings at the Niagara County Courthouse in this city on June 8. The sale will be conducted by Frederick Charman of Niagara Falls. The sale will probably be a simple formality to clear the title to the road and equipments, as it is said the road is already practically the property of the Ely syndicate, which will operate the electric railway system between this city, Buffalo and Olcott.

Marion, Ind.—The Indiana Traction Company, building an electric line from Marion to Elwood via Alexandria, has secured the right to operate over the lines of the Elwood Street Railway Company. It was a coup on the rival line, the Union Traction Company.

Norwich, Conn.—A huge trolley enterprise is reported that involves a continuous line between Norwich and Worcester, running almost parallel with the Norwich and Worcester steam railroad. It will require the co-working of five companies, three in Connecticut and two in Massachusetts. One of the companies is about to build a link of the proposed line from Putnam, Conn., to East Thompson, Conn., under an existing charter, and the plans have been drawn for the rest of the line in Connecticut, and petitions filed in Massachusetts.

Oxford, Mass.—The selectmen have granted a franchise to the Worcester & Webster Street Railway Company to run their cars through Oxford en route. The company will build its power house near Carbone's pond in Oxford, which is a place convenient to the whole road.

Rochester, N. Y.—It is understood that arrangements have been made for building the long talked of electric railway that is to connect Solus Point with this city. Charles Van Vorhis, Ira Luddington and James C. Tone of Rochester have held a conference with the business men of Solus with the result that they have been able to announce that the road would surely be built.

Sedalia, Mo.—The Sedalia Electric Railway & Light Company on the 17th inst. disposed of its entire plant to an Eastern syndicate for \$350,000, and F. W. Child of New York has been appointed general manager, with headquarters in Sedalia. The electric railway owns fifteen miles of track, one park of 40 acres and another of 130 acres, while the lighting plant operates 100 arc and 200 incandescent lights. Extensive improvements are to be made at once.

Springfield, O.—B. V. Randalls and Herbert Forgy, of New Carlisle, have been looking over the ground, accompanied by the county commissioners, with the view of building an electric road from St. Paris via New Carlisle to Dayton.

St. Louis.—The Broadway cable road is, it is said, to be converted into an electric line if the company succeeds in getting a franchise from the council for certain proposed extensions of the line.

Staunton, Va.—A syndicate of widely known professional and business men propose to develop the Seawright Spring property by erecting a sanitarium, and hotel on the grounds and making the place generally attractive. An electric road will be built to establish connection with the main lines of travel. It is expected that a meeting of the men composing the syndicate will be held at Staunton the latter part of this month.

LIGHTING PLANTS.

Bay City, Mich.—The electric light committee of the council has been instructed to see what can be done toward improving the city's commercial lighting plant. Superintendent Cornish recommends the purchase of another incandescent dynamo, an exciter and a switch-board.

Bellaire, Mich.—The village council has taken action looking toward the establishment of an electric light plant.

Brooklyn, N. Y.—Bids will be opened at the office of the Department of Public Buildings, Lighting and Supplies, 346 Broadway, on May 31, for furnishing, operating and maintaining electric lamps for the year

1898, for lighting such of the streets, parks and public places in the borough of Brooklyn of the city of New York as may be determined upon by the commissioner of public buildings, lighting and supplies after the estimates are opened.—Vice-President Corbin, of the Manhattan Beach Hotel & Land Company, Limited, has been informed officially by the Government authorities in charge of the harbor and its defenses that no order had been, or would be issued requiring the extinguishment of lights at night in the hotels or residences on the shores of New York Bay.

Charlotte, N. Y.—The board of trustees has fixed June 2 as the date for opening bids for the sale of \$35,000 worth of bonds to be issued for the purpose of putting in an electric light plant and waterworks. The light bonds, amounting to \$10,000, will be made separate from the waterworks bonds.

Chicago.—The Chicago Edison Company will soon have control of the entire lighting business of the city. For some time negotiations have been in progress to consolidate the eleven independent concerns under the Commonwealth Electric franchise which a few months ago was purchased by the Chicago Edison people. It is not part of the programme to merge any of the outside companies into the Chicago Edison, but to form an entirely new corporation. This new corporation, however, will be as much under the control of the Chicago Edison Company as if it were a part of it.

Huron, O.—The village council has set June 20 as the date for awarding the contract for the construction of the electric light plant.

Huntsville, Ala.—The new power-house of the Huntsville Electric Company will be completed June 1. The capacity of the old plant has been necessarily doubled, the company having secured a contract from the city to furnish a double number of electric arc lights.

La Grange, Ind.—Judge Wilson has issued an order requiring the court rooms to be lighted by electricity.

Mitchell, S. D.—The electric light plant was totally destroyed by fire on the evening of the 15th inst. The estimated loss is \$7,000, with no insurance. Mr. Clemenger, the owner, says he will rebuild immediately.

Milwaukee, Wis.—Sealed proposals will be received at the office of the Board of Public Works, this city, until Thursday, June 2, at 10:30 o'clock A. M. for furnishing all the materials and doing all the work necessary and required to construct and install an electric light and power plant in the Public Library and Public Museum building in the city of Milwaukee, according to plans and specifications on file in the office of the board.

New Haven, Conn.—Mayor Baker of Providence visited this city last week to investigate the lighting system. He is on a trip through New England collecting statistics on the cost of lights in different cities.

Providence, R. I.—The directors of the Narragansett Electric Lighting Company, after due consideration of the proposition presented by the city council committee on underground wires, have practically decided to agree to the provisions of the city measure providing for placing the wires underground.

Quincy, Ill.—At a recent meeting of the city council J. C. Hubinger, of Keokuk, was granted franchises for gas and steam heating and electric lighting. He was recently granted a franchise for an electric line of street cars in the city, and the last two franchises were granted upon the condition that he shall carry out his contract with the city for building the electric street car line. The heating franchise is granted for thirty and the electric lighting for twenty years, and he is allowed sixty days for accepting the ordinance and is required to commence the work ninety days thereafter. He is bound to give greater facilities and cheaper rates for electric lighting than now exist in the terms of the two established companies in the cities.

San Bernardino, Cal.—The local correspondent of the Los Angeles "Herald" writes to that paper that "there is a new system of furnishing the incandescent light that is said to be much cheaper than the present one, and capitalists have been here to investigate the chances for putting in such a plant in this city. While not giving out their plans for publication, yet they seem to think this an excellent place to locate such an establishment."

Syracuse, N. Y.—About 100 lights are to be added under the new law to those already in operation. This adds \$10,000 to the lighting fund, which is now \$100,000. It is said that the Syracuse Gas Company will compete for these new lights.

Trenton, N. J.—The Governor has signed the Crispin Electric Pole bill, which legalizes franchises granted by municipalities to electric light companies. The bill was subject of much discussion before the Legislature, and its opponents claimed that it conferred upon electric light companies power to plant poles wherever they pleased. The Governor maintained that it does not extend any privileges not contained in the original franchises.

MANUFACTURING, ETC.

New York.—We learn from the "N. Y. Commercial" that the Sprague Electric Company, of No. 20 Broad street, has just shipped an immense quantity of electrical material to London, Liverpool, Hamburg, Rotterdam and other European cities. Over \$12,000 worth went to London, \$20,000 worth to Hamburg, \$9,000 worth to Rotterdam, while over \$68,000 worth was for Buenos Ayres. The Sprague Company has just shipped to Lon-

don an automatic elevator which was constructed for the Grosvenor square residence of Mrs. Caroline Astor Haig, formerly Mrs. Coleman Drayton. It was shipped by the Wilson line, and is now being put in the house. Mr. Sprague secured the contract against keen competition from the English engineers. Every particle of the equipment, car finish, ropes and all, was made in this country. The elevator has the same control system as will be used in the elevators which the Sprague Company will construct for the Brooklyn elevated railroad.

Philadelphia.—The ordinance giving the United States Time & Weather Service Company permission to erect meteorological and time columns in this city and to connect them with underground wires has been referred to the electrical committee by the sub-committee without any recommendation, and on motion the measure was laid aside.

Pittsburg, Pa.—The "Commercial Gazette" states that an important enlargement is about to be made to the arc lamp department of the Westinghouse Electric & Manufacturing Company at East Pittsburg.

TRANSMISSION PLANTS.

Marysville, Cal.—An experiment concluded here by Dr. F. A. C. Perine of Stanford University, for utilizing the electrical power line of the Yuba Power Company from their power-house to Brown's Valley, a distance of ten miles, has resulted in demonstrating that 36,000 volts may be transmitted over a copper wire using glass insulation against 16,000 which has been the maximum in practice in power transmission heretofore. The result of the experiment will be to effect a saving of half the cost of wire in the construction of electrical transmission plants in future. The exact loss in transmission of this high current has not as yet been made known.

COMPANY MATTERS.

Albany, N. Y.—At a meeting of the directors of the Albany, Helderberg & Schoharie Electric Railway Company, held here lately, measures were taken to adjust the differences that had arisen in the company, and it is probable that the construction of the road will be proceeded with. The "Express" states that a Mr. Burgett of Boston, and Mr. Schermerhorn of New York, who are backing the company financially, are satisfied that the project will succeed now that the differences have been amicably settled. It will cost \$1,250,000 to construct the road. The road will be about 44 miles in length if it is continued to Middleburg—five miles beyond Schoharie.

Binghamton, N. Y.—The stock of the Binghamton Gas & Electric Company, valued at \$360,000, has been transferred to E. C. Brown, of New York, who purchased the plant for Emerson McMillin & Co. of that city. William G. Phelps, who held a controlling interest in the concern, conducted the negotiations preliminary to transferring the plant to the New York owners.

Montpelier, Vt.—A committee appointed by the Montpelier board of trade and the owners of the charter of the Mad River Valley Electric Railroad have taken a trip over the projected route and conferred with the people in the various towns interested in the enterprise. The incorporators already have 200 shares subscribed. The road would open up a large lumbering and farming country and there are valuable soapstone quarries along the route. The charter members of the railroad are H. O. Ward of Moretown, T. J. Deavitt of Montpelier, F. C. Kennedy, J. J. Flynn, A. O. Humphrey of Burlington.

Philadelphia.—The directors of the Citizens' Street Railroad Company of Indianapolis met in this city on the 14th inst., and re-elected W. W. Kurtz vice-president, and W. K. Mulholland of Indianapolis secretary and treasurer. No nomination was made for president. The board met again on the 10th of June.

Sandusky, O.—L. S. Baumgardner, receiver of the Put-in-Bay Water Works, Light & Railway Company, has applied to the United States Court at Toledo for leave to lease the railway property by public outcry. The lease is to be from June 1 to October 1, the lessee to put the property in proper shape and make necessary repairs and improvements at his own expense, such repairs and improvements to become the property of the company.

Troy, N. Y.—It is stated that the directors of the Troy City Railway Company and those of the Albany Railway Company have under consideration a proposition for the consolidation of the roads. The proposition is understood to have originated in Albany, and, while it has not met with positive approval here, is said to have the sanction of many stockholders. The argument is advanced by those favoring the scheme that such a combination would reduce operating expenses and facilitate travel between Troy, Lansingburgh, Cohoes, Waterford, Watervliet and Albany.

ELECTRICIANS IN THE WAR.

At Cincinnati, T. C. Haston, a civil engineer, and W. M. Goodale, an electrical engineer, have recruited a company of electricians, linemen, telegraph operators and other skilled men, and have offered their services to the Government.

President McKinley on the 19th inst. sent to the Senate the nomination of Eugene Griffin to be Colonel of the First Regiment Volunteer Engineers. Mr. Griffin is the originator of the recent movement looking to the formation of a corps of electrical engineers. In the

electrical business he had attained prominence as First Vice-President of the General Electric Company.

Julius Buerastaele of Manitowoc, Wis., left that place a few days ago to accept the position of electrical engineer on one of the United States naval vessels. The salary which he will receive is only half of what he received from the Manitowoc Electric Light Company, which position he could have held indefinitely.

PERSONAL AND MISCELLANEA.

George F. Haggerty, a manufacturer of electric bells and annunciators for hotels and flat houses, with a factory at 201 East Forty-seventh street, New York, died on the 16th inst. at his home in Fifth avenue of Bright's disease. He had been on a business trip South and was taken ill while on his way home.

Joseph McArdle, an electrician, while repairing some wires in Washington, D. C., on Thursday afternoon last, received a shock from the effects of which he died soon afterwards. He was 28 years old and unmarried.

Electrician George Tully of 135 East Thirty-sixth street, New York, was taken to Bellevue Hospital last week for treatment for an attack of hiccoughs which began several days before. The hiccoughs were so severe that he could neither sleep nor eat but the doctors at Bellevue at last accounts had succeeded in relieving him.

Frank Callahan, an employee at the Salt Lake City Water & Electric Power Company's Jordan Narrows plant, was recently found drowned and parboiled in the hot springs about two miles distant from the plant. The springs are entirely unimproved, and the mud is very deep in places, while the water is exceedingly hot. It is supposed that Callahan got into the mud and could not get out. The water where he was found was near boiling temperature, and the man's body was terribly scalded. Callahan was a native of Dubuque, Ia., 28 years of age, and had been in the employ of the power company since March 28. He was formerly employed by the Big Cottonwood Power Company.

A license has been obtained by a Birmingham (Eng.) firm for the manufacture of a patent continuous current electric motor for transmission of power. The principal advantage claimed for this motor is in the circular form of the magnet, which not only uses the material to the best advantage but also provides a framework for the machine and a metallic casing for the armature and field coil. The commutator is sufficiently enclosed to preserve it from ordinary accident, yet is open enough to render it easily accessible for the adjustment of brushes, etc. In order to have a uniform and constant lubrication of the spindle, the motor is fitted with two brass rings which dip into the oil and hang upon the shaft of the motor at each bearing. When the motor is in operation the rings revolve slowly and carry round a sufficient quantity of oil. The starting switches and resistance are fireproof. A fuse is also provided, which melts if too great a load is placed upon the motor.

I. R. Nelson has tendered his resignation as superintendent of the Milwaukee, Racine & Kenosha Electric Railway Company to take effect on June 1. Mr. Nelson will be succeeded by John Blatt of Cleveland, O., who assisted in the construction of a portion of the line.

The winner of the first prize for speed and accuracy in receiving and typewriting telegraph messages at the telegraph tournament at the Electrical Exposition was H. V. Emanuel of Philadelphia. Mr. Emanuel received fifty messages in thirty-two minutes. The average length of the messages was fifteen words, necessitating a frequent change of blank on the typewriter. Referring to the feat the Philadelphia "Record" says: "The prizes, \$100 in cash and a Remington Sholes typewriter, are a source of great gratification to Mr. Emanuel, as, in addition to receiving them for speed and accuracy, he was commended for the neatness of his copy. Mr. Emanuel was born in Philadelphia on November 27, 1869, and is in his twenty-ninth year. He entered the employ of the Western Union Telegraph Company when 15 years of age. From his boyhood he has had a predilection for telegraphy and from the time he entered the company's employ has applied himself to his favorite study. He has had a practical experience in the business and states that his proficiency is the result of close application and what he has learned was gleaned in the office, never having attended a school of telegraphy. Mr. Emanuel has a cozy home at Bryn Mawr, where he spends the time when off duty with his estimable wife."

RECENT COMPANY ELECTIONS.

Bay County Electric Light Company, Bay City, Mich.—Directors: E. T. Carrington, C. F. Eddy, Benjamin Godkin, M. Haggarty, J. L. Stoddard, O. A. Eddy, D. W. Case.

Cincinnati & Hamilton Street Railway Company, Hamilton, O.—President, William Christy, Akron; treasurer, F. J. Pomeroy, Cleveland; secretary, C. E. Hooven, Hamilton; directors: J. C. Hooven, George Rentschler, James Christy, William Christy, F. J. Pomeroy, F. J. J. Sloan and J. F. Hogan.

Consolidated Street Railway Company, Worcester, Mass.—President, Francis H. Dewey; director: Albert H. Stone; both to succeed the late Charles B. Pratt, who was president of the company and also a director. There will be no other changes in the management of the road.

Consolidated Electric Company, Denver, Col.—President, E. W. Rollins; vice president, A. S. Hughes; general manager, John H. Poole; secretary and treasurer, T. H. Reynolds; directors: A. S. Hughes, H. T. Rogers, F. A. Keener, E. L. Foster, J. H. Poole, T. E. Poole, T. H. Reynolds, G. H. Taylor, A. E. Greer, E. W. Rollins and H. K. Devereaux.

Hudson Electric Light Company, Hoboken, N. J.—President and general manager, E. D. Mullen; treasurer, C. R. Dougherty; secretary, H. M. Francis; superintendent, A. H. Bonta.

Leavenworth Electric Railroad Company, Leavenworth, Kan.—Manager, E. E. Coombs; directors: Newman Erb, New York; H. N. Smith, Boston; W. D. Beihel, Denver; E. Summerfield, Lawrence, Kan.; E. E. Coombs, Leavenworth.

Manchester Street Railway Company, Manchester, N. H.—President, W. A. Tucker of Boston; treasurer, Philip L. Saltonstall of Boston; clerk, Judge J. W. Fellows; general manager, Edwin P. Shaw, Jr.; directors: W. A. Tucker, Walter M. Parker, Charles T. Means, Philip L. Saltonstall, Edwin P. Shaw, Jr., N. H. Walker, who has acted as superintendent of the road for several years, will be retained in the same capacity.

Mechanic Falls Water, Electric Light & Power Company, Mechanic Falls, Me.—President, Horace Purington; vice-president, H. C. Rowell; treasurer, L. A. Moulton; clerk, H. F. Sands; directors: Horace Purington, H. C. Rowell, L. A. Moulton, Percival Bonney, S. S. Wat-rhouse.

COMMERCIAL PARAGRAPHS.

The Jersey Electric Company's Renewed Lamp has become so popular that they are unable to purchase enough burnt out lamps to fill orders. Anyone having any to sell would do well to write them for cash prices paid for same. See advertisement on page v.

The Warren Electric & Specialty Company of Warren, O., the well-known manufacturers of High-Grade Anti-Trust Incandescent Lamps, are nothing if not original. Their advertisements are usually unique and masterpieces. With this company's attractive advertisements, coupled with the fact that the lamps made by the concern cannot be surpassed in life, candle power or brilliancy, they should not lack for orders.

The American Stoker Company, now established in commodious quarters in the magnificent new Washington Life Building, Broadway and Liberty street, New York, have just issued a new catalogue which is ready for distribution. The company has spared no expense in the production of this catalogue, and its illustrations, typography and arrangement speak well for the tact and taste of its compilers. In a card announcing the issue of the catalogue the company says: "A man is known by the company

he keeps' is regarded as an axiom. Apply this axiom to Stokers, then note the firms whose plants are reproduced in our catalogue. We think you will unite with us in agreeing that the American Stoker moves in pretty good society."

We would call our readers' attention to the advertisement of James H. Mason which appears in this issue. Mr. Mason is the patentee of the well-known Mason Electric Fan Motor, with offices at 152 East 23d street, New York. The Electric Portable Fan outfit which Mr. Mason manufactures is attractive in appearance, light, durable and so simple in construction that it can easily be handled, and cared for even by a child. This fan motor has moreover been so designed that any danger from shock is entirely eliminated. It is extremely economical in operation and

may be run for 15 hours at an actual cost of ten cents. No acids are required for the battery as the latter is made to generate current through the medium of a battery salt and water. As one of these electric motors, mounted on a stand with 8 inch four-bladed fan and guard, including battery, costs but \$10, they should find a ready sale. Mr. Mason also manufactures a small motor for power purposes which is extremely well thought of and in great demand.

THE IMPROVED BERRYMAN.

(KELLEY'S PATENT.)

ONE OF THE MANY METHODS OF CONNECTING KELLEY'S PATENT IMPROVED BERRYMAN FEED-WATER HEATER AND PURIFIER.

THE IMPROVED BERRYMAN

is a LITTLE GIANT at heating water and keeping steam boilers clean and free from scale. It is the product of long and varied experience of the firm of Benj. F. Kelley & Son of this city of over 16 years with the well-known "old style" Berryman, which they are still manufacturing in connection with their other specialties, which are Improved Economical Power Pumps, the Standard Feed-Water Heater and Kelley's Improved Exhaust Pipe Heads.

Any information, catalogues and prices may be obtained by applying direct to the main office of the firm, Benjamin F. Kelley & Son, at 91 Liberty street, New York City.

ON EXHIBITION

during the Electrical Show in the Generating Department a 800 Horse-Power Improved Berryman Feed-Water Heater and Purifier, furnishing hot water to a large battery of steam boilers.

This heater is rapidly superseding the "old style" Berryman, owing to its much greater compactness, higher efficiency and durability.

At the space occupied by the firm are exhibited the Berryman Heaters, "Old Style" and Improved, and their marked difference is causing many comments among the visiting mechanical engineers. Mr. Geo. Ernst, a representative of the firm, has charge of the exhibit.

INCORPORATIONS.

The Ephrata Electric Railway Company, Ephrata, Lancaster County, Pa. Capital stock, \$15,000. Directors: F. E. Bailey, Philadelphia; S. N. Bailey, Dillsburg; A. W. Mentzner, H. G. Mentzner, J. W. Von Neida, Ephrata.

The Detroit Light & Land Company of Detroit, Becker County, Minn., has filed amended articles of incorporation, by providing that the company may do a general real estate business as well as furnish electric lights to the Detroit people.

The Suffolk Gas & Electric Light Company of the towns of Islip and Babylon, Suffolk County, N. Y. Capital stock, \$200,000. Directors: Charles F. Street, Hunter Wykes and William B. Hord of New York City.

The Maranacook Electric Light & Power Company, Augusta, Me.—to supply the towns of Winthrop and Readfield with gas and electricity for all purposes. Capital stock, \$10,000. President, Frank Ridlon of Dorchester, Mass.; treasurer, John A. Hamblin of Augusta; clerk, L. A. Burleigh; directors: Frank Ridlon, John A. Hamblin and Joseph Williamson, Jr.

The Key West Electric Company, Key West, Fla.—to carry on a general electric business at Key West. Capital stock, \$300,000. Incorporators: Harry E. Knight of Westfield, N. J., and David J. Newland and William E. Knight of New York City.

The Seaside Park Light, Water & Sewer Company, Camden, N. J. Capital stock, \$100,000. Incorporators: William J. Bradley, Camden; Harry Reeves, Gloucester, and Francis R. Fishian, Bridgeton.

The Washington Lighting Company of New Hampshire has filed articles of incorporation with the Secretary of State at Concord, N. H. The company controls the new "Washington light" for the State of New Hampshire. Capital stock, \$300,000. Incorporators: Frank H. Sargent, Victor A. Grant, Sherburne J. Winslow and William S. Lougee of Pittsfield and Frank A. Dearborn of Boston.

The Consumers' Electric Company, Elizabeth, N. J. Incorporators: George F. Chapman of Elizabeth, and W. J. Davis, W. E. Connor and Charles McArthur of Jersey City.

The Diamond Electric Company, Peoria, Ill., has certified to an increase of capital stock from \$50,000 to \$100,000.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 17, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

604,098. Rail Conductor for Electric Systems. Louis E. Watkins, Springfield, Mass., assignor of one-half to Francke W. Dickinson, same place. Filed Aug. 18, 1897.

604,196. Trolley for Electric Railways. Sidney H. Short, Cleveland, O. Filed Sept. 26, 1896.

604,097. Street-Car Fender. James E. A. Walker, Walkerton, Canada. Filed May 21, 1897.

604,171. Fender or Guard for Tramway-Cars. Joseph Leighton, Reading, Pa., assignor of three-fourths to Jacob Shaaber, same place, and Edward Leighton, Harry Leighton and Adrien Leighton, Conshohocken, Pa. Filed July 27, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

604,081. Electric-Lighting System for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 16, 1897.

604,082. Electric-Lighting System for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 22, 1897.

604,083. Electric Lighting Apparatus for Railroad-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Sept. 25, 1897.

604,084. Electric-Lighting Apparatus for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Oct. 11, 1897.

604,085. Electric-Lighting Apparatus for Railway-Cars. Willard F. Richards, Buffalo, N. Y., assignor to Charles M. Gould, same place. Filed Oct. 14, 1897.

604,101. Electric-Lighting Apparatus for Cars. Edward Wilhelm and Willard F. Richards, Buffalo, N. Y., assignors to Charles M. Gould, same place. Filed Oct. 28, 1897.

604,209. Electric-Arc Lamp. Frank W. Steinacker and Edwin F. Cowley, Cleveland, O. Filed April 12, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

604,094. Telephone-Switchboard Plug. James Taylor, Heathercliffe Helsby, England. Filed Nov. 21, 1896.

604,238. Apparatus for Joining Telegraph-Cables. Henri Menier, Paris, France. Filed Dec. 28, 1897.

MISCELLANEOUS.

604,033. Electrical Safe-Protection System. Isaac Freed, Harrisburg, Pa. Filed June 15, 1897.

604,035. Electromagnet Having Rotating Fields. Walter Langdon-Davies, London, England, assignor, by mesne assignments, to the Davies-Motor Company, Limited, same place. Filed May 23, 1896.

604,128. Electrical Apparatus for Operating Elevator Doors. Humphrey E. Smith, Chicago, Ill., assignor to the Burdett Rowntree Manufacturing Company, same place. Filed April 14, 1897.

604,137. Apparatus for Electrically Working Metals. James D. Bishop, New York City. Filed May 6, 1897.

604,127. Circuit-Closer. Willis D. Kennedy, Easton, Pa. Filed March 25, 1895. Renewed Oct. 2, 1897.

604,220. Commutator-Brush Holder. William B. Stull, Bayonne, N. J. Filed Feb. 12, 1898.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

TELEPHONE AND TELEGRAPH.

A Suit Against the Detroit Telephone Co.

The Western Electric Company (Bell Company manufacturer) has begun action in the United States District Court at Detroit to restrain the Detroit Telephone Company and Wm. L. Holmes from using a multiple switchboard in which the plaintiff claims exclusive rights under a patent upon an invention of Leroy B. Firman, purchased by the plaintiff in 1881, and patented January 17, 1882.

With reference to the suit, President Holmes of the Detroit Telephone Company says:

"The Firman patent expires in January, 1899, and hence has only seven months more to live. The switchboard of the Detroit Telephone Company was constructed in a manner to conflict in nowise with any other patent. This, of course, was known to the Bell Company, or it would have commenced suit two years ago, when our company first started.

"It has been part of the policy of the Bell Company to try to embarrass us in every way. That company knew that our equipment was not like theirs, and hence predicted that it would not work, but it has been disappointed by our excellent service.

"The only object of the Chicago corporation in commencing this suit is to be revenged upon the citizens of Detroit who have refused to pay exorbitant telephone charges like those which this monopoly maintains in every other large city in the United States.

"While, of course, the telephone trust cannot have any hope of securing an injunction against the operation of a public franchise from any court in the United States, it does hope by these proceedings to head off, for a few months, the construction of independent telephone exchanges in other large cities."

The New Haven (Conn.) Register of the 19th inst. says: "Alois J. J. Pfeiffer, a young local electrician, sails to-morrow for France to take charge of the building of a new telegraph line from Paris to Rome. Mr. Pfeiffer is 23 years of age, and has made a brilliant success already. He graduated from Sheffield scientific school, Yale college, in '94 and immediately went to the General Electric Company at Schenectady. Later he went to Niagara Falls as an expert electrician and remained there until offered the position of chief electrician of the great telegraph line from Paris to Rome, which is controlled by a wealthy French syndicate. Mr. Pfeiffer is a brilliant young man and the news of his success will be received with pleasure by his many New Haven friends."

A public meeting was held at Washburn, Wis., on the night of the 14th inst., to protest against the excessive rates charged by the Wisconsin Telephone Company (Bell), and devise ways and means to obtain better and cheaper service. A proposition was made by the Chequamegon Telephone Company to put in 'phones and establish an exchange at a reduction of over 25 per cent. from the present rates. The proposition was accepted and the new company will begin work in a short time.

The assembly committee on streets, St. Paul., has decided to recommend for passage the ordinance granting a franchise to the American Telegraph & Telephone Company. The company proposes to give a long distance service, taking in Chicago and Eastern cities. The ordinance as amended provides that the company shall have no authority to fix its rates, if it establishes a local exchange, at a higher rate than the lowest amount charged by any competing exchange. The city council is also given full authority to regulate the business of the company within the city as it may think for the best interest of the citizens.

A Carlisle, Pa., dispatch states that Daniel Drawbaugh, the inventor, announces that the underground and submarine device for long-distance signaling on which he has been working for the past eight years or more is now in such an advanced stage of perfection that an officer of the Government will at once make a thorough inspection and test of it. Mr. Drawbaugh thinks the device would be especially valuable to the Government in the present war with Spain. He claims it will notify the operator at either end of the line the moment a person or vessel passes over it and can be worked any distance.

The Rural Telephone Company has been organized at Pleasantville, Westchester county, N. Y., with the following officers: R. S. Haviland, president; W. H. Moore, vice-president; Guy G. Norton, secretary, and C. W. Page, treasurer. The company will operate in Pleasantville, Chappaqua, Mount Kisco, Unionville and other places in the county.

The South Jersey Telegraph and Telephone Company has elected the following directors: James E. Mitchell, James Merrihew, S. M. Plush, Henry S. Huldekeper, Thomas Sherwin, John E. Hudson and O. A. Jaaks.

Rules Governing Cable Companies During the War.

The telegraphic orders given by Gen. Greely have been accepted by each of the cable companies, and now constitute an agreement with the Government. The agreement between the Government and the cable companies is as follows:

"In order to safeguard the public interests until further instructions, these companies refuse to receive or transmit the following:

"First—Any and all messages, either to or from officials of Spain or any of her colonies, except such as are addressed to or signed by the President of the United States or any member of his Cabinet, in Washington City.

"Second—All code or cipher messages to any point in the West Indies, Brazil or Venezuela, with the following exceptions:

"(a) Messages addressed to or signed by the President or members of his Cabinet at Washington.

"(b) Messages exchanged between any Ambassador or Minister of Austria-Hungary, France, Germany, Great Britain, Italy and Russia in Washington City and their duly recognized consular officials.

"(c) Messages exchanged by neutral European Governments and their consular agents, provided that such messages are officially signed and addressed.

"Third—All messages in plain or open text that on their face contain information against the United States in the present war with Spain."

In addition to these general restrictions, the cable companies at Key West, Fla., and the Haitian Cable Company in New York City, decline to receive or forward any messages communicating information as to the movements of United States naval vessels or current military operations.

The orders relating to foreign cablegrams simply emphasize the orders given when the war began, and do not relate to cable dispatches to any other parts of the world than those which are affected by the war.

The new State Telephone Company began operations at Lapeer, Mich., on the 12th inst with 125 telephones in service. Its only line at present leading from Lapeer is to Detroit. Connections are being made with all the villages in the county. The Moore Telephone Company intends forming a junction with the State Company to the north.

President Andy R. Smith of the telephone company, Rock Hill, S. C., died suddenly in the First Presbyterian Church of that town on the 15th inst. While seated in one of the pews, he was seen to suddenly throw up his hands, give a gasp and fall back over the seat. Two physicians in the church sprang to his aid, but he was dead before they reached him. Mr. Smith was also treasurer of the Electric Light Company at Rock Hill.

The American District Telegraph Company, Philadelphia, at the annual meeting on the 16th inst. elected these officers: E. J. Mathews, president; William H. Baker, vice-president; O. C. Adams, vice president and general manager; William L. Fry, secretary and treasurer; C. C. Adams, William H. Baker, E. O. Bradley, A. B. Chandler, George G. Glenn, E. J. Mathews, E. R. Mathews, E. O. Platt, W. L. Stanger, directors.

Raleigh, N. C., is now in telephonic connection with Goldsboro, and the line will be continued from Goldsboro to Newberne, and possibly to Wilmington.

The telephone line between Fort Collins, Col., and Livermore will be built immediately. The contract for furnishing and setting poles has been awarded.

The committee of the Chattanooga, Tenn., council to which was referred the two new telephone franchises have not yet agreed upon a report.

A 7,000 ton telegraph cable-laying ship is now in course of construction at Barrow, Eng.

The War Revenue bill taxes telegraph messages one cent each.

New Companies Incorporated.

The Galva Telephone Company, Galva, Ill. Capital stock, \$2,000. Incorporators: George D. Palmer, T. H. Johnson and W. A. Wigren.

The Citizens' Telephone Company, Medina, N. Y. Capital stock, \$12,000. Directors: John C. Moorhead, Cleveland; Robert J. Moorhead, North East, Penn.; Samuel B. Rawson, Elyria, Ohio; Clayton J. Rannister, Westfield; Ralph J. Quale, Silver Creek, and George H. Frost and Fred W. Plato, Buffalo.

The Conneautville Telephone Company, Conneautville, Pa. Capital stock, \$4,500. Directors: R. F. Wilcox, L. D. Carey, J. H. Smith, J. F. Snodgrass, W. J. Darby and D. E. Mewitt, Conneautville.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 12@12.10c.; casting, 11½c.

The Columbus (O.) Street Railway earned \$16,579 gross for the second week of May, a comparative increase of \$6,113.

The Wilmington City Electric Company, an old-established concern, and the Wilmington Light, Heat & Power Company, which was about to build a large plant in Wilmington, Del., it is reported have consolidated.

The Edison Electric Illuminating Company of New York reports for April: Gross earnings, \$260,609; operating expenses, \$139,813; net, \$120,796. The same month in 1897 the gross earnings were \$206,142; operating expenses, \$105,298; net, \$100,844.

In the action entitled The People ex rel. The Rochester Railway Company vs. the city assessors of Rochester, N. Y., Referee Benton has handed down a decision which relieves the railway company of paying any tax on its capital stock for the year 1897.

The Chicago "Dispatch" states that Charles T. Yerkes, the street railway king, has at last given his opinion as to the rate of compensation which the city should receive from the surface railway companies for fifty year franchises. He is willing, after all bills are paid, including interest charges, to divide equally with the city the profits of the companies under his control.

A meeting of the Redlands (Cal.) Electric Light & Power Company has been called to be held on July 21 for the purpose of considering and voting upon the question of increasing the capital stock of the incorporation from its present sum of \$200,000 to the sum of \$500,000, and considering and voting upon the question of increasing the present bonded indebtedness of \$100,000 to \$400,000.

The Philadelphia "Stockholder" says: "The Pennsylvania Railroad has just completed the installation of an immense storage battery to operate all the telegraph lines, telephones, call bells and other electrical appliances in use along the line between Pittsburg and Harrisburg on Sundays and at other times when the dynamo plant at Altoona is closed down. This is the most extensive application of storage battery power to such purposes undertaken up to the present time."

The suits of the Guarantee & Indemnity Company of New York, and the Guardian Investment Company of Cleveland, against the Fort Wayne Consolidated Street Railway to foreclose a mortgage for \$2,100,000 are being tried before Justice O'Rourke at Fort Wayne, Ind. J. J. Shipperd, who is accused in court of misappropriating \$300,000 worth of bonds of the company, is there as a witness.

The Consolidated Traction Company of New Jersey reports: Gross earnings for April, 1898, \$252,289.87; operating expenses, \$123,900.45; net earnings, \$128,389.42; fixed charges, interest and taxes apportioned, \$115,471.10; surplus, \$12,918.32. For the four months ending April 30, 1898, the surplus was \$16,896.82; for the corresponding period of 1897 the surplus was \$248.06.

Among the concerns in Chicago now under the control of the Chicago Edison Company are the Hyde Park Electric Light & Power Company, Hyde Park; Thomson-Houston Electric Light Company; Mutual Electric Light Company; People's Light & Power Company; People's Electric Light, Motor & Power Company; Englewood Electric Light & Power Company; Chicago Illuminating Company; Western Light & Power Company; Edgewater Electric Light Company; West Chicago Electric Light & Power Company and Enterprise Power, Light & Heat Company.

The stockholders of the Lancaster (Pa.) Electric Light, Heat & Power Company, which has a five years' contract for lighting Lancaster, recently voted to increase the capital stock from \$150,000 to \$200,000 and create a bonded indebtedness of \$100,000, the money to be used in improving the plant. On the 19th inst. a bill in equity was filed at Lancaster by John B. Oblinger, William L. Blair and Byron G. Dodge, former directors, asking the court to restrain the company's officers from making such increase. This action is construed to mean that a faction of the stockholders are opposed to any financial manipulations.

By a recent invention, carbolic, from which ethylene, said to be superior to acetylene, is generated, is being made from slag. The new utility of furnace slag is the invention of Herman L. Hartenstein of Chicago. The old Bessemer plant at Hammond, Ind., is being fitted with electrical appliances for the perfection of the venture. The process of converting the slag into a white metallic substance of twice the weight of gold is by impregnating the molten slag with pulverized coke and then subjecting the mixture to an electrical process whereby the whole is fused. It is claimed that each pound of the product will produce five feet of gas, each foot equal to fifteen of coal or water gas in illuminating power.

The Chicago "Inter Ocean" of the 18th inst. says: "The rights of the street railway controversy in Chicago are at last in a fair way to be settled. A gathering of prominent business men of the city, which met at the Grand Pacific Hotel yesterday afternoon, agreed to make an investigation into the relations of the street railway companies to the municipality and to collect such figures as are found to be necessary to show the actual state of transportation matters existing here. The work will begin at once, and the conclusions reached by the investigators will form a basis for intelligent opinion on the subject in future."

The Boston "News Bureau" states that a rumor is current that the American Bell Telephone Company is contemplating a bond issue. The company has \$2,000,000 6 per cent. debenture bonds, which mature in August, and it is possible that the company may issue new bonds to take up the maturing issue. After the recent monthly meeting a director said: "We have not yet decided whether we will pay off the bonds or exchange for new bonds. The company has plenty of money on hand, and besides has given President Hudson authority to sell by auction the 1,500 shares of stock remaining in the treasury which stockholders did not take."

Judge Wickes, at Baltimore, has ratified the sale of the Columbia & Maryland Railway Company to the Maryland Traction Company. An order was passed by the same court substituting the Maryland Traction Company for the purchasers of other franchises and property formerly owned by the Columbia & Maryland Company, including the line of railway extending from the District of Columbia northward through Hyattsville to Laurel. It is understood to be the purpose to consolidate the Eckington & Soldiers' Home Railway and the Maryland & Washington Railway in the District of Columbia with this road from the District line to Laurel, and operate them under the name of the Washington City & Suburban Railway Company. It is the intention of the Maryland Traction Company to at once complete the road between Baltimore and Ellicott City. Both the Maryland Traction Company and the Washington City & Suburban will be controlled by the stockholders of the Baltimore Security & Trading Company, but they will be operated as independent systems.

The committee on street railways have reported a bill in the Massachusetts Senate which practically revises the street railway law of the State. Among the more important provisions of the bill is one in section 7 placing an excise tax on the railways as follows: Companies whose annual gross receipts per mile of track are \$4,000 or less, 1/2 of 1 per cent. of the total annual gross receipts; companies whose gross receipts are more than \$4,000 and less than \$7,000, 1 1/2 per cent.; more than \$7,000 and less than \$14,000, 1 3/4 per cent.; more than \$14,000 and less than \$21,000, 2 per cent.; more than \$21,000 and less than \$28,000, 2 1/4 per cent.; more than \$28,000, 2 1/2 per cent. The excise tax thus provided shall be in addition to the taxes now provided by law. The eighth section permits an appeal to the Railroad Commission for a revision of the amount of the excise tax. The excise tax shall be applied towards the construction, repair, etc., of the public ways and the removal of snow therefrom. Street railway companies shall not be required to keep any portion of the surface material of the streets, roads and bridges in repair, and may, as an incident to their corporate franchise, without fee, open any street where the railway is located to make repairs or renewals of the railway.

EDITORIAL NOTES.

A Movable Electric Bridge. At a recent meeting of the Channel Bridge Company, held in Paris, a rather novel method was suggested for bridging the English Channel. The new scheme consists in rolling, on a bridge submerged to a depth of 49 feet below the water surface, an immense platform emerging above the water. The latter it is proposed to operate by electricity, presumably much in the same way that a submerged tramway is now operated along a section of the British coast. The platform would be built large enough to accommodate four trains at a time, the rails on the platform being at the same elevation as the rails on land at the point of departure and arrival. Those who have studied this novel method of bridging consider it to be practicable and claim that it will do away with many of the objections raised against its predecessors as a means of opening communication between England and France. It is said to be simple and possesses absolute safety both during its execution and in its working. The present scheme is also said to escape the principal international objections raised against an overhead structure. It would moreover in no way impede or menace navigation, and the insular situation of England would still remain intact.

The platform on which the trains would stand while being electrically propelled across the Channel would be 492 feet in length and 49½ feet in width. It would be supported by iron pillars solidly braced together by means of iron girders, the whole resting on the submerged platform which would be provided with fifteen pairs of wheels rolling on rails fastened to the bridge. The submerged platform would be about one hundred feet wide, so that the columns supporting the upper platform would incline inward, thus keeping the center of gravity well over the center of the lower platform and making it impossible for the waves or wind to overturn the structure. The necessary electric current would be generated by means of a suitable electric plant on the upper platform and would be transmitted separately to each of the fifteen pairs of wheels with which the submerged platform is to be provided.

The *London Standard*, referring to this novel bridge, says:

"This new work could be completed in five years. The total cost would not exceed 350,000,000 francs, or three times less than the bridge above the water. Three rolling platforms, working simultaneously, and only during the day, would suffice for a traffic of 3,000,000 tons of merchandise and 2,000,000 passengers, which would produce an annual income of over 60,000,000 francs, or a net income of 50,000,000 francs. Considering the facility of brilliantly illumi-

nating the platforms with electricity, they could also travel at night. The great English company, the Thames Iron Works and Ship Building Company, limited, is in accord with the French *Compagnie de Fives-Lille* for the grouping around this project of the principal iron working firms and companies of the two countries into a vast international consortium, which, with the present Channel Bridge Company, will demand the concession and secure the execution of the work."

The bridging of the English Channel by a movable electric bridge, so to speak, is exceedingly interesting and rather unique, but like most gigantic undertakings it would probably be discovered after work had once begun that the original estimated cost of the undertaking was far too low. Almost insurmountable difficulties would arise and would have to be overcome, and it would therefore seem that if it is absolutely necessary that a train should make through trips from Paris to London or vice versa, some form of train float could be devised and put in operation and probably effect a saving of \$70,000,000 on the scheme suggested.

* * *

Summer Convention of the Northwestern Electrical Association.

The final arrangements for holding the summer meeting of the Northwestern Electrical Association were completed at a meeting held in Chicago on May 24 at which were present Mr. F. A. Copeland, president of the Association, the Board of Directors and the special Committee of Arrangements, consisting of Messrs. J. M. Hill, W. W. Low and Wm. Gofitz. The action taken at the meeting practically assures the success of the Convention. As we stated in a previous editorial, some weeks ago, the honorary guests are to be Mr. Thomas A. Edison, Prof. Thomson, Mr. Frank Sprague, Mr. Nikola Tesla and Mr. Wood. Prof. Elisha Gray and Mr. W. S. Mallory, we are now informed, have been added to the number.

The members attending the Convention will leave Chicago as originally planned, on the commodious steamer *Northwest* on Friday, June 10, at noon, the steamer putting in at Milwaukee for such of the members as desire to embark there instead of at Chicago. It is proposed to stop for a few hours at Mackinac Island and from there go on to Sault Ste. Marie, where the steamer is scheduled to arrive at 5 P. M. on Saturday. The vessel will first touch on the Canadian side to afford the members of the party an opportunity to inspect the plant for the smelting of nickel ores by electricity, which is very fast approaching completion and which we are informed will be in operation by the time the *Northwest* reaches there. The large plant of the *Tagona Company* and other points of interest will also be visited. The members will then be taken over to the

American side, where the citizens propose to entertain the visitors Saturday evening. The vessel will remain here until Sunday noon, which will allow of the morning being utilized for the inspection of the big locks, the ship canal and the carbide works. Hancock will be reached about 4 A. M. on Monday, and the members will be taken at an early hour to inspect the well known Calumet and Hecla copper mines, remaining until 2 P. M. While the gentlemen of the party are at these mines the ladies will be entertained by the ladies of Hancock and Houghton, the two cities being practically together.

At Duluth, where the party will arrive on Monday about 9 P. M., a large reception is to be held which should prove extremely attractive from a social standpoint. A paper on the "Electrical Smelting of Ore," is to be read at Duluth by Mr. W. T. Horry, and there is also to be a varied entertainment furnished by the citizens. Altogether the stay at Duluth should prove both enjoyable and instructive. The banquet is to be held at West Superior on Tuesday night, and will be given jointly by the citizens of Duluth and Superior. It is to be one of the most elaborate affairs ever given in the West, and will be attended by men of note from all parts of the country.

The party will leave Duluth by special train, stopping some three hours in Minneapolis for the inspection of the mammoth new power plant of the Twin City Rapid Transit Company, and will in all probability dine at the West hotel. The special train will leave Minneapolis about 8:30 P. M., arriving in Chicago early on the morning of the 16th.

As we stated in the article referred to above, a unique feature of the Convention on the steamer will be the establishment of a question-box in which questions will be dropped and answered by experts during the session. A wide range of topics of importance will be discussed, including arc lamps, lighting, meters, transformers, measuring instruments, boiler furnaces, engines, mechanical draught and numerous other topics of interest to the electrical engineer, manufacturer and central station man. Well-known experts and specialists who are prominently identified with the devices and subjects under discussion will take part, which should go far toward making the 1898 Convention an extremely valuable one from a scientific standpoint.

An unusually large attendance of central station men is assured, and we are informed that Mr. J. M. Hill, chairman of the special Committee of Arrangements, has heard from many people of note who are either owners of electrical properties or who are interested in some new electrical development, assuring him that they will be present. The technical departments of all the large manufacturing companies will, moreover, be well represented. The three days on the steamer, it is generally thought, will prove of lasting benefit. The ladies are to be unusually well provided for, but those who contemplate taking ladies would do well to address Mr. Hill, 1240 Monadnock Block, Chicago, at as early a date as possible in order that extra care may be exercised in assigning staterooms for their comfort.

It is safe to predict that this Lake Convention will prove one of the most enjoyable gatherings of the year.

Uses to Which the Telephone Is Put.

Recently a new form of telephonic apparatus has been perfected for the United States Signal Corps after five years of experimental work. This system, which somewhat resembles the Charolles system in vogue in France, might be said to be an outgrowth of the latter. The system invented by Captain Charolles of the French Army, and which bears his name, consists of an uninsulated bimetallic wire which may be laid upon the surface of the ground, each end being connected by a specially designed transmitter and receiver. The success of this appa-

ratus was to a large extent attributed by its inventor to the peculiar properties of the bimetallic wire. Experiments were made with the system in this country, and it was found that by replacing the Charolles receivers and transmitters by magneto-telephones much better results could be obtained. The experimenter, Captain James Allen of the United States Signal Corps, next made a study of the bimetallic wire, which led him to believe that equally good results could be obtained by the use of a single conductor of the same diameter as the bimetallic. Silicon, pure copper, bronze and other wires were tried with excellent results. The original idea was to use the uninsulated wire for oral communication only, but it then became necessary to adapt it to the use of the Signal Corps as a part of its means of telegraphic communication. With this end in view, Captain Allen replaced the magneto transmitter by one of carbon, with greatly improved results. The transmitters were then introduced into a circuit with a suitable battery, induction coil and telegraph key. With this arrangement the principal objection, and one that seemed almost impossible to overcome, was that the back stroke of the diaphragm was much louder than the sound obtained when the current was sent through the magnet. After considerable experimenting, however, a solution was found for this problem whereby the ordinary Morse code could be read through the receiver.

This combination of a telephone and telegraph system was thoroughly tested in actual warfare during the late trouble with the Arizona Indians. It is said to have been operated successfully in both its capacities at a distance of 625 miles. As the whole outfit weighs but about sixteen pounds it is extremely well adapted for making quick connections between neighboring army posts during a campaign.

Another important use to which a modified form of telephone has recently been adapted is in enabling deep sea divers to communicate, while under water, with their attendants. This system was invented by Captain Louis Sorocho of Baltimore, and consists of a specially designed headgear for both the diver and tender, made of rubber. This fits over the head much the same as the ordinary telephone exchange headgear. The receiver is placed over the left ear, a wooden pad over the right, which shuts out all sound and prevents pain in the ear from the air pressure. The waterproof cable containing the wires passes through the front of the diver's helmet, a stuffing-box being employed to prevent the admission of water. The necessary current for operating the phones is obtained from dry batteries, ranging in number from eight to twenty-four, according to the depth at which the diver is working. The transmitter and receiver are round and flat, much resembling those frequently met with in telephone exchanges.

By means of Captain Sorocho's submarine telephone a diver can have anything he may happen to need sent down to him, or can, if a connection is made on the surface, hold a conversation with another diver at some distance from him. As a means of safety the submarine telephone is invaluable, for should a diver's life-line become entangled or his air-pipe foul, he could notify his tender to that effect in a word and be immediately drawn to the surface. With the Sorocho apparatus, the accident which recently caused the death of a diver by asphyxiation while examining the bottom of the gunboat Newport would have been impossible.

The strength of the Spanish navy in torpedo boats makes it necessary that all the vessels of the United States navy and the forts should be provided with searchlights, but it is found to be no easy matter to purchase a sufficient quantity of searchlights in the present emergency owing to the scarcity of suitable mirrors, an adequate supply of which cannot be

had. Having the necessary reflectors, the electric companies would have no difficulty in turning out projectors at a rapid rate.

Under the Searchlight.

Notes and Comments on Various Topics.

A BOSTON financial paper publishes an item from a New York source asserting that the Manhattan Elevated Railway directors are considering plans for the equipment of the road with electricity, and that "Mr. Siemens, the foreign electrician, who some time ago made a careful inspection of the whole Manhattan system at the request of the Manhattan people, will soon arrive in this country and probably submit a plan which may be adopted. Assurances are given that Mr. Siemens' plans and ideas are the most acceptable so far investigated." It has been so often stated in the public prints that the General Electric Company had secured the electrical equipment of the Manhattan road that this announcement, which is going the rounds, comes like a surprise—that is, under ordinary circumstances, it might come in that way, but the statements set afloat by the busy press bureau of that company have so often proved false that every one has ceased to believe them. As the General Electric is using the Siemens system of underground conduit, or an imitation of it, perhaps the Manhattan directors thought it probable that Mr. Siemens might have ideas on elevated traction which it would be preferable to take from him personally rather than through the poachers who have "appropriated" his underground system.

* * *

THE Holyoke Street Railway Company is defendant in a suit for damages brought by a young woman who claims that she is entitled to \$25,000 for injuries alleged to have been received May 30, 1897, while returning from Mountain Park on one of the company's cars. The car slipped its trolley, it is claimed, and ran into a car ahead. Since the time of the accident the girl has been confined to her bed. At the trial, which is in progress as we write, one physician stated while on the stand that it was his opinion that the young woman was suffering from what might be termed "hysteria with an object," and that her recovery he believed would be very rapid after the lawsuit. It is scarcely necessary to say that he was not the physician in attendance on the girl.

New York is sending over bullish despatches on General Electric.—*Commercial Bulletin, Boston.*

THE bullish depredations of the General Electric in New York have dwindled to narrow dimensions, and the manipulators are apparently seeking other fields. It is astonishing, however, that they should have chosen Boston as a new working center. The history of General Electric is about as well known in Boston as the story of Captain Kidd, and evokes about the same kind of emotion when recalled.

* * *

A BOSTON dispatch to the New York Times, dated May 27, states that a new and powerful apparatus has just been completed by Prof. John Trowbridge of Harvard University for experiments in electrical force, his principal object being to test the penetrating power of the X-ray. The apparatus consists of a series of 120 Franklin plates or Leyden jars, supplied with power by a storage battery containing 10,000 Planté cells. The voltage necessary for experiments is 2,500,000. Prof. Trowbridge already has made experiments which prove that with apparatus as powerful as this the X-rays can be made to penetrate not only human flesh, but also bones and tendons, thus probably making possible still more remarkable attainments in surgery by their aid.

THE ELECTRICAL EXHIBITION.

The management of the Exhibition has decided to keep this instructive and most entertaining show open a few days longer than was originally intended, and have therefore leased the Garden until Saturday, June 4. This will afford many persons, who probably otherwise would have missed seeing the many electrical wonders, an opportunity of examining them. In spite of the inclement weather which New York had been experiencing almost unceasingly for the past week, throngs continued to congregate in the Garden and take the most lively interest in all the special features and many of the private exhibits. The school children, who took the Garden by storm some ten days ago, continue to besiege it every afternoon in throngs. To these children the phonographs, electric cascade, submarine mines and bright lights make the place a fairyland. The lighting of the tower on the Garden attracts general attention and may be seen for miles around. The striking and original effect produced by multi-colored beams from fourteen searchlights behind a mass of very thin white silk gauze is beyond description. The *Evening Post* describes the effect as follows:

"The tower of Madison Square Garden has often presented a beautiful spectacle at night, but it was never more a vision of beauty than since the Electrical Exhibition opened. With apparatus and by means which the management refuses to disclose, the tower each evening after dark is thrown up against the sky with a multi-colored radiance that causes every eye to be turned upon it, not only in the adjacent streets, but across the ferries and out well into New Jersey, and the Connecticut suburbs. The name that is already commonly given to this popular performance is 'Diana's skirt dance.' It really seems to be a huge representation of the Loie Fuller effects, with the aid of the wind and of colored screens and searchlights. In waving columns of steam and cloud, some diaphanous material coils and curves around the shaft of the tower, right up to the foot of Diana, and then the tinted fires of electricity are let loose on this ever-changing scenic effect. At one minute the tower is all the colors of the rainbow; the next it is a pearly white or blue, and then again it is all bathed in blood red, while at the same time a keen searchlight is thrown on Diana herself, as she points to the wind. Just below, of course, hangs the electric sign of the show, suggesting the wondrous things that are going on within the Garden itself; and thus a piece of advertising not less beautiful than it is clever accomplishes its purpose."

The special exhibits continue to attract general attention. One of the most instructive is that of the underground trolley. The track is of standard gauge and is made up of two rails 9 inches high weighing 90 pounds to the yard. Full size yokes are shown which carry conduits consisting of 6-inch ducts imbedded in concrete. A full size car is operated backward and forward over the section, which is some 60 feet in length.

Another exhibit which has been attracting considerable attention is that of Prof. S. H. Short, which consists of a pioneer electric car used in Denver, Col., as far back as 1885. This car is shown running on underground conductors and was one of the first attempts at underground propulsion.

The Diesel motor, located in the basement, is attracting the attention of central station men from all over the country. The motor which is now being exhibited is of 20 horse-power, directly coupled to a generator. It runs at the comparatively low speed of 170 revolutions per minute, as owing to its late arrival time was lacking to adjust it to a higher speed suitable for electrical work.

The Exhibition has unquestionably been well managed and care and judgment exercised in the selection of the special features. It only remains now for the gentlemen who have devoted both their

time and energy to afford the public an opportunity of visiting an unsurpassed electrical show, to reap the reward of their labor.

Convention of Fire and Police Telegraph Superintendents.

[OFFICIAL.]

Brooklyn, N. Y., June 1, 1898.

To Superintendents and Electricians:

The Third Annual Convention of the Fire and Police Telegraph Superintendents and Municipal Electricians will be held at Elmira, N. Y., August 9 and 10, 1898, at 10 A. M. All members are expected to be present. Bring your ladies; special arrangements are being made for their entertainment. Several papers will be read by well-known electricians. Will you be present? Fraternally.

W. Y. ELLETT, President,
Elmira, N. Y.

H. F. BLACKWELL, Secretary.

Take D. L. & W. Road from New York or Buffalo and intermediate points.

Electrical Work in South Africa.

The *British and South African Export Gazette* gives many items of news which show that the advantages of electric transmission of power are bringing it to the fore. Thus we learn that "a power plant has just been installed at the York gold mine, comprising two belt-driven 50-H.P. three-phase inductor type generators, running at 750 revolutions per minute and supplying power to two 24-H.P. motors coupled to belt-driven pumps; also a 3-H.P. motor connected to a centrifugal pump; and several small motors for various kinds of machinery, including one of 9-H.P., coupled direct to a continuous current dynamo of 15 volts 300 amperes output, for cyanide work." Again, "an electrical plant recently sent out to the Vogelstruis gold mine by the General Electric Company, Manchester, consisted of two 150-KW. three-phase generators, belt-driven at a speed of 300 revolutions per minute, a frequency of 30 cycles and a pressure of 950 volts; three triplex single-acting pumps, with plungers $6\frac{1}{2}$ in. by 8 in., coupled direct to 35-H.P. motors running at 360 revolutions.

"Speaking of the increasing difficulty which the South African mining industry, and in particular that of the Rand, has experienced in procuring a sufficient supply of native labor, this fact has given a great stimulus to the introduction of machine drills. A variety of these have been imported, chiefly from America, or invented to meet the requirements of the mining industry, and have been largely adopted by mining companies. Opinions, however, differ as to the economy of their employment as compared with hand labor, although it is admitted that they have the advantage of placing the mines in a position of independence with regard to hand labor in cases of emergency, and often do away with the necessity of stopping driving power.

"The drills in use have been found to work well in large stopes, but less so in small. The chief desiderata of a good stopping drill are considered to be (1) lightness, so as to be easily handled; (2) strength, so as to reduce repairs to a minimum; and (3) economy in air (or other power) consumption. The drills known on the Rand are driven by air and steam, but the latter has been found very objectionable in working. No electric drill has, however, yet been placed on the market so far as we are aware. This affords an opening for English electrical invention which it is to be hoped may be taken advantage of for the credit and profit of home industries, as the market for this class of tool in South Africa is undoubtedly large and growing."—*Elec. Engineer, London.*

The General Electric Company owed on January 1, 1898, \$1,339,360 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

CARBONIZATION OF FILAMENTS BY ELECTRICITY.*

BY LEIGH S. POWELL.

The idea of carbonizing filaments by electricity, in lieu of the common furnace method, must have occurred to many. It was widely reported some ten or twelve years ago that the remarkable "adamant" filaments, introduced by Woodhouse and Rawson, had been subjected to intense heat by electricity, but no details of the process employed were ever noised about or reached the ears of the writer; and it is believed that at the present time the carbonization of filaments by means of electricity has not been practically adopted. As the subject is not without interest or economic possibilities, it has occurred to the writer to be worth while putting on record an electric method he devised for this purpose about five years ago, and a few particulars of certain rough and superficial experiments which were made at the time at a Continental lamp factory to test its practicability. It is hoped that some incandescent lamp experts, who care to test the plan further, and who are able to bring together the means and conditions needed for the investigation, will succeed in bringing this process, or one allied to it, to a successful issue.

The features of the method in question and the principles involved are very simple and obvious. The carbon blocks on which the cellulose threads are wound are conductors of electricity, and the plumbago powder in which they are packed is likewise a conductor. If a pile of blocks be therefore made with a layer of plumbago powder between each, and the whole be surrounded with suitable non-heat and electricity-conducting materials, while a current of electricity is made to pass, it is evident that the blocks will become heated, and grow hotter and hotter, until in time the filaments will be carbonized or "baked."

To bake filaments successfully by this method, it is naturally necessary to attend to several conditions. It is obviously of prime importance that the heterogeneous conductor be encased in insulating material of the best quality, and arranged in the most suitable manner. It is equally necessary to exclude the air, so as to prevent the burning of the filaments. Other considerations of more or less importance are: facility in packing and unpacking the containing vessel, the construction of the terminal conductors, the manner of applying the current, the duration of the operation, and the final cooling of the blocks.

As already intimated, the experiments that were made were in the nature of mere trials rather than a serious and persistent attempt to thoroughly ascertain the economic practicability of the method. Two experiments only were made; and as the notes taken of the dimensions, times, amperes, etc., were far from complete, and also by reason of the superficial nature of the trials, it is not proposed to describe them in detail. Suffice it to say that in the first experiment two parallel brick troughs were constructed on a brick platform covered with a layer of slag wool. The troughs, which were about a meter long, were packed with wound blocks, plumbago powder being sprinkled between each space. The current entered one trough by means of a stout terminal plate of carbon, flowed to the end, then across to the other trough by a long slab of carbon, and so on to the other terminal. The upper surface of the troughs was covered by slabs of earthenware, and the whole was surrounded with a thick coat of slag wool.

The current which was available for the operation had a pressure of 110 volts, and this factor was largely responsible for the arrangement of the furnace in manner described. The resistance could was a little over 2 ohms, and the current at the start was 50 amperes. In an hour or so the current had risen to 150 amperes, when it was lowered to 50 amperes again by introducing an external resistance. At the re-

*From the *Electrical Review*, London.

duced pressure the resistance of the circuit continued to decrease, and the current once more rose to 150 amperes.

On examining the filaments at the end of the operation they were found to be brittle and useless, a circumstance which was probably due to burning by access of air during cooling, to hasten which a considerable quantity of slag wool had been removed.

In the second experiment the length of the row of blocks was increased to about three meters in order more nearly to suit the current pressure; and instead of forming a simple \cup the course ran thus $\cup \cup \cup$. To more effectually displace the air, a layer of plumbago powder, sprinkled with paraffin, was spread along the bottom of the troughs before charging them with the blocks. In this experiment the plumbago powder was more tightly compressed than in the previous one, the resistance cold being 8.8 ohms. For the purpose of raising the temperature more slowly at the commencement, an external resistance was included in the circuit, and the current adjusted to about 18 or 19 amperes. Instead of the resistance falling from the start, as in the previous experiment, it had a tendency to rise during about 5 hours. This increase, which amounted at the maximum point to about 25 per cent, may possibly have been due to the presence of paraffin. By gradually cutting out the resistance, the current was caused to rise slowly to 25 amperes. In 10 hours from the start the current was only 30 amperes, in 12 hours it was 35 amperes, in 14 hours 55 amperes, and in 17 hours it had reached 65 amperes. The circuit was here interrupted for the night, but was again closed next day, after a lapse of 6½ hours, the current starting at 27 amperes. In 6 hours' time it once more attained 65 amperes. It is believed that the current was stopped soon after this, but the notes taken are not specific on the point.

The majority of the filaments obtained from this second operation were satisfactory in every respect, their flexibility and "color" being good, while their resistance cold remained practically steady both before and after raising to incandescence in an inert gas.

The problem of baking filaments by electricity was allowed to drop, not because it was anticipated that the process could not be made to give satisfactory results, but principally because it was not considered to be worth while to arrange for a current of lower pressure and larger quantity to suit other and more convenient forms of apparatus, and also because it was supposed, by some, that the electric method would not prove to be more economical, or possess any striking advantage over the ordinary furnace plan. Without, however, ascertaining a good deal more thoroughly what degree of perfection can be attained, the data wherewith to form a sound judgment as to cost, etc., are not forthcoming.

To describe in detail the best manner of proceeding in order to construct suitable and efficient apparatus is not in the writer's power. Many materials and arrangements, however, naturally suggest themselves, and some of the more prominent of these may, perhaps, be mentioned.

It is patent that, in order to reduce the cost of the predominating item of expense, viz., current, to a minimum, it is imperative that the amount of matter surrounding the blocks, consistent, of course, with good heat insulation, should be reduced to utmost limit. In the experiments referred to, this condition was most imperfectly studied. A considerable mass of brickwork became heated to bright redness, at the expense of current, by contact with the blocks, and the extensive external brick surface was moreover very inadequately protected by the slag wool from the cooling influence of the surrounding air. The vessel in which the blocks are packed should, by preference, be either cylindrical or rec-

tangular in form—the latter to suit the shape of the blocks—and of large enough dimensions, both in height and diameter, to be convenient for packing and unpacking the blocks. The vessel should stand in an upright position, and it should be made as thin in the wall as possible of a material which is practically impervious to air. Probably as good a material to use for the purpose as any would be the fire-clay employed for making salamander crucibles. The vessels should be closed both at the top and bottom by a stout carbon plate or disk, the bottom one being cemented into position so as to admit no air at the junction with the vessel. The platform on which the vessel rests might, perhaps, best be made of the porous fire-clay of which Fletcher's furnaces are made.

The question of how best to prevent the escape of heat at high temperatures is doubtless one in which a good deal of improvement might be made on attainments already arrived at, and it would form an interesting subject for investigation. Without possessing any special experience on the subject, the writer would propose that the vessel should be surrounded by two, three, or more (as may be found desirable) movable cylindrical covers of increasing dimensions, and made of the same material as the platform. Each cover, which must perforce have a small hole at the top through which the conductor, conveying the current, must pass, should be made as thin as practicable. The lower rims of the covers might fit into concentric grooves made in the platform, each groove being filled with powdered charcoal or lampblack. A series of air spaces would thus surround the vessel at regular intervals, and these would be likely to effect good heat insulation, while the actual mass of solid material employed would be reduced to a comparatively small cubical bulk. The arrangement would further possess the advantage of easily and expeditiously effecting the cooling of the blocks at the close of an operation by the simple removal of the covers or shades.

It may well be that better heat insulation and more conveniently arranged apparatus might be constructed on other lines. Many insulating materials packed round the vessel, such as asbestos, slag wool, lampblack, metallic oxides, etc., might perhaps be arranged to give excellent results. In the selection of such substances, it would be well to bear in mind the different specific heats which the various substances possess, although other properties and considerations may very likely far outweigh this one in importance.

All the world knows of the remarkable success which has attended Prof. Dewar in his experiments on liquid air and its preservation by means of exceptionally perfect heat insulation, effected by surrounding it with an intervening vacuum. The application of this principle to the form of electric furnace under discussion would doubtless be productive of highly successful results. The manner of constructing apparatus involving this principle is, however, not so very apparent, although it is a problem which would be well worth attempting.

Another principle, which might be made to give satisfactory results, would be that of heating the outside of the vessel by means of gas or otherwise, and so lessen the escape of heat generated by electricity. A loose outside fire-clay mantle might be arranged round the vessel, inside which gas was made to burn, or heated gases to circulate. The external surface of the case would not need such careful protection from the outside air, and the cooling down at the end of the operation could be easily effected. The total energy expended by this means of conservation of temperature would naturally be greater, but not necessarily more costly by reason of the difference in cost of heat produced by gas and that produced by electricity.

As regards the current needed for the generation of heat, it would doubtless be necessary to have the power of considerable variation of electromotive

force. The amount of energy consumed would depend almost entirely upon the perfection of the surrounding heat insulation. With this very perfect, and with sufficient time, the temperature requisite for the proper carbonization of filaments should be reached with a comparatively small current. The manner in which the current is applied and the duration of the operation to give the best results are points which can only be determined by actual experience with any particular form of apparatus.

It may, perhaps, be idle to let the imagination run too freely on the advantages that are likely to result from the carbonization of filaments by electrical means over methods of heating by fuel, before they have been actually demonstrated. Some advantages, however, are highly probable, and a few of them may be enumerated:

1. The wear and tear of the apparatus is likely to be appreciably less for the following reasons: (a) There would be more regular heating and cooling of the apparatus; (b) there would be less lifting and moving about of the apparatus both in the heated and cold condition; (c) there would be an absence of fluxing material to destroy the apparatus.

2. The precision with which the current could be regulated ought to ensure greater uniformity in the quality and resistances of the several batches of filaments turned out in the regular course of manufacture. The defect inherent in the use of crucibles heated from an external source, due to the impossibility of heating equally all parts of the contents whilst raising the temperature, would be wholly absent.

3. The labor needed to work the process would be of a much more agreeable and less arduous description.

In addition to these probable advantages, it is quite possible that the electric method might possess others of an important nature. The temperature of the furnace might be easily raised to a very high degree, and this condition might be conducive to producing filaments of a very dense and durable description. Further, by reason of the compact and isolated manner in which the apparatus might be arranged, it would be possible to perform the carbonization under unusual physical and chemical conditions, such as in vacuum or under pressure in air or hydro-carbons or other gases by inclosing it in a suitable chamber. Such altered conditions might result in producing new and desirable results.

On the question of initial cost of apparatus and of the electric energy consumed, it will be prudent to venture no remark other than that both are likely to be in favor of electricity as compared with heating by fuel.

The electric furnace in various forms is now being employed in a number of industrial manufactures, both in the smelting of metals and in the preparation of substances such as carbide of calcium, graphite for electrodes, carborundum, etc., and there seems no reason why it should not be also successfully applied to the carbonization of filaments.

International Exhibition at Glasgow.

There is to be held in Glasgow, Scotland, in 1901 an International Exhibition at which special attention to electricity will be given, both for lighting and power services. The guarantee fund for the Exhibition already exceeds \$1,750,000.

The railway committee of the Privy Council at Ottawa has granted a charter to the North Shore Electric Railway Company which proposes to build a railway in the vicinity of Montreal connecting Montreal with outlying districts. This road will run from Three Rivers, Que., along the north shore of the St. Lawrence. The promoters of this enterprise intend to use the water power of Shawanigan Falls for the generation of the necessary power to operate the road.

ELECTRICAL ALLOYS.*

BY ROLLO APPELYARD

Ten years ago German metallurgists began to study the problem of mechanical and electrical permanence of the cheaper alloys used for resistance coils. They appealed to the Reichsanstalt. Metal founders submitted specimens for analysis and criticism, elaborate tests were made, and the results led to the favor and adoption of "manganin" and "constantan." There is still some doubt as to the durability of these alloys, but the evidence shows that, with proper precautions, manganin and constantan may be protected against all ordinary sources of deterioration. The history of that investigation deserves to be told in full, as an object-lesson upon the benefits conferred by a National Laboratory. It is all written in Band II of the *Wissenschaftliche Abhandlungen der Physikalisch-Technischen Reichsanstalt*; parts of it have from time to time been quoted in various electrical journals, but several important details have been omitted; it is therefore proposed here to give a summary of the investigation more or less as it appears in the original volume.

I. METALLIC ALLOYS FOR STANDARD RESISTANCES.

The first step was to investigate the electrical resistance of most of the familiar alloys, with the intention of elucidating the question of the variation of their specific resistances, for it is these variations that most disturb precise measurements. German-silver was next examined, samples being taken from that made by Messrs. Siemens & Halske for standard resistances; also nickel wire from Obermaier, of Nürnberg, and platinum-silver and platinum-iridium from Messrs. Herius, of Hanau. Of these alloys, the particular quality of platinum-silver examined was found to be too inhomogeneous and too brittle; it had, therefore, to be excluded from the final research.

Platinum-iridium, on account of its high price and great temperature coefficient, was discarded, as it was considered to be only of secondary importance for practical purposes. In the course of the experiments, the nickel used for coins in the Imperial Mint and manufactured by Messrs. Basse and Selve in Altena, under the trade name of "Patent nickel," was carefully tested.

In order to characterize the materials as nearly as possible, analyses of the various samples were made in the Chemical Laboratory of the Reichsanstalt, with the following results:

TABLE I.

	German silver (1 mm.) Messrs. Siemens and Halske.	Nickel. (1 mm.) Messrs. Obermaier.	Patent nickel.
Copper ...	90.16	61.63	74.71
Zinc ...	25.37	19.67	0.52

Thermo-electric power against Cu.	14.4	18.1	29.1

For reference, three physical constants are added to the table: (1) The specific resistance in microhm-centimeters; (2) the thermo-electric power against copper in micro-volts per 1° C., temperature difference; and (3) the temperature coefficient.

In the next case, the effect of rolling the wire was investigated at various adjustments of the rollers. Copper pieces were hard soldered to the ends of the wire under test, and the resistance was measured; then, avoiding tensile strain so far as possible, the wire was rolled, and finally its resistance was again determined at the same temperature.

All wires in Table II show an increase of resist-

ance after rolling, varying from 0.04 per cent. to about 0.87 per cent. Patent nickel varies least, german-silver the most. If the diameter of the roller is 40 times that of the wire, only a very small increase in the resistance of the patent nickel wire is observed; with german-silver the increase is about four times greater. If rollers of ten times the diameter of the wire are used, both of these alloys show a change of resistance of about four times the above increment. The cause of this increase of resistance by rolling is partly due to stretch, and partly to mechanical hardening, the result of bending and twisting.

Variations due to bending may be prevented very easily and effectively in standard resistances, by attaching the wires permanently to metal with a strong coating of shellac.

The quasi-permanent resistance changes due to heating of the material are much more serious. In order to investigate them, bobbins of the foregoing metals were heated for several hours in a dry oven at 40° C., 100° C., and 150° C., and then again at 100° C., measuring the resistance before and after every heating. Table III, column 6, shows the

alteration of resistance, corresponding to the various temperature ranges. Patent nickel gives a diminution, german-silver and nickelin an increase, of the specific resistance after heating. The first heating, 40° C., produces a slight but definite alteration with all the wires. With the next heatings, 100° C. and 150° C., german-silver and nickelin have very nearly the same order of increase, which is approximately double of the diminution exhibited by patent nickel. Heating at 100° C., after previous long-continued heating at 150° C., influences german-silver and nickelin only very slightly; with patent nickel, as a general rule, there is no difference within the limits of observation. The important results derived from these experiments are: (1) that the specific resistance of german-silver and nickelin can be made approximately constant by

prolonged heating at 150° C.; and (2) that the specific resistance of patent nickel becomes, within the limits of observation, perfectly constant under the same treatment, so that it does not undergo any subsequent changes even when heated to 100° C. Secondly, the experiments show that of the materials investigated patent nickel is essentially better than german-silver and nickelin as a material for standard resistances. The above variations are considered by the Reichsanstalt to be due to the presence of zinc in the german-silver and in the nickelin samples.

Resistance Alterations Due to Other Influences.—Of the other influences that can bring about variations in the resistance of metallic alloys, oxidation has first to be considered. The results show that shellac is effective in preventing oxidation, even with the alloys most liable to be attacked. The thermo-electric force of the above specimens against copper brings about apparent changes of resistance. These changes are most observable with low resistances used with large currents; but by suitably designing the resistances and apparatus they can be nullified.

Of much more importance are the changes of specific resistance with temperature. There is no means for compensating these changes, they can only be held within limits by careful jacketing in oil baths, meanwhile observing the temperature of the oil. They constitute the principal cause of uncertainty in standard resistance coils, and they form the starting point of the investigations of the Reichsanstalt.

Klemencic studied the properties of platinum-iridium and several other alloys used as standards of electrical resistance. He investigated platinum-iridium, platinum-silver, german-silver and nickelin, but without giving analyses of the samples. The Reichsanstalt have since examined some of the nickelin alloys used by him, and they find their composition to be:

	Copper.	Nickel.	Manganese.
1. Bare wire.....	75.4	24.6	Trace.
2. Covered wire....	75.5	24.5	Trace.

thus corresponding with the patent nickel in Table I.

The different materials were tested with regard to their specific resistance, their temperature coefficients, and their thermo-electric force against copper, also the change of their resistance with time, the influences of mechanical deformation and of moderate temperatures. As a result of the whole investigation, it is found that german-silver is of all the alloys the least suitable material for standards of resistance, since it is the one most influenced by mechanical deformations. In this regard the Reichsanstalt conclusions agree with those of Klemencic. The temperature changes in Klemencic's experiments, though comparatively small, were quite great enough to produce noticeable acceleration of the resistance variations. He himself says: "It would perhaps be possible to bring newly-constructed resistance coils to a final steady value by submitting them for a considerable time to a fairly high temperature." But he did not pursue this idea very far. In his investigations, platinum-silver, such as was recommended thirty years before by Matthiessen, proved the best; in the Reichsanstalt experiments, however, this material seemed to lack homogeneity. With regard to the use of "nickelin" (patent nickel) of standard resistances, Klemencic says: "It has many good properties, but its high thermo-electric power against copper, and the small degree to which it can withstand chemical actions, must be regarded as unfavorable." This alloy is very generally used in the construction of coils for ordinary resistance boxes.

II.—NEW ALLOYS.

It was thought that some further diminution in temperature coefficients could be obtained, for it was found that with some specimens of patent nickel examined at the Reichsanstalt this constant had fallen to 0.00017. It appeared that this diminution resulted from increase of nickel in the constitution

* From the *Electrical Review*, London.

of the alloy. A number of experiments were therefore made with copper and nickel, or similar metals, in order to investigate the effect of the quantity of nickel upon the temperature coefficients. Alloys of copper and manganese, such as were being made by Dillenburg at the Isabell foundry for parts of machinery, were examined. The Reichsanstalt were encouraged to pursue this investigation by the success of the patent alloys of Weston, of Newark, N. J. (American patents Nos. 381,304 and 381,305), which

and 3. Abscissæ in Fig. 2 represent different alloys of nickel; the ordinates marked ρ represent the specific resistance in microhms per co.; those marked α represent the temperature coefficients, giving the significant figures after four decimal places. The ordinates drawn to meet the curves represent the observed values. Fig. 3 sets forth the same data for manganese alloys. Fig. 4 shows the variation of resistance with temperature for various alloys of manganese and copper. These alloys can only be ex-

manganese produces an alloy which at 0° C. has a small positive temperature coefficient; this vanishes at from 40° C. to 50° C., and beyond that temperature assumes increasing negative values. In Fig. 4 the ordinates of the seven curves show these various results, each represents the change in resistance experienced by a wire of 1 ohm when its temperature is varied from 0° C. to 100° C.

With nickel-copper the diminution of temperature coefficients as the nickel is added is slower than the

FIG. 1.

Variation of the resistance of alloys of manganese and copper with temperature.

FIG. 4.

were described as having negative temperature coefficients. Twelve nickel-copper alloys, with different quantities of nickel, were therefore specially manufactured for them by Basse and Selve, in Altena, Westphalia. The specific resistances and temperature coefficients were determined from wires of 0.5 mm. diameter and about 2 mm. long, soldered to copper contact pieces, and after their diameter and length had been measured, wound double upon a strip of mica, as represented in Fig. 1. Afterwards these wires were kept in a thermostat at 120° C. in a dry heat for 24 hours. The wire was then put into an oil bath, and its resistance was measured at different temperatures. The results corresponding to both groups of alloys are given in curves in Figs. 2

and 3. Abscissæ in Fig. 2 represent different alloys of nickel; the ordinates marked ρ represent the specific resistance in microhms per co.; those marked α represent the temperature coefficients, giving the significant figures after four decimal places. The ordinates drawn to meet the curves represent the observed values. Fig. 3 sets forth the same data for manganese alloys. Fig. 4 shows the variation of resistance with temperature for various alloys of manganese and copper. These alloys can only be ex-

amined up to 30 per cent. of manganese, as alloys beyond that limit cannot be worked. Both with copper-manganese and copper-nickel alloys, the specific resistance increases in proportion to the added manganese or nickel; up to this 30 per cent. value, the resistance of copper-manganese increases about 2.5 times as rapidly as copper-nickel. With the latter alloy, the resistance then diminishes up to 46 per cent. of nickel, and then remains fairly constant up to 62 per cent.; after that, it falls steadily until the metal is all nickel.

With manganese-copper, the temperature coefficient diminishes at first very rapidly, then gradually slower, until at 7 per cent. of manganese it becomes nil. Beyond that point, increasing the quantity of

Temperature coefficient α , specific resistance ρ and thermo-electric force (against copper) \mathcal{E} the constitution of the alloy of nickel and copper.

FIG. 2.

Variation of manganese with temperature.

FIG. 5.

change noticed when manganese is added to manganese-copper; it is slower in the same proportion as the increase of specific resistance is less. Close to the zero-line there is a bend to the curve of alteration of temperature coefficients, the second part of the curve is not horizontal, but has a slight upward inclination, and then falls somewhat rapidly towards the zero line at 46 per cent. of nickel. This alloy gives the least temperature coefficient. At this same 46 per cent. value the specific resistance also attains its maximum.

The alloy represented by F (Fig. 2) has approximately the chemical formula NiCu. In these alloys it may be supposed that the combination of one molecule of nickel with one of copper is mixed with

different quantities of copper and nickel, and that these possess high specific resistances and negative temperature coefficients. The practical result of this investigation is to show that it is possible to obtain two kinds of alloys with vanishing temperature coefficients. With manganese-copper only 7 per cent. of manganese is required to produce an alloy of infinitesimal temperature coefficient. In practice, 12 parts by weight of manganese, 2 of nickel and 86 of copper are adopted. Nickel has the effect of raising the thermo-electric force against copper, besides delaying the bend of the curve of resistance variation with temperature by about 20° C. (see Fig. 4). This alloy has received the name of manganin. It is specially made at the Isabell foundry for standard resistance coils. Fig. 5 shows the change in resistance of a 1-ohm coil of manganin at various temperatures; the observation-points on the curve are numbered for purposes of reference.

Temperature coefficient α , specific resistance ρ the constitution of the alloy of manganese and copper.

The numbers in brackets are interpolated from the specific resistances of the specimens as observed.

Fig. 3.

From the curve given in Fig. 3 it appears that there are only two alloys of nickel and copper for which the temperature coefficient vanishes. The relative merits of these two alloys remain to be studied. Messrs. Baase & Selve, of Altena, who have made all the sample alloys for the Reichsanstalt throughout this investigation, make an alloy with 40 per cent. of nickel, corresponding to the first coincidence of the curve with the abscissa axis, and they have given this alloy the trade name of "constantan."

Important as is the production of an alloy possessed of a vanishing temperature coefficient, such an alloy cannot be adopted for standard coils until the permanence of the specific resistance has been firmly established. Experiment seems to have proved that manganin and constantan are, in this regard, as

suitable as patent nickel. In considering other properties, the thermo-electric power against copper comes first under notice. The table given below, Fig. 3, shows that manganese-copper has only small negative values for this power; this can be got rid of altogether by adding a trace of nickel to the alloy. On the other hand, nickel-copper, and especially constantan, have high thermo-electric power against copper; these are given in microvolts in Fig. 2 for different proportions of nickel.

The recorded values were determined by soldering the ends of the specimen wires to copper wires that were connected to a galvanometer. All the wires were contained in an oil bath kept at constant temperature by a heating spiral and a stirring wheel. The thermo-electric power disturbed the resistance measurements, especially when low resistances and strong currents were employed. It is true that these defects can generally be eliminated by care in the construction of the apparatus, but for resistance measurements of great precision it is almost essential to have a material such as manganin, for which the thermo-electric power against copper is nil.

Manganin is rather easily oxidized; this, no doubt, is due to the affinity between the manganese and the oxygen of the air. At 100° C. the wire soon tarnishes, and during annealing the surface manganese is perceptibly oxidized out of the alloy, leaving a surface of copper beneath the oxide. As might be expected, the electrical qualities suffer in consequence. The surface of copper can be removed by "dipping" in nitric acid, after which the good qualities of the manganin are restored.

Surrounding the manganin with powdered charcoal during heating does not sufficiently preserve it against oxidation. Moreover, dipping in acid is impracticable with the finer wires. At first this question of rapid oxidation at annealing temperatures presented a great difficulty to manufacturers of manganin wire, but the wire drawers have now learnt how to draw manganin cold, even to very fine gauges, so that the trouble is very much lessened. By varnishing the finished coils with shellac, it is found that the wire is rendered proof against oxidation, at any rate up to 150° C.

Constantan, on the other hand, resists oxidation. It can be heated with impunity up to 300° C. On account of its strength and flexibility it can be drawn into fine wires or rolled into strips. For many electrical purposes—for instance, where considerable heating is to be expected—the qualities of constantan are of great value; but for standards of resistance manganin takes preference, chiefly because of its small thermo-electric power against copper. In joining manganin wires to the copper connecting pieces for standard resistances, tinman's solder was previously used, applied with a soldering iron. But this method is found to be detrimental; it produces in the course of time very perceptible changes in the resistance. The soft solder causes fissures, and generally alters the structure and properties of the manganin. The present method employed is to solder the wires with silver solder to copper lugs that are screwed under the contact pieces, so that they can be removed if necessary. All coils, after varnishing several times with shellac, are dried for some hours at 140° C. In winding, the insulated wire is not touched by the hand, but is passed through a clean dry cloth. The bobbins are made of as large diameter as possible, and other precautions are taken to avoid bending of the wire. It is often found better to use several thinner wires in parallel than a single thick one.

Elisha Moore, of Meductic, York County, New Brunswick, has invented an alternating switch for street railways which can be operated from the car by simply pressing a button. The device obviates the necessity of stopping the car and does away with switchmen, which means a great saving to railway companies. Mr. Moore has patented his device both in Canada and the United States and will now apply for European patents.

THE DISTRIBUTION OF ELECTRICAL ENERGY IN PARIS.

BY J. LAFFARGUE.

(Continued from page 311.)

La Compagnie d'Air Comprimé et d'Electricité.—At the outset this Parisian company had at their disposal two works—one established at the Boulevard Richard Lenoir and the other at Rue Saint-Fargeau. These two stations were supplied with a certain number of 500 volt dynamos connected in series, giving 1,500 volts, and two series were coupled for the supply at 3,000 volts of a network comprising 20 sub-stations with accumulators distributed within Paris. Each sub-station then constituted a special center for secondary distribution. Only three of these sub-stations are now in existence, and these are still supplied from the works at the Boulevard Richard Lenoir (1,000 kW.) and from those at Saint-Fargeau (1,300 kW.). But these sub-stations are shortly to disappear, and to be replaced by the system of distribution now to be described. It should be mentioned that the high-tension circuit is still connected to a sub-station at present utilized—the St.-Roch sub-station, where it supplies 12 rotary transformers of 80 kW. and four of 40 kW. at 120 volts. There are also two reserve stations, with motors working by compressed air, at the Bourse du Commerce and at the Rue des Jéneurs.

The distribution is at the present time effected in Paris by means of a network of five wires connected at various points to sub-feeders proceeding from the two sub-stations at the Rue St. Roch and at the Rue Mauconseil. These two sub-stations are themselves supplied each by means of three feeders of 1,000 square millimeters section from the large central station at the Quai Jemmapes. This station is established on the banks of the Saint-Martin Canal. In front are the offices, and to the left, passing from the ground floor to the second story, are to be found a repairing shop, a testing room and the accumulator room. The works, properly speaking, consist of an extensive longitudinal wing, which will be of the maximum length of 240 feet when all the machines are installed. The width is 45 feet. On the ground floor is the engine-room, which is 38 feet in height. At present it contains five Corliss steam-engines of the vertical compound type, of 1,200 HP., constructed by the Société Alsacienne de Constructions Mécaniques at Belfort. These machines, furnished at one side with an enormous flywheel of 31 tons, and with a small auxiliary steam-engine for starting, actuate directly, by means of a star wheel of 39 arms, a dynamo, with external collector and 12 internal fixed poles, giving 750 kW. at 500 volts, with 70 revolutions per minute. Two other similar machines are shortly to be installed. The guaranteed consumption of steam is 15 lbs. per brake horse-power hour.

The switchboard is fixed at the end of the room, upon a platform at the height of the first floor. Each machine is provided with a panel, to which are attached the measuring and regulating apparatus. All the instructions are given by means of optical signals, made with incandescent lamps of different colors placed near the machines, and which are lighted or extinguished by the electrician-in-chief according to the switchboard requirements. All the dynamos are connected in parallel, and the switchboard is connected by means of two bus bars with the board to which the feeder terminals are attached. On this board are arranged switches, which allow of the current being transmitted to the feeders either directly or through an adjustable resistance, according to the requirements of the service. On the first floor, above the machine room, are at the present time installed 20 multitubular Belleville boilers, having a fire-grate surface of 100 square feet, giving, at a pressure of 170 lbs. per square inch, about 6,800 lbs. of steam per hour. The 20 boilers are dis-

tributed in five sets of four each, each set having its own chimney flue and water tank. The coal is located in the false roofs above the boiler room, and is supplied in front of each boiler through hoppers arranged for this purpose.

Parallel with the first building just described is a second building of less importance, having in the basement a gallery from which proceed the cables, and on the ground floor stores and a shop for mechanical repairs. When the works are completed, this last building will be located in the middle; and, on the other side, there will be a building similar to the first-mentioned, and, like it, comprising an engine room, with ten engines of 1,200 HP., and a boiler room.

The distribution is wholly carried out by means of lead-covered armored cables, manufactured by the Société Alsacienne de Constructions Mécaniques of Belfort; they are laid directly in the earth, with a metallic trellis above them to give warning of their proximity. Three feeders, 1,000 square millimeters in section, proceed to the Saint-Roch sub-station, and three others, of the same sectional area, to the sub-station in the Rue Mauconseil.

The Saint-Roch sub-station contains two batteries of 280 Tudor accumulators, yielding 2,000 ampere-hours with a current of 600 amperes; and one battery of 280 cells, by the Société des Métaux, yielding 880 ampere-hours with a current of 300 amperes. These accumulators are charged from 12 Thury rotary transformers of 80 kW., and from four of 40 kW. The primary conductors of these transformers are supplied from the high-tension circuit of the Richard Lenoir and Saint-Fargeau works. The secondary circuits are coupled in parallel with the feeders at 500 volts from Jemmapes for the supply of the sub-feeders belonging to the five-wire distribution. The sub-station at the Rue Mauconseil contains four batteries of 280 accumulators from the Société pour le Travail de Métaux, having a capacity of 2,200 ampere-hours with the maximum current of 300 amperes. The starting point of the two stations is at the sub-feeders, with five wires supplying a network of distribution.

The total power at present at the disposal of the Cie. Parisienne de l'Air Comprimé is 3,600 kW. at the Quai Jemmapes works, and 2,325 at the Richard Lenoir and Saint-Fargeau works. At the end of the year 1896 the company had 1,504 subscribers, utilizing 1,713 arc lamps and 64,353 incandescent lamps. The motors for various applications were 90, having a total power of 350 kW.; there were in addition 44 electric lifts, absorbing a total power of 130 kW. As we have just seen, this company has completely transformed its system of distribution, and has definitely adopted that with five wires. The two old works are still in existence as well as a few sub-stations, but these are shortly to disappear. In any case, the new central station at the Quai Jemmapes constitutes a really magnificent work which is very well conducted.

The Municipal Works at the Halles Centrales.—The municipal works for the Central Markets were installed in 1889 in the basements belonging to the latter for the purpose of providing electric lighting for the Halles, and also to carry out some tentative distribution outside. The works contain in the boiler room six Belleville boilers giving 3,300 lbs. of steam per hour at the pressure of 210 lbs. per square inch. In the machine room there are three vertical Weyher and Richemond triple-expansion engines of 150 HP. at 160 revolutions per minute. These actuate by belting six Edison bipolar dynamos, yielding 40 kW. at 120 volts at the speed of 600 revolutions per minute. The cables from the machines are first connected to a special switchboard for coupling, and then to a switchboard for the feeders. Two of these supply the lighting to the Halles Centrales, consisting of 245 arc lamps of five and ten amperes and 743 incandescent lamps. The other feeders supply the distributing network established in some of the

neighboring streets to meet the requirements of a few subscribers and those of public lighting, notably that of the square of the Tour St.-Jacques and that of the Boulevard Sebastopol, which has recently been lighted from the Rue de Rivoli to the Rue Etienne-Marcel. The distribution is effected by means of insulated cables carried by lateral insulators within concrete subways, and also by means of lead-covered and armored cables laid directly in the ground. A trial of distribution by alternating currents has also been made. The installation comprises within the works three horizontal Leconteux and Garnier engines, of 170 HP., of the Corliss type, with tandem condenser. The speed is 180 revolutions per minute. Each of these machines actuates by means of belting a Ferranti alternator of 110 kW. at 2,400 volts, working at 530 revolutions per minute. A special countershaft has been installed which allows two steam-engines each to actuate during the day two Desroziers dynamos of 42 kW. at 170 volts for the purpose of charging two batteries of 72 accumulators of the Société des Métaux having the capacity of 2,000 ampere-hours.

(To be continued.)

ELECTRIC CABLES WITH DRY-AIR CIRCULATION.*

BY A. BARBARAT.

The telephone network in Paris is entirely underground, and up to 1893 it was made up entirely of gutta-percha covered seven-pair cable. The price of these cables and the cost of laying them was very high. The external diameter of the cables was from 0.82 to 0.87 in. When the transformation of the Paris telephone system was begun in 1893, with the object of diminishing the number of exchanges and erecting multiple boards, it was recognized that this type of cable would take up too much room and would be too heavy, and fifty-pair cables, first with cotton insulation and subsequently with paper insulation, were tried, the cables being entirely filled with paraffin. Each of these cables replaced seven of the seven-pair cables, and effected an economy of 40 per cent. in the cost of the lines to distribution centers, when the cost of laying the cables was taken into account in both instances. Up to the middle of 1894, 115 miles of this type of cable was laid, and then the adoption of cables with dry-air circulation became general. As mentioned above, the first cables, which were made by the Western Electric Company of America, were entirely filled with paraffin. Later patterns were only paraffined at the ends of each section for a distance of about 23 ft. This sealing of the ends of the sections was to prevent a disturbance, caused by a perforation in the cable, from extending to more than one section. The jointing, and more especially the repair, of these cables when laid in the sewers presented serious difficulties, and as a remedy I propose that cables should be manufactured in such a manner as to allow of the passage of dry air through them from one end to the other. On comparing the cost of such cables with that of the paraffined cables they replaced, and again taking account of the cost of laying and jointing, it is found that an economy of 68 per cent. was effected; that is to say, the cost was only about one-fifth that involved in the use of the gutta-percha-covered cable. As a result of this saving in cost, and of other considerations still more important in my opinion, all patterns of cables used by the French Administration of Posts and Telegraphs, whether for telephony or telegraphy, have been replaced by the type with dry-air circulation.

I will now describe the system of telephone cables employed at present in Paris. All new cables are ordered with paper insulation and dry-air circulation. No special process is specified to the contractor,

* Abstract of a paper read before the Société Internationale des Electriciens, March 2, 1895. From *The Electrician*, London.

who is free to use a longitudinal or a spiral paper covering. A certain tenacity is specified for the paper, but this is also to the interest of the contractor, as it would be impossible to manufacture the cable if the paper ribbon were too brittle. The thickness of the lead varies from 0.098 to 0.148 for the different types of cable containing 1, 7, 23, 56, 112 and 224 pairs. A maximum diameter is specified in each case, and a maximum capacity of 0.07 microfarad per kilometer (0.1126 microfarad per mile). The contractor is free to use a diameter smaller than the maximum specified, if he fulfils the other conditions, and this is of course to his interest, as the price of the cable can be diminished in that way, and it is a question of public tenders. The large cables of 56, 112 and 224 pairs are laid in sheet iron conduit, the others are fastened on hooks. Some of the large conduits near the central exchange in the Rue Gutenberg have as many as ten cables above one another. The cable heads are of wood. As it is impossible to make these wooden boxes sufficiently air-tight to withstand the pressure of air used, the end is sealed with paraffin, and the air is sent through a pipe tapped into the cable behind the seal. The joints are made without special precautions; the conductors are simply twisted together and covered with a paper tube, and the whole joint is covered with a lead sleeve soldered to the lead sheathing of the cables on either side. The cables end in distribution chambers, from whence they are distributed in seven-pair cables, and finally in single-pair cables to the subscribers. In these chambers cast-iron cable-heads are used, with double bottoms, but occasionally this distribution is made in the sewer itself by means of a special lead sleeve. Distribution from seven-pair to single-pair cables is usually made through a piece with seven tubes, but in rarer cases, where a single subscriber is far from such a distributing point, his single-pair wire has been tapped directly from the seven-pair cable.

The chief advantage of this dry-air system lies in the facility of making repairs. If the cable is damaged and the quantity of water which has penetrated into it is not great (this is shown by the insulation test), it is sufficient to force dry air through the cable. To hasten the drying action of the air the cable is heated where the fault is; the place is localized by an electrical test, and is easy to find by hearing the escape of the air. After some hours the insulation resistance will be high enough, the fault is soldered up and the repair is complete. If the cable has been completely soaked the same method is used, but it takes longer to dry the cable and it is necessary to shift the subscribers; but this happens less frequently. In Paris air from the mains of the Parisian Compressed Air Company is used; in large provincial towns Westinghouse pumps are usually employed. The air is dried by passing it through six large cylinders, 1 ft. diameter and 4 ft. high, containing calcium chloride. Cables more particularly liable to be covered with water in the sewers are kept continuously at a pressure of three atmospheres, and a meter shows as soon as there is a puncture. This is especially important when no spare cables are available.

Cables with dry-air circulation have even been used to replace long-distance underground lines. Thus a section 40 miles long has been laid from Marseilles to Toulon. This cable has six pairs of 2 mm. conductors. Faults have been dried out of this cable by means of a hand-pump and a portable dryer, but it is suggested to use the petroleum motors of motor-cars for the purpose of working the pump.

In articles published in the *Annales Télégraphiques* in May-June, 1894, I expressed the opinion that all gutta-percha covered telegraphic and telephonic cables should be replaced by dry air cables. I also added that these cables would be found useful for the transmission of electrical energy. At present, taking account of the results obtained, I am convinced that an experiment in this direction ought to

be made, and that the electrical industry would find important advantages from the point of view of economy and facility of repair. It would be very easy to maintain these cables under pressure, as explained above, and one would then be protected from interruptions due to the accidental perforation of the lead covering.

ON THE CATHODE-RAY SPECTRUM.*

BY M. BIRKELAND.

On September 28, 1896,† I had the honor to present to the Académie des Sciences a note on some experimental results obtained on deflecting suitably a very narrow beam of cathode rays by magnetic forces, in such a manner as to cause the deflected rays to be made manifest by phosphorescence on a glass surface beyond other luminosities which might trouble the phenomenon. By this means one recognizes a certain dispersion of the deviated rays, showing that they form themselves into different groups.

Recently Prof. J. J. Thomson‡ found that the appearance of this spectrum is always the same for discharges across different gases, provided that the mean differences of potential between the anode and cathode are also the same. He found besides that the same spectrum can be produced by deflecting the cathode rays by electrostatic instead of by electromagnetic forces. These results are easily understood by the following researches which I have just made, after having perceived that the appearance of the spectrum varies—sometimes even considerably—with different cathodes introduced successively into the same tube. It appears that it is less the different material forming the cathode than the details of its mechanical construction that is the cause of this. By taking certain precautions, however, one succeeds in obtaining regular and corresponding results for different tubes. I will describe some obtained with an ordinary aluminum cathode, in which the metallic contact between the different parts, and the contact with the conducting wire connecting the cathode to the negative pole of the large coil used, were as perfect as possible. In addition, precautions were taken before the experiments to carefully remove occluded gas from the tube and the electrodes, after which a sufficiently small quantity of pure hydrogen was introduced into the tube to prevent the potential difference between the anode and cathode at the moment of discharge from falling below 10,000 volts. During the discharges the cathode rays must emanate regularly from the middle of the cathode.

Taking account of the above remarks, I found, in a special spectrum, four yellow bands separated by dark bands. In each luminous band I often distinguished lines of more intense luminosity, and sometimes these lines appeared fairly numerous. To study these phenomena closely I introduced an adjustable water resistance in series with the cathode and connected to it by a short fine copper wire. By this means a single yellow band is obtained, which remains steady from one discharge to the next, and can easily be given a width of several centimeters by giving a suitable value to the resistance. The width of the band increases, moreover, with the primary current of the coil used, and, in addition, with a variable water resistance it has a very marked maximum. At the first glance this band appears to have a uniform luminosity, but on examining it attentively traces of an enormous number of lines are observed.

If, however, the copper wire connecting the water resistance with the cathode is joined to an insulated metallic ball (I employed spheres of 10 cm. and 30 cm. in diameter), the yellow band contracts and resolves itself into fine lines, changing their position now from one discharge to the next. It is easy to see, without counting, that these lines are much

more numerous when the 10 cm. sphere is used than with the 30 cm. sphere, other things being equal. The number of lines could be diminished at will by adding capacity. I used three Leyden jars, whose volume was 120, 750 and 1,200 cubic cm. respectively. With the first I estimated that there were about 30 lines, with the second I counted five, and with the third I rarely saw more than one. It must be observed, however, that with these capacities the number of lines increases with the primary current and diminishes when the water resistance is increased.

There is a means of separating the lines of these spectra from one another to any desired distance. If by trial one succeeds in closing the circuit of the deflecting magnets at the moment a discharge is taking place the spectrum widens considerably, and I have often succeeded, with the smallest Leyden jar, in producing on the glass a phosphorescent image of perfect beauty and almost identical with the images of intermittent discharges reproduced in a celebrated memoir of Feddersen's.* The rapid variation of the magnetic system plays the same part here as Feddersen's turning mirror in his experiments. By means of an automatic arrangement I made the magnetic field vary synchronously with the discharges, and in this manner I observed that the distance between the lines of the spectrum increases with the capacity and water resistance connected to the cathode. If, on the other hand, the capacity and water resistance are connected on the anode side we do not obtain the phenomena described above, but other results less marked and of a nature to confirm the theory. If the cathode plate is badly fixed to the leading-in wire the results are quite different. The spectrum in that case consists of large bands, which are hardly affected by the capacity and water resistance connected to the circuit. If the cathode rays emanate from different points, irregularly distributed on a cathode plate, the results are no longer well defined.

The phenomena which I have just described throw considerable light on M. Jaumann's discovery of interference surfaces of cathode rays. It appears to me also that this indicated differentiation of the discharge emanating from the cathode promises to throw more light on the question of stratification of the positive column. From a well-known experiment of J. J. Thomson's it is certain that the strata appear at first near the anode, and later on in the neighborhood of the cathode. But does it follow that the elementary discharges which are indicated by these strata are emitted by the anode? The strata do not exist in the neighborhood of the cathode; yet it is admitted that the elementary discharges are also propagated across this space. Now we know that the distance between the strata and the cathode depends greatly on the distribution of the electric force in the tube, and this distribution is quite different at the moment a discharge commences than it is later. On the other hand, M. Goldstein showed 16 years ago that properties of the simple and well-defined strata depend entirely on the nature of the cathode, and not at all on the conditions of the anode. I have just shown that the distance between the simple strata does not vary if one connects capacities to the electrodes; even small capacities connected as intimately as possible to the cathode and anode have no influence in this direction. The number of intermittent shocks creating the strata in unit of time is probably regulated, therefore, by the gas alone, or by the properties of the Grotthus chairs formed in it.

From what I have just described, I think that it would be most natural to suppose that the cathode emits: (1) Intermittent discharges whose properties are principally regulated by conditions exterior to the discharge tube, viz., the difference of potential between the anode and cathode, the capacities and the state of conductivity in the neighborhood of the cathode—these discharges create the cathode rays; (2) discharges whose properties are, above all, regulated

lated by the conditions of the gas in the tube—these discharges cause the strata.

NATIONAL ELECTRIC LIGHT ASSOCIATION.

Rates of Fare—Train Schedule, Etc.

NEW YORK, May 26, 1898.

Editor ELECTRICITY.

SIR: As already announced, the various passenger associations have granted a rate of a fare and one-third, on the certificate plan, for delegates and their friends attending the Chicago Convention of the National Electric Light Association, to be held June 7, 8, 9. Arrangements have been made to have the New York delegation leave Grand Central Station Sunday, June 5, via New York Central & Hudson River & Michigan Central Railroad, on New York, Boston and Chicago special train, leaving at 1 P. M.; Poughkeepsie, 2:43; Albany, 4:30; Schenectady, 5:05; Utica, 7:03; Syracuse, 8:35; Rochester, 10:47; Buffalo, 11:50 P. M., Central time; Detroit, 8 A. M., arriving in Chicago 3 P. M. Monday. The train leaving Boston at 10:30 A. M. Sunday, June 5, will connect with this train at Albany. This being a limited train, an excess fare of \$1 is charged, therefore the railroad fare is \$21 and the berth rate \$5, making a total of \$26.

In purchasing tickets, delegates should be particular to obtain a certificate from the agent from whom the purchase is made, as in the absence of such certificate no rebate can be allowed on the return fare. In case the number of delegates attending should warrant, a special train will be run as a second section to the train named. Tickets can be procured at any ticket office of the New York Central Railroad, and space reserved by applying to either the undersigned or to M. C. Roach, General Eastern Passenger Agent New York Central & Hudson River Railroad, 413 Broadway, New York. Yours very truly,

C. O. BAKER, JR.,

Master of Transportation, 136 Liberty St.

Reception Committee of the N. E. L. Association.

Mr. C. H. Wilmerding, chairman of the Reception Committee, Chicago, has sent out the following notice:

"The local members of the National Electric Light Association have organized a Reception Committee to provide for the entertainment of the visiting members of the Association, and this committee will advise later of the programme that is being arranged, but in the meantime it desires to offer its services, in the matter of securing hotel accommodations, to members who are going to attend the Convention. If we can be of any assistance to you in this matter kindly communicate with Mr. Jno. Jay Abbott, Secretary of the Reception Committee, No. 139 Adams street, Chicago, giving him full information as to what you want."

Electrical Appliances in South Africa.

It is said that the overhead trolley system is to be installed in the street railway system at Durban in Natal.

An electric lighting and street railway plant is being installed at East London, Cape Colony, at a cost of \$127,000.

Queenstown and Woodstock, both in Cape Colony, are considering the introduction of electric lighting plants.

There are excellent openings throughout South Africa for the sale of electric drills, electric cranes and electric elevators for mines and mills.

Through telegraphic communication has been established between Capetown and Blantyre, in British Central Africa.

The Bell Telephone Company have commenced work on their new exchange in the city of Quebec. The structure will be built of granite and will cost upwards of \$20,000. The switchboard will accommodate 3,000 subscribers.

THE NEW YORK ELECTRICAL SOCIETY.

Election of Officers—Annual Dinner.

The annual meeting of the New York Electrical Society was held at Madison Square Garden on Thursday, May 26. The following officers were elected:

President—Gano S. Dunn.

Vice-Presidents—Willard S. Case, H. B. Coho, Dr. C. A. Doremus, F. A. Pattison, E. E. Higgins, Charles Blizard.

Secretary—Geo. H. Guy.

Treasurer—H. A. Sinclair.

The Treasurer's report shows the Society to be in a prosperous condition. According to the Secretary's report, the membership last year was 397; this year there have been 215 members elected, 4 resignations and 1 death. There are now 607 members in the Society.

LIST OF MEMBERS ELECTED MAY 26.

B. B. Hoffman, Douglass Burnett, Leo R. Manheims, W. S. Atkinson, W. J. Schweiger, John O'Connor, Chas. H. Kienle, Wm. W. Rosenbaum, M. J. Adler, George J. Schoeffel, W. S. Alexander, E. Bradford Bumsted, Julius W. Eichler, Arthur H. Brown, Walter A. Houghaling, Sterns Francis Jones, I. W. Smith, James H. Campbell, Farley G. Clark, Chas. F. Bauer, James B. Faulks, Jr., Jos. Bijar, H. L. Shippey, H. H. Harrison, C. B. Taylor, George Clapperton, all of New York City.

G. A. Robertson, J. E. Sleight, Jr., Otto Kartzmark, all of Brooklyn.

Samuel Van Ronts, Syracuse, N. Y.

John W. Schroeder, O. A. Sandborgh, East Orange, N. J.

Albert Flammer, Fred Joorg, Jersey City, N. J.

Charles Moyer, Union Hill, N. J.

Adrian Chamberlain, New Brunswick, N. J.

F. W. Roebling, Trenton, N. J.

ANNUAL DINNER.

The annual dinner of the Society was held at the Hotel St. Denis on Friday evening, May 27; there were 100 guests, and the affair was a pronounced success. The following are the toasts and speakers:

"The Electrical Society," Gano S. Dunn.

"The American Institute of Electrical Engineers," Prof. Crocker.

"Sister Societies," Dr. W. McMurtrie.

"The Electricity of the Past," Dr. C. A. Doremus.

"Electrical Applications," F. W. Jones.

"The Newspaper Man," S. L. Coles.

"The Electrical Manufacturer," H. Ward Leonard.

"What We Think of Electrical Engineering,"

C. L. Eidlitz, C. O. Mailloux, M. I. Pupin.

"The Technical Colleges," Joseph Wetzler.

CANADIAN NOTES.

The Canadian Motor Syndicate is looking for a site for a factory, the purpose being to manufacture electric motor vehicles.

The Cataract Power Company of Hamilton, Ont., are engaged on an immense undertaking in the County of Welland, Ont., for the purpose of creating electricity on a large scale with a view of supplying power to any and every business industry that may require it in their line of route of upwards of 40 miles. At the De Cew Falls a very large reservoir is in course of construction, the water for which will be supplied from the Welland Canal at Allanburg, which is itself fed from Lake Erie, and which stands at a considerable elevation above the site of the new reservoir. Seven or eight other storage reservoirs are being made between De Cew Falls and Allanburg so as to have an abundant supply of water always on hand. At the De Cew Falls an immense power house has been erected and the water will be carried from the reservoir through pipes 8 feet in diameter, the fall from the reservoir to the power house in the valley below being about 100 feet.

LEGAL NOTES.

Suit for the dissolution of the Ohio Storage Battery Company and the appointment of a receiver for it has been commenced in the Common Pleas Court at Cleveland, O., by W. H. Marshall. He sets up that he is one of the stockholders of the company, owning more than one-fifth of its \$60,000 worth of paid-up stock. For the past three years, he alleges, the company has not been able to pay dividends, and for that reason he wants its career ended.

The U. S. Supreme Court on the 23d ult. rendered a decision in the franchise controversy adverse to the Detroit Citizens' Street Railway Company. The latter is the successor to the Detroit City Railway, which by an ordinance passed by the Detroit council in 1862 was exclusively authorized to construct and operate street railways in Detroit. By an ordinance of 1879 this right was extended thirty years. In 1894 an ordinance was passed granting to the Detroit Railway Company the right to construct railways upon some of the streets occupied by the Citizens' Company. The latter brought suit against the Detroit Company and the city of Detroit to prevent them from carrying out the terms of the ordinance of 1894, asserting that it violated a contract made with the Citizens' Company. The State courts held that the council had no power to grant exclusive right to the Citizens' Company, and their judgment was affirmed by the Supreme Court.

Judgment for \$28,356 has been entered against the Buffalo, Kenmore & Tonawanda Electric Railway Company in favor of John B. Dumont of Buffalo, N. Y., for the amount due on nineteen notes of the company, and also for money advanced to the company by the Erie Construction Company. The latter claim has been assigned to Mr. Dumont.

Judge Amidon of the U. S. District Court, in a telephone suit at Minneapolis, made the novel ruling that every street and avenue in the city on which United States mail is distributed is a post road and could therefore be used for stringing wires and poles for telegraph or telephone service. The judge intimated, however, that wires can be ordered underground if public interest demands it.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE NEWS.

What is Going On in the Electrical World.

STREET RAILROADS.

Albany, N. Y.—The Albany "Times-Union" suggests that the Albany, Helderberg & Schoharie Railroad Company will have a powerful rival in the system of electric roads which have been authorized and already begun work preliminary to construction to open up Greene and Schoharie counties and the southwestern end of Albany county. There are four roads in the system and they extend from Coxsackie to the village of Schoharie, a distance of 77 miles. The four roads are: The Coxsackie & Greenville Traction Company, the Oak Hill Traction Company, the Windham Traction Company and the Middleburg & Oak Hill Traction Company. Their combined capitalization is \$950,000. They were incorporated under the laws of the State in July, 1897, and in the following September were authorized by the State Railroad Commissioners to construct their roads.

Ann Arbor, Mich.—The Ann Arbor & Ypsilanti Electric Railroad Company has been merged into the Detroit, Ypsilanti & Ann Arbor Railroad Company.

Appleton, Wis.—The Fox River Valley Electric Railway Company is experiencing some difficulty in keeping the road through the slough, on which it will run cars to Menasha, in repair. The trouble is caused by muskrats, which abound in the slough. They dig holes in the clay and these are enlarged by the rise and fall of the water in the lake.

Cleveland, O.—The Akron, Bedford & Cleveland Electric Railway Company now owns two miles of the Cuyahoga Valley, starting at Cuyahoga Falls and extending in a southwesterly direction. This is one of the

most picturesque spots in Ohio, the river having worn through the cliffs until it now runs through a gorge 150 feet deep in places. The property includes the falls in the Cuyahoga River and the famed "Old Maid's Kitchen," a large cave. J. C. Mengensdorf, general passenger agent, told a "Leader" reporter a few days ago that the Akron, Bedford & Cleveland Electric Railway would soon have new equipment, giving more speed to the cars and cutting down the schedule time between Cleveland and Akron from two hours and ten minutes to one hour and fifty minutes. Each car will be equipped with four fifty horse-power motors, giving an aggregate power of 200 horse power to each car.

Frederick, Md.—F. S. Douglas of Millersville, Pa., has signed a contract with the Myersville & Catonsville Electric Railway Company for the construction of that company's road. The road will be five and a half miles long, and will run from Myersville to Middletown, connecting at the latter place with the electric road to Frederick, already in operation.

Georgetown, Ky.—The Georgetown Street Railway was recently purchased at the sale ordered by the Circuit Court by J. D. Grover for \$28,000.

Jackson, Miss.—A correspondent states that "the war clause in the franchise of the electric railway for Jackson postpones, but does not defeat, the road. When Sampson and Schley catch the Spanish fleet and sink it, the war will soon end, and then Jackson will have this much-needed convenience."

Jersey City, N. J.—The Street & Water Board on the 25th ult. adopted an ordinance permitting the North Hudson County Railway Company to substitute electricity for horses as the motive power on its Grovestreet line from Jersey City to Hoboken.

Marion, Ind.—The Union Traction Company and the Marion Street Railway Company have absorbed the interests of the Indiana Traction Company, and Mr. Clodfelter will retire from the railroad business.

Minneapolis, Minn.—The Twin City Rapid Transit Company, as soon as the new interurban line is completed, will commence giving regular street car excursions about Minneapolis and St. Paul, in which the principal points of interest in both cities will be visited. The excursions will be daily affairs during the warm months, from June to October. Special cars elaborately upholstered and with the latest modern conveniences, will be put on for that purpose and each of them will be provided with music of some kind. For a nominal fare Lake Harriet, Minnehaha and Como will be visited and the trip so arranged that in reaching and returning from these points the car would pass over different lines, thus giving a general view of the cities. Excursions will start from both cities.

Mt. Holly, N. J.—After the long struggle for supremacy between the Monmouth Traction Company and the New York & Philadelphia Traction Company, the announcement was made at the special meeting of the board of freeholders here on the 24th ult. that the two companies had about decided to stop fighting, pool their issues and either consolidate or arrange upon an equitable division of the disputed territory. The matter of awarding the franchise will not be considered until the regular meeting of the board, in July next.

New York.—The Metropolitan Street Railroad Company and the Third Avenue Railroad Company have made application to the Railroad Commission for permission to change the motive power on all their cable lines to that of the underground system of electrical propulsion. The Metropolitan has also made application to change the motive power on its horse lines to the underground system of electricity, or to compressed-air propulsion. Hearings will be given by the Commission on these applications on Thursday, June 2, at the Fifth Avenue Hotel, New York.

Peekskill, N. Y.—The Peekskill Traction Company has been granted an electric railway franchise running 25 years. Several changes were made in the franchise as originally presented and the company may decline to accept the amendments.

Red Bank, N. J.—The Chancellor has appointed James E. Degan of Red Bank receiver of the Atlantic Highlands, Red Bank & Long Branch Electric Railway, a trolley road operating between Belford, Red Bank and Long Branch.

Rochester, N. H.—The "Courier" states that it has reliable information to the effect that responsible parties are seriously considering the building of an electric road in Rochester with an extension to East Rochester.

St. Louis.—The court has ordered the case brought in the Supreme Court against the Central Traction Company dismissed on the ground that the proceedings were premature.

Victor, Col.—Representatives of the Canon City & Victor Electric Railway who were in town a few days ago stated that the old organization had been revived by the purchase of the right of way by a new company which has sufficient capital to complete the road and to equip it with the necessary rolling stock and electric appliances. Work is to begin immediately and will be rapidly pushed.

Washington, D. C.—The successful change from the cable system to the underground electric which has just been made on the 7th street line without stopping for an instant the daily running of the cars, is looked upon as something remarkable in the history of street railroad construction. It is probably the first time a work of this kind was ever attempted, and it was not believed by many that it could be done. However, the

contractor, Mr. Saxton, was confident that he could do it, and the result has shown that he was correct.

Westfield, N. J.—The Westfield township committee has passed the ordinance granting the Elizabeth & Westfield Street Railway Company the right to construct a trolley road through the township.

Westerly, R. I.—Work upon the Sea View Railway has been started, and before many weeks have passed, if no obstacle is encountered, people will have the opportunity to ride on trolley cars between Saunderson and Narragansett Pier.

Wilmington, Del.—The managers of the Wilmington City Railway Company have decided to build the trolley line between Chester and Wilmington over the route of the Philadelphia & Wilmington Turnpike Company, and a survey will be made at once.

LIGHTING PLANTS.

Albany, N. Y.—The "Times-Union" says: "The task of drilling the holes in the pedestals preparatory to installing the many electrolights which will illumine the front, sides and western staircase of the Capitol has nearly been completed. Holes have been made in twenty eight pedestals and the work of wiring has been inaugurated. Sixty men have been put to work doing this. Six weeks must see the entire lighting plant in operation, and the cost for the same will be \$24,000 for wiring and drilling and \$58,000 for the handsome electrolights, which will be the finest that artistic skill or money could provide. It has been in this spirit that the completion of the Capitol has been carried out, consequently a visitor beholds the finest work of which artisans are capable. The wiring is being done by the E. G. Bernard Company."

Atlanta, Ga.—Sealed proposals addressed to A. L. Koutz, clerk county commissioners roads and revenues, Fulton County, Atlanta, Ga., will be received until 12 o'clock M. on Saturday, June 25, 1898, for furnishing and erecting complete and ready for use a direct connected electric light plant for the new Fulton County jail, Atlanta, Ga., consisting of one 25 kw. generator, engine, sub-base, foundation, and necessary fixtures. Plans and specifications can be had upon application to Grant Wilkins, engineer, 94 Peachtree street, Atlanta.

Cass City, Mich.—At a special election here on the 23d ult. it was decided to bond the village for \$18,000 for the purpose of putting in an electric lighting plant and water works system.

Clyde, N. Y.—At a recent meeting of the village trustees a franchise was granted to the Clyde Electric Light & Gas Company, which is a renewal of the Clyde Gas Company's and the Clyde Electric Light and Power Company's franchises, the two companies being now consolidated.

Dundee, N. Y.—A movement is on foot here having in view the lighting of the streets by electricity.

Elkhart Lake, Wis.—This place will be lighted by electricity after July 1. Mr. Gottfried, a Chicago capitalist, is erecting a \$15,000 electric light plant. The latest and most improved machinery is being used.

Elma, Iowa.—The question of the city building and maintaining an electric light plant has been under discussion for some time, and since so many favor it the council have decided to give the citizens an opportunity to vote on the question. A special election for this purpose will be held June 10.

Elizabeth, N. J.—The Suburban Electric Light Company of this city has passed into the control of a syndicate which has, under the name of the Consumers' Electric Light, Heat & Power Company, filed articles of incorporation in the office of the county clerk, placing its capital stock at \$1,000,000. The Suburban Company, in addition to this city, supplies electric light to all towns on the line of the Central Railroad east of Fanwood. It is the intention of the syndicate to greatly enlarge the capacity of the plant, put in new engines, dynamos and other machinery, and to furnish power to operate the Elizabeth branch of the Consolidated Traction Company. The incorporators of the new company are George F. Chapman of Elizabeth; David Young, John W. Omberson and William O'Connor of Newark; W. J. Davis, Harrison; John E. McArthur of Jersey City; W. G. Shailer of New York.

Henning, Minn.—A few evenings ago a mass meeting of citizens took place at the opera house for the discussion of the advisability of putting in an electric light plant by the village. The sentiment was greatly in favor of so doing.

Newport, Vt.—C. A. Prouty is enlarging his electric lighting plant and intends to make such additions as will enable him to furnish power as well as light.

Rochester, Minn.—The electric light plant of this city, which has been run for four years, is to be reorganized at an expense of about \$10,000, and new dynamos put in to replace the antiquated machines with which the plant has previously been equipped.

Sea Isle City, N. J.—The borough council has advertised for proposals for supplying this resort with electric lights.

Syracuse, N. Y.—A subway franchise has been granted by the council to the Syracuse Electric Light & Power Company.

Uvalde, Tex.—The Uvalde Water, Ice & Electric Company will shortly begin work on the proposed electric light plant.

MANUFACTURING, ETC.

Baltimore, Md.—The "Herald" says: "Twenty American-made electric cars were recently delivered in Berlin, and one hundred more have been ordered, the cars manufactured over here being deemed to be superior to those with the Berlin brand. We are told also that the car-makers of Germany are not so reliable as those of the United States. Now we know why Herr Bismarck is against us in our war with Spain."

Laconia, N. H.—The Laconia Car Company has completed the shipment of 48 open cars for the Boston Elevated road. Work on the 50 closed electrics for the same road is in progress, and about a dozen of them are already set up in the electric department.

Lehigh, Pa.—The town council has awarded a contract for an electric light plant to the Fort Wayne Electric Company of Philadelphia for \$18,800, the plant to be completed within thirty days' time after signature of contract.

New York.—The "Journal of Commerce" says: "The latest advices from England to a local concern say that in the first week of this month the Chilean Electric Tramway & Light Company had been organized in London with a capital stock of \$5,250,000. This concern proposes to work and maintain a number of electrical undertakings in the principal cities of Chili, such as electrical railroads and electric light and power plants. Ingle, Holmes & Son, No. 20 Threadneedle street, London, are said to be the principal parties interested in this large corporation. It is generally believed that this company will begin active work very shortly. The quantities of material required will be thoroughly appreciated by manufacturers, and as American electrical material is to-day effectively competing the world over, some good contracts may be secured in the local market."

Stockholm.—During the last few months practical steps have been taken by the Swedish Government to utilize the celebrated waterfall of Elkarleby. For a long time it has been under consideration to utilize this enormous power for Stockholm. Engineers are said to be drawing plans to utilize about 20,000 horse-power. The total expenditure will amount to about \$2,160,000. Orders for the machinery and supplies for this Swedish plant will be forthcoming at an early date.

ELECTRICIANS IN THE WAR.

Among the appointments confirmed by the U. S. Senate last week were the following: First Regiment of Volunteer Engineers—To be Colonel, Eugene Griffin of New York; to be First Lieutenants: Algernon Sartoris of the District of Columbia; Fitzhugh Lee, Jr., of Richmond, Va.; Carlos Carbonel of Troy, N. Y.; Karl Fisher Hansen of New York. The President has nominated Samuel W. Campbell of Colorado to be a First Lieutenant in the above regiment.

A. D. Brown of Chester, Pa., for many years chief engineer for the Chester Electric Light Company, has been appointed an assistant engineer with the rank of Ensign in the U. S. Navy.

The H. J. Smith Electrical Works, on the banks of the Wanaque River, N. J., have been rushing out Government work since the outbreak of hostilities. The firm is making fuses for the explosion of submarine mines, torpedoes and shells.

Branch No. 5 of the National Brotherhood of Electrical Workers, Pittsburg, Pa., at a meeting on the 20th ult. resolved that the services of the members be tendered to the Government. J. W. Ecoff, W. A. Evans and F. D. Malone were appointed a committee to communicate with the Navy Department in regard to the matter. There are about eighty unmarried electricians in Pittsburg who are ready for war service.

Major Ruffner, chief of the engineer corps at Charleston, S. C., has received a large and powerful electric searchlight which will be mounted at once on one of the forts on Sullivan's Island. It will be operated from the electric plant already installed in the Mortar Battery and will be used to assist the patrol boats in watching the channel entrance at night. The harbor is now thickly "sown" with mines.

Recruiting for Col. Griffin's brigade of volunteer engineers is going on all over the country. The brigade is limited to a total of 3,500 men. The Washington "Star" says: "The engineer troops will be armed and drilled as infantry. They are line troops and must take their places in the line of battle when necessary. Their engineering duties will be the construction of and destruction of fortifications, field works, entrenchments, bridges, roads, railroads and tunnels, and will embrace field engineering work generally, besides map making and field reconnaissance work, photography, operation of stationary and locomotive engines, and electric apparatus, etc. Recruits, therefore, must be foremen, skilled mechanics of various sorts, handymen and first-class laborers, machinists, electricians, telegraph linemen, carpenters, timber framers, bracers, tunnel men, bridge men, iron men, erectors, riggers, blasters, quarrymen, lumbermen, boatmen and railroad men. Two cooks are also required for each company, also stationary and locomotive engineers and firemen. Allowances in addition to pay will be rations, bedding, all clothing, medicines and medical attendance. The volunteer troops will be disbanded and discharged as soon as the war is over, but no man should enlist, it is announced, unless he is prepared to serve for the full two years. Men should not be tempted to enlist by the hope that the war will be over in a month or two, and that then they can return home."

PERSONAL AND MISCELLANEA.

Arthur Bryant, an electrical engineer of Akron, O., received a letter lately from a firm of solicitors in England enclosing \$800 with which to pay his expenses to that country. He has been made the sole heir to property in England estimated to be worth \$50,000.

W. J. Hart of Saginaw, Mich., has resigned his position as general manager of the Interurban Railway. He will assume the management of the new Detroit, Lake Shore & Mt. Clemens Electric Railway, with headquarters at Detroit.

Sonichiro Matsumoto, a graduate of the Rensselaer Polytechnic Institute and now director of the Imperial Government Railway Department in Japan, was the guest of Mr. E. G. Bernard at Troy, N. Y., a few days ago. He is inspecting electrical apparatus in this country. Another Institute student, Ichisuke Fujitora, is now professor of Electrical Engineering in the Imperial University at Tokio.

"Buck" Davis, the notorious criminal, sentenced to Dannemora prison on the 25th ult. for six years for jail breaking, and who was wanted in Schenectady for the alleged murder of George R. Blodgett, the chief patent attorney of the General Electric Company, committed suicide in the Salem, N. Y., jail on the 28th by hanging.

One of the theaters in Munich, Germany, has an electrically operated stage. This stage is circular in shape, and three or four times larger than the play requires. It is divided into sections, or compartments, and can be rotated so as to present any section before the audience, all the machinery being operated by electricity. This arrangement obviates any intermissions between the acts, as each scene is arranged on one section, and while it is turned toward the audience the next is being arranged and in due course of time is moved around to face the audience.

Dr. Emma Sutro Merritt, recently elected president of the Sutro Electric Railway in San Francisco, is the eldest daughter of Adolph Sutro, the noted California pioneer and capitalist, now insane. Her husband, Dr. George Merritt, is a practicing physician in San Francisco, and she also was a medical practitioner until lately, when she gave up her practice to devote herself entirely to the management of the railroad and the Sutro estate. So far as the railroad is concerned, she has ideas of her own as to its management. She is not ignorant of electric railways. While at college she took a scientific course, and electricity has always been one of her hobbies. She is intensely modest and retiring and has no desire to shine as a woman of affairs. Nevertheless it is predicted that she will make a distinguished success as a railway president. She is a woman of the broadest culture and education, and though she has devoted her life to medicine, she is by no means a physician merely. She is of middle age and strongly resembles her father in physical characteristics. From Vassar she was graduated with honors in 1877. Upon her return to San Francisco she entered Toland Medical College, where she received her degree in 1881. She is also a graduate of the School of Medicine in Paris. After several years of practice in San Francisco she and her husband went abroad three years ago, where they pursued studies in the largest European hospitals. Mrs. Merritt was one of the founders of the San Francisco Children's Hospital.

RECENT COMPANY ELECTIONS.

Chester & Derry Electric Railroad Association (trolley company), Chester, N. H.—President, C. S. Campbell; superintendent, Charles Bartlett; treasurer and general manager, F. J. Shepard; clerk, A. H. Wilcomb; directors: the officers and G. K. Bartlett, N. W. Goldsmith and Geo. Sherman West.

Camden & Suburban Railway Company, Camden, N. J. Secretary, Samuel T. Corliss, to succeed Morris W. Hall, deceased.

Laurel Electric Light Company, Laurel, Md.—President, C. F. Shaffer; vice president, C. H. Stanley; secretary, George W. Waters; treasurer, F. W. Awalt. The old board of directors were re-elected with the exception of Robert Morang, of Savage, who was chosen to fill the vacancy caused by the death of Dr. Snowden.

North Jersey Street Railway Company, Jersey City.—President, Edward F. C. Young, vice J. K. Carrière, resigned; vice-president, David Young, in place of H. W. Doremus, resigned; secretary, Wilbur F. Johnston; treasurer, E. N. Hill; auditor, E. D. Hobbs. The North Jersey Street Railway now controls the following organizations: Consolidated Traction Company, Jersey City & Bergen Railroad Company, Jersey City, Harrison & Kearny Railroad Company, Newark Passenger Railroad Company, New Jersey Traction Company, Passaic & Newark Electric Railway Company, Passaic & Newark Electric Traction Company, Newark Plank Road Company, Port Richmond & Bergen Point Ferry Company, Bergen Point & Staten Island Ferry Company, and Newark & South Orange Railroad Company.

COMMERCIAL PARAGRAPHS.

The Electric Appliance Company, Chicago, have recently concluded the general distribution of their Fan Catalogue for the season of 1898. In sending out catalogues to a very large list of buyers it is very often the case that some are overlooked. The Electric Appliance Company would be very pleased to hear from any of the trade who have not received a copy of this handsome catalogue, as they are anxious to place the same in the hands of every possible user or purchaser of fan motors.

INCORPORATIONS.

The Home Electric Company, Brooklyn, N. Y.—to manufacture and sell electric goods, machinery and supplies. Capital stock, \$25,000. Directors: Walter S. Pierce and Joel W. Thorne, New York City, and James H. Mason of Brooklyn.

The Penn Electrical & Manufacturing Company, Irwin, Pa. Capital stock, \$12,000. Directors: David M. Waggoner, Frank C. Hackensmith and Jesse L. Wagoner, Irwin; John A. Wright and W. F. O'Neill, Wilkinsburg.

The Creager Electric Light & Power Company, Fremont, O. Capital stock, \$50,000. Incorporators: Frank Creager, J. H. Clauss, John M. Sherman, Horace B. Buckland and Samuel Brinkerhoff.

The Electric Supply & Fixture Company, Decatur, Ill. Capital stock \$2,500. Incorporators: C. E. Gibson, G. B. Marshall and E. H. Coleman.

The Suffolk Gas & Electric Light Company, Islip, N. Y.—to furnish gas and electricity for lighting and power to the towns of Babylon and Islip, L. I. Capital stock, \$200,000. Directors: Charles F. Street, Hunter Wykes and William B. Hood.

The Army Post Street Railway Company, Little Rock, Ark. Capital stock, \$60,000. Incorporators: M. D. L. Cook, E. Meek, L. W. Cherry, Maxwell Coffin, J. H. Hollis and B. Bodeman.

The Shelby Electric Company, Shelby, O., has filed a certificate of increase of capital stock from \$100,000 to \$250,000.

The Lodi Light, Heat & Power Company, Lodi, N. J. Capital stock, \$100,000. Incorporators: Frank T. Ternes, Philip S. Hoffman and Charles I. Ternes, all of New York.

The Clyde Gas & Electric Company, Clyde, N. Y. Capital stock, \$40,000. Directors: Lucius L. Moses, George H. Lang and Charles W. Field, of Clyde; Edward Moir and John M. Moir, of Marcellus, N. Y.

The Asbury Park & Sea Girt Railroad Company, Asbury Park, N. J.—organized to acquire the franchises and effects of the Asbury Park & Belmar Railway Company, sold or to be sold under the direction of the Circuit Court of the United States. Capital stock, \$100,000. Incorporators: John E. Comins, Arlington; Daniel H. Shea and H. B. Perrine, New York.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 24, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

- 604,679. Incandescent-Electric-Lamp Regulator. Daniel McF. Moore, New York City, assignor to the Moore Electrical Company, same place. Filed Feb. 10, 1892.
- 604,680. Electric-Lamp Regulator. Daniel McF. Moore, New York City, assignor to the Moore Electrical Company, same place. Filed Oct. 18, 1894.
- 601,641. Inter-upter for Electric-Lighting Systems. Daniel McF. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed Dec. 3, 1895.
- 604,683. Electric-Lighting Apparatus. Daniel McF. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed Feb. 15, 1897.
- 604,686. Apparatus for Producing Luminous or Similar Effects. Daniel McF. Moore, Newark, N. J. Filed July 3, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 614,544. Electrical Governor. Mark A. Replogle, Akron, Ohio. Filed Feb. 19, 1897.
- 604,682, 644,683. Magnetic Circuit-Breaker. Daniel McF. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed Sept. 8, 1896.
- 604,684. Automatic Vibratory Interrupter. Daniel McF. Moore, Newark, N. J., assignor to the Moore Electrical Company, New York City. Filed Dec. 17, 1896.
- 604,687. Circuit-Interrupting Mechanism. Daniel McF. Moore, Newark, N. J. Filed Sept. 9, 1897.
- 604,688. Circuit Interrupter. Daniel McF. Moore, Newark, N. J. Filed Sept. 10, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 601,373. Automatic Telephone-Exchange. Ward Decker, Owego, N. Y. Filed March 25, 1895.
- 601,431. Telephone Signal System. Wallace A. Stillwell and Alexander Barneck, Salina, Kan. Filed Nov. 10, 1896.
- 601,499. Multiple Telephony and Telegraphy. Richard Pfund, New York City. Filed Oct. 22, 1897.
- 601,533. Combined Transmitter and Receiver. John M. Joy, New York City, assignor to the Printing Telegraph News Company, same place. Filed June 21, 1897.

METERS.

- 601,459 (filed March 20, 1897); 601,460 (filed Aug. 6, 1897); 601,461 (filed Aug. 6, 1897); 601,462 (filed Aug. 11, 1897); 601,463 (filed Aug. 26, 1897); 601,464 (filed Sept. 11, 1897); 601,465 (filed Sept. 24, 1897); 601,466 (filed Nov. 8, 1897). Electric Meter. Thomas Duncan, Fort Wayne, Ind.
- 601,501. Motor-Wattmeter. Carl D. Raab, Kaiserslautern, Germany. Filed Dec. 27, 1897.

MISCELLANEOUS.

- 604,344. Electric Heater. Edward E. Gold, New York City. Filed Oct. 14, 1897.
- 604,418. Accumulator-Plate. Isidor Rosler, Berlin, Germany, assignor to Lehmann & Mann, same place. Filed March 10, 1898.
- 604,431. Electric Signal for Railway-Crossings. Leon C. Smith, Columbus, Ohio. Filed May 18, 1897.
- 604,453. Secondary Electric Clock. Aaron D. Blodgett, Newton, Mass. Filed May 29, 1897.
- 604,503. Electric Clock. William Whitehead, Manchester, England. Filed June 7, 1897.
- 601,588. Storage Battery. Herbert S. Lloyd, Philadelphia, Pa. Filed Dec. 28, 1896.
- 604,616. Electrical Lighting Device for Kerosene or Other Burners. Svend M. Meyers, Brooklyn, N. Y. Filed Jan. 27, 1897.

DESIGN.

- 28,697. Switchboard for Telephone Operators. William F. Smith, San Francisco, Cal. Filed April 18, 1898.

TELEPHONE AND TELEGRAPH.

At the request of the defendant's attorneys, Judge Swan has granted a postponement until July 12 of the preliminary hearing in the injunction suit brought by the Western Electric Company against the Detroit Telephone Company. William M. Holmes, who appeared for the Detroit Company, addressing the Judge, said: "This action on the part of the Western Electric Company has been incubating for a long time, your honor. They have sat on the egg for years, and now they seek to hatch it by coming in here and, in giving us only brief time to answer their charges, interfere with our business and the 16,000 customers we represent." Attorney George Barton, of Chicago, for the plaintiffs, offered to telegraph to Washington and within two days get Mr. Holmes all the data he needed on foreign patent rights. "Which only confirms the rumor I have long heard," said Mr. Holmes, "that the Bell Company has the Patent Office right under its thumb."

The Home Telephone Company's franchise passed by the city council of Pittsburg, Pa., expired at the end of May, the company having failed to meet the promises it made when the rights were given away. May 30 of this year the concern was to have had its pole and conduit systems completed and 1,600 telephones in operation. Each succeeding year until 1900 a like number of 'phones were to have been placed and put in operation. Comparatively little work has been completed since the franchise was granted. The company now asks that it be given until May 30, 1899, to place 1,000 'phones, and that it be given until 1901 to place another thousand, instead of the arrangement provided for in the original franchise. The ordinance was referred to the corporations committee.

Mayor Taggart of Indianapolis has signed the New Telephone contract. The company has deposited its cash forfeit of \$25,000 and given an additional bond of \$25,000 to ensure the faithful performance of its contract with the city. The company is also required to file a bond of \$10,000 as a guarantee of indemnification to the city from judgments for damages. Of the cash forfeit it has been provided that the company is to receive back \$10,000 when the conduits are built within the one one-mile square, \$5,000 when the overhead wiring is completed, \$5,000 when the plant is completed and \$5,000 when the system has been in operation three months. The company will begin work immediately.

The Helena, Mont., *Independent* says: "Before the close of 1898, the people of Helena and other towns and cities in Montana connected with the Rocky Mountain Bell Telephone system will be talking with those of Portland, Ore., and possibly with other coast cities. In less than a week, a construction crew will commence work upon a telephone line which will connect Missoula with Wallace, Ida., which is connected with Portland and intermediate points. When the breach is completed, a business man in any of a score or more Montana towns may call up Portland and give an order for goods or take one themselves."

The Western New York Telephone Company, recently incorporated with a capital stock of \$500,000, has certified to the Secretary of State at Albany an extension of its telephone lines. The extreme points to be connected are Dover, Del., Erie, Pa., and Buffalo, N. Y. The lines will run through the various cities, villages and towns of Erie, Niagara, Orleans, Genesee, Cattaraugus, Chautauqua and Monroe counties and in the towns, villages and cities of the other counties included in the Second, Third and Fourth Judicial Departments of New York State.

A Terre Haute, Ind., correspondent of the *St. Louis Chronicle* says that a great interest in telephone matters has developed in Terre Haute. W. P. Ijams, president of the American Trotting Association, is at the head of a company that has bought an old franchise which provides for an aerial plant, and B. F. Havens has an incorporated company which wants a franchise for a conduit system. Both companies promise connection with more than 100 telephone companies in the State.

Senator Gorman's amendment to the War Revenue bill provides that from and after the passage of the act every firm, person, company, etc., owning or possessing or managing any telegraphic line by which telegraphic or telephonic messages or dispatches are received or dispatched, or carrying on the business of furnishing electric light or power, etc., whose gross annual receipts exceed \$250,000, shall be subject to pay annually a special excise tax equivalent to one-half of 1 per cent on the gross amount of all receipts of such persons, firms, etc.

A recent dispatch to the *Detroit News* from Three Rivers, Mich., says: "Last July the Three Rivers Telephone Company started out to compete with the Bell company in establishing their system in this city. The Bell people met them with a reduction of rates, even going so far as to offer

to put in 'phones for nothing in some cases. Notwithstanding the opposition, the home company has gone steadily forward and now have over 120 'phones at work. In addition to this they have a good system of State line connections."

The Maryland, Pennsylvania & West Virginia Telephone & Telegraph Company has made arrangements to extend its system, and has entered into a 15-year contract with the Union Telephone Construction Company. In Pennsylvania it has exchanges at Conellsville and Uniontown. Another will be installed at Dunbar, and the lines will be extended eventually to Pittsburg.

A representative of the National Telephone Company of Chicago has made a proposition to the people of Evansville, Ind., to put in a highly improved telephone system with copper wires, the rates to be \$2 per month for business houses and \$1.50 for residences. The Evansville Manufacturers' Association has taken the proposition into consideration with that of other independent companies applying for franchises in Evansville.

The annual meeting of the stockholders of the International Bell Telephone Company, Limited, was held in New York on the 25th ult. The following directors were elected: Samuel D. Babcock, Louis A. Von Hoffmann, Richard A. McCurdy, Charlton T. Lewis, Ellisha S. Converse, Ferdinand M. Theriot, Howard S. Randall, Louis A. Thebaud and Charles J. Bell.

The D. A. Tyson Telephone Company has completed all but a few miles of its long-distance line between Macon and Savannah, Ga. From Macon to Savannah the line is about 175 miles, coming by way of Dublin, Swainsboro, Statesboro and other intermediate points. It branches out from Swainsboro to Mount Vernon and other points near the Georgia and Alabama Railroad.

There is a report circulating in Wilmington, Del., that the Delmarvia Company is to pass into new hands. The *Wilmington News* of the 23d ult. says it was definitely stated on the previous evening that parties have been taking a great interest in the company and are bargaining for its control.

At the annual meeting of the stockholders of the Western Union Telegraph Company in New York on the 25th ult., the retiring board of directors was re-elected, with the exception of Messrs. Van Horn and Rochester, who were replaced by J. Merrihew and G. W. E. Atkins.

Manager McDonald of the Telephone Exchange at Augusta, Ga., has resigned his position and will take charge of a new electrical company, known as the Augusta Electric & Construction Company, as general manager.

The Kinloch Telephone Company expects to be able to begin service in St. Louis about the 1st of August. It is thought that by that time the 4,000 subscribers of the company in the city will all be connected with the main office.

B. L. Piggott and Noah E. House have just completed a telephone line between Piggott and St. Francis, Ark. They will likely extend it to Boydsville where it will connect with the Corning line.

A telephone system is being established at Cheraw, S. C., by Kirkwood & Thomason. It will connect with the network of 'phones throughout the Pee Dee section.

A long distance telephone line connecting Vicksburg with Jackson, Miss., has just been completed.

New Companies Incorporated.

The Carroll County Telephone Company, Carrollton, O. Capital stock, \$10,000. Incorporators: Union C. De Ford, H. J. McGranahan, J. C. Patterson, A. L. Iden and Simeon Ashbrook.

The Mens Telephone Company, Mens, Ark. Capital stock, \$5,000. Incorporators: H. M. Quigley, Edward Keogh and J. S. Kelley.

The Badger State Long Distance Telephone Company, Baraboo, Wis.—to own and operate lines in Wisconsin. Capital stock, \$100,000. Incorporators: F. T. Brewster, F. A. Philbrick and W. H. Hatch.

The Columbia & Montour Telephone Company, Bloomsburg, Pa.—organized to compete with the Bell Company in the section of Pennsylvania for which it is named. Capital stock, \$50,000.

The Pike County Telephone Company, Pittsfield, Ill., has certified to an increase of capital stock from \$3,600 to \$5,000.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½c.; Lake, 11½@12c.; casting, 11½c.

The bill giving electric light companies permission to sell gas has been rejected by the Massachusetts Senate by a vote of 13 to 18.

There were two lots of \$155,000 each of the bonds of the General Electric Railway Company of Chicago sold by auction last Wednesday at 25.

The Westinghouse Electric Company has decided to close its glass factories for the season June 1, one month earlier than usual.

The Government has rejected all the bids for furnishing and installing an electric light and power plant at Fort Washington, and new bids will be called for.

The capital stock of the Electrozone Commercial Company, admitted to the unlisted department of the Philadelphia Stock Exchange on Friday last, is \$600,000.

There was a report current in Chicago last week that the City Railway Company had finally succeeded in getting possession of the General Electric Railway franchise.

A blanket mortgage for \$15,000,000, covering the rolling stock and other property of the North Jersey Street Railway Company, has been recorded at the office of the Essex County Register, Newark, N. J.

The Edison Electric Illuminating Company of Brooklyn, N. Y., reports gross earnings for April of \$73,590, an increase of \$5,805 as compared with the same month last year, and net \$31,413, an increase of \$544.

The Worcester & Suburban Street Railway Company of Worcester, Mass., will pay a dividend of \$2 per share on June 10 to stockholders of record June 1. It is reported that the company makes a much more favorable showing this year than at any corresponding period for a number of years.

At the last meeting of the directors of the Metropolitan Railroad Company, Washington, D. C., it was decided to reduce the quarterly dividend from \$1.25 to \$1.20 per share. A director of the company is quoted as saying that the reason for this action was that the company had been under heavy expense recently and it was thought best to economize.

The annual meeting of the stockholders of the International Bell Telephone Company, Limited, was held in New York on Wednesday last. These directors were elected: Samuel D. Babcock, Louis A. Von Hoffman, Richard A. McCurdy, Charlton T. Lewis, Elisha S. Converse, Ferdinand M. Theriot, Howard S. Randall, Louis A. Thebaud and Charles J. Bell.

The street railway investigating commission which it was understood was to examine and report fully the status of the street railroads of Chicago in their relations to the city has decided to take no action in the matter at present, Mayor Harrison having refused to appoint additional members to make the commission so widely representative as to disarm criticism.

The Philadelphia "Times" says: "Stockholders of the Northern Electric Company, which has been taken in by the Pennsylvania Manufacturing, Light & Power Company, are being told that they will receive a cash dividend of about 2½ per cent., and in consequence their subscription privilege on Pennsylvania Manufacturing Company stock will be but 5 per cent. of their holdings, instead of 20 per cent., as at first proposed."

A trust mortgage for \$2,000,000 was filed on the 25th ult. in the Register's office in Brooklyn, N. Y., by the Coney Island & Brooklyn Railroad Company to the Mercantile Trust Co. on property at Smith and Huntington streets and Coney Island avenue and King's Highway, and upon the franchises of the company, to secure an issue of 4 per cent. bonds made necessary by the consolidation agreement with the Brooklyn City & Newtown Railroad Company.

President Uhlman of the Brooklyn Elevated Railroad said a few days ago that in consequence of the continued rainy weather it will be impossible to start the cars across Brooklyn Bridge on June 15, but they would be started just as soon as practicable. He also stated that his company had entered into a contract with the Brooklyn Heights Railroad Company to furnish electric power. It is expected, however, that the "L" road will subsequently have its own electric plant.

Transfer was made at Baltimore on the 23d ult. of the securities issued by the Columbia & Maryland Electric Railway Company, on the Baltimore & Washington Railroad line, amounting to about \$425,000, purchased by Nicholas P. Bond of Baltimore, Scott & Co. of Wilmington, Del., and their associates. John E. Searles, secretary of the American Sugar Company, who, with Mr. Bond and Mr. Scott, indorsed the notes given by the Baltimore Trading & Security Company, will not be identified with the new company.

The annual report of the Boston Electric Light Company, covering operations for the fiscal year ending June 30 next, will show earnings, after interest charges, equivalent to about 13 per cent. on the 25,000 shares capital. The company is at present paying 6 per cent. dividends. On the basis of present selling price for land on Summer street, Boston, near the new station, the company's property there is worth \$1,800,000. This property stands on its books at a valuation of less than \$400,000, which is equivalent to a profit of about \$1,500,000, or \$60 per share.

The Trenton, N. J., "Gazette" of the 23d ult. says: "Deputy Marshall Bower of the United States Circuit Court is serving summonses in the case of Augustus Ireland, of New York, against the Trenton Light & Power Company, Hugh H. Hamill as trustee, and the Trenton Banking Company and others to discover the whereabouts of about 600 shares of the Trenton Light & Power Company stock which were sold by Sheriff Ashmore as the property of Frank A. Magowan. These shares were sold subject to claims on them. Mr. Ireland, who has an interest in them, says he has to resort to the courts to learn where the stock is, as Magowan will not give him any information."

Judge Barnard, in Poughkeepsie, has enjoined temporarily the majority stockholders of the Kings County Traction Company, Brooklyn, N. Y., from disposing of the assets of the company or proceeding for a voluntary dissolution pending the trial of an action by the Attorney General to prevent the dissolution. Judge Barnard says that the present conditions should continue until the trial, as the company held very valuable property, which was broken up unwisely and not advantageously to the owners of the stock. The cause is to go to trial at the next Equity Term in Queens County, the plaintiff to have the right to move to vacate the injunction if the plaintiff fails to try the cause when reached, or before, if the Judge, in view of the great interests involved, should advance the trial.

The Washington, D. C., "Times" says: "The burning of the central cable power house of the Capital Traction Company in September last, which caused that company to install the underground electric system, has proven to be of immense financial benefit to its stockholders. In anticipation of the earnings that it was estimated would result from the installation of this system, its stock has already advanced from \$45 to \$74 per share, and it is now predicted that it will advance to par, as the earnings of the road justify the payment of a 1 per cent. dividend in July, notwithstanding the fact that the new system has been in operation on the avenue for only a month and has not yet been installed on the Seventh Street line. When the road is fully equipped with the new system it is estimated that the earnings will be sufficient to pay a 1½ per cent. dividend, equal to an annual dividend of 5 per cent., which will certainly be welcome news to the many stockholders who paid par or thereabouts for their stock and who saw it drop speedily to 50 and less with grave concern."

ELECTRICITY.

Vol. XIV.

NEW YORK, JUNE 8, 1898.

No. 22.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

EDITORIAL NOTES.

Another Important Patent Decision. The Sprague Electric Railway and Motor Company has just won a decision in a long-drawn-out lawsuit against the Union Railroad Company, better known as the "Huckleberry" Road, and the Walker Company, restraining the latter from either using or selling the Sprague electric railway motor. The decision rendered by Judge Wheeler of the United States District Court, in which the Court of Appeals now concurs, orders that the defendants be perpetually enjoined from making, using, or selling the device. It also directs that the defendants pay to the plaintiff all profits which they have derived from the infringement and the use of the Sprague motor, the original inventor of which was Mr. Frank J. Sprague. Commissioner Shields is designated as master to take an account of such profits and to report to the court. This decree is final and ends this long-drawn-out suit, which has been considered and passed upon by nearly every United States Judge in this District, unless the defendants decide to carry the litigation to the United States Supreme Court.

Incandescent Lamps.

Probably strictly speaking the first incandescent lamp was invented in 1841 by Frederick de Molyens of Cheltenham, England. This lamp, which was only valuable as marking the beginning of a new era in lighting, was constructed on the principle of the incandescence produced by the high resistance of a platinum wire to the passage of an electric current. Some four years later, J. W. Starr of Cincinnati suggested the use of carbon as a filament, and produced an incandescent lamp having twenty-six lights which was widely talked of at the time, even attracting the attention of Faraday. A number of other incandescent lamps were brought out about this time or within a few years, although no substantial progress was made in the way of commercial incandescent lighting until the dynamo made its appearance, many years later. It was very soon discovered, when it became a question of practical lighting, that filaments of platinum would not answer the purpose as they rapidly deteriorated in the air, finally breaking, owing to the action of oxygen on their surfaces. Scientists then abandoned platinum, after attempting in every possible way to get satisfactory results, and sought to discover some other substance which would not deteriorate by oxidation when heated. Carbon was thought of, the superiority of which as an illuminant having already been demonstrated, its principal objection however being the rapidity with which it was consumed. It

was therefore necessary to devise some means of retarding the consumption. This it was thought could be accomplished by excluding the oxygen from the vicinity of the carbon filament while hot. An attempt was made to solve the problem by filling the globe in which the filament was located with nitrogen, endeavoring in this way to eliminate the oxygen, at the same time maintaining a pressure in the globe equal to that of the atmosphere, which was thought necessary to ensure good illumination. This method, although it attracted considerable attention at one time, was not sufficiently satisfactory for practical purposes. The invention of the mercurial air pump made it possible to obtain what heretofore had been extremely difficult, namely, an almost perfect vacuum. The difficulty of introducing the current into the globe containing the filament was then overcome by imbedding an extremely fine platinum wire in the glass, thus connecting the enclosed carbon with the external circuit.

The next point of greatest importance was the obtaining of carbons of the proper consistency, tenacity and durability. Brown paper and cardboard cut into narrow strips were finally tried. These were reduced to carbon by being placed in an iron mold in which a high temperature was maintained. Carbon filaments made in the above manner were exceedingly fragile and short lived. Bamboo fiber was then tried. The thin threads were carefully stripped from the surrounding material and were carbonized by being placed between two grooved plates of graphite and subjected to an intense heat for several hours. The filaments obtained in this way are then attached to their wire supports and introduced into the glass bulbs. While the air is being exhausted an intermittent electric current is passed through the filament, causing it to become alternately heated and cooled. The object of so doing is to remove all the occluded gases which remain after the carbonizing, and furthermore to render the carbon homogeneous and elastic. Filaments of carbonized bamboo are used very extensively at the present day. The weakness of the substance, however, is its structure, and moreover it is an extremely difficult matter to obtain the carbonized fiber uniform in cross section. These objectionable features have led to other materials and methods being tried. A filament made of cotton treated with nitric and sulphuric acids, reducing it to nitro-cellulose, then mixed with alcohol and ether and subsequently having its combustibility reduced by the action of ammonium hydro-sulphide, has been used with excellent results. This product is an amorphous cellulose of great durability, tenacity and homogeneity. It is rolled into sheets, filaments of the desired size being then cut off and carbonized in the usual manner. Silk, both natural and artificial, has been tried and is still being made use

of by certain manufacturers. A form of incandescent lamp has very recently been perfected abroad in which the inventor, instead of making use of a carbon filament, utilizes magnesium oxide. Whether this new form of filament will prove more satisfactory than those now generally in use remains to be seen.

* * *

The National Electric Light Convention.

The Twenty-third Convention of the National Electric Light Association, to be held in Chicago on June 7, 8 and 9, will undoubtedly prove most enjoyable and instructive. No pains have been spared by the committee having the arrangements in charge to make the Convention the most notable yet held, and everything points to a realization of their desires. Elsewhere in this issue will be found a detailed description of the arrangements that have been made for the comfort and enjoyment of the visitors as well as the programme showing what papers will be read and topics discussed. An agreeable feature of the Convention will be the large number of ladies present. The entertainment committee having been assured of a numerous attendance of the fair sex, have taken special care to provide suitably for their comfort and entertainment while the gentlemen of the party are discussing intricate problems in the Convention hall. A feature which should prove most enjoyable is the proposed sail on the lake, which will probably take place on Tuesday evening, a band of music and refreshments having been provided for the trip.

The papers to be read and topics which it is proposed to discuss, as can readily be seen, are almost without exception of an extremely practical nature, which is much to be desired. The tendency in the National Electric Light Association to-day would seem to be towards a progressive organization which will ultimately exert a strong influence as an educational medium, and it is to be hoped that the careful selection of the papers to be read and topics to be discussed at the Chicago meeting will serve as a precedent for future gatherings.

* * *

Electric Light in Italy.

Italy is said to be fast appreciating the advantages of the electric light. This is in part due to the fact that the price of petroleum, which has heretofore been extensively used for illuminating purposes, has been forced up by restrictions and protective duties. Most all the theaters, many of the streets and the principal shops and offices are now lighted by electricity. This form of illumination is extremely acceptable owing to its cleanliness and convenience, and to the fact that it does not perceptibly heat a room, which is much to be desired in a comparatively warm climate such as that of Italy. Wherever water power is available, advantage has been taken of it for generating current for illuminating purposes. The thriving town of Capua is lighted by energy obtained from the river Volturno, and Cava dei Tirreni, also an important town, derives its power from the machinery of a large mill, driven partly by water and partly by steam, which grinds corn during the day and illuminates the town at night.

There are many other centers of population in Italy that have made good use of water power for the purpose of operating electric lighting plants, or that contemplate so doing. The town of Amalfi, which is a favorite resort of travelers in the winter season owing to the salubriousness of its climate, has a swift stream of water running through it which is utilized for operating numerous paper mills as well as several large factories. To install an electric lighting plant there, as proposed, would be neither costly nor difficult, and that it would pay to do so cannot be doubted, as it is claimed the large hotels alone would ensure remunerative returns.

Naples is now illuminated by electricity and is

supplied with a continuous current of 110 volts. The lamps most generally used are of German manufacture, either the Schubert or those turned out by the Allgemeine Elektrizitäts Gesellschaft; lamps very inferior in color of globes, finish and illuminating power to those manufactured in this country. In view of this fact and the general conditions existing in Italy, there seem to be excellent opportunities for the introduction of American lamps and other electrical apparatus. During the last fiscal year this country exported but \$86,281 worth of electrical machinery to Italy, which can scarcely be said to compare very favorably with the \$298,000 worth exported that same year to France, or even to \$168,864 which represents the amount exported to Belgium. We have noticed, however, that several contracts for electrical installations in Italy have of late been awarded to American manufacturers, and it would not be surprising therefore if the amount of electrical exports to Italy this present year much exceeds that of last in spite of our war with Spain.

Under the Searchlight.

Notes and Comments on Various Topics.

AN electrical exhibition similar in some respects to that which has just closed at Madison Square Garden is now in progress in Philadelphia.

* * *

THE report that Capt. Coffin, president of the G. E. Company, had an inclination to follow his first vice and other patriotic members of the company into the war, but that finding all the fat places in the commissary and quartermaster departments were already filled, and that in any line position he was likely to get there was a possibility of his sudden taking off by a Spanish bullet, unshriven and unprepared, he dismissed the intrusive thought. His conclusion probably was, that—

While dynamos and motors sell, and lamps hold out to burn,
Escape is possible from—well, the vilest sinner may return.

* * *

THIEVING has lately taken a new departure which may result in serious consequences if not nipped in the bud. It has lately dawned on a thievish gang of boys in New Jersey that the copper and zinc to be found in most electric batteries are marketable commodities, and as a result they have recently been relieving the electric batteries which furnish the current to the signaling apparatus on the Central Railroad of these essential metals. Serious accidents from the weakened batteries are said to have only been avoided by the watchfulness of the tower-men.

* * *

APPARENTLY the General Electric Company, not content with working its stockjobbing schemes in this country, or possibly awakening to the fact that its methods are becoming very generally known here, is about to branch out and begin operations in Central America. This company is now said to be connected with a movement in London to take charge of Costa Rica or of the cities and towns thereof for the purpose of putting in lighting plants and electric railways. San Jose, it is said, has been selected as the first point of attack.

* * *

THE latest fad among society women is to have some member of the body photographed by X-rays. They like particularly to have their hands X-rayed, with all the bones clearly defined, outlined with a faint penumbra which represents flesh, while the rings and bracelets stand out in black relief. One woman not satisfied with exhibiting the beauty of

the bones in her hand, has had her whole body X-rayed, and the full-sized bone portrait has been on exhibition at the Electrical Exhibition during the past two weeks. Comments on the thing varied according to the impressions of the spectators, but the consensus of opinion was that such displays are more repulsive than edifying.

* * *

THE Rev. F. F. Jernegan's process for extracting gold from the sea has again been heard from. This process, which is said to have been the result of a vision, is controlled by what is termed the Electric Marine Salts Company, whose present field of operation is at or near North Lubec, Me. This plant, by the force of electricity and the use of a "certain chemical," it is now claimed extracts gold and silver from the ocean at a net profit of \$100 a day. This alleged excellent showing should certainly be inducement enough for many of the simple-minded Puritans of New England to purchase stock, of which, of course, very little is to be had. This scheme, however, should, we think, be classed in the same category with the Electropoise, electric combs for turning hair from white to black, and with electric shoes which a firm in England has recently brought out.

* * *

IN a certain punctilious suburb, says the New York Evening Sun, they have recently set up a code of "telephone etiquette." Any one who has enjoyed the domesticated telephone knows the grievous uncertainty attached to such problems as, who shall ring off first, she who has been called up or she who has done the calling? What is the best form of greeting through the telephone? And in announcing one's self, is it proper to give the Christian name or the prefix Miss or Mrs.? All these and similar vexed questions the book of telephone etiquette assumes to answer satisfactorily. According to its code, the proper telephonic salutation when the caller-up is a man is "Hello!" When the caller-up is a woman it should be "Hallee!" In this way the sex of the inquiring individual is at once made clear. The prefix to the name should always be given, says the etiquette book. Remember that Central and crossed wires supply many opportunities for others hearing your conversation, and that to most such you are a woman with a prefix. It is treating them to too much familiarity to boldly belittle forth your Christian name. The etiquette book is very severe upon those who commit conversations of personal and private nature to the tender mercies of the telephone wires. Gossip it taboos in particular, though it admits that much of the spice of suburban society would be removed if this rule was followed. It is telephonic bad form for two women who do not visit to consult each other upon any matter over the wires. If they don't call they have no right to "call up." Several methods of terminating a telephonic interview are given, among others: "Well, I guess I'll say goodbye now—hm-m-m," "Well, my dear, I won't trouble you any longer: goodbye—hm-m-m," and "So sorry to have bothered you, but—hm-m-m," the indefiniteness of the final words being the artistic and inexorable point. The happy diplomacy of getting rid of an unwelcome telephonic guest by pretending that some person or something demands your attention elsewhere is not encouraged by the etiquette book, and is only to be resorted to in extreme cases. In all homes of the suburb, where the need of a code to define what was good and bad form over the telephone first made itself felt, the etiquette book hangs right beside the list of subscribers, and is not less used. "Still," observed a man on glancing through the book the other day, "I notice that it says nothing about the good or bad form of the things you say when you ring up a certain number twenty times, and are each time told that it's busy."

THE TWENTY-FIRST CONVENTION OF THE NATIONAL ELECTRIC LIGHT ASSOCIATION.

The Twenty-first Convention of the National Electric Light Association, which is to be held in Chicago on June 7, 8 and 9, and which unquestionably is the most important event of the year in electrical circles, should prove of great value from a technical standpoint as well as a most enjoyable social gathering. The papers to be read and topics that will be discussed at this meeting are of supreme importance, and owing to the presence of a large number of experts thoroughly conversant with these subjects, many knotty questions should be solved and much valuable information furnished to the electrical industry in general and the electric lighting field in particular.

tain the visiting members and unquestionably afford them a good time, without however interfering with the work of the Convention. As most of the Eastern delegates will arrive in Chicago on Monday, the 6th, it is proposed to hold an informal reception at the Association's headquarters in the Auditorium on the same evening, which will last from 8:30 to 10 P.M., with a view to having the visiting members meet and become acquainted with the local central station men and representatives of kindred industries. There will be music, and light refreshments will be served, and this informal gathering should go far toward breaking the ice and making the more formal meetings to be held on the following days all the more enjoyable.

Mr. Samuel Insull, who has so ably filled the position of President of the Association during the past year, has on behalf of the Chicago Edison Company, of which he is also president, extended a general

The ladies of the party, a large number of whom are expected, will be well cared for by the Committee on Arrangements, and in order that time shall not hang heavy on their hands while the Convention is in session, it is proposed to give two tally-ho parties, one on Tuesday through the South Park system, to be followed by a luncheon, and another on Wednesday which will take in the North Shore drive, Lincoln Park and the Sheridan drive. Providing the weather is not inclement, the party may go through Buena Park and even as far north as Evanston. It is thought that these coaching parties will prove very attractive and enjoyable.

The official programme of the Convention is as follows:

TUESDAY, JUNE 7.

Meeting of the Executive Committee at 9 A.M., Secretary's office, Auditorium Hotel.

AUDITORIUM HOTEL, CHICAGO, WHERE THE NATIONAL ELECTRIC LIGHT CONVENTION WILL BE HELD.

The final arrangements for holding the Convention have all been completed, and, thanks to the energy of the gentlemen having charge of these matters, the success of the gathering is assured. As we stated some time ago, the headquarters of the Association will be at the spacious and commodious Auditorium Hotel, which is beautifully situated, overlooking as it does the waters of the lake, and moreover has the advantage of being centrally located. The preparations that have been made for the reception and entertainment of the members are on a most elaborate scale. A committee of twenty-five has been appointed to act as a reception committee, composed of representatives of leading electrical interests in Chicago. These gentlemen will receive and enter-

invitation to manufacturers and agents having apparatus and supplies of any description in use in the Edison system to invite friends to inspect these products in actual operation. The Western Electric Company will also extend an invitation to members of the Association and other visitors to inspect their extensive factory during the Convention week, and the Chicago Telephone Company has placed the company's service at the disposal of the members of the Association during the Convention.

An extremely enjoyable feature of the Convention will be a ride on the lake, Tuesday evening having been selected for this entertainment. A steamer will be chartered and arrangements made for music. Refreshments will also be served during the trip.

Morning Session, 10:30 o'clock, Convention Hall, Auditorium Hotel.

Address of President Insull.

Paper—Calvin W. Rice, Brooklyn, N. Y. "Cost of the Generation and Distribution of a Unit of Electricity."

Topic—"Prices and Discounts for Electric Current and Methods of Billing Current to Customers."

Afternoon Session, 2 o'clock.

Paper—Alex. Dow, Detroit, Mich. "Public Lighting with Relation to Public Ownership or Control."

Topic—"Legislative Policy as to Public Service Corporations."

WEDNESDAY, JUNE 8.

Morning Session, 10 o'clock.

Paper—Herbert A. Wagner, St. Louis, Mo. "General Distribution from Central Stations by Alternating Currents."

Paper—Louis A. Ferguson, Chicago, Ill. "General Distribution from Central Stations by Direct Currents."

Topic—"Standardizing Apparatus for Central Station Use."

Afternoon Session, 2:30 o'clock.

Paper—W. McLea Walbank, Montreal, Canada. "Cost of Producing Electric Power by Water Power from Lachine Rapids, Canada."

Report of Committee on Standard Candle Power of Incandescent Lamps; Dr. Louis Bell, chairman.

SAMUEL INSULL,
President National Electric Light Association.

Questions and Answers—What is it you wish to know?

Executive session.

Evening Session, 8 o'clock.

Lecture—Joseph Wetzel, New York. "Electricity Direct from Coal" (illustrated with stereopticon).

THURSDAY, JUNE 9.

Morning Session, 10 o'clock.

Paper—Prof. Winder Elwell Goldsborough, Purdue University, Lafayette, Ind. "Transformer Economy."

Report of Committee on Amendments to Freight Classification; James I. Ayer, chairman.

Report of Committee on Legislation Concerning Theft of Current; James I. Ayer, chairman.

Afternoon Session, 2:30 o'clock.

Topic—"Freight Rates on Electrical Apparatus."

Report of Committee on Finance; John A. Seeley, chairman.

Executive session.

Election of officers.

President Insull, while in this city recently, stated that he expected an unusually large attendance, especially of central station managers. With the important papers which are to be read, there is little doubt but what the programme as outlined above will attract many practical men who will be anxious to participate in the discussions.

Shoreditch Destructor Plant.

At a recent meeting held in the Shoreditch Vestry, London, Mr. H. E. Kershaw congratulated the Electric Light Committee upon the success of the Shoreditch Destructor plant. During a period of nine months the total profits reached \$21,320, which, it is claimed, would be equivalent to a dividend of 6½ percent.

OPENING OF THE TRANS-MISSISSIPPI AND INTERNATIONAL EXPOSITION.

The Trans-Mississippi and International Exposition at Omaha, Neb., was formally opened shortly after 1 o'clock on June 1 by President McKinley amid the music of 50 bands and the cheering of 100,000 persons. Early in the morning on the day of the opening, special trains from all sections of the country began to unload their crowds, who, mingling with the citizens of Omaha, lined the route of the parade for ten miles. At 9:30 the great civic parade started from the center of the city toward the Exposition grounds, with the Marine Band from Washington in the lead. This parade was three miles long, being made up of the Exposition officials and their guests, city and State officials of Nebraska, Iowa, Illinois, Missouri, Kansas and Colorado, the civil and military societies and a large number of handsomely decorated floats. Upon the procession's arrival at the Court of Honor, and at a preconcerted signal given by Mr. G. W. Wattles, President of the Exposition, all the bands played "America" in concert. The Rev. Dr. Samuel J. Nichols of St. Louis then delivered the opening prayer, which was followed by short addresses by President Wattles, Mr. John N. Baldwin of Council Bluffs and Mr. John L. Webster of Omaha. The ceremonies at Washington were brief. Members of the Nebraska delegation in Congress assembled at the White House, accompanied by the ladies of their families, and were presented to the President by Representative Mercer. Some difficulty was at first experienced in getting a clear wire to Omaha, but shortly before 2 o'clock everything was in readiness and the President pressed the button which set in motion the machinery 1,500 miles away. The Nebraska delegation then withdrew and joined in a congratulatory telegram to the President of the Exposition.

President McKinley's telegram of congratulation, addressed to the Hon. G. W. Wattles, was as follows:

"The cordiality of the invitation extended to me to be present at the opening of your great Exposition is deeply appreciated, and I more deeply regret that public duties prevent me from leaving the capital at this time.

"The events of the memorable half century which the Trans-Mississippi and International Exposition commemorates are interwoven with the history of the whole nation and are of surpassing importance. The mighty West affords most striking evidences of the splendid achievements and possibilities of our people. It is a matchless tribute to the energy and endurance of the pioneer, while its vast agricultural development, its progress in manufactures, its advancement in the arts and sciences and in all departments of education and endeavor, have been inestimable contributions to the civilization and wealth of the world.

"Nowhere have the unconquerable determination, self-reliant strength and sturdy manhood of our American citizenship been more forcibly illustrated. In peace or in war the men and women of the West have ever been in the vanguard.

"I congratulate the management upon its magnificent enterprise, and assure all who participate in this undertaking of the deep interest which the Government has in its success."

The Exposition which has just been opened so auspiciously promises to be one of the most attractive ever held in this country. The electrical features especially have been given most careful attention and the Grand Court and Lagoon will be nightly illuminated by some 10,000 16 cp. incandescent lamps. These are clustered upon columns, 154 in number, located about thirty feet apart. The edifices are extremely handsome, especially the Machinery and Electricity building. The Lagoon and electric fountain, "Nautilus," will constantly be played upon by the rays from a number of search-

lights, which should add much to the beauty of the general illumination.

The electrical exhibits are numerous and are representative of the progress made in every branch of the industry.

OBITUARY.

Charles E. Emery.

We regret to have to announce the decease of Mr. Charles Edward Emery, who died on the morning of June 1, after a short illness, at his residence, 370 Gates avenue, Brooklyn. Mr. Emery was well known in electrical circles and was an active and prominent member of the American Institute of Electrical Engineers. He was born in Aurora, N. Y., and in 1861 entered the United States Navy as third assistant engineer and was assigned to the warship Richmond. He served under Farragut in all the operations on the Mississippi, and in 1862 was promoted to the position of second assistant engineer and participated in the blockade of Charleston. On his retirement from the Navy in 1867 he was made consulting engineer and for a time had charge of the construction of war vessels.

Mr. Emery was a high authority on electrical and mechanical subjects, frequently reading papers of importance before the American Institute of Electrical Engineers and other scientific bodies. Ten years ago he was awarded the Tilford prize for reading the best paper before the British Society of Electrical Engineers. Of late Mr. Emery has been practising as an electrical expert, with offices in the Bennett Building on Nassau street, New York. By the death of Mr. Emery the electrical profession loses a highly valued and esteemed member whose ability every one respected. He leaves a widow and a son to mourn his loss.

ELECTRICAL EXHIBITION.

The Electrical Exhibition, which has attracted thousands of persons to Madison Square Garden during the past few weeks, has now drawn to a close with satisfaction to every one concerned—managers, exhibitors and visitors. During the past week probably the greatest interest was centered in the Moore chapel. An Edison phonograph was recently placed at the altar by Messrs. William Edison and E. M. Smiles which repeats the Lord's Prayer, a Psalm and the Beatitudes. On Wednesday evening a marriage was consummated in this chapel, in the presence of a select audience, between Miss Jennie S. Gilmour of Brooklyn and Mr. Charles S. Merten, an electrician, of New York. The ceremony was according to the Presbyterian form, and the beautiful subdued light diffused from the vacuum tubes made the scene impressive and strange. With a view to making the wedding thoroughly electrical the bridal party drove over from Brooklyn in an electric automobile and returned by the same means. The music was furnished by the Edison phonograph. Next to the electrical wedding the theatrophone has probably been the greatest attraction. On Monday night a concert by the well-known Lauder Orchestra, which was being given in the Palm Garden at Milwaukee, was transmitted over the wire a distance of a thousand miles and plainly heard by a large number of auditors. Other long distance musical transmissions were effected with equal success. The many special features of interest which we have described in detail at various times during the past month continued to attract general attention while the Exhibition remained open.

The New York Electrical Exhibition of 1898 will long be remembered as probably the best show of the kind ever held in this country. The success of the Exhibition was unquestionably due to the good judgment, tact and untiring energy of Mr. C. O. Baker, Jr., president of the company, and Mr. Marcus Nathan, the general manager.

THE PREVENTION OF INTERRUPTIONS TO ELECTRICITY SUPPLY.*

BY LEONARD ANDREWS.

It is probable that some central station engineers will remark, on reading the title of this paper, that it is several years behind the times; that interruptions to the supply from a properly equipped modern station never now occur; that at their own particular stations the supply has never once been interrupted since it was started, etc.

It speaks volumes for the progress of electrical engineering during the past few years that there are several existing central stations that can show an absolutely clean sheet in this respect since their commencement, and everyone will agree that their engineers hold a very enviable position. It is very doubtful, however, if any one of them can say that they have not a consumer connected to their mains who has during the past 12 months ever had his supply disconnected; and, if that is so, surely there is still sufficient room for improvement to make the matter worth discussing. After all, it is these local interruptions that are so irritating to consumers. Our experience has been that we get far more abuse from a consumer whose lights fail when his neighbor's lights are burning satisfactorily than we do if they are both suffering together.

Some of the engineers who have achieved such an excellent record attribute their immunity from failures to the fact that they use fuses made of copper of the same sectional area as the mains. There can be no doubt that a large majority of the interruptions that do occur are caused by fuses blowing when they have no business to do so. Yet it does seem rather risky to use no safety devices at all. We have already heard of more than one case where an arc of a few thousand horse power has been started under the pavement, and would not be quieted until the supply had been switched off from the works. On the other hand, when one remembers upon what a number of fuses the continuity of an average consumer's supply is dependent, it is really wonderful that he is not more often left in darkness. It is no exaggeration to say that there are often from 15 to 20 fuses between the generators and the lamps they supply. Is it, then, to be wondered at that we are so often told that electricity supply is not to be relied upon? It would be different if we could always depend upon fuses blowing at approximately the current they are set for. But we cannot. It is no uncommon case to take two similar fuses that have been in use for some months and find that one requires about 100 per cent. more current to blow it than does the other. The fuses used on alternate-current circuits appear to be particularly erratic in this respect.

The London Electrical Review drew attention to this fuse trouble in one of its leading articles a few months ago. Still more recently, Mr. W. B. Sayers, in an article in *Lightning* on the subject, says:

"In a city less than 100 miles from where I live there is an electricity works which, so far as I am aware, has not failed to maintain its supply for a single minute during the last four or five years; and yet the popular belief that the 'electric light is not reliable' is maintained to this day, and with good reason. . . . Now the only proper cause, in my opinion, for a main fuse 'blowing' is a short-circuit on the mains, and yet I have no hesitation in saying that less than 1 per cent. of the cases of main fuses 'blowing' are due to this cause."

The conclusion that we have come to at Hastings is that the only reliable conductor of electricity appears to be a copper cable; and, consequently, it seems advisable to reduce all fuses, switches, safety devices, and mechanical connections of any description to a minimum.

If any fuses that it is customary to use can be

omitted, every one will admit that they are a source of danger, and, consequently, better omitted. Take, for instance, the fuses between alternate-current generators and the bus-bars: what are they used for? They cannot be necessary to protect the machines from being overloaded, because all modern makers claim that their machines may be short-circuited with impunity. Presumably they are intended to prevent a generator that fails short-circuiting other machines working in parallel with it; but everyone knows that if two or three machines of an equal output, and equally fused, are working together, it would be the fuses of the healthy generator that would blow, and not those of the faulty

FIG. 1.

one, because the former have to carry sufficient current to blow the latter, in addition to all the useful work on the mains at the time.

Now what should we think of an omnibus driver who cut the traces of one of his horses because it attempted to do more than its share of the work, or who, when one of them fell down dead, made the remaining horse drag the dead one along in addition to the extra work thrown upon it by the decease of its comrade? This sounds absurd, but it practically represents the manner in which we alternate current station engineers have been educated to treat our machines; for are we not taught carefully to equip them with safety devices to cut them out of circuit just at the time when all their energies are required to burn out a short-circuit on the mains, whereas any device to prevent a failing machine from short-circuiting others is considered quite an unnecessary piece of apparatus?

In continuous-current stations zero out-outs, or

FIG. 2.

discriminating out-outs, are generally used in preference to excess-current out-outs—the word "discriminating" being used to designate a out-out that operates only when the current is flowing through it in a reverse direction to its normal.

Magnetic out-outs of any description have not hitherto been looked upon with much favor in this country. The majority of those now in use require too careful and delicate treatment to be popular. Only people who have attempted to design a simple

and trustworthy discriminating out-out can realize the number of difficulties that have to be overcome in doing so. It is easy enough to make an apparatus that will operate under certain specific conditions in the workshops, but it is a very different matter to construct a out-out that can be relied upon to open the circuit of a failing generator with a very small return current, and that can be guaranteed never accidentally to operate at any time when it is not required to do so. In the first place, the sectional area of the winding must be large enough to carry the maximum current of the generator without undue heating; at the same time the apparatus must be small and compact, consequently the turns must be few; and, finally, it must operate with a return current of only a small percentage of the maximum current, therefore the ampere-turns or magnetizing force must be small. This generally involves the use of delicate releasing mechanism or relays, which require careful treatment, or they will operate at the wrong time, and not when a failure occurs. These are only workshop difficulties. The more serious are those which confront us when the apparatus is in use under actual working conditions.

Take, for instance, the case of zero magnetic out-outs. Everyone knows that these can be made to operate only when the current falls below a predetermined amount; and yet it is also well known that if a short-circuit occur on a system of mains supplied by a number of generators equipped with zero out-outs, several of the generators will be promptly cut out of circuit. This is simply a specimen of the many troubles which it is impossible to foresee and guard against in the manufacturer's workshop.

Between three and four years ago we realized that a reliable discriminating out-out was badly wanted, and since that time considerably over 100 different combinations of compound windings and releasing mechanisms have been experimented with. Many of these have only reached the experimental stage, but a fair proportion have had several months' actual use under working conditions before some unforeseen difficulty made it necessary to scrap them for some new and improved arrangement. The result has been that we have at last been able to secure a out-out that appears to be perfect.

It appears at first sight impossible to design a satisfactory discriminating out-out for use in connection with alternate-current machines in which the current is reversing in direction some thousand times a minute. So long as one considers these reversals in relation to a constant polarity, it is, of course, impossible; but as soon as the direction of the current through a particular machine is considered relatively to the direction of the current in all other parts of the system, the problem becomes a comparatively simple one. Fig. 1 illustrates diagrammatically what we have found to be the most satisfactory method of applying this principle. The operating device in this arrangement is practically a shunt-wound motor, the thick winding of which is connected in series with one of the leads from the alternator it is intended to control, and the shunt winding is connected across any transformer excited off the bus-bars. Now it is obvious that the direction of the current in the shunt winding, SH, will pulsate synchronously with the current in the bus-bars, and will be quite independent of the direction of the current in the series winding, SE, whereas the direction of the current in the latter relatively to the current in the bus-bars will depend upon whether the machine to which it is connected is generating current or is being driven as a motor. If both machines are generating current, then the direction of the current throughout the whole system at a given moment will be represented by the arrow-heads shown full. But if, say, alternator D₁ fails, it will tend to short-circuit the rest of the system, and the current will rush back into it in the direction shown by the dotted arrow-heads, whereas

* Paper read before the Institution of Electrical Engineers, London, Eng., May 5, 1908.

the direction of the current in the other circuits will remain the same. In the former case the relative direction of the shunt winding to the series winding in the out-out device will be such as to tend to make the armature rotate in a clock-wise direction, and so to lock the switch securely; but when, as in the latter case, the direction of the series current relatively to the shunt current is reversed, the arma-

FIG. 3.

ture will rotate in a contra-clockwise direction, and so open the circuit.

Fig. 2 is a sectional elevation of a mechanical application of this principle to a low-tension out-out suitable for use with continuous-current generators, transformers and low-tension mains. The weight, W, is held in a nearly vertical position by the catch, C. Attached to the catch is a lever, L, the free end of which engages in a pin projecting from a metal disk on the end of the armature, S H. The series winding, S E, consists of a few turns of thick copper tape wound directly around the armature. One end of this is sweated and riveted directly on to a brass plate screwed and sweated to one of the contacts, and the other end is sweated on to a thimble, T (Fig. 3), which forms one of the series terminals. The other series terminal is screwed and sweated directly on to the second contact. The whole of the series connections and contacts are supported on three corrugated porcelain insulators sulphured into the base. Fig. 3 shows these series connections removed from the rest of the out-out. This series winding encloses a practically closed double magnetic circuit consisting of the armature core, a portion of the base, and the cast-iron covers. For alternate-current working these parts are, of course, laminated.

An important feature of this out-out is the releasing catch. This is shown in detail in Fig. 4. The pin, P, is fixed in such a position on the armature

FIG. 4.

disk that an extension of the arc described by the lever, L, will cut the pin P and the center of the armature disk. The result of this arrangement is that no amount of vibration or pressure applied to the weight W will tend to make the disk rotate in either direction. And consequently when the armature is rotated by a return current it releases the

weight without having first to lift it, as it would have to do with any other form of catch. We find this an absolutely reliable and extremely sensitive form of release.

When the weight W is released it falls through an angle of about 60 degrees, then with a sharp blow it strikes the arm carrying the contact connecting piece, thus overcoming any sticking of the contacts due to a good fit or to corrosion.

A specimen of 500-ampere out-out of this description is shown on the table. You will see that it is so reliable that, even when there is no forward current on to lock it in position, it may be knocked about with a mallet to show that no amount of vibration will release it, whereas it is so sensitive that the pressure of a feather upon the armature will do so.

The same general arrangement without any winding on the armature makes a very sensitive and reliable excess-current out-out.

Fig. 5 is a sectional elevation of a similar out-out modified for use in connection with high-tension currents. In this arrangement the contacts are screwed and sweated into metal pots, and immersed in water. This serves effectively to quench any tendency to arcing when large high-tension currents are interrupted. All the high-tension parts in this out-out are entirely covered with porcelain or other

FIG. 5.

insulating material. The releasing mechanism is practically the same as in the low-tension out-out.

Fig. 6 is a diagram of the Hastings switch gear. We have found this arrangement entirely satisfactory in every respect. It has not only enabled us to cope with several breakdowns to machinery without interruptions to the supply, but it has also effected a saving in coal, etc., during the past 18 months of over £400. This has been saved by the arrangement referred to enabling us to work safely without running a spare plant.

All the machines are arranged to feed into a common pair of inner and outer bus-bars. The inner bus-bar, however, is divided at A, by a change-over switch, C, into two separate branches. One of these, A₁, is permanently connected to A, but the other branch A₂, may be connected either to the main bus-bar or to a spare bus-bar, B. Normally it is connected to the former. Each machine and circuit is equipped with a two-way switch, T, by means of which any machine or any circuit may be connected either to the inner bus-bar or to its auxiliary branch. In the diagram only three circuits and three machines are shown. The maximum output of the machines is 60 amperes, and the total load of the three circuits is assumed to be 120 amperes—namely, 60 on No. 1, 40 on No. 2 and 20 on No. 3. By setting the circuit two-way switches, T₂ and T₃, over to the left, circuits 2 and 3 are connected directly on to the A₁ branch of the inner bus bar; whereas, T₁ being set over to the right, circuit 1 is connected on to the A₂ branch. The machines Nos. 2 and 3 are connected in parallel by their two-way switches directly on to the inner bus-bar, A. And the machine No. 1 is kept turning as a spare, with its two-way switch over to the right, thereby connecting it on to the

spare bus-bar, B. The change-over switch C is constructed to be released by a solenoid excited off any convenient source, E. Inserted in series with it are two switches, S and L₁, L₂ or L₃. Both the S and one of the L switches must be closed together to excite the solenoid. When S only is closed it completes a circuit through an electric bell, which can be heard anywhere in the station. The driver has

FIG. 6.

instructions that whenever that bell rings he must immediately run the spare plant up to speed. Now, if either of the running plants break down, the switchboard attendant merely has to close switch S, and then as soon as the volts on the spare machine have risen to normal, or before if necessary, he releases the out out switch of the faulty machine. The weight of this on falling closes switch L₁, and so completes the circuit through the solenoid of the releasing change-over switch C. This disconnects the bus-bar A, with its load of 60 amperes from the inner bus-bar A, and transfers it to the spare bus-bar

DETAILS OF ONE SECTION OF FIG. 6.

B at precisely the same moment as the generator supplying 60 amperes is disconnected from the inner bus-bar. Thus the lights on the circuits Nos. 2 and 3 are not affected as they would be if the change-over were not done simultaneously with switching out the faulty machine; and the lights on No. 1 circuit only give a momentary flicker, which, as a rule, is not even noticed by the consumers.

Of course the use of a spare bus-bar is not original,

but we believe that the simultaneous method of change-over is.

In the discussion on a paper read before the Northern Society of Engineers on switch gear last year, it appeared to be the general opinion of engineers present that all high-tension connections should be absolutely enclosed. But it was objected that it did not appear possible to do so without having exposed connections at the back of the board, and boards with backs to them increased rather than decreased the risk of accidents. A suggestion was also

FIG. 7.

made in this same paper that a full-sized diagram of connections painted on the walls above the switch gear would often prove useful, but other engineers thought that the switch gear should be its own diagram. We venture to think that in the switch gear shown in Fig. 6 we have succeeded in complying with both of these specifications. The leads from the machines are carried in porcelain or other insulating pipes directly up to their respective out-outs, from these to the two-way switches via their ammeters, and so on to the bus-bars. All the high-tension connections, both in the out-out switches and the two-way switches, are entirely enclosed; and, as these switches and the conductors are bolted and clipped to the surface of a brick wall, all the connections are diagrammatically shown at a glance.

Some form of excess-current out-out should certainly be used on the feeders. We prefer magnetic out-outs to fuses, as we find them more reliable. They can also be used as switches if necessary, which is a distinct advantage. At any rate, whatever form of out-outs is used, their operation should on no account be permitted to interrupt the supply to any consumers.

It is curious that engineers have not paid more attention to the duplication of electrical mains. It is the custom to spend thousands of pounds on duplicating boilers, engines, dynamos, and other plant which is directly under the engineer's control; but no steps are taken efficiently to duplicate that part of the system over which he has no direct control, and which is always at the mercy of such external forces as gas explosions, burst water mains, fires, pick-holes, etc.

It is true many engineers arrange their mains on

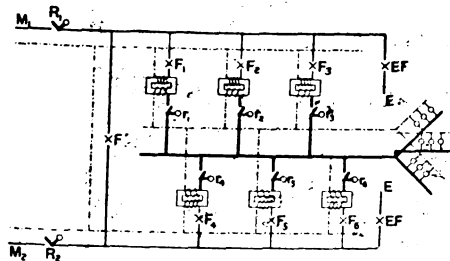

FIG. 8.

some ring system, so that any portion of it may be made dead for repairs, extensions, etc.; and some go even further, and fix fuses at intervals round the ring, so proportioned that a fault will only out out a certain section of the lights. But that is not sufficient. We ought not to be satisfied until we are able to guarantee an absolutely constant supply to everyone. The problem of how to do this has been troubling us at Hastings for years. But we now

feel satisfied that we have solved it. Our method of doing so is shown in Fig. 7.

Each sub-station or feeding point is supplied from the works, W, by two feeders, either by running to each two distinct mains, each sufficiently heavy to carry without excessive fall of pressure half the load of the sub-station, as shown at A, or by connecting together two sub-stations, each supplied by separate feeders, as at B; or, in the case of low-tension distribution, by running radial feeders from the generating station, and connecting the several feeding points on these to corresponding feeding points on an adjacent feeder by the distributing mains, as shown at C. If a fault occurs on either of these feeders, the current will be supplied to it both directly from the generating station and also via the adjacent feeder and connecting mains. To prevent this fault from short-circuiting the whole of the system, fuses have previously been inserted in the feeders at a_1, a_2, b_1 and b_2 . A little consideration will show, however, that this arrangement can never be satisfactory, for it is obvious that either one of these feeders may at any time have to carry as heavy a current as the others; consequently, they must all be equally fused. Now, if a short-circuit occurs at, say, E, fuse a_1 will blow. The current will then be

FIG. 9.

supplied via a_1, b_1 and b_2 . Now fuse b_2 should, of course, blow, and so out out the faulty main, leaving both sub-stations to be supplied via feeder 1. But this will not happen, because a_1 and b_1 would have to carry sufficient current to blow b_2 , in addition to the useful current taken by the sub-stations. The result will naturally be that a_1 or b_1 will invariably blow before b_2 , thus cutting off the lights supplied by both feeders. Now, if fuses b_1 and b_2 are replaced by discriminating out-outs, no amount of current flowing in its normal direction will cause them to operate, but a comparatively small return current will immediately release them. As the only conditions that can possibly cause the current to flow back from the sub-stations to the generating station is a fault on the feeder between these points, this form of out-out can be relied upon to operate only when it is required to do so.

It is, of course, very essential that the out-outs used for this purpose should be made not to operate if either the series or shunt current is interrupted

separately or simultaneously, as it would cause a great deal of trouble if the supply from the works was ever interrupted for a few seconds and all the out-outs on the mains were thereby caused to operate.

Cut-outs that are opened with a spring or springs should also be avoided, as it is impossible to make them sensitive and reliable, owing to the fact that the catch has to be released against the maximum tension of the springs; and further, these springs must be very stiff, as in addition to overcoming the friction of the contacts when they are clean, a large margin must be allowed to overcome the increased friction that will certainly be caused by corrosion of the contacts after they have been in, say, a few months. A falling weight seems much better suited for the purpose than a spring, for the pressure on the releasing catch is comparatively small, and the sharp blow upon the contact arm is just what is required to overcome with certainty any tendency to sticking due to corrosion.

Cut-outs should have no screws about them liable to work loose and so release the catch and open the circuit.

For burying under the pavements they should be as compact as possible, as the space is then very limited.

They should also be unaffected by rust, dust, damp or corrosion, and precaution should be taken to prevent any possibility of their being caused to operate by external vibration. They should be made to cut out with as small a current as possible, to prevent excessive arcing when the circuit is interrupted.

The out-out illustrated in Fig. 5 has been designed to comply with these and other requirements.

Another very frequent cause of local interruptions is the failure of primary fuses of transformers. It certainly appears to be advisable to use some form of excess-current out-out between the primary winding of transformers and the mains supplying them. But the object of this out-out should be, not to prevent the transformers from being overloaded, but to protect the mains from being short-circuited by a faulty transformer. Where two or three transformers are coupled together no good can come of cutting one of them out of circuit because it is overloaded, for if one is cut out the extra load is thrown upon the others, thus invariably blowing their fuses as well and cutting off the supply to the whole district.

We consider that a transformer fuse should not blow unless the excess current exceeds the normal current by about 300 per cent.

Fuses between the secondaries of transformers and secondary bus-bars are invariably worse than useless. Take, for instance, the case of three transformers of equal size feeding a common bus-bar. If one of these fails, the current will rush back into it from the other two; but, as these have to supply the useful current to the mains, in addition to that required to blow the faulty transformer's fuse, they will blow their own fuses before that of the faulty transformer. Obviously these fuses should be replaced by discriminating out-outs.

Fig. 8 is a diagram showing the equipment of a sub-station we now have in hand. The two high-tension feeders from the generating station, M_1, M_2 , terminate in two return-current out-outs, R_1 and R_2 . Beyond the out-outs they are connected together by the fuse F . Fuses F_1 and F_2 , etc., are inserted in series with the primaries of each transformer. Return-current out-outs, r_1, r_2, r_3 , etc., are inserted in series with the secondaries of each transformer. The primary connections of the sub-station are divided into two distinct halves; the inner bus-bar of each half is equipped with an earthing fuse, EF . Any man found working on the primary connections of either side without the earth fuse inserted will be instantly dismissed. Either half sub-station can, of course, be made dead by opening the return-current out-out of the feeder to which it is directly connected

fuse F, and the secondary return-current out-outs of that side.

There are no high-tension connections exposed in this sub-station. The primary out-outs are of the type illustrated in Fig. 5. The fuses are also of an enclosed type, and are screwed to two cast-iron frames—one frame for each half of the station. A section of these frames is shown at G, Fig. 9. The bus-bar, B, to which the transformer fuses are connected, is supported on insulators inside this frame. These frames are hung on hinges, H, so that they can be lifted to enable the connections to the fuses to be periodically examined. High-tension cables are run down to the transformers in porcelain tubes, P, clipped to the walls. The high-tension apparatus for one half of the station is on the north wall, and that for the other is on the east wall. The low-tension return-current out-outs, which also serve as secondary switches, are on the south wall, and the distributing bus-bars and instruments are on the west wall. This sub-station is a building 12 feet long by 8 feet wide by 7 feet 6 inches high. It is built above ground in a back garden in the center of the district it supplies. We pay £10 per annum for the rent of the ground it stands upon.

Several of our existing sub-stations are placed under the pavement. These have been such a source of trouble to us that we are now abandoning them entirely.

Arrangements are made to cut off all the transformers except one small one during the hours of light load, not only for the purpose of saving the current wasted in exciting them, but also to allow them to cool down between each heavy shift. We expect by so doing to greatly increase the life of our transformers.

Whether it is advisable to equip the low-tension distributors with out-outs or not, is a question upon which we should be glad to hear the opinion of other engineers. We are inclined to think that, if a 200-volt short-circuit occurred on a cable not exceeding 1 square inch sectional area, it would in most cases burn itself out before it damaged other parts of the cable. If we could be sure of this, we should endeavor to loop all of our distributors and insert in series with each main a magnetic out-out adjusted to operate when the current exceeded five times the normal. If the main burnt asunder before the out-outs operated, the supply would not then be interrupted to any consumers.

Presumably everyone will admit that excess-current out-outs are necessary on electric light services where they enter consumers' premises, but we think the majority of central station engineers will agree with Mr. Sayers, that they should not operate until the normal current has been exceeded by at least 300 per cent. Is it not possible that the number of branch out-outs at present used to comply with the fire insurance regulations might be reduced? It appears to us to be rather a question whether or not so many of these out-outs do tend to reduce the risk of fires. Consumers who are repeatedly troubled by these branch fuses melting are apt to discover that a fuse replaced by a stout piece of copper wire gives them far less trouble. Now, if the connection to one of these short-circuited fuses should work loose, it gets hot, the heat is transmitted to the cable and a smell of burning is the result. Of course, if no branch fuses were used, it would be advisable entirely to enclose the house wiring in some form of fire-proof conduit instead of in wood casing; but we are inclined to think this would be a preferable arrangement both for the prevention of interruptions to the supply and for the reduction of fire risks.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE ELECTRO-CHEMICAL INDUSTRIES OF ENGLAND.

ARTICLE II.

(Specially Contributed by JOHN B. C. KERSHAW, F. I. C., London.)

The British Aluminium Company's Works, Foyers, Scotland.—This company shares with the Acetylene Illuminating Company the only large water-power yet developed in the British Isles for electro chemical or electro-metallurgical operations.

The company was formed in 1895, with a nominal

work was commenced at Foyers in July, 1895, and the manufacture of aluminum at Foyers commenced in June, 1896. The power available at this spot has been gradually developed; the hydraulic engineering works and generating plant have been recently completed, and 3,500 HP. is now produced at the turbine shafts for conversion into electrical energy. The current produced is divided between the two manufactures carried on at this spot—aluminum and calcium carbide; but the writer has not been able to ascertain the proportion of the total power which has been used for the aluminum manufacture. The process used is that of Herault, and differs from that

VIEW I.—THE DEPOSITING VATS, WIDNES WORKS, ENGLAND (BOLTON & SON'S COPPER REFINERY). share capital of \$1,440,000 of which \$480,000 represents shares issued to the vendors of the patent rights. There have been two issues of debenture

of Hall, worked at Niagara by the Pittsburg Reduction Company, only in unimportant details. There are five 10 feet turbines in position, each capable of

VIEW II.—GENERATING PLANT, WIDNES WORKS, ENG., 300 KW. (BOLTON & SON'S COPPER REFINERY).

representing \$480,000, and mortgages have been raised equal to \$177,600, so that the total liabilities of the company are at present \$2,097,600. The company possesses a bauxite mine at Glenravel, Ireland; an alumina works at Larne Harbor, also in Ireland; a power plant and reduction works at Foyers, Scotland; rolling mills at Milton, England, and a carbon factory at Greenock, Scotland. The construction

developing 700 HP. with the 350 feet head of water under which they work. The armatures of the dynamos are keyed on to the same vertical shaft; each weighs 14 tons. Three more sets of generating machinery are to be added to the present five; this addition will bring up the power available at Foyers to 5,600 HP.

The profits made since the commencement of man-

manufacture in June, 1896, have enabled this company to pay dividends on its preference shares up to the end of 1896—5 per cent. for 1895 and 3½ per cent. for 1896.

The views shown represent the depositing vats at the Widnes Works and the generating plant at Foyers. Further details concerning this manufacture will be found in the issue of *ELECTRICITY* for December 8, 1897.

Messrs. Bolton & Sons' Copper Refineries at Froghall, Staffordshire, and at Widnes, Lancashire, England.—Some details of these refineries, the former of which is the largest in Europe, were published in the article upon Electrolytic Copper by the present writer in the issue of *ELECTRICITY* for November 17, 1897. This firm possesses, in addition to its two

in size to those used at Froghall. Belt-driving is resorted to (see View II); the capacity of the generating plant is 300 kw.; 350 tons of copper per month can be deposited at this works, and the combined capacity of the two works is therefore 1,050 tons per month, or 12,000 tons per annum.

THE TEMPERATURE OF INCANDESCENT LAMPS.*

I have already described† a purely electrical method of measuring the temperature of incandescent lamps, and more generally of any radiating body whatever. This method consists in studying: (1) the variation in the resistance of the lamp as a function of the difference of potential at the termi-

meter and a voltmeter and presented no difficulty; the subsequent ones were more difficult; they were carried out in the following manner:

A special interrupter enables the following operations to be performed:

1. At the time zero, the current of the lamp is broken.

2. Immediately after, the lamp is introduced into an auxiliary circuit including an accumulator and a resistance box.

3. At the time t , an instantaneous contact brings the two terminals of the lamp into connection with the plates of a condenser.

4. This condenser is discharged through a ballistic galvanometer. These various operations are executed by a slide which moves in a direction parallel to itself between two grooves; the intervals of time are measured by a tuning-fork which inscribes its vibrations on smoked paper; it is evident that at these high temperatures the cooling is very rapid, and that it is necessary to be able to measure accurately fractions of a second. A simple calculation then enables us to find the resistance of the lamp at any given moment.

The experiments were carried out on four lamps, A, B, C, D, of 65 volts and 10 candles. I will call t the temperature, R_0 the resistance of the lamp to the ordinary temperature, R_t its resistance to t° , p the weight of the filament expressed in milligrams, E the tension at the terminals. These are the results obtained:

Lamps.	E	p	R ₀	$\frac{R_t}{R_0}$	t
A	65	6.3	175	.53	1,720°
B	65	5.35	170	.54	1,810°
C	65	5.2	170	.52	1,830°
D	65	4.8	170	.53	1,620°

We see that the results relating to the lamps B, C, D are very similar; the lamp A, for some reason or other, gives a somewhat higher temperature.

However this may be, the above results are of some importance when we consider the differences in the figures of the various writers that have treated this subject. H. F. Weber, in fact, mentions these temperatures as hardly exceeding 1,300°, whereas M. le Chatelier gives 1,800°.* It will be seen that our results more nearly approximate to the latter estimate, especially as we have reason to think that our lamps were less over-run than those of M. le Chatelier; these are the variations of resistance given by him:

t	R ₀
15°	1.00
700°	.75
1,000°	.66
1,400°	.57
1,800°	.49
2,100°	.44

At the temperature of normal working, the ratio $\frac{R_t}{R_0}$ was .49 for M. le Chatelier's lamps, whereas this same ratio attained to .53 in our experiments; now, at this value .53 corresponds exactly to the temperature of 1,600° in M. le Chatelier's table.

The principal cause of error in the above experiments lies in the light weight of the filament; it would be easy to remedy this by working with low voltage lamps. We can, in fact, easily show that, with an equal lighting power, the weight of the filament of a lamp varies in inverse proportion to the two-third power of the difference of potential at the terminals.

From the above experiments we can deduce curves of the variation of the total radiation as a function of the temperature, but this question is too important to be entered upon here.

* *Journal de Physique*, 2d series, Vol. I., p. 208.

VIEW III.—THE GENERATING PLANT, 3,500 HP. (BRITISH ALUMINIUM CO.'S WORKS, SCOTLAND).

refineries, wire-drawing mills at Oakmoor and Birmingham, and rolling mills at St. Helens, and is the largest producer of telegraph and telephone wires in the country.

At Froghall there are four sets of Corliss valve triple expansion condensing engines working under 150 lbs. steam pressure. These engines each drive two 75 kw. dynamos of the Elwell-Parker type, and the total output of the generating plant is thus 600 kw. Rope-driving is resorted to in this works, and neither the engines nor the dynamos can be considered of the best modern build and design. There are a large number of vats at Froghall worked in series of from 60 to 70 vats; 700 tons of copper per month is the maximum capacity of the plant, but a portion of it is used for other depositing work.

At Widnes there are two Galloway engines, each of which drives two Elwell-Parker dynamos similar

nals; (2) the variation, as a function of the time, in the resistance of a lamp which is cooling. From this we can easily deduce the curve of the watts radiated as a function of the time, and consequently the total number of joules or small calories given off by the lamp. The filament is then weighed, and from M. Violle's formula:

$$Q = .355 t + .00006 t^2$$

we deduce the temperature t (assuming that the filament is made of pure carbon).

This method was applied, under my directions, by Messrs. Gindre and Fréau-Ozeune, then pupils at the Ecole Supérieure d'Electricité†; the first measurements were taken with the aid of an ampero-

* Note presented to the Académie des Sciences, March 7, 1898. From the *Electrical Review*, London.

The experiments were made at the Central Electrical Laboratory.

LEGAL NOTES.

Some time ago the city of Atlanta, Ga., passed an ordinance to regulate the rate of fare to be charged by the Atlanta Street Railway Company. The Old Colony Trust Company of Boston, as trustee for the bondholders, brought suit against the city of Atlanta seeking to enjoin the city from enforcing the order, claiming that the ordinance was unconstitutional. The case was tried in the United States Circuit Court at Atlanta, and a decision was given in favor of the Old Colony Trust Company and against the constitutionality of the act. The city of Atlanta took an appeal. The Circuit Court of Appeals at New Orleans has just sustained the decision of the Circuit Court at Atlanta, thereby establishing the fact that the city cannot by ordinance regulate rates of fares so as to interfere with the profitable operation of the road. The injunction is perpetual.

On the 25th ult., at Pittsburg, Pa., a verdict of \$18,250 was given in favor of Alexander R. Todd, in the damage suit brought by him against the Second Avenue Traction Company. The plaintiff was a baggage master in the employ of the Pittsburg, Ft. Wayne and Chicago Railway Company. The accident in which he was hurt occurred April 8, 1897. A traction car in charge of a motorman and a dispatcher reached the railroad crossing and was stopped in order to allow a train that was coming along the Ft. Wayne tracks to pass. At that time the dispatcher of the trolley car was examining the controller on the car, and when through with his examination, he is alleged to have turned to the motorman and saying: "The car is all right. Turn on the power." The motorman, it was alleged, reached up and turned on the power and the car immediately shot forward, breaking through the safety gate of the railroad company, which had been let down to warn all approaching vehicles and people, and crashed up into the rear car of the Ft. Wayne train, a baggage car in which Baggage Master Todd was standing. The force of the blow crushed in the side of the train, and threw Todd, who was a very large, strong man and in perfect health, across the car against a steam register. Two of his ribs were broken close to his spine, and he received internal injuries to the spine from which several physicians testified he will never recover.

THE NEWS.

What Is Going On in the Electrical World.

LIGHTING PLANTS.

Alaska.—The Alaska Light & Power Company has installed a first-class electric light plant at Skagway and the streets of that place are now so well illuminated that all the outside fun is visible. The company was organized at Tacoma, Wash., and the officers are: President, C. B. Hurley; secretary and treasurer, Chester Thorne; general manager, W. G. Gaston.

Algona, Ia.—Among contemplated improvements in this town during the present summer and fall, is the establishment of an electric lighting system.

Baton Rouge, La.—A bill has been introduced in the Legislature to authorize the town of Ruston to issue bonds to the amount of \$50,000 for electric lights, waterworks and a street railway.

Binghamton, N. Y.—The board of supervisors has passed a resolution authorizing the county treasurer to borrow \$3,500 to be applied by the building committee to the purchase of electric light fixtures for the new Broome County Court house.

Brooklyn, N. Y.—Bids were opened on the 31st ult. by Henry S. Kearney, Commissioner of Public Buildings, Lighting & Supplies, for street lighting in the borough of Brooklyn. The lowest bidder was the Kings County Electric & Illuminating Company. Five bids were submitted by this concern, one for the entire borough and four others for the sections. The prices were all the same, namely, 30 cents a night for each 1,200 cp. arc lamp, 35 cents a night for each 2,000 cp. arc lamp, and 14 cents an hour an ampere for incandescent lights. The other bidders were the Edison Electric Illuminating Company, the Citizens' Illuminating Company and the Mutual Electric Light Company.

Covington, Va.—The Mayor may be addressed concerning erection of an electric light plant.

Denver, Col.—The Lafayette-Louisville Electric Company, recently incorporated, intends to introduce into the Northern Colorado coal fields a new plan for

lighting the mines, substituting electric lamps for the dangerous and malodorous oil lamps now in use by the operators.

Des Moines, Ia.—The "Leader" says: "It is generally understood that the McCaskey & Holcomb Company stands ready to commence work on its contract for the erection of the city lighting plant as soon as Judge Bishop rules on the motion to dissolve the injunction, provided the ruling is favorable to the city and without waiting an adjudication by the Supreme Court. Correspondence has been had to this effect and the contractors have said that if work is commenced the plant can be rushed through to completion this year."

Dubois, Pa.—The plant and franchise of the Dubois Electric Light, Power & Heat Company were sold at trustee's sale on the 28th ult. for \$5,000.

Fenton, Mich.—The sale of the electric light plant for \$7,000 by the receiver of the defunct State Bank, which included the plant among its assets, was contested by a large number of the depositors, who applied to the court for and obtained a hearing. While this was under way, a telegram from A. S. Hatch of Detroit, was received offering \$7,600 for the plant. The court, Judge Wisner, then ordered that the plant be readvertised for sale, and that bids be received until June 29 next, to be opened in court the day following. F. L. Thompson, the first buyer, will fight the action in the courts.

Freeport, L. I.—The people of this village celebrated the introduction of electric light on the night of the 28th ult. There was a grand parade of firemen and citizens and a fine display of fireworks. The plant was constructed at a cost of \$20,000. There are 100 arc lights of 1,200 c.p.

Hammonton, N. J.—A movement is on foot to light the Atlantic County Road from Hammonton to Egg Harbor by electricity.

Kaukauna, Wis.—At an adjourned meeting of the council the committee to which was referred the matter of electric street lighting made a unanimous report that the franchise let to the Kaukauna Electric Light Company, and for which they hold a ten-year contract to furnish arc lights, was null and void, for the reason that it had been illegally passed.

Lexington, Ill.—The electric light plant, which has been in litigation for some time, has been sold by order of the court. Capt. F. J. Fitzwilliam and J. T. Roney, two of the original stockholders, bid in the property for \$6,000.

Los Angeles, Cal.—There is some agitation here in favor of putting in a municipal lighting plant, and the council is disposed to call an election for the purpose of ascertaining the sense of the people on the question.

Louisburg, N. C.—The Louisburg electric light plant has been purchased by J. P. Winston who will place the same in operation.

North Tonawanda, N. Y.—The board of aldermen has provided for a special election to be held here on the 17th inst. to vote on a proposition to raise \$15,000 for street lighting purposes.

Philadelphia.—The "Stockholder" says: "Revival of the proposition to establish a municipal electric lighting plant in Philadelphia is not regarded with special concern by the leading interests in the companies which now furnish the city with lights. As the lighting service at present furnished is quite satisfactory, and relatively reasonable in price compared with that of other cities, it is altogether probable that the project will be permitted quietly to expire in committee."

West Superior, Wis.—A satisfactory understanding with the lighting company having been reached, the city has decided not to put in its own electric lighting plant.

STREET RAILROADS.

Baltimore, Md.—The car barn of the Baltimore Consolidated Railway at Irvington was destroyed by fire on the 29th ult.; 130 cars were burned. The loss is about \$260,000.

Brooklyn, N. Y.—The passenger traffic of the trolley roads in this city on Memorial Day was the largest in the history of the various roads. The number of fares taken in aggregated over 1,000,000. The receipts on the Brooklyn Heights system amounted to \$27,140 and they were correspondingly large on all the other roads.

Doylestown, Pa.—The first railway car propelled by electricity that ever entered Doylestown within its more than a century of existence crossed the borough line Tuesday afternoon, May 24, 1898, and the Doylestown "Democrat" says the news of Admiral Sampson's complete triumph over the Spanish fleet could not have created half the excitement in town as did the arrival of the trolley car from Willow Grove.

Dunellen, N. J.—The officials of the Brunswick Traction Company are making preparations for the extension of the branch from New Brunswick to Bound Brook, and through the latter place to Dunellen. The contracts have been awarded and the work of construction will be commenced. It is believed that cars will be running over the new line before July 1.

Elkhart, Ind.—J. J. Burns of Chicago has bought of Naugle, Holcombe & Co. of Chicago the franchise and right of way of the Elkhart, Goshen & Southern trolley line between here and Goshen, ten miles. Mr. Burns owns the electric railways in Goshen and Elkhart, and will build an interurban line this summer.

Fall River, Mass.—The consolidation of the Globe Street Railway and the Fall River Street Railway has been accomplished and both roads are now operating under one management, that of the Globe Company.

Frederick, Md.—The president and directors of the Frederick, Thurmont & Northern Electric Road Company have appointed a committee to draw up at once an estimate of the costs and expenditures of operating the road and an estimate of probable earnings. The route of the new road is from Frederick to the Pennsylvania State line, by way of Thurmont and Emmitsburg. The promoters, who are representative business men, decided to push forward the enterprise in order to have the road built as soon as possible. Col. L. V. Baughman is president of the road.

Manchester, Ia.—The plans for the proposed electric railway from Manchester to Colesburg are nearly perfected and there is a good prospect of its early construction as the farmers along the route are taking great interest in the project and are subscribing for stock in it. The principal promoters of the road are J. H. Rafferty and L. S. Cass of Waterloo and J. H. Shields, formerly superintendent of the Chicago Great Western.

Malone, N. Y.—An electric street railroad in Malone seems practically assured. The village board of trustees has voted to grant the charter, and the company will be incorporated with a capital of \$30,000. The name of the corporation will be the Malone Electric Street Railway Company. The names of the directors are not made public, but have been agreed upon. Four of them will be residents of Malone.

Plymouth, Mich.—The council has granted a franchise to the Detroit, Plymouth & Northville Railway Company to construct and operate an electric railway within the village. It is expected that the company will have cars running from Detroit by the 4th of July.

Somerville, N. J.—Chancellor McGill, on the application of G. D. W. Vroom, counsel for the New York & Philadelphia Traction Company, has made an order vacating an injunction restraining the company from operating its line in Bridgewater township. Since the granting of the injunction last fall, the township authorities of Bridgewater have passed an ordinance allowing the traction company to operate in the township.

Sycamore, Ill.—A fifty-year franchise for the principal streets of this city has been granted to the Geneva Lake, Sycamore & Southern Electric Railway Company. The road, which was incorporated last January, runs from Geneva Lake, Wis., to Morris, Ill. The whole length of the road is 110 miles and it crosses ten other lines, nine of which lead to Chicago and one to Milwaukee. Right of way has been secured over the entire line and work will, it is said, start at once. The officers of the road are: President, James Brannen; secretary, George B. Morris; treasurer, George Brown; general manager, John B. Whalen. The board of trustees, besides the officers, is composed of A. K. Bunker, John R. Kellogg and Emil Arnold, Woodstock; A. White and S. Baker, Sandwich; H. F. Jones, Hebron; D. S. Brown, Geneva; P. T. Parkhurst, Loren Woodard and F. W. Patrick, Marengo; Edward Delana, Cortland.

Tiffin, O.—The greater part of the right of way has been secured for the Tiffin, Fremont & Lakeside Electric Railway, and work on the line will begin in a short time. The route adopted touches Fort Seneca and Old Fort, between Tiffin and Fremont.

Wichita, Kan.—The charter of the company organized to rebuild the street railway has been declared forfeited by the city council. It is reported that another company is about to be formed to take the road in hand with money enough to complete it. A prominent citizen says "the new company will soon come before the city council and ask for a charter, and when they do so they will have money ready to go right ahead to build their electric light plant and street railway."

COMPANY MATTERS.

Media, Pa.—The Media Electric Light, Heat & Power Company will on July 8 vote on the question of a reduction of the capital stock from \$100,000 to \$40,000.

Pittsburg, Pa.—A joint agreement of merger has been ratified by the stockholders of the Homestead & Highlands Street Railway Company, the Braddock & Homestead Street Railway Company, and the Braddock & Duquesne Street Railway Company, under the name of the Monongahela Street Railway Company. The Monongahela Street Railway Company also ratified the agreement.

Richmond, Va.—The Old Dominion Electrical Development & Power Company, R. Lancaster Williams president, has published a notice changing the location of the principal office of the company from the city of Richmond to the county of Norfolk.

Vicksburg, Miss.—At the meeting of the stockholders of the Vicksburg Railroad, Power & Manufacturing Company, held on the 23d ult., the final organization under the State charter was made and the following officers and directors were elected for the ensuing year: President, J. C. Shaffer of Chicago; vice-president, Percival Steele of Chicago; secretary, M. J. Mulvihill of Vicksburg; treasurer, B. W. Griffith, president First National Bank, Vicksburg; directors: J. C. Shaffer, Percival Steele, F. S. Mordant, Jesse E. Roberts, S. E. Hughes, A. Rose and B. W. Griffith.

ELECTRICIANS IN THE WAR.

Col. George L. Gillespie of the Corps of Engineers and Col. Eugene Griffin, recently made Colonel of the First Regiment of Volunteer Engineers, are sitting daily in the Army Building, New York, as a board to examine applicants for commission in the proposed brigade. Among those who have successfully passed so far are Dr. Louis Duncan, professor of electrical engineering in Johns Hopkins University, well and favorably known in the electrical fraternity, and William Barclay Parsons, chief engineer of the Rapid Transit Commission, New York. Recruiting offices have been opened in New York at 335 Broadway, in Boston, Philadelphia, Baltimore, Norfolk, Richmond, Charleston and Savannah. The law under which the brigade will be recruited provides that each regiment shall have 1,106 enlisted men. The non-commissioned officers and privates in the brigade will receive higher pay than those of similar rank in other branches of the service. The privates will receive \$18 a month; corporals, \$24; sergeants, \$40.80; quartermaster-sergeants and sergeant majors, \$43.20.

Among the nominations sent to the Senate last week were the following: First Regiment U. S. Volunteer Engineers—To be Majors: Louis Duncan of Maryland, James Dubose Ferguson, District of Columbia.

About fifty men have enrolled at Denver, Col., for the volunteer engineering brigade at the office opened there under instructions from Col. Eugene Griffin.

The Terre Haute, Ind., "Express" says: "Chief Electrician Abe Balsley of the Street Railway Company has received a communication from friends at Washington asking him to accept a position with the engineering regiment being recruited for the war. Mr. Balsley is offered the position of lieutenant and a salary of \$1,600 a year."

PERSONAL AND MISCELLANEA.

It was one of Mr. Gladstone's rules never to have as a member of his Ministry any director in a stock company.

The Cincinnati "Commercial Tribune" states that Hugo Diemer, of Diemer & Hebble, electrical contractors, has accepted a position of responsibility with the Westinghouse Electric & Manufacturing Company, with headquarters at Atlanta, Ga.

A correspondent states that though he has no statistics before him he feels safe in saying that more mica is used in the electrical business, by manufacturers of dynamos, motors and insulating devices, than by stove makers and wall paper manufacturers combined.

Monroe S. Ross has resigned the position of chief engineer and electrician of the Woburn (Mass.) Electric Light & Power Company to accept the office of general superintendent of a large electrical establishment on Long Island Sound near New York State line.

A Maryland paper states that "the Cumberland Electric Railway Company has made a start toward establishing a zoological garden at the Narrows Park, having placed there a cage each of monkeys and squirrels and a baboon." In these times a Weyler too would add much to the attractions of the garden.

The steamship John Englis of the Maine Steamship Company has been purchased by the U. S. Government, and under the name of the Relief will be converted into an hospital ship. There will be a large number of wards on the vessel, each fitted out with the latest electrical conveniences and improvements. There will be thoroughly equipped operating-rooms and 500 patients can be accommodated in an emergency. More than twenty professional nurses aside from the regularly enlisted nurses will assist the corps of army surgeons and their assistants. There will be a sea water distilling plant, refrigerator and an apparatus for the manufacture of ice and carbonated waters. The ship will carry a complete X-ray outfit, donated by the General Electric Company, which will be used to determine the location of bullets, etc., in the wounded.

"The announcement of the death of Lieut. Col. William R. King at Rock Island," says the N. Y. "Sun" "recalled to the officers at Willets Point the stories that went the rounds four or five years ago about Col. King's big cannon magnet. Col. King constructed a magnet at Willets Point by winding two cannon with wires heavily charged with electricity, which was probably the largest instrument of the kind ever made. It demonstrated nothing new and it was of no practical use. Some of Col. King's inventions, notably his disappearing gun carriage, have been of great use, but this magnet was constructed merely as an interesting experiment. The yellow journal of the day, however, described this magnet as powerful enough to draw iron bolts out of passing ships when the electrical current was on full force. Starting with this statement the story of the big magnet made the rounds of the European papers, gaining strength as it traveled. It finally became a terrible instrument of destruction devised by Yankee ingenuity, and according to one account of it, which appeared in a French paper, its power was so great that if a naval vessel approached within six miles of it her guns would be torn from their fastenings and sent rushing toward the magnet. Col. King was a scientific man and he protested vigorously against these absurd exaggerations of his magnet, but it was impossible to stop the story until it had run its course."

Dr. Johannes Horowitz, Vienna correspondent of the N. Y. "Times," in his letter dated May 14 states that Jan Szczepanik, the inventor of the telegraphoscope already described in these columns, is now exhibiting a device

at the Jubilee Exhibition in Vienna which does away with the laborious work of the designer in the textile industry. By utilizing photography for weaving purposes he can now in a single quarter of an hour accomplish what it has taken the designer months or even years to complete, according to the size of the design. As is known, a design that is to be woven must first be resolved into squares. Now in the case of a large gobelin the designer has at present to fill up millions of such little squares before it is possible to puncture the paste-board cards which are indispensable in the Jacquard loom. Szczepanik, however, totally abolishes the designer, and more than supplies his place by photography and electricity. "At the Jubilee Exhibition," says Dr. Horowitz, "only two gobelins woven by Szczepanik's new loom will be shown. One of them contains Mark Twain's portrait. For some time the great humorist has been giving the well-known Polish painter Henryk Rauchinger almost daily sittings for a portrait for the gobelin. The other day I visited the studio, and found the portrait nearly finished. It will be the best picture of Mark Twain ever painted. The second gobelin will contain the portrait of the Emperor Francis Joseph in his magnificent robes of state and surrounded by allegorical figures, and this portrait also will be from Rauchinger's brush. The Court has lent the painter the valuable state robes. Szczepanik showed me small landscapes woven in silk. They are of wonderful beauty, and of course, exacter than anything manufactured from hand-made Jacquard cards. They have been made on his present small loom."

COMMERCIAL PARAGRAPHS.

Gas and Gasoline Engines.

The steadily increasing popularity of gas engines for driving machinery of all kinds, and for the propulsion of boats, has led the Mianus Electric Company, Mianus, Conn., to place upon the market an engine of this class. This machine is said to be peculiarly fitted to supply the demand for an engine excelling in economy, safety and

2 1/2 HP. GASOLINE ENGINE.

durability. The illustration shown herewith is of a 2 1/2 HP. Palmer Stationary Gasoline Engine, of the two-cycle compression type, with an impulse at each revolution of the crank. The engine is provided with a fly-wheel governor, and is very compactly constructed.

The Mianus Company builds also gas and gasoline engines of the four-cycle type, having an impulse every other revolution. It manufactures engines from one to six horse-power, of both stationary and marine types, and can supply the castings and working drawings for the 1 HP. and 2 1/2 HP. engines to those who wish to construct their own engines. The engines made by this company are readily adapted to the driving of dynamos for electric lighting, motor carriage work and the operation of printing presses. They occupy but little space and consume a minimum quantity of gas or gasoline.

The Electric Appliance Company, Chicago, have recently closed a general Western agency arrangement for the celebrated Armorduct Interior Conduit. The Armorduct is the latest product of the Armorduct Interior Conduit Company, manufacturers of the well-known Armorduct

Steel Armored Interior Conduit. The Armorduct is a steel tube heavily enameled inside and outside by a special and exclusive process. The enamel placed on this tube gives a perfectly smooth interior with a coating which will withstand a temperature of 500 degrees. Bending and twisting the tube will not crack or break the coat of enamel. Further than this, the enamel is absolutely proof against the action of cements or acids of any description. The Electric Appliance Company undoubtedly have a very valuable specialty in their Armorduct and large sales may be safely prophesied.

Electric Novelties and Supplies.

We hereby call our readers' attention to the advertisement of the "S & B" Electric Company, 70-74 Fulton street, New York, which appears in this issue. This well known concern manufactures electric novelties and supplies, of almost every description. They are probably the largest manufacturers of batteries in the country, and also handle large quantities of electrical toys. We cannot do better than quote the following paragraph from a pamphlet they have recently gotten out: "Our 'Little Doctor' will cure the sick; our \$15 phonograph will amuse the old and young; our trolley car or electric boat will attract big crowds around your show-windows; our 'Midget Dynamo' will give you electric light and power; our small grenet battery will give you considerable pleasure; our motor castings will give you interesting work during idle minutes; our electric bicycle lamps will prove a boon to cyclists, and in fact any of the above will dispell the blue feelings of the old and make the youngsters happy."

Handsome Catalogue.

We are in receipt of a handsome 24-page catalogue recently gotten out by the Billings & Spencer Company of Hartford, Conn., the well-known manufacturers of machinists' tools and drop forgings. This catalogue is fully illustrated and contains lucid descriptions of drop-forged

pure lake copper commutator segments, numerous types of segments being shown, with the angle of segment, weight, and chord for one inch radius. The method of manufacturing these drop-forged commutator segments has been greatly improved of late, and this well-known Hartford firm is now prepared to furnish segments unequalled for uniformity and accuracy of gauge. These segments are manufactured under a United States patent dated November 6, 1888, and granted to Mr. C. E. Billings of Billings & Spencer Company. The rules and tables to be found in their 1898 catalogue, just issued, are extremely valuable and handy to have, and for this reason, if no other, the catalogue should be in the hands of all those interested in dynamo and motor construction.

We are in receipt of an attractively gotten up pamphlet, containing some twenty pages of matter, from Stone & Webster, well-known electrical experts and engineers, located at 4 Post Office Square, Boston. This firm makes a specialty of examining and reporting upon electrical properties for prospective investors, and the long list of prop-

erties examined by these gentlemen, as appears in the pamphlet, speaks well for their ability.

INCORPORATIONS.

The People's Light & Heat Company of Garland County, Ark. Capital stock, \$25,000. President, L. D. Cooper; directors: W. H. Perry, J. B. Wood, S. H. Stitt, John G. Lonsdale and C. E. Harrell.

The Lafayette-Louisville Electric Company, Lafayette, Col.—to operate in Boulder and Lafayette counties, Col. Capital stock, \$20,000. Incorporators: H. E. Bocker, John Carruthers and James Simpson.

The Heckert Light Company, Findlay, O. Capital stock, \$10,000. Incorporators: Henry W. Seney, Charles K. Friedman, Horton O. Rorick, G. G. Fenneberg and Curtis T. Johnson.

The Coplay, Egypt & Ironton Street Railway Company, Coplay, Pa. Capital stock, \$60,000. President, H. G. Horn; directors: Jilson J. Coleman, W. B. Clark, Morris L. Kauffman and J. G. Meyle.

The Citizens' Electric Light Company, Xenia, O.—to operate a light, heat and power plant in Xenia. Capital stock, \$10,000. Incorporators: I. W. Newcomer, W. S. Fawcett, W. R. Baker, A. J. Chatfield, J. B. Lewis and Harry L. Canfield.

The Sheffield Electric Light Company, Sheffield, Ill. Capital stock, \$9,000. Incorporators: T. Sprague, B. F. Dewey and W. E. Jones.

The North Shore Interurban Railway Company, Chicago, has certified to a change of name to the Chicago & Milwaukee Electric Railway Company, and to an increase of capital stock from \$640,000 to \$1,000,000.

The Howard Electric Company, Chicago—to manufacture electrical appliances. Capital stock, \$25,000. Incorporators: Robert Greer, William Greer and James H. Parker.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED MAY 31, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

601,729. Elevated Electric Car-Line. Joe H. Cooley, Paris, Tex. Filed Aug. 13, 1897.

601,747. Electric-Railway. John H. Guest, Boston, Mass., assignor to Linus M. Child, Edgar O. Achorn, R. Sherman York and William L. Whitcomb, same place, and Charles H. Moore, Springfield, Vt. Filed Oct. 20, 1896.

604,866. Signal for Electric Railways. William H. Jordan, Brooklyn, N. Y. Filed Feb. 16, 1897.

604,911. Electric Railway. Frederick D. Sweet, Elyria, Ohio. Filed Nov. 4, 1897.

604,968. Automatic Current-Distributor for Electric Railways. Jean Claret and Olivier Vuilleumier, Paris, France. Filed May 4, 1897.

605,036. Third-Rail Underground Electric-Railway System. Louis E. Watkins, Springfield, Mass., assignor of one-half to Francke W. Dickinson, same place. Filed Aug. 21, 1897.

601,910. Car-Fender. George O. Spencer, Manchester, N. H. Filed Jan. 4, 1897.

604,944. Street-Car Fender. George H. Smith, Lowell, Mass. Filed Jan. 12, 1898.

ELECTRIC LIGHTS AND APPLIANCES.

601,049. Rheostat for Electric Lamps. Reinhold H. Wappler and Frederick H. Wappler, New York City. Filed Sept. 20, 1897.

605,026. Globe for Incandescent Lamps. Victor de Spruner-Mertz, Brussels, Belgium. Filed Nov. 18, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

604,842. Electric Motor or Dynamo. Andrew L. Riker, New York City. Filed Nov. 24, 1897.

604,843. Former for Winding Armature-Coils. Andrew L. Riker, New York City. Filed Nov. 19, 1897.

MISCELLANEOUS.

604,712. Electrical Signaling System and Apparatus. Walter F. Banks, Milford, Conn., assignor to the National Electrical Manufacturing Company, same place. Filed Oct. 1, 1896.

601,779. Pneumatic Attachment for Telegraph-Keys. William J. Lieb, Pratt, Minn. Filed April 15, 1897.

604,874. Safety Device for Electric Carriages. Reginald T. D. Brougham and Walter C. Bersey, London, England, assignors to the Electrical Vehicle Company, Limited, same place. Filed Dec. 18, 1897.

605,018. Switching Device and Circuit Arrangement for Electrically-Propelled Vehicles. Emil B. W. Retchel, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Jan. 10, 1898.

605,023. Electric Switch for Use With Electrically-Propelled Vehicles or Locomotives, etc. Albion T. Snell and Charles E. Grove, London, England, assignors of one-third to Arnold Frank Hills, same place. Filed Oct. 8, 1897.

DESIGNS.

28,742. Insulator-Plate. William B. McDonald, Chicago, Ill. Filed Dec. 18, 1896.

28,744. Plug for Electrical Purposes. Hiram Percy Maxim, Hartford, Conn. Filed April 9, 1898.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

TELEPHONE AND TELEGRAPH.

H. C. Fischer, who has just retired from his position as comptroller of the central telegraph office in London, says he has a lively recollection, when superintendent of the foreign department, of the tremendous excitement in England at certain momentous crises in the American civil war. It was in those days looked upon as a piece of exceptional enterprise that several of the newspapers, in order to be the first to obtain news from America, hired tenders to intercept the mail steamers when approaching Cork harbor. Then would follow a race to be first at the Roches Point telegraph office, whence the messages were telegraphed to the old foreign gallery, and subsequently sent out, sheet by sheet, for publication in the special editions of the London papers. This was of course before the laying of the first Atlantic cable. The war ended in April, 1865, while the laying of the first Atlantic cable was not completed until July 28, 1866. The first cabling done over the line was somewhat expensive, \$100 being charged for twenty words. This rate was reduced about three months afterward to \$50 for twenty words, and the following year it was looked upon as comparatively cheap cabling that a man could send ten words for \$26. That was thirty years ago. The rate is now 25 cents a word.

In regard to ocean cable laying, Mr. Herbert Laws Webb of the New York Telephone Company, who has had several years' experience in the business, says it is a difficult and delicate work and success is not always assured by the best appliances. In a talk with a newspaper representative a few days ago, Mr. Webb said: "When we put in the cable between Cadiz and the Cape Verde Islands the preliminary surveys were not very good, and we had to do most of the surveying over again. Even then when we actually put the cable down we found a submarine mountain previously overlooked, which rose from a depth of some 2,000 fathoms to less than forty fathoms of the surface, a place where a vessel could actually anchor in mid ocean! These submarine mountains are one of the greatest obstacles to successful cable laying. The line is paid out rapidly as it ascends the mountain and falls in festoons and loops when it passes the summit. I remember in one case, which occurred on the west coast of South America, after operating satisfactorily for a time the cable failed. After an extensive investigation it was discovered that a whale had fouled one of these festoons, and in the effort to extricate itself had not only lost its life but had succeeded in wrapping about itself many hundred feet of the cable."

William A. Eddy, who has given much time in the last few years to experiments with kites, has discovered that they can be utilized to advantage in war. At Bayonne, N. J., a few days ago, Mr. Eddy sent up two kites, each seven feet in diameter, and one four feet in diameter, in tandem, piano wire being used. To the piano wire was made fast a thin copper wire, the free end of which was allowed to trail. As the kites ascending raised the point of contact higher into the air and further from the starting point, the copper wire trailed out over trees, houses and barns toward the Kill von Kull, the end of it finally resting on the Jersey shore, where it was secured by Dr. W. H. Mitchell, who was assisting Mr. Eddy in his experiments. To the wire Dr. Mitchell attached a telephone similar to those used in the field. A similar instrument was attached to the kite wire at Mr. Eddy's house, a mile or so away on the base line. Conversation was then had between Dr. Mitchell and Mr. Eddy, the communication being perfect. Mr. Eddy claims that this demonstrates that kites can be used to carry wires for field telephoning in times of war.

"Telegraph operators," says the N. Y. Commercial, "have good cause to bless the obstinacy and ignorance of the Spaniards who forced us into the present war. Such a boom has been given to the telegraph business that an idle operator could not be found with a searchlight. Even superannuated knights of the key are coming out of their retirement in response to the great demand for the services of telegraphists. The primary reason is that the Government requires a small army of operators, and as good wages are paid and the prospects of relief from the monotony of routine work in the cities are alluring, there has been a rush of skilled men to the front and vacancies have been made in the home ranks that give work to every one of the stay-at-homes. Another reason for the demand for operators is that the business of the telegraph companies has been vastly increased by the war conditions."

The farmers of Washington Valley, New Jersey, whose farms are all enclosed by wire fences, have concluded to utilize the fences for telephone purposes. The plan has proved successful in a southern section of the State. An expert electrician will be secured to put the connecting wires in place, which can be done in a few days. The farmers intend to operate one line until they see how it works, and in case the line is a success the valley will soon be a network of telephone wire fences.

President H. Samson of the Home Telephone Company, Pittsburg, Pa., was given a hearing by the committee on corporations on the 27th ult., in regard to an extension of the time set in the franchise granted the company. He said the delays that had occurred were due to contending stockholders outside the city who prevented the work moving on with any celerity. Pittsburgers were now, he said, ready to go ahead with it with \$100,000 back of them. W. J. Rhuland, James Platt and J. M. Heasley were appointed a committee to consider the new ordinance prepared by the Home Company.

There is little danger of any Government secrets regarding war movements leaking from the wires that stretch across the country from Florida to California. The telegraphers, from the highest official to the most subordinate operator, are under the strictest kind of orders not to talk of or discuss in any way for publication anything pertaining to the conflict with Spain. The instructions are just the same as governed the service during the civil war.

The Bell Telephone instrument statement for the month ended May 20 shows: Gross output, 82,441; returned, 11,948; net output, 20,493. The gross output for the same month in 1897 was 20,598; returned, 8,452; net output, 12,146. From December 20, 1897, to May 20, 1898, the gross output was 142,363; returned, 63,645; net output, 78,717. The total outstanding at the latter date was 997,438. The total outstanding May 20 in 1897 was 881,574, in 1896 137,066, in 1895 618,629.

At a recent meeting of the stockholders of the Citizens' Telephone Company at St. Joseph, Mo., Edward S. Newell was elected a director and treasurer of the company to act in the stead of Robert Frazer, who has retired from the company. The condition of the affairs of the company is all that could be desired, and the volume of business done is very satisfactory. It is expected that the success of the past will be greatly exceeded in the future, as new subscribers are being added to the list constantly.

The cash bond of \$5,000 given by the Mississippi Valley Telephone Company to the council at St. Paul, Minn., as an assurance of its good faith in securing its franchise, has been returned to the company, who have furnished a surety bond of \$25,000.

R. B. Rood, who has been resident manager of the Bell Telephone Company in Richmond, Va., for a number of years, has resigned his position. The Richmond Times says of Mr. Rood that he was a hard worker and rose to the position which he has resigned from the ranks, and predicts that there is a greater future ahead of him.

The U. S. Senate on Wednesday last in discussing the War Revenue bill agreed to the committee amendment for a stamp tax on bills of lading, telephone and telegraph messages, etc.

J. W. Shugart, superintendent of construction, and a gang of men have just finished stretching the wire on the telephone line from Round Mountain, Blanco county, Tex., to Llano.

At Chattanooga, Tenn., the two telephone ordinances known as the Coleman and Helvin ordinances have been referred to new committees for report.

The new telephone system in Seaford, Del., is now in operation and in a short time will be connected with those of the other towns on the peninsula.

The Detroit Telephone Company has offered to put 'phones in Windsor, Can., for half the price paid for Bell 'phones.

A war balloon, with all the accessories of telegraphs, telephones, etc., has arrived at Tampa, Fla., and drill in its use will be held at once.

New Companies Incorporated.

The Billings & Musselshell Telephone Company, Helena, Mont. Capital stock, \$5,000. Incorporators: Christian Yegen, L. L. Moffett, George Spencer and George W. Hondle.

The Fergus Falls Telephone Company, Fergus Falls, Minn. Capital stock, \$15,000.

The Easton Telephone Company, Easton, Pa.—to construct lines in Lehigh and Northampton counties, Pa. Capital stock, \$1,000. Directors: E. L. Reinhold, Marietta; William Coyle and George F. Coffin, Easton.

The Hamlin-Huntington Telephone Company, Hamlin, Lincoln county, W. Va.—to erect and maintain telephone lines. Capital stock, \$10,000. Incorporators: R. R. Wilson, O. W. May, R. Sweetland, J. D. Porter, B. B. Curry, J. S. Sweetland, W. W. Baker, all of Hamlin, and J. A. Holly of Charleston.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11¾c.; Lake, 11.90@12.10c. casting, 11¾c.

The first mortgage coupons of the Second Avenue Traction Company of Pittsburg, due June 1, will be paid at the banking firm of Brown Brothers & Co., New York, and Alexander Brown & Sons, Baltimore.

The Brooklyn & Brighton Beach Railroad Company reports for the quarter ending March 31 a deficit, after fixed charges, of \$15,854, against a deficit last year of \$14,412.

The Federal Court at Milwaukee has decided the suit for a reduction of Milwaukee street car fares to four cents in favor of the roads. The suit was aimed particularly at the Milwaukee Electric Railway & Light Company.

Standard Underground Cable, which pays 6 per cent. per annum with commendable regularity, to use the words of the Boston "News Bureau," advanced \$2 per share last week to 107 bid.

The Western Union Telegraph Company's Central Cable Office announces that the Government has removed the restrictions as to code and cipher messages for Venezuela and Brazil.

The Boston "News Bureau" corrects the statement that for the year ending June 30 next the earnings of the Boston Electric Light Company would show 13 per cent. on \$25,000 share capital. The earnings would show 13 per cent. on the outstanding capital of \$1,700,000 and not on the increased capitalization of \$2,500,000.

By authority of the stockholders of the Hartford (Conn.) Electric Light Company, the board of directors has voted to increase the capital of the company by the addition of \$100,000 to its present capital of \$400,000. This is the limit allowed by the Legislature and will bring the capital up to half a million dollars. The increase is offered to the present stockholders on the basis of one share to every four now held. The directors decided to call for two payments from subscribers—one-half on July 5 and the remaining half on October 5. The subscription books will be opened at the office of Henry H. Skinner, Phoenix Bank Building, Hartford, Conn., on June 15.

The annual report of the Twin City Rapid Transit Company, according to the St. Paul "Pioneer Press," shows a decrease in gross earnings of \$50,000, which is 2.43 per cent. Operating expenses increased \$6,922 and net earnings decreased \$57,019. The total receipts amounted to \$2,009,120.98, as compared with \$2,059,218 the year before; total operating expenses, \$1,002,080.38, as compared with \$995,158; net earnings, \$1,007,040.60, as compared with \$1,064,059. The surplus earnings were \$235,133.74. The balance sheet of assets and liabilities foots up at \$29,754,790.93.

The North Chicago Street Railroad Company has given notice that it will retire \$500,000 of 6 per cent. debentures beginning July 23. It was this issue which it was determined to take up when the recent increase in capital stock was voted. That increase amounted to \$1,320,000. The debenture issue to be bought in was put out in January, 1891. The certificates were 5-20s. so that they have been redeemable since 1890. They will be retired at par and accrued interest to July 23, 1898.

A dispatch from Chicago states that the Union Transit Company intends to petition the city council for a fifty-year franchise for 20 miles of trolley in 30 streets and alleys of the South Side, with a down-town terminal at Jackson Boulevard and Pacific avenue. From this point the route as given cuts diagonally across the South Side to Sixty-seventh street and Woodland avenue. Lucius Clark of General Electric Railway fame is said to be president of the new company.

The Coney Island & Brooklyn Railway Company, which includes the Brooklyn City & Newtown Railroad, reports for the quarter ended March 31: Gross earnings, \$215,892; operating expenses, \$156,121; net earnings, \$59,771; other income, \$305; total income, \$60,076; charges, \$52,728; surplus, \$6,348. In 1897 the gross earnings were \$186,441; operating expenses, \$130,157; other income, \$2,601; total income, \$58,885; charges, \$45,153; surplus, \$13,732.

A first mortgage given by the Herkimer County Light & Power Company of Herkimer, N. Y., to the Continental Trust Company of the city of New York for \$400,000 was recorded in the county clerk's office at Ilion last week. The mortgagors are the company who recently purchased the gas and electric plants at Little Falls, Herkimer, Mohawk and Ilion. The mortgage recites that at the time of the consolidation of these companies the Herkimer Company had outstanding certificates and items of indebtedness amounting to \$60,000, the Little Falls company \$190,000 and the Ilion company \$75,000. The mortgage is made to secure four hundred \$1,000 bonds, dated May 2, 1898, payable in gold thirty years from date with interest at the rate of 5 per cent., payable semi-annually.

The annual meeting of the Electric Storage Battery Company was held at Gloucester, N. J., on the 1st inst. The old directors were re-elected. President Rice, in his report, said that notwithstanding the great detriment to the company's business caused by the declaration of war, sales for five months from January 1 were \$314,488, against \$241,077 for the same period of 1897. Manufacturing profits in 1895 were \$15,096; in 1896, \$141,998; in 1897, \$325,290. President Rice said that the reason no dividend had been declared was that patents acquired and experimental demonstration had required cash, which had been taken from earnings. If 1898 results equaled 1897, the company would be in a position to consider dividends beginning in 1899.

Mr. Richard H. Rushton, the active head of the Fourth Street National Bank, Philadelphia, says there should be no fears of any developments in the money market adverse to public interests. He says: "There is plenty of money—indications of that are to be found on every hand. And among the holders and owners of money the same confidence that is increasing new business activity and putting up security prices is driving away all fears that may have existed, and making more and more general the disposition to loan freely and at low rates."

The consolidation of the City Passenger and Central Railway systems by the purchase of the Central lines places the street railway service of Baltimore practically under the control of two corporations, the Baltimore City Passenger and the Consolidated Railway companies. The City Passenger Railway Company formerly operated about sixty miles of track, which was increased to 107 miles by the absorption of the Central Railway Company, and will be further increased six and one-half miles when extensions now under construction are completed.

The New Haven "Palladium" offers a few remarks on corporations which, as they relate to lighting plants and street railroads, appear to us timely and reasonable. It says: "One of the subjects to be discussed at the Convention of the League of American Municipalities in Detroit is the remuneration to cities for local franchises, and the discussion ought to result in dissipating a great deal of the talk about municipal ownership and management of lighting plants and street railroad lines. Corporations controlling such interests now are often denounced as monopolies, but where they are compelled to pay a suitable annual compensation to municipalities based on earnings they cease to be monopolies. If earnings increase from any cause the public as well as the corporations profit, and where this is the case the privileges of the latter cannot be called exclusive. If corporations should attempt to wring from the public more than fair compensation for the services they perform it would only be to hand back part of such gains to the public again. The cure for local monopolies, therefore, is in exacting a proper return for municipal franchises. Corporations would not then be at the mercy of political bosses and the community would enjoy all the advantages of municipal control without any of its risks and responsibilities. It is to be hoped that the discussion at the Detroit convention will result in making such facts clearer than they have been heretofore."

EDITORIAL NOTES.

Submarine Cable Cutting.

As Mr. C. C. Mattison aptly said at a recent meeting of the Chicago Electrical Association, "Of all the uses of electricity in warfare it seems to me that the electric telegraph is the most valuable." This statement is undoubtedly to a great extent true. The shutting off of an enemy from outside communication has always been an important factor in war. Before the first ocean cable was laid it was only necessary to destroy or block the adversary's ships. Now, however, things are very different, and although a harbor may be blockaded and all communication through ordinary courses with the outer world cut off, still communication may be carried on and reinforcements asked for by means of a submarine cable. In our present war with Spain a number of these cables have been cut, and undoubtedly more will share the same fate. The question has been brought up as to whether this country has the right to cut cables that are not controlled by American companies, but which afford the enemy means of communicating with the outer world and with its home government. The point brought up is unquestionably a legal one, but it would seem as though a neutral country ought to refuse to transmit war messages to the home government of, for instance, a besieged colony. The messages transmitted would probably be of far more importance than the furnishing of coal to a warship of one or other of the belligerents. However this may be, the United States has out a number of cables running out from Cuba, leaving the question of damages, if any are claimed by neutral countries, to be settled hereafter in court.

It may interest some of our readers to know that the first submarine cable of any length was laid across the Straits of Dover between Calais and Cape Grinez in 1847. This cable was very crude in its manufacture, consisting only of a copper conductor surrounded by an insulating layer of gutta percha, and consequently failed a few hours after having been put in place. In 1858 the first cable across the Atlantic was laid between Ireland and Newfoundland. As will be remembered by many, this cable proved defective, ultimately failing through excessive leakage. Another attempt was made to lay a cable between the Old and New World in 1865, resulting in its breaking in deep water. The following year, however, through the medium of a third cable, communication was successfully established.

As is well known, a submarine cable consists of a conductor of stranded copper wire, the insulation usually consisting of layers of gutta percha, a bedding of jute and an external sheathing of iron wires covered by suitably prepared tape. The latter wind-

ing goes to make up the protecting covering and prevents the stranded copper conductor from becoming exposed through abrasion. It was principally through this lack of proper insulation and sheathing that the first cables that were laid failed. The thickness of the sheathing varies with the depth at which it is proposed to lay a cable. What are known as deep sea cables are lightly sheathed with slender steel wires. Shore end cables, on the other hand, which rest upon rocky bottoms and are more or less subject to the action of storms and heavy tides, are heavily armored.

As soon as it becomes apparent that signals can no longer be transmitted through a cable it is necessary to accurately locate the break in order to repair it. This is done by measuring the electrical resistance of the conductor, usually from each end. Knowing what the resistance in ohms per mile is of the conductor in that special cable, the distance in miles to the break can readily be computed. Thus when Admiral Dewey cut the Manila cable it was immediately ascertained at Hong Kong that the cable was parted some forty miles from Manila.

The grappling for and cutting of a submarine cable are by no means a simple matter unless the ship undertaking this work is provided with all the necessary apparatus. A ship of war usually relies upon what is known as the cutting grapnel to destroy a cable unless it is desired to utilize one section of a cut cable for communicating purposes. In such an event the cable after being caught in an ordinary grapnel is brought on board the ship, where it is severed, the end in control of the enemy being securely fastened to a buoy and dropped overboard. Through the other end messages may be transmitted wherever desired providing the vessel is equipped with suitable transmitting and receiving apparatus. When it is merely desired to part a cable in deep water a cutting grapnel is lowered and the vessel steams slowly backward and forward at right angles to the line of cable. As soon as the latter is hooked it slips, by means of pulleys, between two heavy knives or teeth and the strain in lifting causes the teeth to close and bite off the cable.

The recent cable cutting at the harbor of Cienfuegos was accomplished in a very different manner. In this case the cable to be cut was in shallow water. It had to be grappled for by small boats and when caught hauled up across them. It was absolutely necessary to cut a section many feet in length out of the cable to prevent the ends being spliced later by the Spaniards and communication re-established. This work had to be done under the most adverse circumstances, the tough steel wires forming the armor being hacked off with axes, chisels and saws.

Probably the most important lesson that the present war has taught, so far as submarine cables are concerned, is that every man-of-war should not only

be provided with all the necessary tools for cable cutting, but should also have on board a mirror galvanometer and other necessary instruments for the transmission of messages. This would also necessitate the presence on a war vessel of at least one or two skilled telegraphic operators just as each war vessel now carries a number of expert divers.

* * *

The National Electric Light Association, by far the most important gathering of the year in electrical circles, has met, done its work and dispersed.

The meeting was unquestionably the most successful that has yet been held. Heretofore considerable fault has been found with the National Electric Light Association for not accomplishing more of a practical nature. Through the efforts of Mr. Insull, this criticism would be unfounded if applied to the late Convention, as the papers presented were almost invariably on sound practical subjects and the discussions were conducted in the true didactic spirit. The attendance was unusually large, there being present by far a greater number of central station men than ever attended any previous National Electric Light Convention. In former years the supply men and manufacturers' representatives have predominated, but at the Chicago Convention the central station element outnumbered all others. And this is as it should be, as the Association is presumed to be mainly composed of central station representatives.

This excellent showing of practical men is directly due to the efforts of President Insull, who, himself president of one of the largest central stations in the country, took particular pains and spared no efforts to secure the attendance at the Convention of many central station men who had never previously attended a meeting of the Association. The result of having such a large number of eminently practical men present naturally had its effect on the discussions, tending to make them of an instructive nature and bringing out points actually met with in practice that could have been touched upon understandingly by no other set of men.

The social features were everything that could be desired and most enjoyable, and certainly spoke well for the hospitality to be met with in the "Windy City." The ladies present went on two coaching parties, but unfortunately the enjoyment of the drives was somewhat marred by sudden showers.

The proceedings of the Convention will be found in detail elsewhere in this issue, and we trust that the eminently practical papers read and topics discussed at the Chicago meeting will serve as a precedent for future gatherings of the Association.

* * *

Changes in the Patent Office.

It will interest inventors in general, and electrical inventors in particular, to know that provision has been made for increasing the number of Patent Office examiners. The electrical department of the Patent Office in Washington has always been more or less behindhand in its work of passing upon applications, and has probably never been more so than at the present time. The bill was passed on June 6 by the House of Representatives by a vote of 154 to 58 which calls for the revising and classification of letters patent. By the provisions of the bill the Patent Office is to have an enlarged force for clerical work, by whose assistance it will be possible to relieve the congested condition of affairs which now exists in that office; but if anything, a more important provision of this bill is that which gives the bill its title, namely, the revising and classification of letters patent. For the past ten years efforts have been made to get some such bill through Congress, but hitherto without success. The

Commissioner of Patents is authorized by this bill to undertake the revision and perfecting of the classification for the purpose of determining with more readiness and accuracy the novelty of inventions for which applications for letters patent are or may be filed in the Patent Office, and to prevent the issuance of letters patent for inventions which are not new. Any system or method of classification such as the above should prove of great value as it would undoubtedly save thousands of dollars each year which are now spent in protracted litigation between rival manufacturing concerns over infringements. With some such handy system of classification, the chances of one claim covering another should unquestionably be reduced to a minimum.

The necessity of some form of legislation looking toward an increase of the clerical force in the Patent Office was obvious to every inventor who has recently applied for a patent. During the last decade the business of the Patent Office has increased 33 per cent., whereas the force for conducting the business has increased but 6 per cent. The principal objections brought up against the passage of the bill were based on the fact that it would entail an extra expense of over \$300,000. Assuming that the necessary changes would entail the expenditure of this sum of money, the fees paid by inventors, although not exorbitantly high, more than cover the expenses and certainly entitle them to reasonably speedy service. At present in the case of many novelties the season for them passes before the inventor can secure a patent.

Under the Searchlight.

Notes and Comments on Various Topics.

OF all the electrical papers in New York city, *ELECTRICITY*, containing a full programme of the Twenty-first Convention of the National Electric Light Association, was the only journal to be distributed on the Convention train which left for Chicago on Sunday, June 5.

* * *

Is This Another General Electric Scheme?

The Philadelphia Times of the 9th inst. publishes the following in its financial columns:

The General Electric Automobile Company, stock of which was brought out yesterday on the Philadelphia Stock Exchange, has bought from the well-known electrician and inventor, Rudolph M. Hunter, M. E., E. E., of this city, and others the fundamental patents for electric traction for railways, electric cabs and carriage automobiles, electric car lighting, electric launches, etc., when using secondary batteries or accumulators wholly or in conjunction with dynamos on cars, or when supplied from a distant source through line conductors. Mr. Hunter and associates are said to have expended a very large sum of money in perfecting these patents, of which there are seventy, different and distinct. Competent counsel has passed on the soundness of the legal aspects. They are declared to cover generally and specifically every practical or feasible method of operating cars, carriages, cabs and boats by accumulators, and, as an example of the work already accomplished, it may be said that the modern electric car truck, lighting system and series multiple controller (used upon every electric railway car in the country) are the inventions of Mr. Hunter and covered by the patents controlled by the General Electric Automobile Company.

In another part of the same paper the following appears:

A new candidate for favor was brought out during the day, the stock of the General Electric Automobile Company. Starting at 11½ bid, the price, reflecting good commission house demand, advanced to 12½. Higher prices are thought likely for this stock in the near future. The company was organized under the laws of West Virginia, with an authorized capitalization of \$2,500,000, divided into 50,000 full-paid, non-assessable common shares of the par value of \$50 each. There is no preferred stock, nor any bonds.

Of the total common stock authorized there have been issued 35,000 shares, 20,000 of which are held intact by the controlling interests, leaving 15,000 shares taken over by a syndicate. As an asset for future use there remain in the

treasury 15,000 shares. It is also understood that the treasury will have at the beginning of business a large cash balance. Head officers of the company are located on the fourth floor of the Bourse. The board of directors include J. A. Brill, of the J. G. Brill Car Company, Philadelphia; W. D. Marks, late president of the Edison Company, Philadelphia; Rudolph M. Hunter, inventor and capitalist, Philadelphia; John H. Noblit, capitalist and director of the Frankford & Southwark Passenger Railway Company, Philadelphia, etc. The registrar is the Fidelity Title Insurance & Trust Company of this city.

* * *

AN inventor at Norwich, Conn., is said to be the originator of a new electrical device which promises wonderful results. The invention consists in a method for obtaining or generating electricity without the use of any chemicals or dynamo. The model, for such it is at present, is made of brass and copper. When once placed in position, it is guaranteed by the inventor to last for years, requiring no expense for repairs. It is not connected with or attached to any engine or machine, but is self-operating. A gentleman who witnessed it in operation states that from what he saw the machine can apparently furnish an unlimited amount of electricity at almost no cost. Is this another Keely motor?

* * *

AT the National Electric Light Convention in Chicago there were but few exhibits. The Interior Conduit Company and the Paragon Company had a number of fans in use in various places throughout the Auditorium Hotel and Mr. Randolph had an exhibit in the Annex. From this it will be seen that the number of exhibits was unusually small, there also being a scarcity of souvenirs as compared to previous Conventions. The Circular Loom people presented a briarwood pipe with amber stem, a package of tobacco and a box of matches, and the Okonite Company presented the ladies in attendance with an ornamented table plaque.

Many of the old-timers were present, among whom we might mention Mr. Edward H. Johnson of the Sprague Electric Company, George A. Redmond of the Rochester Gas & Electric Company, Mr. Higgins of Wisconsin, Mr. Randolph, formerly of the Excelsior Company but now of the Sterling Arc Lamp Company, George Fairclough, Col. Hill and Mr. Jampolis of the Chicago Edison Company. A reference to our list of names of those in attendance will show that although the present era seems to be one of great changes in the electrical industry there are still many of the old-timers who always attend these Conventions.

* * *

THE managers of the Electrical Exposition in Philadelphia have made arrangements with a number of experts in the various lines of electrical development to make short addresses on electrical subjects for the edification of visitors to the Exposition. These free lectures will be given every hour from 10 A. M. to 3 P. M., and will doubtless prove of much benefit to those who are able to withdraw their attention from the other attractions of the show.

* * *

IN a recent issue of one of our contemporaries we see it stated among the advertisements that "Even Spain, counting the pennies of poverty, buys Westinghouse electric apparatus." Is it possible that this is one of the reasons why Spain has to count "the pennies of poverty?" Possibly, now that war is being waged, the Westinghouse Company is doing all it can to aid the United States in ruining Spain.

* * *

An automatic electric car fender has been invented by Mr. G. W. Rochester of Ottawa, and the inventor claims that the device is the best yet made. It consists of several pieces of wire netting, arranged on cross bars in such a manner in the front of electric cars that the moment any object strikes this netting another net shoots out in front of the car directly along the ground and picks up the object encountered. There is no possibility of anything getting between this fender and the roadway.

THE CHICAGO CONVENTION.

The National Electric Light Association Meeting a Great Success.

LARGE ATTENDANCE OF CENTRAL STATION MEN.

Report of the Proceedings—The President's Address—Papers and Discussions—The Committee Report on Standard Candle-Power of Incandescent Lamps—The New Officers—List of Attendants.

The delegates to the Twenty-first Convention of the National Electric Light Association commenced to arrive at Chicago on the 6th inst. in formidable numbers, and by evening the corridors and club rooms of the Auditorium Hotel were well filled. In the evening at 8:30 a reception was held. The beautiful parlors of the hotel were profusely and handsomely decorated, the gorgeous palms and the cheerful music making the scene one long to be remembered. Many of the gentlemen were in full evening dress. The toilets of the ladies reminded one of a grand ball. There was no special programme, but every one was left free to mingle with the throng, renewing old-time acquaintances and making new ones. President Insull was everywhere, doing his utmost to show the visitors what a real Simon-pure article "Chicago hospitality" is. He was ably assisted by other members of the Reception Committee. This committee as a whole consisted of C. H. Wilmerding, chairman; B. E. Sunny, J. B. Wallace, Samuel Insull, A. S. Hibbard, E. K. Comstock, F. B. Badt, J. Holt Gates, F. H. Clark, F. S. Gorton, W. H. McKinlock, J. B. O'Hara, Geo. C. Bailey, M. Coster, L. A. Ferguson, G. A. McKinlock, W. A. Kreidler, Chas. Munson, E. B. Kittle, F. W. Kohler, Martin J. Insull, J. R. Wiley, F. E. Donohoe, W. W. Low, R. B. Rawles.

A superb and dainty collation was served and the reception was voted a great success in every way.

On the morning of the 7th large numbers of delegates arrived from the West and Southwest, and by the time the Convention was called to order by President Insull in the Banquet Hall of the hotel the room was crowded. This Banquet Hall of the Auditorium is without doubt the finest and best-appointed room in which the National Electric Light Association ever held a meeting, and its selection was but one of many evidences of liberality on the part of the Chicago fraternity in catering to the comfort of their guests.

When President Insull, at about 11 o'clock, had succeeded in getting the members to take seats by specially calling the attention of Mr. Edgar and some jovial companions to the fact that they were not yet seated, he commenced the delivery of his opening address, which will long be remembered as one of the most instructive, sensible and business-like addresses ever delivered before the Association. The address is here given in full:

PRESIDENT INSULL'S ADDRESS.

Members of the National Electric Light Association—Ladies and Gentlemen: In calling to order the annual convention of your Association my dual capacity presents somewhat of an embarrassment to me. I am in doubt whether as president to enlarge upon the great growth of this Association since its formation in this city on February 25, 1885, or whether as a resident here to dwell at length upon the marvelous growth of the city in which we meet. Chicago and the industry with which we are identified have a somewhat close connection. The growth of the former, if measured from the point of view of the rapidity with which history is made, is, so to

speak, the product of yesterday. The electrical industry, or rather that portion of it with which we are associated, is but little more than the product of to-day. If the growth of this city and that of our own industry is as great during the next thirteen years as the progress they have achieved since the date of your first meeting here, I am sure that both the citizens of Chicago and the members of your Association will have every reason to congratulate themselves. Speaking for those of my friends connected with the electrical industry in Chicago, and also for myself, I can assure you it affords us very great pleasure to welcome you at this convention, and the fact of your meeting in this, my home city, enhances not a little my high appreciation of the privilege of presiding on this occasion.

The officers of your Association have had in mind in preparing a programme for this convention the importance of bringing before you subjects of interest in connection with central station management, and the papers to be read at our various sessions and the topics mentioned for discussion cover such a wide range that it would seem undesirable for me to occupy much of your time by way of introduction. The various gentlemen who have so kindly consented to read papers will deal with such important questions as the cost of generating and distributing the product which we manufacture, transformer economy and the rival claims of alternating currents and direct currents as means of distribution. The many problems which you have to solve in connection with the question of public lighting and the cost of producing electrical energy by water power will also be discussed.

STANDARD VS. SPECIAL MACHINERY.

A matter which has called forth during the last year considerable discussion is the question of the use of standard apparatus and the tendency towards the specification of special machinery on the part of electrical engineers. This course is not by any means confined to large work, but is followed by some engineers whether they are designing a small isolated plant or are projecting a large modern central station. It would seem to me to be of paramount importance to the manufacturer and user that both should co-operate in eliminating as far as possible from the business the necessity of building and using special types of machinery. This can only be done by the adoption of standard specifications for various standard types of apparatus. A committee of the American Institute of Electrical Engineers has already taken this subject under consideration, and I believe that we will be serving alike the interests of the manufacturers and users of electrical apparatus if we will take some action with a view to co-operating with the Institute and other bodies in this matter. In drawing attention to this subject I speak with an appreciation of the position of both manufacturer and user, having had more or less connection with the manufacture of electric apparatus and the manufacture of electric current. Constant duplication of parts resulting in constant duplication of a given piece of machinery means, as any manufacturer will tell you, constant reduction in cost. Variation from a given type means increased cost and even the wiping out of an apparent profit. In the last year or so there has been a great deal of discussion in England prompted by the success of American manufacturers in obtaining large contracts for electric traction work in Great Britain, and the inquiry has often been made, how is it possible for American electrical manufacturers, with high wages against them, to compete with English builders, whose scale of pay to their workmen is on a very much lower basis. If you will examine into the

amount of electric traction machinery manufactured in this country under a system of constant duplication and the use of special tools, and then visit the electrical establishments on the other side of the water and note the tendency there towards specializing each particular job, you will soon recognize that the reason for low cost and consequently low selling price on this side of the ocean is brought about by the fact that in America this class of work is largely designed by the manufacturer, and as a natural result is the duplicate of something already produced, whilst on the other side of the Atlantic the builder of the machinery works from the plans of the electrical engineer, which necessitates his producing something different to fill each different contract. In one case the machinery is really manufactured; in the other case the builder runs a jobbing shop. Unfortunately during the last few years American users of electrical apparatus have somewhat departed from the pursuance of what is really a fundamental principle of American manufacture, namely, the use of existing types which are turned out in large quantities with special tools with a view to the lowest possible cost of production. The electrical engineer for the purchaser has been permitted to draw up specifications which have tended towards the specializing of apparatus, necessarily interfering with rapid manufacture and low cost of the product. The disadvantage to the manufacturer is apparent. It is turning our large electrical works from manufacturing establishments into jobbing shops, cutting down their capacity, increasing their labor cost and lengthening the time that it takes to produce a given article. Looking at it, therefore, from the point of view of the manufacturer, the capacity of his plant is reduced and consequently his interest and general expense cost is higher; his labor cost is increased; and if he finds himself unable to increase his selling price, his shop must be run at a loss instead of at a profit.

The user is necessarily interested in low cost of production on the part of the manufacturer, as he cannot expect to purchase apparatus except at prices which yield a return to the maker. From this point of view alone it would seem to me to be the interest of the user that he should co-operate with the manufacturer with a view to standardizing apparatus eliminating unnecessary variations from a given type and providing specifications for machinery calling for a given capacity at a given efficiency. Such a course would lead to low cost of manufacture and consequently low selling price, coupled with rapid production.

Another objection to special apparatus is the expense and delay in obtaining duplicate parts in case of break-down. The fear of delay under such circumstances often necessitates the user carrying the duplication of his plant to a point entirely unnecessary when standard apparatus is used. Capital investment and consequently interest cost is thus increased, not only by the purchase of apparatus which of itself is expensive to build, but also by the duplication of investment which I have pointed out must of necessity follow.

A further point which should be borne in mind in connection with the lack of standard specifications is the opportunity that it gives to the unprincipled manufacturer to dispose of his second-rate apparatus to the uninitiated. We talk of a machine having a given capacity; but under what conditions should it operate to develop this capacity, and how often does it occur that a dynamo machine is rated entirely too high and at the cost of its efficiency? How much miscellaneous material used in connection with the industry is absolutely unfitted for the purposes for which it is sold? Surely all of us, manufacturers and users, are deeply interested in maintaining the highest possible standard of work and eliminating alike from our central station systems and the installations for our customers worthless appliances whose only recommendation is their apparent cheapness, whereas, as a matter of fact, they are really the most expensive that can be bought, because they are unfitted for the purposes for which they are intended. A proper consideration of this subject would not embrace alone the apparatus we are ourselves in the habit of buying for use in connection with our plants, but also the appliances used in connection with customers' house wiring. It should be borne in mind that faulty apparatus from one cause or another resulting in a stoppage of the service of one or more customers is, in the mind of the user of current, set down to the unreliability of the system as a whole. A central station customer seldom discriminates between a contractor who supplies a worthless device and a company supplying him with current. Standard specifications should therefore cover not alone the machinery used, but also the devices and material forming part of a customers' installation. This Association has addressed itself at various times to the consideration of questions in

connection with house wiring, and has co-operated with the National Board of Fire Underwriters and other bodies with a view to establishing rules to be followed by contractors. I strongly recommend that this matter be taken up on a broader basis than heretofore, and that in conjunction with the technical societies we invite the co-operation of the electrical manufacturers with a view to standardizing apparatus and the specifications therefor, whether for use in the central station itself or in connection with the distributing system.

I do not wish my remarks on this subject to be taken as in any way censuring the many electrical engineers who have by their special training and natural ability done so much to develop the industry with which we are connected. From my experience I am satisfied, however, that from the point of view of the user, the designing engineer who adapts his requirements to the standard apparatus of a first-class manufacture, is able to produce a plant of more satisfactory character and more economical to operate than that designed by those engineers who I regret to say are sometimes influenced by the desire to use machinery which they can claim as their own handiwork rather than use something that would be quite as satisfactory and has the advantage of being the regular product of an established manufacturer.

The consideration of the subject of standard specifications would naturally include the preparation of specifications with relation to the manufacture of incandescent lamps. For several years past a committee of this Association has had this subject under consideration. It has been found practicable by a number of large central station companies connected with another association and buying from one manufacturer to purchase their lamps under specifications which provide for the testing of samples of the product of the factory, the payment for lamps supplied being based on the results of the tests. It seems to me that it would be possible to adopt standard specifications under which our members could purchase their lamps from any reputable lamp manufacturer. The importance of this matter will be appreciated when it is remembered that the cost of lamp renewals per unit of output exceeds \$1.00 per ton of the cost of fuel in operating a central station with the most modern steam plant.

SELLING PRICE BASED ON COST.

It is of prime importance to central station managers that they should sell the product they manufacture, namely, electric current, to the greatest number of consumers at the lowest possible price, and yet obtain a reasonable profit. For a number of years the basis of charge on the part of most companies has been a given unit price, with discounts for quantity. In the early days of the business some companies were in the habit of charging a fixed price per lamp per month, having no control whatever over the use of the product, but being necessarily responsible for the increased operating expenses caused by the wastefulness of customers who could hardly be expected to economize, inasmuch as they paid exactly the same price for the use of light whether they burned it one or twenty-four hours a day. A majority of these companies, however, following this last method, realized at an early date the absurdity of distributing that for which they were not paid, and as a result I presume we can fairly assume that electric lighting business (with the exception of arc light service) is run almost universally on a meter basis. It is therefore unnecessary for us to discuss the question as to whether the measuring of current is a desirable thing in our business, as it is now generally recognized as a necessity. If you will make a careful examination of the factors entering into the cost of current, you will very quickly come to a realization of the fact that interest is by far the most important single element, and that this item varies very considerably with the different classes of service furnished by a central station company. The interest factor in cost depends upon the yearly average consumption of your product by the customer; or, to put it another way, you can figure your interest on the basis of so much per unit of output at maximum load. For instance, take the two probably extreme classes of customers to whom the central station company supplies current for lighting purposes. On the one hand you have an office building whose tenants only use artificial illumination for a very short space of time each day during the winter only. On the other hand you have a basement customer whose use of your product averages nearly one half of the day of twenty-four hours during the whole year. Your investment, to take care of each of these customers, is practically the same; therefore, your total interest cost must be the same in both cases, but if you distribute this interest cost over the actual units consumed you will find that the tenant of the office building

costs you for interest per unit of current sold many times more than does the occupant of the basement. There are of necessity as many different grades of customers between the two extremes I have mentioned as there are different classes of business and different characters of structures in which these businesses are conducted. Surely, if the cost of production varies according to the different conditions under which your customers use your product, it is but fair that the selling price per unit should vary correspondingly. If it does not, you, of necessity, encourage the use of electricity by customers whose business is unprofitable to you, and discourage the use of your product by customers whose business at a lower price would yield you a fair return. In past conventions the question of how to improve the load for the purpose of raising the average output, what classes of business should be encouraged other than lighting to achieve this result, and the price at which we can afford to sell current to the operators of these different lines of business, have come up for discussion. At the last convention the realization of the fact that great differences exist in the elements governing the cost of product for different classes of lighting customers was ably presented by Mr. Arthur Wright, and he pointed out that the improvement of your load factor, the broadening of your curve and the rendering less acute of your peak is a matter within your own adjustment, providing that you will realize in considering cost with a view to making a selling price that conditions are so dissimilar that the expense to you per unit of supplying two customers in the same block is likely to be widely different. Various plans have been adopted by a comparatively small number of companies to meet the conditions as we now know them to exist. Some companies have adopted the scheme of allowing certain special discounts providing the income per month per lamp connected exceeds a certain amount. Other companies charge one rate for current used during certain specified hours of the day and a much lower rate for the current used during the remaining hours of the day. A third method is a system of discounts based upon the total consumption of current during a given period, considered in connection with the maximum consumption at any time during that same period.

These various methods all have the same object in view, namely, the meeting of the conditions of each individual customer, and yet at the same time earning a fair return on all of the investment provided for all of your customers.

In discussing this matter I have referred alone to interest cost because it forms so large a proportion of the total cost, but you will find that this same principle enters into a number of the other elements which go to make up your total cost. It would therefore appear to me that in considering the cost of generating electricity you should bear in mind that a large proportion of the items which go to make up the total are within your own control, and their amount per unit of output depends very largely upon the methods adopted in selling your product.

PUBLIC CONTROL AND PRIVATE OPERATION.

A subject of growing importance to a number of our members is the question of the public ownership and operation of the undertakings now operated by electric lighting companies. The agitation in connection with this subject has called forth a great deal of discussion, partly by those interested in it simply with a view to extending the influence of political parties, and partly by serious disinterested thinkers who believe that the best interests of the greatest number are to be obtained by the creation of a municipal socialism, which, if carried to its logical conclusion, must ultimately result in municipalities performing, with others, such public service work as we are engaged in, and also in producing the food we eat and the clothes we wear. To those occupied in the management of electric lighting properties it does not seem possible that the movement in favor of municipal operation of electric lighting plants, based upon the assumption that a municipality can produce electricity cheaper than, or even as cheap, as a private corporation, is well founded. We all realize, from the close attention we have to give to our own affairs, that self-interest and the necessity of getting a return on our investment are the first essentials to the economical administration of large enterprises. While I do not pretend to claim that electric lighting companies are beyond reproach, I wish to point out that many of the evils complained of as pertaining to corporate management are the direct results of the enforcement of unwise conditions through legislative action. Ill-advised efforts are often made by legislative bodies to secure advantages in the direction of control which cannot be obtained without giving an equivalent in protection to the industry. This causes the

investor to feel that his property is being attacked and compels him to resist such legislation. The result is a feverish agitation, crimination and re-crimination, between the would-be improvers of municipal government and the owners of corporate properties without reaching a conclusion satisfactory to either. The fallacy of the so-called reformer's theory results from looking only at what he calls the injurious effects of corporate management without taking into account its indisputable benefits. He does not seek for the cause of the trouble. If reformers will take accurate account of all the points in the problem they will discover that the evils complained of result from errors in legislation designed to determine the relations between municipal bodies and electric lighting companies. It seems to me that the claim that municipal operation is the universal cure for all diseases for which electric lighting companies are supposed to be responsible, merely proposes the substitution of political in the place of industrial management. This raises the question: Is the administration of municipal affairs in the various cities throughout this country so economical as compared with the management of private industries and the class of service rendered so efficient as to justify the increasing of the burdens already imposed upon municipal government? It appears to me that a correct division of power and responsibility requires political government to control private industrial management. Where political government and industrial management are merged into one interest, the power of control is seriously impaired, since a political administration cannot be reformed without overturning the party in power.

I cannot bring myself to the belief that the citizens of this great country are in fact opposed to large aggregations of capital in corporate form, as such aggregations are absolutely necessary to the operation of all great undertakings by private enterprise. It is as impossible to operate such vast affairs with individual capital, as a personally owned business, as it is for us to live without municipal, state and national governments. The misunderstandings which from time to time occur between communities and the managers of electric lighting companies will, to my mind, disappear entirely if the relations between the two are correctly founded on the basis of public control, with corresponding protection to the corporations operating this industry. It would seem to me to be a very proper function for this Association to address itself to educating the public to a definite legislative policy which will be fair to the municipalities, securing to the public the best service at the lowest possible price, and protect corporations by giving them franchises which, while conserving municipal control, will insure to the investor the permanency of the undertaking.

COMPETITION IS NOT THE TRUE REGULATIVE FORCE.

It is supposed by many who discuss municipal affairs that the granting of competitive franchises for public service work is the true means of obtaining for users the lowest possible price for the service rendered, whereas, as a matter of fact, the exact opposite is the ultimate result. This is proved by results in all large cities where the most severe competition has taken place. Acute competition necessarily frightens the investor, and compels corporations to pay a very high price for capital. The competing companies invariably come together, and the interest cost on their product (which is by far the most important part of their cost) is rendered abnormally high, partly owing to duplication of investment and partly to the high price paid for money borrowed during the period of competition. The selling price of a service should be based on its cost, and in any business such as public work, where the investment is large and the annual turn-over is comparatively small, if the item of interest be unnecessarily augmented, it must be reflected in the price paid by public and private users.

While it is not supposed to be popular to speak of exclusive franchises, it should be recognized that the best service at the lowest possible price can only be obtained, certainly in connection with the industry with which we are identified, by exclusive control of a given territory being placed in the hands of one undertaking. In most European countries public service corporations enjoy exclusive franchises under proper control, and are able to obtain capital for their undertakings at the lowest commercial rates, thus materially affecting the cost of their product, of which interest, as I have already stated, is necessarily so great a part. In order to protect the public, exclusive franchises should be coupled with the condition of public control requiring all charges for services fixed by public bodies to be based on cost, plus a reasonable profit. It will be found that this cost will be reduced in direct proportion to the protection afforded the industry. The more certain this protection is made the lower the rate of interest

and the lower the total cost of operation will be, and consequently the lower the price of the service to public and private users. If the conditions of our particular branch of public service are studied in places where there is a definite control, whether by commission or otherwise, it will be found that the industry is in an extremely healthy condition, and that users and taxpayers are correspondingly well served.

COMPENSATION FOR FRANCHISES.

When prices for service are based on cost it matters not whether in the establishment of a system of legislative control provision is made for paying a portion of the receipts direct to the municipality. If the public demands a percentage, surely we can afford to pay it, as it would simply be added as an item of expense on which our selling price would be figured. If the public does not demand a percentage, this selling price would be proportionately less. It is simply a question as to whether our municipal bodies prefer to raise a portion of their income by taxing their citizens through the agency of public service corporations, or whether they prefer to raise that portion of their income by collecting it direct from citizens themselves. Revenue raised by a percentage on gross receipts of the electric lighting business would, at the present time, however, seem to be somewhat unfairly obtained in cases where the selling price is subject to legislative control and based on cost of service, as the result would be that a small minority of citizens using electricity would be forced to contribute largely to the public revenue, whereas the benefits enjoyed therefrom would be to the advantage of the whole community.

TAKING PRIVATE PROPERTY FOR PUBLIC USE.

Another point that should be included in a proper scheme of public control is a condition under which the municipality would have the right to purchase the undertaking. Such a right should include a direct obligation on the part of the municipality to purchase the property at a fair price whenever it is thought desirable that the industry should be operated by the municipality. The possibility of the exercise of the right of purchase by the municipality would of itself make it to the interest of the owners of the property to do their full duty in their relation to the public. On the other hand, if a community licenses a corporation to perform a certain public service, and if that corporation invests its money and develops its business, surely it is unfair for that community to go into the same line of public service work itself without first purchasing the existing plant. If this is not done the value of private property will be destroyed without just compensation being made therefor in an attempt to secure a public benefit. I do not believe that the people as a whole are so unfair as to demand that such a course shall be taken.

My recommendations on the subject, which I have just presented, are by no means original. Most public service corporations in Great Britain are run on practically the bases indicated, and in more than one State in the Union corporate legislation has taken the same direction.

I would summarize the position which I think we should take on this subject in just two sentences.

First—Franchises granted to public service corporations should secure them the same degree of protection in their rights to their property as is enjoyed by other investments.

Second—Public control of charge for service based on cost plus a reasonable profit, and eliminating the factor of competition, is the proper safeguard for the interests of users, taxpayers and investors.

The address was followed by hearty applause.

President Insull requested that the subjects presented in his address, being of vital interest, be discussed some time during the meeting. He then read numerous letters of regret from absentees, among them being those of A. M. Young of Waterbury, Conn., Nikola Tesla and Elihu Thomson.

A number of invitations were read from various Chicago concerns tendering hospitality to the Association. These were referred to the proper committees for action.

The President then announced the next order of business to be the paper by Mr. Calvin W. Rice, Brooklyn, N. Y., "Cost of the Generation and Distribution of a Unit of Electricity."

Mr. Rice said he was fully aware of the responsibility of undertaking a discussion of the subject he had chosen and would confine his remarks to a resumé of the most reliable data at hand. In America the variation in the investment per kilowatt is \$200 to \$750 according to the capacity of the

installation; in the great majority of cases the cost was \$400. The majority of plants in Great Britain and the Continent cost \$500 per kilowatt installed. The importance of keeping down the investment per kilowatt, he said, need not be emphasized, and the location of the plant ought to be considered with reference to all influences, having in view the dollars and cents value per year for each consideration. In buying steam and electric plants it was essential to consider reliability above everything. It is of assistance in examining bids on electrical apparatus or engines to compare the prices per pound and weight in pounds per kilowatt or horsepower, and in considering boilers, heating surface and pounds per horse power as well as price per pound. He introduced tables showing that the cost of fuel averages 46 per cent. higher where the dynamos are rope-driven than where the dynamos are direct-driven by high-speed engines. Good regulation in the station, he said, was more important than high efficiency, and the value of accessories in the reliability of a plant and the reduction of labor and attendance are important. He enumerated these accessories under the headings of feed-water appliances, boiler appliances, cranes and auxiliary apparatus. Tables were introduced to show that electricity as delivered at the switchboard is generated with economy and can be used more advantageously than steam. The use of an oil-distributing system reduces the amount of oil consumed and the attendance required. He recommended the use of the air-blast for cleaning around generators. Referring to the distributing system, he said the cost of underground construction is about four times that of overhead construction, and great care should be taken in the choice of duct and insulation on conductors. In testing cables the testing apparatus should be at least about 50 kilowatt capacity, and the test pressure should be maintained at least one hour. Mr. Crompton's system of estimating the cost and profit per unit of 1,000 watts maintained for one hour was given, from which it was deduced that it required 50 cents worth of plant to generate and distribute one kilowatt hour per year. Load factor was considered, and the advantages of a high-load factor pointed out and illustrated by a table from an English source. The cost per unit of a number of English stations, and the average cost of coal and contract price per arc lamp per year in American cities were given. These averages, obtained from the statistics of 46 States concerning arc lighting, were also given: Hours per year, 3,326; coal, per ton, \$3.03; contract per year, \$101; price per hour, \$0.34. Treating of railway plants, Mr. Rice's paper gave a great deal of tabular information which we defer to a future issue.

When Mr. Rice had finished the reading of his paper, the President announced that discussion of the paper was in order, remarking that the topic following for discussion, "Prices and Discounts for Electric Current and Methods of Billing Current to Customers," was so closely interwoven with the subject of Mr. Rice's paper that they might both be discussed together.

The discussion which followed was participated in by Messrs. Scovil, Rice, Ayer, Barker, Coggeshall, Wagner, Dow, Creeden, Insull, Armstrong, Van Trump, Hubeley, Wendell, Ferguson and Weeks, and, as the latter remarked, there had been few discussions before the Association of greater importance to central station interests. At its conclusion the Convention adjourned until 3 o'clock.

AFTERNOON SESSION.

President Insull called the meeting to order at 3:10 P. M., and announced the first paper to be that of Mr. Alexander Dow of Detroit, Mich., on "Public Lighting With Relation to Public Ownership or Control."

Mr. Dow's paper was followed by papers on the same subject by Mr. Samuel Scovil of Cleveland, Ohio, Mr.

H. M. Atkinson of Atlanta, Ga., and Mr. E. H. Davis of Williamsport, Penn.

At the conclusion of the reading of these papers the meeting adjourned to executive session.

WEDNESDAY, JUNE 8—MORNING SESSION.

President Insull called the meeting to order at 10:30 and announced that the papers for the morning session would be that on "General Distribution from Central Stations by Alternating Currents," by Herbert A. Wagner of St. Louis, and "General Distribution from Central Stations by Direct Currents," by Louis A. Ferguson of Chicago.

The purpose of Mr. Wagner's paper was to show the alternating current applied in the same manner as the direct current with a view to comparing the results. The various methods of distribution are then reviewed. He advocated a combination of the alternating and direct current systems by adopting the most desirable features of each. Such a combined system is described in detail as being in successful operation. The paper ends as follows: "In summing up, we find the following marked features in which the alternating current, properly installed, has been shown to have pronounced superiority over the direct current: Highest possible efficiency of distribution and operation; best regulation; largest territory desired readily supplied from one station; comparatively small cost of feeders, effecting enormous saving in investment; least cost of real estate; cost of installing and operating sub-stations entirely avoided; the only system in which all classes of service can be supplied from one type of generator; greatest flexibility." Diagrams of distribution efficiency curves and distributing systems were given.

Mr. Ferguson at the outset stated in his paper that he does not blindly advocate the general use of direct currents under all conditions for both transmission and distribution of electricity for commercial purposes. Reference is made to and description given of the method of distribution by the Chicago Edison Company as representing the latest development in direct-current distribution. Variations in load were shown by means of ampere curves for each station. In the Chicago Edison system three-phase alternating current is used for long distance transmission with step-up and step-down transformers. The alternating current is conceded to play an important part in the distribution of electricity by this company. In some central stations two or more pressures are used. This is not economical except when the dynamos can be worked very near the maximum load. The method most to be recommended is to have the dynamos and storage batteries feed into one general system at different points. The useful field of operation for an alternating current distribution system is to be, in the opinion of Mr. Ferguson, suburban residence districts and not large cities. Various diagrams and pressure charts were shown in connection with the paper.

After the reading of these papers, President Insull said: I have pleasure in calling upon Prof. Fujioka, one of our honorary members, who is professor of electrical engineering at the Imperial University of Tokyo, Japan.

Prof. Fujioka—Mr. President and Gentlemen: In opening this discussion I wish to give some description of what we have done in Japan. Although I have the honor to be an honorary member of your Association, I have very little opportunity to attend your Conventions. I shall take great pleasure this morning in giving a short description of the plant and system which has been carried out under my direct supervision in Japan. I have no data to be compared with the papers which have been read, so I will draw a rough map of Tokyo. We originally had five central stations. No. 1 station was originally installed in 1883 entirely with the Edison three-wire system. Nos. 2, 3, 4 and 5 were installed afterwards, also on the Edison three-wire system. Before going further I would like to say that these

are some conditions peculiar to Japan; that is to say, the city of Tokyo has quite an extended area, occupying about 100 square miles, and the buildings are scattered, and we have not high buildings because of the danger from earthquakes. I saw the advantages of the Edison three-wire system of distribution, so we began to supply the more crowded parts of the city by means of the three-wire system. We subsequently found that it was necessary to supply current to more settled parts of the town, so we added single-phase alternating currents in most of the other stations. Since we saw the advantages of the three-phase current transmission we have decided to install one big power station near the river. All the former stations were worked with high pressure non-condensing engines, and I may state that coal in Japan, particularly in Tokyo, is very expensive, costing \$5 to \$6 a ton. So we found that it might be wiser to install a condensing station near the river, having triple expansion engines. We installed ten triple expansion engines on the condensing system, each engine coupled to low speed generators, four of them single-phase generators. The three-phase generators were wound for 3,500 volts, whereas the single-phase were wound for 2,000 volts. We did not like to disturb the existing three-wire network in this crowded portion of the city, and we wanted to keep the three-wire network as we have had it for about ten years. The way I have done it was to place induction motors in No. 1 station, taking out all the engines and boilers, and placing the induction motors in the same place as we had the engines. So in the same way Station No. 3 was converted in a similar way, and in Station No. 2 we have four induction motors, each 150 H.P., directly connected to multiphase direct-current dynamos. No. 4 station was taken down altogether. In No. 5 station we took down all the old engines and dynamos, and replaced the three phase transformers with the four-wire systems for alternating currents. The other parts are coupled by means of 2,000 volt single-phase currents, raising the voltage at the necessary place to the required potential. In that way we have succeeded in reducing a great deal of the expense in fuel and labor items. I cannot tell at present the exact proportion of the decrease, but we know we have reduced the expenses materially, and I shall be pleased if this brief description will convey to you some idea of what has been done in Japan. (Applause.)

The President—The general subject of alternating currents and direct currents for electric lighting is now open for discussion.

The discussion on these subjects occupied the remaining hours of the morning session and was continued in the afternoon session, the advocates of both systems going into various details showing their comparative efficiencies or defects.

WEDNESDAY—AFTERNOON SESSION.

The President called the meeting to order at 3:15 P. M.

As mentioned, the discussion of the papers on the general distribution by alternating and direct currents was resumed. The members engaged in the discussion from the beginning were Messrs. Thayer, Wagner, Van Trump, Robinson (of Baltimore), Dow, Wilmerding, Ferguson, Goldsborough, Scovil, Rice, Insull, Ayer, Fakes, Davis, Stetson, De Camp, Hubeley, Chandler, F. E. Smith, Walbank and Carnes.

At the conclusion of Mr. Carnes' argument the President said he would close the discussion by having some remarks from Mr. Wagner and Mr. Ferguson, giving the preference in time to Mr. Wagner who was a visitor to Chicago.

Mr. Ferguson argued in favor of the direct current system of distribution and referred to the various Edison stations throughout the country as sustaining his position. He exhibited a curve which represented the efficiency of distribution of the Edison central stations in Boston, Detroit, the original

Adams street station of the Chicago Edison plant, and others, and which he said at all times showed a higher efficiency than that of the best alternating current station presented in the papers read. But, he said, the real thing is not the curve of efficiency, but the actual cost of the production of the unit of electricity. In regard to regulation, he said: If the alternating companies propose to have a pressure regulation equal to the direct current they must operate in parallel if they hope to have the same regulation.

Mr. Wagner said he did not favor the use of the alternating current in every location and for every application. If a system is to be changed, and a station which has been operated for some years is to shut down, and it has a large number of direct current motors and devices to do the work required of the direct current, involving a large investment, it might not be at all advantageous to change it to an alternating current station; but for reaching out into new districts and developing them it seemed to him that there would be no use for using the direct-current rotary transformer. The Brooklyn Edison Company has a station which has been in operation some time, where they have installed a large plant some six miles from the center of distribution. They are generating alternating current entirely, three-phase, carrying it to their former centers of distribution and transforming it into direct current. The fact that they are doing it, and the Chicago Edison Company is preparing to do the same thing in some instances, shows that there is economy in moving the central station to one side of the district to be lighted, where real-estate is cheaper, where water can be obtained for condensing and coal can be had cheaper; and in order to do that in most cities it is necessary to employ alternating currents, because the distances obviously become too great for the use of the direct current.

When Mr. Wagner concluded his remarks the Convention adjourned until Thursday morning.

On Wednesday evening Mr. Joseph Wetzler delivered a lecture on "Electricity Direct from Coal," illustrated with stereopticon views. The lecture was well attended.

THURSDAY—MORNING SESSION.

President Insull called the meeting to order at 10:40 A. M. The first paper read was on the "Cost of Producing Electric Power by Water Power from Lachine Rapids, Canada," by W. McLea Walbank of Montreal.

Mr. Walbank stated in his paper that as far back as 1866 a company was formed to erect dams and utilize the water power of Lachine Rapids but the scheme never materialized. Another company was organized on a solid financial basis in 1895, and two years later had a plant completed. A description and the cost of this plant were given in detail. Mr. Walbank, in justice to the Lachine Rapids plant, gives first the cost per kilowatt per year for the portion of the plant at present installed and ready for operation, and second what the cost will be per kilowatt per year when the whole water power development is in operation. The first amounts to \$22.97 per kilowatt on a twenty-four hour day basis, the second to \$8.14 on a twenty-four hour run. In concluding, Mr. Walbank stated that he hoped he had shown that where reliable water power can be obtained within reasonable distance from power centers it can be made to produce cheap electric current.

The discussion on Mr. Walbank's paper occupied considerable time and was participated in by Messrs. Wagner, Walbank, Ferguson, Insull, Fakes, Davis, Matlack, Rice and Anderson.

The President at the close of the discussion called upon Prof. Goldsborough to read his paper on "Transformer Economy."

Prof. Goldsborough read his paper. As the title indicates, the paper treats of the economy of the static transformer of alternating currents from

various standpoints. The result of a number of tests made of various designs of transformers at the laboratories of Purdue University were especially referred to. With but one exception the transformers tested surpassed the requirements of the specifications laid down by Prof. Jackson, and conformed fairly closely to the published guarantees of the companies submitting the transformers for test. The matter of burn-outs was touched upon as not always being due to faulty construction, but frequently to poor installation.

The President—Gentlemen you have heard this very interesting paper and it is before you for discussion. I beg, however, at this time to announce the committee to nominate officers and members of the Executive Committee for the ensuing year. I will appoint as a Nominating Committee the following gentlemen: A. M. Robertson, Minneapolis, Minn.; James Dee, Houghton, Mich.; James I. Ayer, Boston, Mass.

The President then announced that the discussion on Prof. Goldsborough's paper would be proceeded with.

The discussion, which was opened by Mr. Layman, drew into it Messrs. Thayer, Werts, Wagner, Davis, Matlack, Walbank and Huntley. At its close the Convention adjourned until 2:30 P. M.

THURSDAY—AFTERNOON SESSION.

President Insull called the meeting to order at 2:55 P. M. The first business was the report of the Committee on "Standard Candle Power of Incandescent Lamps," Dr. Louis Bell, chairman. Mr. Ayer presented the report of the committee, as follows:

Your committee has been able to have tested in the most careful manner, through the courtesy of Prof. W. L. Puffer of Boston, sixteen incandescent lamps from eleven different makers. The lamps were obtained directly from the makers or their authorized agents and were known to be for test.

These lamps were all sold for 16 C.P., 110 volts, no watts specified, and may be fairly assumed to represent the product which would be shipped to consumers who did not desire the lamps for test, although one batch of lamps came with the bases marked to show the point to be turned toward the photometer screen.

On test these lamps, 33 in all, averaged 14.1 mean normal C.P. and about 11.7 mean spherical C.P. Only one batch of three averaged over 16 normal C.P. One batch fell below 11 normal C.P. and two below 12 normal C.P. Five makes fell below 14.5 normal C.P. The highest average of any batch was 16.99, the lowest 10.82. The average consumption of energy was almost exactly 4 watts, the lowest 3.78 watts per candle, and two batches ran over 5 watts. It should be noted that the voltage was determined by a Weston voltmeter freshly compared with Clark cells, and each lamp was marked at its marked voltage (110).

A separate series of tests showed that these lamps on the average gave their mean spherical candle-power when measured under rotation with their axes tilted 44° and 24° from the vertical toward the photometer, thus confirming closely your committee's estimate of 45° as a proper angle.

A series of tests on proper speed of rotation showed that the best results were obtained with a speed of 200 to 250 revolutions per minute, and that the lamps would readily stand this speed.

Many of the lamps showed bad spherical distribution, which seems to be quite needless since it is merely a matter of properly proportioning the form of the filament.

Of an equal number of batches of 32 C.P. lamps only one batch averaged 32 normal C.P., the majority falling to from 26 to 28 C.P. The 32 C.P. lamps averaged slightly greater efficiency, but were otherwise much like the 16 C.P. size.

From this investigation the fact stands out that the incandescent lamp sold for 16 C.P. is on the whole a lamp which is often giving considerably less than its rated C.P. even when new. Some of these lamps would probably show a temporary increase of candle-power after say 50 hours' burning, but the committee has not extended the research in this direction as yet, and adheres to the opinion that the initial candle-power is the only practical commercial test, and any increase consequently is simply to be regarded as a device for keeping the lamp a little longer from its inevitable decay.

From these and other data kindly furnished by

manufacturers and obtained from various other reliable sources, your committee is convinced that the need of a uniform rating is even greater than it concluded it was in the preliminary report of last year, and that a rating test in order to be effective must involve measurement of candle-power of lamps in more than one direction. Neither mean horizontal nor mean spherical candle-power, nor candle-power in any one direction, will define a lamp well enough to ensure adherence to the rating. Your committee therefore recommends that incandescent lamps be required to conform both to a standard mean normal candle-power and to a mean candle-power when revolved with the axis tipped 45°, this representing the spherical distribution. It recommends that the limits for the mean normal candle-power be 15 and 17.5 cp. Unless the minimum be as high as 15 there will certainly be found a tendency to produce lamps near the lower limit. The 45° should be at least 85 per cent. of this minimum. This is not an excessive requirement and will tend to prevent working near the lower limit of horizontal candle-power unless with a lamp very good in other respects.

Your committee has blocked out a standard form of photometer, a type of which it proposes to build, test and put at the disposal of the Association with directions for proper use.

It suggests that testing be by sample, a lot of ten lamps being taken from each barrel. Of these no lamp when run at its marked voltage shall show less than 15 nor more than 17.5 cp. mean horizontal when rotated at 200 to 250 revolutions per minute; and no lamp shall give when thus rotated at 45° inclination less than 85 per cent. of the above minimum.

The committee will make arrangements for standard lamps as indicated in the preliminary reports to go with the standard photometer.

Mr. Barleigh—I move that the report of the committee be adopted, that this committee be discharged and another committee be appointed to continue the work.

Motion carried.

The President appointed as a committee: Chairman, James I. Ayer of Boston, Louis A. Ferguson of Chicago, and Calvin W. Rice of Brooklyn.

The Committee on Amendments to Freight Classification requested further time to report, and the report was postponed until the next meeting.

The Committee on Legislation Concerning Theft of Current made a verbal report in which they stated that the committee had collected laws passed in 27 different States bearing on this subject, and they recommended that the same be published for the benefit of the members of the Association.

The recommendation of the committee was adopted and a new committee was formed as follows: Chairman, E. A. Armstrong of Camden, N. J.; James I. Ayer of Boston, and A. W. Field of Columbus, O.

The meeting then adjourned to executive session.

The report of the Secretary and Treasurer was presented, showing the affairs of the Association to be in a flourishing condition.

On motion of Mr. Armstrong, the following resolution was adopted:

Resolved, That the annual meeting shall be held in May or June in each year alternately in the cities of New York and Chicago, unless otherwise directed by the executive, and on such date as the committee shall determine.

On motion of Mr. Atkinson, a very hearty vote of thanks was passed to President Insull for his untiring efforts for the success of the Chicago Convention.

Mr. Ayer moved that the thanks of the meeting be extended to the Chicago Edison Company, the Metropolitan West Side Elevated Road, the South Side Elevated Road, the Northern Steamship Company, the Chicago Telephone Company, the American Telephone & Telegraph Company, and all others who had extended courtesies to the Convention for their kindness in so doing.

Mr. Field moved a vote of thanks to the Reception Committee for their very considerate attention to the ladies accompanying the delegates to the Convention.

The following officers were elected for the ensuing year:

President—A. M. Young, Waterbury, Conn.

1st Vice-President—E. H. Rollins, Denver, Col.

2d Vice-President—F. A. Gilbert, Boston, Mass.

Members of the Executive Committee—Samuel Insull, Chicago; Samuel Soovil, Cleveland, O.; H. M. Atkinson, Atlanta, Ga.; F. A. Copeland, La Crosse, Wis.

The Convention then adjourned sine die.

ATTENDANTS AT THE CONVENTION.

Abbott, Jno. Jay, Chicago Edison Co, Chicago.
Ayer, Jas. I., American Elec Htg Corp, Boston.
Arnold, W. L., Siemens & Halske Elec Co, Chicago.
Atkinson, H. M., Georgia Elec Light Co, Atlanta.

MIDSUMMER MEETING OF THE NORTHWESTERN ELECTRICAL ASSOCIATION.

On Board Steamer North West, Chicago to Duluth, Beginning June 10, 1898.

The Convention was called to order at 8 p. m. for the purpose of arranging a programme.

The Secretary announced that stops would be made at Mackinac, the "Soo," and at Houghton, and that it was expected the steamer would reach Duluth Monday night, June 13; that there would be a reception tendered the members of the Association at Sault Ste. Marie, and that there would be an inspection of the Government canal especially arranged for the benefit of the members of the Association; that there would also be a stop made at Houghton long enough to permit of a tour of the famous copper mines there, and that suitable arrangements had been made for that purpose; that the only requisite would be an Association badge, which he was prepared to furnish to the members of the Association and to guests at a nominal price.

Professor I. Fujioka, of Tokyo, Japan, who has been sent by the Japanese Government to the United States for the purpose of investigating electrical progress here, was called upon for an address, and said:

"I do not wish to address the Convention at length this evening, but if it is desired will at some future session say something on the subject of the electrical industry in Japan, adding some comments on the subject of electrical education there, as I think that these topics will be of some interest to you all, and as I am naturally, perhaps, more familiar with the situation of electrical matters in Japan than most of the gentlemen here could be expected to be."

This remark of Mr. Fujioka was greeted with good-humored acquiescence.

It was announced that Professor Elisha Gray of

Highland Park, Illinois, would deliver an address during the Convention, at an early session.

The programme for the next regular session was made out, consisting of a paper on the subject of "Incandescent Lamps," by Mr. S. Everett Doane, the session to be held at 11 A. M. June 11.

The Secretary announced also that an address would be delivered by Mr. A. J. Werts of Pittsburg at some session during the trip, and that other addresses would be announced later.

Announcement was made that W. F. Barker, Gas Commissioner of Massachusetts, would also deliver an address.

Arrangements were made to place a question box in position to receive queries for consideration and discussion during the sessions.

An adjournment was then taken until June 11 at 11 A. M.

The following is a list of the members of the Association and their guests on the steamer North West, Chicago to Duluth:

President F. A. Copeland, La Crosse, Wis.
 Secretary Thomas R. Merozin, Milwaukee, Wis.
 J. N. Ely, Atlanta, Ga.
 B. B. Downs, Minneapolis.
 W. P. Upham, Chicago.
 A. L. Daniels, Aultman, O.
 C. D. Wilkinson, Chicago.
 W. S. Rugg, Chicago.
 Douglas Hapeman, Ottawa, Ill.
 R. A. Willson, Marquette.
 Robert F. Carr, Chicago.
 Arthur Warren, Pittsburg.
 J. W. Mabbs, Chicago.
 C. S. Kehler, Chicago.
 E. H. Abadie, St. Louis.
 Charles P. Williams, La Crosse.
 J. B. Kuntson, La Crosse.
 John S. Baker, Evansville, Wis.
 Miss Eliza Cleland, Evansville, Wis.
 Fred Brooks, Boston, Mass.
 Morgan Brooks, Minneapolis.
 L. S. Randolph, Blacksburg, Va.
 Herbert H. Dow, Midland, Mich.
 J. W. Hull, Steubenville, O.
 H. H. Brooks, Boston.
 J. H. Harding, La Porte, Ind.
 Samuel Wilkinson, Northville, Mich.
 R. M. Heskett, Green Bay, Wis.
 Charles F. Frego, Hoopeston, Ill.
 James H. McGraw, New York.
 F. L. Perry, Chicago.
 P. H. Kerst, Racine, Wis.
 W. D. Packard, Warren, O.
 L. K. Comstock, Chicago.
 H. C. State, Milwaukee, Wis.
 Wm. Chandler, Sault Ste. Marie.
 C. A. Ross, Chicago.
 C. Dysturd, Monterey, Mex.
 Geo. V. Williams, Chicago.
 Geo. Rex, St. Louis.
 A. G. Paul and wife, Chicago.
 H. S. Anderson, Springfield.
 George A. McKintock, Chicago.
 W. L. Candee, New York.
 Elisha Gray and wife, Highland Park, Ill.
 A. E. Lang and wife, Cleveland, O.
 A. J. Werts and wife, Pittsburg.
 W. F. Barker, Boston, Mass.
 Mr. Whitney.
 Iohisuke Fujioka, Tokyo, Japan.
 Mr. Fitzgerald and wife, Duluth.
 W. B. Banks, Superior, Wis.
 Mayor Truelsen, Duluth, Minn.
 O. C. Hartman, Duluth.
 C. F. Leland, Duluth.
 F. L. Taylor, Duluth.
 O. H. Simons, Duluth.
 H. E. Smith, Duluth.
 Mayor Dietrich, West Superior.
 Mr. Perrin, West Superior.
 A. A. Cross, West Superior.
 Mr. Scanlon and wife, Milwaukee.
 W. M. Lowerie, Chicago.
 W. H. Friend and wife, Vincennes.
 G. T. Manson, New York.
 S. C. D. Johns and wife, Cleveland, O.
 B. J. Arnold and wife, Chicago.
 Thos. J. Stacey, and wife, Chicago.
 Jos. Wetzler and wife, New York.
 J. M. Hill and wife, Chicago.
 Mrs. S. D. McDonald, Chicago.
 H. G. Underwood and wife, Milwaukee.
 H. Hergett and wife, Pekin, Ill.
 H. D. Goodwin and wife, Milwaukee.
 Hugo P. Goodwin, Milwaukee.

M. L. Stern, Denver, Col.
 S. Scovill and wife, Cleveland, O.
 Miss Parker, Evanston.
 H. C. Maloney, Chicago.
 J. J. McDonald, Chicago.
 J. J. Schayer, Chicago.
 H. A. Wagner, St. Louis, Mo.
 Mrs. Perry, Chicago.
 J. Jennings, Wilkinsburg, Pa.
 Thos. Ferris, Milwaukee.
 F. M. Kimball, Boston, Mass.
 H. F. Edgar, Boston, Mass.
 W. W. Dailey, Chicago.
 Max Bass, Chicago.
 Wallace O'Connor, Chicago.
 H. M. Atkinson, Atlanta.
 E. B. Kittle, Chicago.
 F. N. Boyer, Chicago.
 L. J. Densberg, Sault Ste. Marie.
 W. F. Kingman, Sault Ste. Marie.
 S. E. Doane.
 Converse D. Marsh, New York.
 W. C. Knight, Ft. Wayne.
 W. S. Smith, Toledo.
 F. N. Phillips, Providence, R. I.
 F. E. Donohoe, Chicago.
 Mr. Woodbridge, New York.
 C. W. Price, New York.
 J. S. Church, Chicago.
 James R. Dee, Houghton, Mich.
 Henry L. Doherty, Madison, Wis.
 A. D. Page.

Illinois Street Railway Association.

The second annual meeting of the Illinois Street Railway Association was held in Chicago on the 7th, 8th and 9th inst. Representatives of nearly all the street railroad companies in Illinois were present, and the papers read and discussions which followed showed that the railway men of the State are possessed of sufficient ability to guard the interests entrusted to their charge. The papers on the programme were of a specially practical nature and the subjects were treated with intelligence and good judgment. The authors and titles of the papers were as follows:

"On the Rights of Street Railways Under the Constitution." C. L. Bonney, Chicago.

"On Operation of Street Railways in Small Cities." E. X. Lesseure, Danville, Ill.

"System of Collection of Fares and Checking Employees." W. L. Ferguson, Decatur, Ill.

"Relations of Street Railways and Municipal Corporations." D. B. Sherwood, Elgin, Ill.

Mr. Bonney's paper was the feature of the meeting. In it he stated that the attitude of the city of Chicago toward its car lines was indefensible and amounted to oppression. He advised street railway companies when their rights were assailed by the councils or the Legislature to carry their grievances to the federal courts.

Personal.

It will be of interest to the general public hardly less than to the electrical fraternity to know that Lieut. Frank J. Sprague, who has for the last six weeks been confined to his house, and in great suffering, from a severe injury to his right eye, is in a fair way to recovery. Nearly two months ago a piece of the eyeglass Mr. Sprague was wearing was accidentally forced into the ball of the eye, and Mr. Sprague had to remain for some two weeks under the care of a specialist. Being very anxious to push forward to definite shape the Volunteer Corps of Electrical Engineers, which he offered some time ago to organize for early service at the front, Mr. Sprague imprudently went to Washington, where he caught cold in the injured eye. Severe complications set in, along with iritis, and for some time it was feared that blindness was inevitable. This danger however seems to have passed, and there is every prospect that Mr. Sprague will soon be able to renew his active part both in the affairs of the company with which he is identified and the formation of a fighting corps that should fill a place of its own in the war resources of the Government.

THE X-RAYS AND THEIR SAFE APPLICATION.*

Destruction of X-Ray and Other Infections by Electro-Sterilization.

BY J. MOUNT BLEYER, M. D., F. R. A. M. S., LL. D.,
New York City.

The discovery of new properties of the X-rays go on apace and the scientific world is closely watching to determine any new effect of these rays upon the human body. Since their discovery and their application in medico-surgical work, reports have spread throughout the profession and the lay public of a grave danger accompanying the use of these X-rays owing to their producing so-called virulent burns by exposure to them. Many cases of such burns are on record, differing in degree, some having even proven fatal from a lingering exposure to the rays. The records tell us of a recent murder trial in this State in which the question arose as to whether death was not due to an act of negligence on the part of the physician who made the X-ray exposure. Let me say at the outset that from what I have gathered from my experimental work all your timidity in the use of X-rays may be allayed. The conclusions which I have arrived at are, that if the X-rays are applied with certain precautions no danger exists. I speak now of the actual daily applications of these rays to the chest-wall with a view of gaining early diagnostic signs of tubercular and other allied diseases if present.

This investigation gives me the right of an opinion, and I freely express it before you to show how we all have fallen into a fallacious position by calling this phenomenon as produced by X-rays burns, when it is nothing more nor less than an inoculation. Now that we know how to guard against the danger attending their use, how best to avoid the repetition of mistakes, and who the blame should rest on if the proper precautions are not observed.

I shall again refer to these facts in a few moments. Let me eliminate from your minds that an X-ray application or the use of its photography is a dangerous procedure either on a long or short exposure. If this force when applied is handled by skilled hands, a suitable mechanism used, there is absolutely no danger to be feared from this phenomenon of inoculation known fallaciously as X-ray burns.

This inoculation is due, according to my observation during a series of experiments, to several physical effects produced by the generation of these rays and the general conditions present. It is a known fact that the Ruhmkorff coil if used in connection with the generation of these rays is an apparatus which gives an exceedingly high electromotive force and amperage, and whose discharges produce certain physical conditions surrounding the atmosphere of the patient or person exposed to these X-rays. We find that this high discharge when leveled against the subject carries with it from the surrounding atmosphere particles floating therein, and is also surcharged with bacteria and foreign material found upon the clothing and skin of the subject, setting up under the skin exposed to this phenomenon sometimes an infectious and at other times an inflammatory condition from these force-driven materials.

This inflammatory or inoculated condition is the result of the facts set forth above, as I discovered during my investigations, and can be avoided without difficulty now on the part of the operator by the adoption of a few rules gleaned from my experience which I shall give in the summing up of my remarks.

I bring before your notice a few most important facts which are corroborated by others as well as by my personal investigations. These facts cannot fail to be appreciated as they come from several late

observers who have studied the question of burns due to fire, hot water, etc., and the causes of death therefrom.

We already know that many deaths are due to burns produced by other causes than the X-rays. It has puzzled scientists to account for deaths which occurred among persons suffering from burns, even where the injuries received seemed wholly inadequate to produce fatal results. The havoc caused by skin diseases might be much greater and a far larger surface of the skin attacked, but generally a cure could be effected, whereas in the majority of cases of severe burns the end would be fatal.

Persons who have escaped with their lives from a fire, whether severely burned or otherwise, suffer intense pain, which is followed by a peculiar torpor and drowsiness, and not infrequently by delirium and convulsions. The pulse becomes weak, the breathing irregular, the temperature lower, and there almost always follows vomiting and other symptoms of poisoning, terminating within twenty-four to twenty-eight hours in death.

Although these symptoms have received the attention of a number of scientists, their views as to the actual cause of death were widely diverse. The first guesses though ingenious were very far from the truth. A German, F. Falk, arrived at the conclusion that persons suffering from burns died of cold caused by the abnormal amount of heat given off through the burned portions. Prof. Ponfils, on the other hand, believed the cause to be the destruction by the heat of a great number of blood corpuscles, inducing a disturbance of the circulation. Addakoff, a Russian physician, stated as his view, gained from clinical observations, that the result of burns upon the system bore a resemblance to the effects produced by certain poisons, particularly those generated in the body by the failure to throw off secretions. Lustgarten and Kijanitsin come still nearer to the truth, the former comparing the results of burning with that of ptomaine poisoning, and the other declaring that under some influence or other, probably that of a ferment of bacteria, a poisonous matter developed in the blood of burnt persons. He actually found in the blood of such persons a poison (ptomaine) that is not present in normal bodies. It is a formless, yellowish or brownish yellow matter, with a sharp disagreeable odor, and injected into dogs or rabbits produces all the symptoms caused by burning. The belief of Lustgarten that bacteria, causing impurities which settled in the wound, were the generators of the poison, was shown by the experiments of Ajello and Parascandolo to be unfounded. Both these were able to take from any part of the body of a burnt animal a poison, the injection of 10 grammes of which into a dog weighing twenty pounds produced instant death. The strongest poison was obtained from the burned flesh, a lesser was in burned entrails, and the weakest of all came from the blood.

From this may be deduced with certainty that the ptomaine is not solely in the blood but in the whole of the burned portions and is thence carried into the system. Burnt persons poison themselves, so to speak.

The poison may be regarded as the product under the influence of high temperature of the albumen and the direct impregnation of bacterial poison from without, etc. It has been found possible, however, to prevent poison from spreading by removing the burned portions before the ptomaine had entered the circulation. It is also known from Ajello and Parascandolo's experiments with animals that all recovered without having suffered from the symptoms incidental to burns when the amputation of the burned parts occurred immediately after the burns were received. Where the amputation was delayed for twenty-four hours they all succumbed, except in instances where large quantities of blood were removed by bleeding; the blood drawn off being replaced, however, by a transfusion of pure

blood. By the bleeding a large quantity of the poison was removed, the blood artificially supplied so strengthened the animals that there was facilitated a further separation of the poison from the blood by means of the kidneys.

I lay much stress upon this important point due to these X-ray phenomena, that the X-ray burns always appear many days after the application of this force or light to a part of the body and do not show absolutely any early manifestation, minutes or hours thereafter, but days elapse, even as late as 18 days thereafter. These X-ray burns begin with a painful dermatitis and slowly develop symptoms resembling burns from heat or scalded. It is therefore seen that from the very outset the clinical difference in the conditions is apparent.

How should we avoid this dangerous condition in the application of the X-ray?

To sum up the whole matter, let me say in a few words the following, viz.:

Above all, substitute the static machine for the Ruhmkorff coil. This form of electricity has not the physical properties of carrying foreign material into the depths of tissue so readily as the other current. Static electricity gives only the high voltage with low amperage, while the other is productive of both high forces making it an unnecessarily dangerous appliance.

All parts to be either photographed or examined by means of these X-rays should have all clothing removed therefrom, and be washed with an antiseptic solution or so prepared as if a surgical operation was to be performed. Also a room which is as free as possible from infectious materials should always be made ready, or specially appointed for the purpose. These are the cardinal rules, and must not be deviated from, in order to avoid a dangerous inoculation or poisoning.

Specific Treatment for Such Conditions.—Should such a condition arise, from unforeseen causes or otherwise, sterilization of the affected part by means of electrolysis is the safest and quickest specific known to me, with the amputation of loose tissue surrounding the parts. I found in my early work, as far back as May, 1896, when I had been as unfortunate as others in inflicting these burns on several patients, that something more was present to deal with than an ordinary electro-dermatitis. Experimental study of the question soon elicited facts that brought me to the discovery of the following remedial agent which I recommend to your notice. Electrolysis or sterilization of the parts is a specific. The current decomposes all the infected materials and changes them into some other non-poisonous compound, thereby relieving the system of poisonous products. This is accomplished by placing such parts of the body into a salty solution of distilled water and connecting the electrode with the negative pole of a galvanic battery with a milliamperemeter. The positive pole may be placed on any convenient part of the subject. Vessels of porcelain, wood or glass are best. The strength of this current should average 5 milliamperes to a square inch of surface to be sterilized, lasting at least half an hour; after that time the polarity should be reversed for five minutes in order to set free the chlorine which will again react on all the external and internal exposed surface. As serious conditions will arise unless one knows the exact amount of current passing, accurate measuring by means of a milliamperemeter with the use of such current must be strictly adhered to, so as to judge the exact quantity of chemical action, thereby controlling its destructive effects, which if not known will do serious injury to healthy surrounding tissue.

I know of no more satisfactory and scientific method in the treatment of these X-ray wounds, and in fact all deep and superficial wounds, than the sterilization by electricity as advocated in my method. All other kinds of wounds containing pus should first be drained by incision before the above procedure is

* Read before the Medico-Legal Society, Psychological Section, May 26, 1898.

undertaken. I must state in my recommendation of sterilization by electrolysis to those who may hereafter apply it that they should at least be acquainted with the fundamental principles involving electrochemistry. Good judgment is necessary, as much damage can be done if proper precautions are not observed. The time of application must always be left to the discretion of the operator, especially in deep-seated conditions. Reapplications can always be resorted to. There are no contra-indications for this treatment by electrical sterilization to any class of infected wounds and skin diseases presented to surgery. After such treatment protective dressing of a simple kind is necessary to keep the parts from further infections.

I bring my new and novel investigation before your notice for the first time, and hope that it will find its way into general surgery with as much and better satisfaction than the methods heretofore employed and give as good account of itself as it has in my hands.

This work has been the outcome of early results obtained by me in the treatment of tuberculosis and several other inflammatory diseases of the lungs, etc., which still occupies my time with results already most fruitful.

My investigations brought me to a most important point, and that is that all microscopic crevices are cleaned of bacilli and pus cells, while in the use of antiseptic solutions, etc., a mere coating is effected thereby, leaving it always liable to a re-infection. This form of sterilization does not absolutely admit of such a condition, as destruction takes place instantaneously by chemical decomposition; also by reversing of the polarity of this current, these microscopical crevices are again closed completely by its electro-dynamic action.

Electro-sterilization must be highly recommended as a prime antidote to all kinds of stings, dog bites, or in fact venomous wounds produced by serpents. In such cases, however, the current should be applied a much longer time than for ordinary cases.

I beg to acknowledge the assistance received from Dr. H. T. Waits during my experimentation.

A New Electrical Thermometer.

At a recent meeting of the Frankfort Electrical Society Herr F. Heitmann described a new electrical thermometer constructed by Messrs. Hartmann and Braun of Frankfort. In principle it resembles a Bruger direct-reading ohmmeter. Two crossed coils are free to rotate in a strong non-homogeneous magnetic field. In circuit with one is a resistance of fixed value, and in circuit with the other is the resistance to be measured—in this case the temperature wire. The scale of the instrument is graduated to read directly in degrees. The apparatus can be made for any range of temperatures, and by adjusting the shape of the pole pieces it is possible to produce an "open scale" in the neighborhood of any particular temperature. A platinum wire is used for high temperatures, and a "nickelin" wire for lower ones. Temperatures up to 1,200° C. can be measured with the instrument, and it is stated that it can also be used with similar accuracy for temperatures below 0° C. The current required is only about 0.03 ampere at about 5 volts, and the instrument can be left constantly in circuit without injury.

CANADIAN NOTES.

The eighth annual meeting of the Canadian Electrical Association is to be held in Montreal on June 28, 29 and 30. Headquarters will be at the Windsor Hotel, and already accommodation has been provided in the city for 150 members. A large number of papers by prominent men and of interest to the members will be read. The Convention will visit in a body the electrical works at Lachine Rapids and at Chambly.

The Canadian Pacific Railroad copper telegraph

line from Montreal to Vancouver, B. C., is being strung in three divisions—to Fort William, thence to Donald, B. C., thence to the coast. A great deal of trouble has been experienced by telegraphic companies by reason of wires coming in contact with each other through the breaking of the glass insulators by which the wires are attached to the poles. A test was therefore made at McGill University, Montreal, with a view to ascertaining the comparative resistance of glass and porcelain insulators, with the result that it was found that porcelain resisted much heavier and a greater number of blows than the glass. The testing of the wire is also going on at the Applied Science Department of McGill, from samples taken at random from bundles of ten as they are manufactured by the Dominion Wire Company. The wire must be .137 of an inch in diameter, perfectly cylindrical and weigh 300 pounds to the mile, four pounds of a variation being allowed in this distance. Frequent electrical tests are made upon pieces one one-hundredth of a mile in length to determine the purity of the copper used, which must be 97 per cent. Each bundle weighs 170 pounds, and the wire must be in one continuous length, without joint or break. Each six inches of wire will stand 50 twists of 1 twist a second before breaking and an average breaking strain of 970 pounds and stretch 1 per cent. before breaking. When completed there will be a length of about 2,900 miles of wire.

Mr. J. W. Scott, an enterprising citizen of Napanee, Ont., has closed a contract with the Canada General Electric Company for a 100 kw. 4,000-volt three-phase generator of the revolving field type, for the purpose of supplying light and power to the town of Napanee from a water-power 8 miles distant from the town. He will also supply light and power to intermediate points.

LEGAL NOTES.

Judge Daly, on the application of Geo. J. Schoeffel, a judgment creditor, has appointed Charles Donohue receiver of the property in New York State of the Ogley Electric Company, which formerly had an office in the city of New York and a factory in Jersey City. Mr. Schoeffel learned that the company has assets in New York City consisting of notes aggregating \$37,500 against which there is a claim for \$13,773. The receiver was appointed here to collect the notes and apply the proceeds to the satisfaction of the claims.

The Supreme Court of New Jersey on the 8th inst. handed down a decision upholding the action of the city council of Atlantic City in awarding a contract for lighting the city for a period of five years to John H. Kothermel, of Reading, Pa.

The Superior Court at Tacoma, Wash., has handed down a decision in favor of the city in the suit of the Tacoma Gas & Electric Light Company against the city of Tacoma to restrain the latter from selling certain property formerly belonging to the Tacoma Light & Water Company. An injunction restraining the sale is dissolved by the decision. The suit arose over the alleged fraudulent sale of the water works to the city, and the latter was awarded a judgment amounting to nearly \$1,000,000, and seeks to recover by selling the property of the former light and water company.

Judge Townsend in the United States Court at New Haven has granted the Electric Car Company of America a stay of proceedings in order to get further testimony in the suit of the Thomson-Houston Company vs. the Hartford & West Hartford Railroad Company. The suit was brought for infringement of patent No. 393,323, pertaining to improvements in switches for electric motors.

In the United States Circuit Court for the Southern District of New York, Judge Lacombe has granted to the Consolidated Car Heating Company a preliminary injunction restraining the Gold Car Heating Company from the further manufacture, use, or sale of a spiral coil electrical heating apparatus, the patent for which is claimed by the complainants to have been infringed by the Gold Car Heating Company. The court further orders that

the operation of the injunction shall be suspended until November 1, 1898, if the defendants file a bond for \$10,000 to secure the payment of any decree for damages and profits that may be entered.

Suit has been instituted in the Court of Common Pleas of Baltimore by the Virginia Electric Company of Baltimore against the Richmond Railway & Electric Company of Richmond, Va., through its vice president, George E. Fisher, for \$500,000. The plaintiffs obtained a thirty years' franchise from the Richmond city council to furnish and supply electric light and power last December. The company pledged itself to construct and erect such hydraulic work in and near James River as might be necessary to furnish water power to produce not less than 2,000 horse-power of electricity for the furnishing of electric power and light. They claim in their bill to have expended in surveys and experimental work the sum of \$20,000, and to have entered a large number of contracts. The managers of the Richmond Railway & Electric Company, they claim, had a strong interest in preventing the plaintiffs from carrying forward the development of the water power, which would have made the said plaintiff company a competitor of the defendant company in its business, and therefore continued to delay and to embarrass the plaintiff company and to prevent it from entering into relations with any other railway company or capitalist, and more especially to prevent its completing the conditional contract for the purchase of land and water rights within the time limited in said contract.

THE NEWS.

What Is Going On in the Electrical World.

LIGHTING PLANTS.

Belleville, N. J.—The township committee are considering the bids presented for lighting the town with electricity. James Hardman Jr., of Belleville, was the lowest bidder, at \$13.85 a light for the first year, \$13.50 on a three years' contract, and \$13 on a five years' contract. Mr. Hardman said he did not have a plant, but could be ready to furnish light in sixty days.

Durham, N. C.—There is a movement here in favor of putting in an electric light plant to be owned and operated by the city.

Elmira, N. Y.—The lamp committee of the common council has adopted a resolution looking to the establishment of a municipal lighting plant in Elmira, and will ask for authority from the council to provide for plans and specifications and advertise for bids for its erection.

Los Angeles, Cal.—The proposal to have the city erect and run its own electric lighting plant has brought out a healthy opposition, not the least of which comes from the oil men who have sent a protest to the council calling attention to the fact "that at least two electric light companies now operating in the city use the local oil as fuel in power production and that no plan or scheme should be urged upon the people of the city which will, for the sake of misleading and false economy, deprive us of an almost certain market of over one thousand barrels of oil per month."

New Castle, Wyo.—The council has granted a six years' franchise to C. A. Peterson for an electric light plant and made a contract with him for lighting the city for that length of time. The plant will be erected as soon as possible.

Macon, Ga.—The electric light plant of the Macon Gas, Light & Water Company was sold recently at public sale to the Macon & Indian Spring Street Car Company for the upset price fixed by the court—\$40,000. There were no other bidders.

Milwaukee, Wis.—The joint committee on finance and street lights have decided to refer the question of erecting a municipal plant to the committee on street lights.

Sioux City, Ia.—The city council has decided to discard the gasoline and gas lamps now in use in this city, and the light committee has submitted a report recommending that the city enter into a new contract with the Sioux City Electric Company and the Sioux City Gaslight Company.—The Sioux Rapids Electric Light & Mill Company's plants were burned on the 2d inst., with a total loss of \$25,000 and \$2,000 insurance.

Springfield, Minn.—The village council has closed a contract with the Fort Wayne Electric Corporation for additional lighting facilities.

St. Louis.—The power house of the Imperial Electric Light, Heat & Power Company is almost completed and will have a capacity of about 12,000 horse-power. The Imperial company is making contracts with consumers for periods of three to five years, and it is re-

ported that it will make an attempt to secure the city lighting contract.—The Carondelet Electric Light & Power Company has made an appeal to the mayor to stop, if he can, the furnishing of electric light by the railway companies of the city.

Toledo, O.—Electric light is to be re-introduced into the Government building, in place of Welsbach gas burners, which were put in less than a year ago. In the post office department especially the gas burners were objectionable because they raised the temperature several degrees.

STREET RAILROADS.

Albany, N. Y.—The contract for the construction of the Albany, Helderberg & Schoharie Electric Railway was awarded on the 2d inst. to the Albany Construction Company. The work will be begun in a few days, and within three months the road is to be in operation to a point beyond Thompson's Lake. It is stipulated in the contract that after the construction company has expended from \$10,000 to \$15,000 it shall have a majority representation on the board of directors of the railway company. The contract price is about \$1,000,000 and Boston capital is backing the construction company. W. H. Burgett of Boston is the president of the railroad company and Richard Schermerhorn of Brooklyn chief engineer. Mr. Schermerhorn is president of the construction company. The other directors of the railroad company are Charles E. Bibber, Herbert Smith, Charles Perkins, all of Boston; Benjamin M. Secor of Albany, Thomas Wood of Berne, C. G. Kromer and M. Twitchell of Schoharie, and J. M. Borthwick and R. J. McAuley of Albany.—The State Board of Railroad Commissioners have granted two of the applications recently filed by the Metropolitan Street Railway Company of New York City for authority to use the under trolley system on lines operated by it.

Anderson, Ind.—The Indiana Gas Belt Electric Railway is now in operation between this city and Summitville and Marion and Fairmount, leaving but five miles to connect up to complete the Marion-Anderson line. The Elwood line is well under way and the Muncie line will be started at once. The Indianapolis branch will be built this fall or early next spring. Congressman Henry is at the head of the system.

Bridgeport, Conn.—Andrew Radcliff, formerly of Newark, N. J., the president of the Bridgeport Traction Company, has just closed a deal whereby he practically becomes the sole owner of the Westport street railway line, one of the best equipped and most profitable of the Connecticut suburban lines.

Buffalo, N. Y.—The "Commercial" says: "Notwithstanding the denials which have been made by Herbert P. Bissell, Joseph B. Mayer and E. G. S. Miller, officers of the Buffalo Traction Company, it may be stated that the transfer of the company has been made, practically, through Ladenberg, Thallman & Co., of New York, who financed the Traction Company."

Chattanooga, Tenn.—The council has passed an ordinance limiting the franchise of the Chattanooga Electric Railway Company to twenty-five years, at the expiration of which time the value of the franchise will be reappraised by the mayor and aldermen.

Chicago.—The Union Transit Company, which has made application for a fifty-year franchise for about twenty miles of streets, is the successor to the rights of the Great Lakes Transit Company. This latter company was incorporated with a capital stock of \$6,000,000 August 7, 1883. The incorporators were Emanuel P. Barnett, Albert K. Norton and Frank E. Hayner, all Chicago lawyers. In April of last year the name of the company was changed to that of the Union Transit Company and the by-laws changed so that its purposes were increased from owning vessels on the lakes to operating street car lines. Frank T. Winslow was president of the company and Leonidas Connell secretary last year. Lucius Clark, late of the General Electric Railway Co., has now secured control of the charter.

Easton, Pa.—The Easton, Palmer & Bethlehem Electric Railway Company, composed principally of New England capitalists, has begun the construction of its trolley line, twelve miles long, connecting this city with Bethlehem. The company expects to have the road in operation by September 15.

Hartford, Conn.—The incorporators of the Suffield & East Granby Street Railway Company have accepted the charter granted by the last Legislature. At a recent meeting held here by-laws were adopted and an organization fully perfected. The capital stock is \$50,000.

Jersey City, N. J.—J. H. McGurty of this city, who claims to be the inventor of a new single-rail elevated railway system, is erecting a trestle for experimental purposes on the old reservoir site, and has invited a number of railway men and electrical experts to witness tests which he expects to be ready to make in a few days. The motive power of Mr. McGurty's railway is to be electricity and the motors will be beneath the cars. The inventor claims that cars can be run by his system safely at a speed of 100 to 120 miles an hour if necessary.

Lewiston, Me.—A. F. Gerald, who is associated with I. C. Libby in the projected electric railway connecting this city with Bath, thirty miles distant, says that they are getting on fairly well and expect to have the road ready for operation by July 1. The water power of the Cabot mills at Brunswick will be used to generate electricity for the trolley cars.

Lima, O.—A movement is on foot looking to the building of an electric line to connect this city and Delphos by way of Elida and Gomer, which would make a line

about eighteen miles long. A committee has canvassed the territory and met with success.

Lockport, N. Y.—The work of transforming the Erie's Lockport branch from Tonawanda to Lockport into an electric line is being pushed rapidly, and it is expected that all of the poles will be erected and wire stretched within another week. Trolley cars will be operated by the Buffalo & Lockport Railway on July 1.

New Haven, Conn.—The promoters of the Torrington & Hartford trolley project, involving a "cross country" line twenty miles long, have decided to open the books for subscriptions. The layout of the road is through pretty remote farm regions, where the land-owners have so earnestly desired the line that in some cases, it is said, they have not only given free right of way, but offered to supply ties and even do part of the grading.

Ottawa, Can.—The Senate has passed the bill to incorporate the North Shore Electric Railway Company.

Plainfield, N. J.—Civil Engineer Frank J. Hubbard, who has been employed by the Union County board of freeholders to prepare the maps and plans for the proposed widening of the boulevard between Plainfield and Elizabeth, in order to build a trolley road along the route under the provisions of the Squire law, has completed his work. It is estimated that the work cannot be accomplished for less than \$500,000, which sum it is calculated can be raised by the sale of the franchise for the trolley road to the highest bidder.

Quebec, Can.—The amalgamation of the Quebec, Montmorency & Charlevoix Railway and the Quebec District Railway Company is expected to take effect on or about June 30, after which work will be commenced upon applying electricity as the motive power of the former road.

Salem, Ore.—A deed has been filed in the recorder's office conveying the property of the Salem Consolidated Street Railway Company to the Salem Light & Traction Company.

Syracuse, N. Y.—The Rapid Transit Railway Company has decided to build several additional lines of railroad within the city limits.

Waco, Tex.—The Citizens' Street Railway Company having abandoned their College Heights line, a new company will be organized to take up this line and make it the first link in a proposed system.

Washington, D. C.—Arrangements have been made by which the Capital Railway Company will furnish the Chesapeake Beach Railway, of which Mr. Otto Mears of Denver, Col., is president, an entrance into the city of Washington. The latter road is now nearly completed from the District line to Chesapeake Beach. Mr. Mears says it is the intention of the Chesapeake Beach Company to expend at least \$1,500,000 in making improvements at the Beach and to spare no expense to make of the latter the finest resort on the Atlantic coast.

MANUFACTURING, ETC.

Charleston, W. Va.—The Secretary of State has issued a charter to the General Electric Automobile Company of Philadelphia, Pa. The capital subscribed is \$2,500 in shares of \$50, with the privilege of increasing the capital to \$2,500,000. The purpose is acquiring patents and inventions relating to the operation of electrical and mechanical appliances and doing a general manufacturing business. The shares are held by A. B. Pearson, C. E. Lent, J. E. Lewis, T. R. Heller and C. W. Cox. The charter expires March 23, 1943.

Fort Wayne, Ind.—The general agents of the Fort Wayne Electric Corporation assembled in this city on the 6th inst. Meetings of this kind are held once a year when the representatives of the corporation come together and discuss the business which is in their hands. They exchange views and much valuable information is passed around.

Indianapolis, Ind.—The Jenney Electric Motor Company has begun the erection of a large brick building on the ground where the works burned stood. The main building is 180 feet long by 60 feet wide.

New York.—The New York Insulated Wire Company, 15 Cortlandt street, is reported to have sold a few days ago \$50,000 worth of copper wire and rail binders for a trolley road connecting Yokohama with Odawara, Japan. The Glenwood Works of Youkers, through Mr. J. W. Godfrey, 15 Cortlandt street, has also recently sold large supplies of a similar kind to Japanese concerns. There is a large demand in Japan at the present time for electric railway supplies of all kinds.

Pittsburg.—The Westinghouse Electric & Mfg. Company has received an order from the Driggs Seabury Gun & Ammunition Company of Derby, Conn., for several 30-horse power motors for the electrical equipment of its shops, made necessary by the rush of Government war contracts. A big generator has also been ordered.

Washington, D. C.—The Navy Department, through the Bureau of Supplies, is inviting sealed proposals until June 23 for furnishing the New York Navy Yard with the following electrical equipment: One 100 k w. 125 volts generator, compound wound, direct current, complete; speed not to exceed 600 revolutions per minute. Six 2-horse power 110-volt enclosed portable motors, each motor to be mounted on 3 or 4 wheeled truck provided with 3 vertical screws by means of which the truck can be raised from the floor and held stationary when the motor is to be belted to machine tools. Two 5 horse power motors and two 10 horse power motors of similar design. One 20-horse power shunt wound 120-volt motor, complete; speed to be between

800 and 900 revolutions per minute. Prospective bidders desiring blank forms of proposals and additional information can obtain the same upon application to the Navy Pay Office, New York, or to Paymaster Edwin Stewart, Navy Department, Washington.

TRANSMISSION PLANTS.

Los Angeles, Cal.—The San Gabriel Electric Company has nearly completed its work of establishing a great electric plant in the San Gabriel Canyon, by which electric power is to be transmitted over copper wires to Los Angeles, twenty-two miles from the mouth of the canyon. It is expected that the line will be completed by the 15th of June, and its ultimate capacity will be 3,500 horse-power delivered, after deducting all losses in transmission. The water is conveyed through thirty-eight tunnels of an aggregate length of 22,000 feet which had to be excavated and 7,000 feet of 48-inch wooden pipe connects the tunnels, transmitting a continuous stream for seven miles down the canyon to the power house at its mouth; the total fall is about 400 feet.

Portland, Me.—The Sebago Transmission Company has been organized for the purpose of supplying electricity for heating, lighting and power purposes. The capital stock is \$50,000, of which nothing is paid in. Among the shareholders are Hon. Charles F. Libby, Portland; George W. Brown, Deering, and Harry L. Jones, Medford, Mass.

COMPANY MATTERS.

Detroit, Mich.—The plant of the Peninsular Electric Light Company was sold here last week by Court Commissioner Hurst, under foreclosure proceedings, for \$120,000. Geo. Peck, David Whitney, Jr., and Hoyt Post being the purchasers. The Peninsular Company was organized in 1891, and purchased the plant of the Brush Company for \$600,000.

Indianapolis, Ind.—C. F. Smith, president of the Indiana Bicycle Company, is negotiating for the purchase of a controlling interest in the American Electric Carriage Company of Chicago, and if the deal is completed will remove the factory to Indianapolis. The American Electric Carriage Company owns the patents for an electrically operated horseless vehicle, and Mr. Smith and other Indianapolis men will, it is said, invest about \$200,000 in the manufacture of the carriage.

Jersey City.—The first meeting of the North Jersey Street Railway Co. since it absorbed the Consolidated Traction Company was held here on the 6th inst. These directors were elected: John F. Dryden, L. D. Ward, Peter Hauck, J. F. Kehoe, James E. Shanley, David Young, Abram Q. Garretson, George F. Perkins, Edw. F. C. Young, A. J. Cassatt, T. Dolan, P. A. B. Widener, William L. Elkins and John D. Crimmins. The officers were elected next day as follows: President, Edward C. Young; vice-president, David Young; auditor, E. H. Hibbs; treasurer, E. N. Hill; secretary, Wilbur S. Johnson; general superintendent, Frank Ellmaker. E. F. Hebbard will have charge of the Essex County lines, H. W. Fuller of those in Hudson County and G. F. Chapman in Union County.

Newport, R. I.—Notice is being published in the local papers of the pendency of the petition of the Middletown and Portsmouth Street Railway Company and others, before the General Assembly of the State of Rhode Island at its present session, for the passage of a bill, entitled, "An act to consolidate the Middletown & Portsmouth Street Railway Company and the Fall River & Stone Bridge Electric Railway Company and confirming the consolidation already existing."

ELECTRICIANS IN THE WAR.

J. J. O'Rourke, an expert electrician employed by the Government in the work of placing mines in the St. John's river, Fla., was accidentally killed by a torpedo explosion in the mining-room at Jacksonville on the 10th inst. His assistant, named Houston, was also killed, and Lieut. William W. Harris, engineer officer in charge of the work, was severely injured by pieces of the torpedo striking him on the back and head. O'Rourke unaccountably connected the battery wire with a firing plug instead of a testing plug.

The cruiser Yankee, manned by New York naval reserves, and whose executive officer is Lieut. S. Dana Greene of the General Electric Company, is reported to have distinguished herself at Santiago and Caimanera in the recent bombardment of the forts that guard the entrances to those harbors. At Santiago, the Yankee ventured closer to the Spanish stronghold than any other vessel of the fleet, and her guns kept up such a rapid fire on the lower batteries that they were soon silenced. At Caimanera she and the Marblehead are said to have pounded the enemy's works into unrecognizable masses of ruins and caused a Spanish gunboat to take to her heels.

PERSONAL AND MISCELLANEA.

The special American commission to the Paris Exposition has arranged for a display of American electrical machinery to the value of \$1,000,000.

Edward L. Chapman, manager of the Electric Light Company at Grand Junction, Col., died in that city on the 7th inst., of appendicitis. The body was shipped to Cincinnati for burial.

Superintendent Nelson of the Milwaukee, Racine & Kenosha Electric Street Railway was recently presented with a handsome gold watch by the employees of the

road at Racine. Mr. Nelson had resigned his position and as soon as this was known, the men determined that he should take with him on retiring some testimonial of their esteem and respect.

Bernard Moebius, the scientist, died on board the steamship Kaiser Wilhelm der Grosse on her last outward passage. Mr. Moebius was credited with being the first to extract economically precious metals from base ores by means of electricity. He was also the author of several text books on metallurgy and electricity. He was a native of Hartha, Saxony, and was born forty-six years ago.

The Tonawanda "News" states that Philip Perow of Tonawanda, N. Y., has effected a patent for a canal boat towing trolley which is considered by those who have examined the model at the canal collector's office in Buffalo superior to any device heretofore proposed for the purpose. An experimental line will be erected on one of the State canals for a practical test of the invention, if permission can be obtained from Superintendent Aldrich.

C. E. Mears of Silver City, Ia., has on exhibition at the Omaha Exposition a curiosity in the way of the smallest horizontal steam engine in the world. The construction of every part is in full accord with mechanical rules, and the engine may be operated either by steam or air. It has been run with 10 drops of water for some time. There are 118 pieces in the engine, every one of which has been made by Mr. Mears himself. The cylinder of this tiny engine is $\frac{3}{8}$ of an inch long and the diameter of the flywheel is $\frac{3}{8}$ of an inch.

John J. Shipherd, whose death from paralysis of the heart occurred at Cleveland, O., on the 1st inst., was one of the most prominent figures in business and street railway circles in Ohio, and up to a few months ago one of the most respected, but his last days were embittered by certain charges made against him which impugned his honesty and fixed upon him the stigma of embezzlement. At the time of his death he was out on bail to answer this charge. He was born in Oberlin in 1840, and was the son of the founder of Oberlin College. Mr. Shipherd went to Cleveland in 1872 and resided there up to the day of his death with the exception of a short time passed in Indiana. Several years ago he formed a partnership with Charles H. Potter, under the firm name of C. H. Potter & Co., in the banking and investment business. Mr. Potter's connection with the firm has for some time been purely nominal. Later, Mr. Shipherd invested in a number of enterprises, among them street railway ventures in Fort Wayne, Ind., Cincinnati and elsewhere. He was also connected with the old Cleveland Cable Railway Company before its merging into the Cleveland City Railway Company. Mr. Shipherd within the last two or three years became involved in business difficulties and lost considerable money. At one time, several years ago, it was thought that he was moderately rich. His business troubles are supposed by many to have contributed to the disease which caused his death. His wife and two daughters survive him.

COMMERCIAL PARAGRAPHS.

There can be no more convincing commentary upon the wide range of applications of compressed-air power than the sales report of the Clayton Air Compressor Works, Havemeyer Building, New York, for the months of February, March and April. In all, nineteen air compressors were sold for operating pneumatic stone tools, chipping and calking tools, air hoists, etc.; nine air compressors for moving and elevating acid and chemical solutions; four air-lift pumping plants were installed and placed in operation; three air compressors were furnished to rubber works for removing hose from mandrels, testing hose and inflating tires; one compressor was supplied for the pneumatic transmission of messages; two for oil burning plants; three for racking off beer in breweries; one for spraying brick in the process of manufacture, and six for unusual applications of compressed air power. In addition to this number of air compressors furnished for domestic use, four were exported to Europe for operating pneumatic shop plants. Among the orders of especial interest included in the above summary may be mentioned the plant installed at the Navy Yard, Brooklyn, for supplying pneumatic drills, paint machines and hammers, and one furnished to the Yarrow Ship Yard, London, for operating pneumatic tools. Another installation of interest is the compressor at the Dunn Building, New York, which supplies compressed air-dusting nozzles for cleaning the iron grill work of the elevator shafts. Among the orders now in hand is a large compressor for the Bath Iron Works, Bath, Me., to operate pneumatic tools.

The new catalogue of the International Arc Lamp Company, Houston and Mercer streets, New York, contains handsome photo-engravings of a number of their new designs in arc lamps and lamp fixtures. Their lamps are all made from designs by Mr. MacIntire of the firm, who has achieved distinction through his productions in this line which for graceful forms and elegant proportions cannot well be surpassed. For interior illumination—parlors, libraries, drawing-rooms, dining rooms, boudoirs, etc.—the lamps of the company are especially to be commended, as many of the objectionable features existing in arc lamps have been eliminated. The catalogue is neatly printed and the engravings are real works of art.

INCORPORATIONS.

The Paducah Railway & Light Company, Paducah, Ky. Capital stock, \$200,000. Incorporators: George O. Thompson, S. J. Flouruey, George C. Walton and W. F. Paxton.

The Keene Electric Railway Company, Keene, N. H. Incorporators: F. H. Whitcomb, K. F. Lane, C. H. Hersey, C. J. Woodward, Edward Gastine, F. C. Faulkner, Daniel R. Cole and others.

The Maranacook Electric Light & Power Company, Maranacook, Me. Capital stock, \$10,000. President, Frank E. Dion; treasurer, John A. Hamblin.

The Deering Electric Light Company, Deering, Me.—to furnish electric light for the cities of Westbrook and Deering and towns of Gorham, Cape Elizabeth and South Portland. Capital stock, \$25,000, with nothing paid in. President, Elmer E. Fernald, Portland, Me.; treasurer, William L. Watson.

The Munson Company, Laporte, Ind.—to manufacture electrical appliances. Capital stock, \$100,000. Directors: William R. Everett, John H. Munson, William A. Roberts, Peter J. Heldt and Leroy A. Stringham.

Articles of association, incorporation, amalgamation and consolidation of the Pasadena & Pacific Railway Company of Arizona, the Pasadena & Pacific Railway Company of California, the Los Angeles & Pacific Railway Company of California and the Los Angeles Pacific Railway Company, consolidated, were filed on the 2d inst. with the county clerk at Los Angeles. The new concern is to be known as the Los Angeles Pacific Railroad Company. The estimated length of the road and its branches is 10 miles. The directors of the company are J. Ross Clark, M. H. Sherman, E. P. Clark, W. D. Larrabee, John D. Pope, M. E. Hammond and A. I. Smith. The capital stock of the corporation is \$1,000,000. E. P. Clark is president and A. I. Smith secretary.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 7, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

605,211. Trolley-Switch. Jacob H. Vanasselt, Seattle, Wash. Filed Oct. 2, 1897.

605,251. Trolley-Wire Hanger. George E. Johnson, Los Angeles, Cal. Filed Aug. 19, 1896. Renewed July 22, 1897.

605,261. Third Rail for Electric Railways. Sidney H. Short, Cleveland, O. Filed Nov. 5, 1897.

605,817. Electric-Railway System. William Lawrence, New York City, assignor to the Universal Surface Electric Railway Company of West Virginia. Filed Dec. 1, 1897.

605,826. Trolley Connection for Electric Cars. John G. McLaughlin, Brooklyn, N. Y., assignor of one-half to Robert W. Gleason, same place. Filed Dec. 28, 1897.

605,284. Car-Fender. George C. Hutchinson, St. Louis, Mo., assignor, by mesne assignments, of one-half to J. Reed Elliott, same place. Filed Oct. 7, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

605,228. Electric-Arc Lamp. William Hochhausen, Brooklyn, N. Y. Filed Jan. 22, 1897.

605,279. Safety-Lock for Incandescent Lamps. Ernst Falter and Hermann Herbstritt, San Francisco, Cal. Filed Sept. 17, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

605,667. Electric Switch. Charles C. Badeau, Schenectady, N. Y. Filed Sept. 17, 1897.

605,090. Electrical Apparatus for Charging Furnaces. Joseph P. Eck, Muncie, Ind. Filed Aug. 12, 1897.

605,154. Instrument-Winding Device. Henry H. Watt, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Dec. 14, 1896.

605,114. Electric Transformer. John J. Bellman and Charles T. Rittenhouse, New York City. Filed June 29, 1897.

605,197. Electrical Valve-Controlling Device. Arthur E. Colgate, New York City, assignor to George J. Shoeffel, Brooklyn, N. Y. Filed May 28, 1896. Renewed April 1, 1898.

605,304. Controller. Thorsten von Zweigbergk, Cleveland, O., assignor to the Walker Company, same place. Filed Feb. 23, 1898.

605,309. Electric Selector System. Thomas O. Drake, Malta, O. Filed Feb. 26, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

605,097. Telephone System. Edwin W. Ham, Worcester, Mass. Filed April 22, 1897.

605,294. Telephone-Holder. Jehiel T. Moore, Minneapolis, Minn., assignor of one-half to Harry L. Jenkins, same place. Filed Aug. 24, 1897.

605,341. Telephone System. Robert T. Reid and James McDonnell, Tacoma, Wash., assignors of one-half to Frank C. Cardin and John T. Bibb, same place. Filed Sept. 25, 1897.

605,345. Call-Box System. Edgar E. Salisbury and Albert E. Dean, Tacoma, Wash., assignors to themselves and Frank B. Taylor, same place. Filed June 22, 1897.

SIGNALS AND SIGNALING APPARATUS.

605,358. Signaling Device. Frank B. Taylor, Edgar E. Salisbury and Albert E. Dean, Tacoma, Wash. Filed July 23, 1897.

605,359. Railway Signaling and Switching Apparatus. John D. Taylor, Chillicothe, O. Filed March 24, 1897.

MISCELLANEOUS.

605,109. Insulator. Fred M. Locke, Victor, N. Y. Filed April 23, 1898.

605,174. Induction-Coil. Adrian L. Bogart, Jamaica, N. Y., assignor to William B. M. Jordan, New York City. Filed April 22, 1897.

605,231. Means for Raising Sunken Vessels. Laurent Magignon, La Garenne Colombe, France. Filed Nov. 80, 1897.

605,256. Insulator. Ralph D. Mershon, Colorado Springs, Col. Filed Feb. 14, 1898.

605,840. Process of Producing Aluminum Sulphide and Reducing Same to Metallic State. Henry S. Blackmore, Mount Vernon, N. Y., assignor to the Pure Aluminum & Chemical Company of West Virginia. Filed July 22, 1896. Renewed April 21, 1898.

605,424. Connector for Storage Battery Plates. Gilbert Hart, Detroit, Mich. Filed Jan. 18, 1898.

TELEPHONE AND TELEGRAPH.

The Western Union Telegraph Company has completed its line from Seattle, Wash., to Victoria, B. C.

The Minnesota Central Telephone Company has given notice of acceptance of the ordinance passed by the board of aldermen of St. Paul and has filed a bond for \$15,000.

There are indications at Atlantic, Ia., that there will be a rate war between the Iowa Union Telephone Company and the Atlantic, Mt. Etna & Corning Telephone Company.

The E. H. Martin Telephone Company of Webster City, Ia., is erecting a full metallic circuit from Boone to Des Moines which will give the company a direct inlet to the State capital.

The telegraph stations from Hong Kong to London are Saigon, Penang Island, Madras, Bombay, Aden, Suez, Alexandria, Malta, Gibraltar, Carcavellos, near Lisbon, and thence by ocean cable to England.

The New State Telephone Company is about to wire Jackson, Mich., for service, after which Chelsea, Dexter, Scio and Delhi will be quickly connected. The company is also extending its lines from Ann Arbor to Whitmore, Zuke, Portage and Base Lakes.

The lines of the Dixie Telephone Company have been completed to McMinnville, Tenn., and connected with the switchboard of the local exchange. This puts McMinnville in direct connection with Irving College, Viola, Beersheba, Monteagle, Altamont, Tracy City and other points.

The Interstate Telephone Company has been granted a franchise to erect an exchange in Raleigh, N. C., and operate its system in that city. The company is now building a line between Wilmington and Winston, and expects before a great while to connect Raleigh with the different towns along the line.

The ordinance granting a franchise to the Lackawanna Telephone Company has passed the second reading in the Scranton council and is likely to be adopted as the business people are generally favorable to the new company, which promises good service at much lower rates than those of the Bell company.

The Citizens' Telephone Company of New York has made application to the Hackensack Improvement Commission for permission to erect and operate an exchange in Hackensack, N. J. The company agrees to give commercial telephone service for \$2 a month and private service for \$1.50.

E. W. Coleman, in behalf of himself and associates, has addressed a letter to the mayor and council of Columbus, Ga., in which he requests permission to erect a telephone exchange in that city. He promises to install an underground system, long distance telephones and complete metallic circuit. The draft of an ordinance accompanying the letter was referred to the committee on ordinances.

A dispatch from Niles, Mich., states that the Gilliland Telephone Company had announced the suspension of its service in Niles. The death of the Gilliland system was due, it is stated, to the fierce fight with the Bell Telephone Company, which, in order to drive the weaker system out of existence, furnished service practically free of charge. It is now predicted that the Bell company will advance its rates.

The War Tax bill as agreed to by the Senate and House places a tax of 1 cent on all telephone messages for which a charge of 15 cents or more is made. Telegrams are taxed 1 cent each, and the companies incur a penalty of \$50 for failure to affix a stamp on each telegraph message transmitted, excepting only official dispatches of telegraph or railroad companies sent over their own wires, and official business of the Government. The President has signed the bill.

New Companies Incorporated.

The Winston Telephone Company Princeton, Mo. Capital stock, \$1,000. Incorporators: H. G. Orton, J. B. Hyde, O. P. Rogers and others.

The Bushnell Telephone Company, Chicago. Capital stock, \$5,000. Incorporators: Joel Lightner, E. E. Johnson and H. A. Cleveaud.

The Missouri & Iowa Telephone Company, Princeton, Mo. Capital stock, \$25,000. Incorporators: J. S. Rogers, H. G. Orton, E. M. Hyde and others.

The Montour & Columbia Telephone Company, Danville, Pa. Capital stock, \$25,000. Directors: James H. McDermitt, C. M. Clement, Sunbury; R. E. Polk, F. C. Angle, E. Carman, O. P. Hancock, Danville; H. R. Murty and J. P. Helfenstein, Shamokin; W. M. Vastine, Mt. Carmel.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.

a Consolidation of Baltimore Traction Company and City & Suburban Railway Company. Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikesville Railway and Wallbrook, Gwynn Oak & Powhatan Railway and Park.

b Leased to Boston Elevated Railroad Company.

c Owned by Brooklyn Rapid Transit Company.

d Leased to Brooklyn Heights Railroad Co., which guarantees 10% on capital stock.

e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.

f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.

g Owned by Atlantic Ave. RR. and leased to Nassau system.

h \$30 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.; \$250,100 of stock owned by North Chicago Street Railroad Company.

i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.

j 85% per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.

k Majority of stock owned by Chicago West Division Railway Company; 5% on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.

l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. § Ex div.

a Leased to New Orleans Traction Company at 6% on stock.

b Leased to New Orleans Traction Company at 8% on stock.

c Leased to Central Crosstown Railroad at 8% on stock and interest on bonds.

d Operating the former Met. Trac. system, that corporation having become extinct.

e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

f Leased to Houston, West Street & Pavyon Ferry—now Metropolitan Street Railway.

g Leased to Metropolitan Street Railway at 8% on stock until Oct. 1, 1897; thereafter 9%.

h Leased

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 11.90@12.10c. casting, 11½c.

The stock of the Dayton (O.) Traction Company has been listed on the Philadelphia Stock Exchange.

War seems to have a good effect on American stocks good and bad. There has been a rise in the whole list since the opening of hostilities.

The Chicago City Railway Company has declared its regular quarterly dividend of 3 per cent., payable June 30. Books close June 15 and reopen June 21.

The United Traction & Electric Company of Jersey City has declared a dividend of 2 per cent., payable July 1. Books close June 21 and reopen July 2.

The \$5,000,000 four per cent. ten year debenture bonds of the American Bell Telephone Company have been awarded to Lee, Higginson & Co., Boston.

The Philadelphia "Stockholder" says: "Until autumn nothing definite will be done in the direction of readjusting the finances of the General Electric Company." Manana!

The directors of the Western Union Telegraph Company have declared the usual quarterly dividend of 1½ per cent., payable July 15. Books close June 20 and reopen July 1.

The Commercial Cable Company has declared its usual quarterly dividend of 1½ per cent. on the capital stock of the company, payable July 1. Transfer books close June 20 and reopen July 2.

According to official figures the gross receipts of the North Chicago Street Railway Company in May were \$2,448,670, an increase of \$11,011 over the same month last year and \$13,887 compared with April, 1896.

The Chicago Stock Exchange election last week resulted as follows: President, Alfred L. Baker; treasurer, John J. Mitchell; members of the governing committee: B. K. Cain and C. H. McGrath.

It is understood that a satisfactory arrangement has been reached by the Bridge Commissioner and the managers of the elevated roads by which the elevated cars will be run on Brooklyn Bridge.

A dispatch from Poughkeepsie, N. Y., states that Judge Shipman has just decided the foundation reversible trolley patent in favor of the Walker Company and against the General Electric Company, with costs against the latter company.

The stockholders of the Brooklyn Edison Electric Illuminating Company, at a meeting held in Brooklyn on the 2d inst., voted to authorize the board of directors to increase the capital stock of the company from \$4,000,000 to \$5,000,000.

The law requiring the street railway companies of St. Louis to make their returns for assessment and taxation to the State Board of Equalization instead of to the city assessor went into effect this year. The returns are made on June 1, each year.

The Chicago Edison Company reports for the fiscal year ended March 31, 1898: Gross earnings, \$1,661,843; operating expenses, \$985,338; net income for the year, \$676,504; charges against income, interest on bonds and debentures, \$226,680; dividends, \$398,072; balances, \$51,772.

The Massachusetts House by a vote of 119 to 90 passed the street railway bill providing that all dividends over 8 per cent. shall accrue to the State and levying a graded excise tax. The Boston Elevated is exempt for 25 years. The bill has passed the third reading in the Senate.

The Court of Appeals has decided in the "Bridge trolley case," in which William R. Heurt was appellant against John Shea and others respondents, that the New York & Brooklyn Bridge Company had a right to construct or lay loops for the use of electric trolley railways across the passageway for foot passengers at the New York terminus.

The city of Philadelphia has a plant in operation for the manufacture of crude electrozone for disinfecting purposes. The Electrozone Commercial Company proposes to erect similar plants in New York State in all cities needing pure water supply and purified sewage. On a capital of \$5,000,000 it is stated that the British Electrozone Company last year paid 25 per cent. in dividends.

Word has been received at Amesbury, Mass., from Concord, N. H., stating that the committee appointed by the New Hampshire Supreme Court had reported favorably on the petition of the Amesbury & Hampton Street Railway Company to lay its tracks within the New Hampshire State limits. The message stated that the New Hampshire Secretary of State would at once issue a charter to the company and the construction of the road would then be commenced.

One cause of the failure of Hooley, the great London promoter, as given by the "Financial Post" of that city, has a broad application. Says the "Post": "You may manipulate the shares of a company and get them quoted at a fictitious price upon the stock exchange, but if, as is the case with every one of Mr. Hooley's companies, the capital is in enormous excess of what it ought to be, you cannot pay respectable dividends—any way, for any length of time."

The plant of the Bloomington, Ill., City Railway Company was recently sold by order of the court and was purchased by a syndicate representing the second bondholders for \$202,500. On the 6th inst. some of the parties to the litigation headed by John T. Patterson, who has controlled the road for ten years, asked Judge Myers to set aside the sale. The application was made in the interest of the third mortgage bondholders, who claim their interests have not been protected, and that the road should have brought a larger price, and will do so if sold again.

The State Railroad Commissioners at Albany, N. Y., on the 8th inst. gave a hearing on an application of the Catskill Electric Railway for permission to increase its capital stock from \$30,000 to \$400,000. The company intends to extend its lines to Windham and Cairo and other villages in Greene and adjoining counties, instead of only operating in Catskill village as originally intended. The Commissioners reserved decision.

"Greater Buffalo," a magazine published in Buffalo, N. Y., advocates the establishment of cotton and other factories in that city and neighborhood on the ground that an abundant and cheap supply of electrical power from Niagara Falls would insure great economy in operation. It argues thus: "For example, 1,000 horse-power can be generated in the Eastern mill at the cost of \$25 per horse-power per year for ten hours a day. The cost of 24 hour power would therefore be \$60 per year and 1,000 horse-power would cost \$60,000 per year for continuous service. The cost of electric power on the Niagara frontier would be \$18 per horse-power per year, 24 hours per day. The loss by friction in the application of steam power by shaft and belting is 50 per cent. The loss in the application of electric current is 25 per cent. The saving effected in the use of electric power is therefore 25 per cent. of the power generated. The mill needing to generate 1,000 horse steam power would have to purchase only 750 electrical horse-power to attain the same results. 750 horse-power at \$18 per horse-power per year comes to \$13,500, which, compared with \$60,000, shows a saving of \$46,500 per year by the use of electric power. This sum represents a dividend of nearly 10 per cent. on a capital of half a million dollars."

The certificate of incorporation of the White Plains Lighting Company, formed for the manufacture and use of electricity for producing light, heat and power, and in lighting streets and public and private buildings, was filed in the county clerk's office, White Plains, N. Y., on the 10th inst. The amount of the capital stock is \$50,000, divided into 500 shares, and the duration of the company is fifty years. The directors are Winthrop G. Bushnell, New Haven, Conn.; Joseph L. Hall, Port Chester, N. Y., and John C. Bennett, Brooklyn, N. Y.

ELECTRICITY.

EDITORIAL NOTES.

The Northwestern Electrical Convention.

The midsummer meeting of the Northwestern Electrical Association, held on board the steamer North West en route from Chicago to Duluth, was unquestionably one of the most enjoyable as well as instructive gatherings that Association has ever held. The happy thought of holding this meeting in a floating convention hall on Lake Michigan proved an extremely popular one, there being considerably over 100 members and guests present. In spite of the fact that the start from Chicago was made under more less unpleasant conditions, owing to the inclement state of the weather, no inconvenience was experienced, and the enjoyment of the evening of the first day out, which was mostly given over to social intercourse, was in no way marred, the large number of ladies present materially adding to the pleasure of the gathering.

In spite of the many enjoyable attractions aboard, the scientific feature of the Convention was by no means lost sight of. A number of excellent papers on practical subjects were read and ably discussed. The unique feature of a question-box proved a success and was the means of eliciting much useful and instructive information on important subjects. A report of the proceedings of the Convention will be found elsewhere in this issue. At Minneapolis, after a dinner given the members of the Association and their guests at the Mercantile Club by President Morgan Brooks of the Electrical Engineering Company of that city, Mr. J. M. Hill was presented by the members of the party with a handsome scarf-pin as a token of their high appreciation of his efforts in making the trip so thoroughly enjoyable. The Midsummer Convention of the Northwestern Electrical Association will most assuredly be remembered by those who participated in it as an enjoyable and instructive outing.

* * *

The General Electric Stock Problem.

Messrs. Samuel Carr, Thomas L. Livermore and Edward F. Atkins, who were appointed a committee in January, 1896, by holders of more than one-half of the preferred stock of the General Electric Company, have recently issued a circular addressed to the holders of the preferred stock which, after referring to the financial condition of the General Electric Company as set forth in its last annual report, says: "To remove what directors regard as legal obstacles in the way of resuming dividend payments, it has been suggested to us that the nominal

value of the capital stock should, by vote of shareholders, be reduced so as not to exceed the value of the assets of the company, and to this end a reduction of 50 per cent. of the par value of the shares has been suggested, together with payment of the accumulated dividends on the preferred shares to date of reduction at rate of 7 per cent. on the present par value of \$100 per share.

"Eminent counsel advise the directors that as a legal result of this reduction the holders of preferred shares would be entitled to dividends out of future earnings of 7 per cent. on \$50 per share only, while holders of the common shares would be entitled to all the remaining earnings. This would, for the future, reduce the dividend on preferred shares one-half, while it would leave the common shareholders in a better position than their present one.

"The assets of the company amount to at least 72 per cent. of the par value of all the shares, and for this reason we have declined to recommend a reduction to any amount below \$72 per share. We have some encouragement to believe the common shareholders might assent to a reduction to \$80 per share. At an early day the proposition to reduce the par value of the shares to \$50 is to be submitted to a meeting of stockholders, and unless restrained by legal process it can, under New York laws, be carried by a vote of two-thirds. We propose, if encouraged by legal advice to be taken, to oppose this project at the meeting and if necessary in the courts."

It is but natural that the preferred stockholders' committee should object to the proposed plan of scaling down the preferred stock by one-half, and especially Mr. Samuel Carr, who represents the Ames estate which owns 7,961 shares of preferred stock in the General Electric Company. It is likewise natural that the preferred stockholders should want to get the reorganization price of the stock as high as possible. As the dividends in this class of stock are cumulative, and as they will ultimately have to be paid before any of the common shareholders receive any dividends, it would certainly seem good judgment on the part of the preferred stockholders to object to this scaling process and await developments. Were we a preferred stockholder we should strenuously object to having the par value of our stock reduced by one-half and possible future dividends reduced in proportion, for if no dividends can be earned the stock is practically worthless anyway, whereas if the company ever does get in a position to pay a regular dividend the preferred stockholders might just as well insist on being paid dividends on stock with a par value of \$100 as on stock that has a par value of but \$50, or, as has been suggested, \$72. Moreover, the preferred stock was presumably purchased in good faith, with the understanding that the dividends were to be cumulative, and it has been promised that as soon

as the earnings of the company justified it the payment of these dividends would be resumed. Next month these accumulated dividends will have aggregated 35 per cent., and it is certainly to the interest of the preferred stockholders that the dividends (so long as they cannot be paid) should go on accumulating at the rate of 7 per cent. a year rather than at the rate of $3\frac{1}{2}$ per cent., which is practically what this scaling down process means. As the report of the committee aptly says, the arrangement suggested would leave the common shareholders in a far better position than their present one by throwing the whole burden upon the preferred stockholders, which in our opinion is contrary to the intent and meaning of the word "preferred."

As the preferred stockholders have been waiting since 1893 for a dividend, it would certainly seem as though they might wait a little longer, and be paid possibly full dividends some time in the future, rather than jump at a settlement on a fifty cents on the dollar basis.

As we have frequently stated, a concern should not be capitalized for a greater amount than its yearly gross earnings, and in the case of the General Electric Company, therefore, its capitalization should not exceed \$12,524,938, and on a basis of say \$13,000,000 there would not be much left for the common stockholders after the preferred stockholders and the bondholders get their just dues. It will therefore be seen that the great and only General Electric Company is not in a comfortable condition. Fixing the value of either the common or preferred stock by action of the stockholders does not make an actual value by any means. It takes sufficient profitable business to pay dividends, and if the General Electric Company had all the electric light and power business it could not earn dividends on over \$20,000,000 capitalization. As it stands, that company does little more than half the business.

Kite Telephoning. Some recent experiments in England in which a kite was made to support a telephone wire connecting two ships has created considerable talk in United States naval circles as possibly affording a new and simple method of signaling either between ships at sea or between ships and a fort. The importance and value of kites in warfare was conclusively proven in a number of experiments made at Governor's Island in New York Harbor some time ago, when a camera was sent up and took an accurate photograph of the surrounding country.

The telephonic kite, however, is a new departure, and, as previously stated, was tried for the first time by the English naval authorities. The kite used in the experiment was of the ordinary kind, six feet long by three across at the broadest part, but in place of a tail the kite carried two wires. One of these was attached to a torpedo boat destroyer, while the end of the other was without difficulty dropped on the deck of H. M. S. Dauntless, where it was secured and made fast to a suitable telephone apparatus.

The end of the wire on the torpedo destroyer was also attached to a telephone, and as soon as both connections were made it was found that the two ships were in perfect communication. The experiment lasted four hours, during which time the kite remained suspended, secured by the two wires, and communication between the two vessels was uninterrupted.

The successful carrying out of this experiment and one recently made in this country should prove of value in more ways than one. It showed conclusively that it was possible to arrange a new system of signaling from one ship to another that would be far superior to any system of flag signaling now in use, as after telephonic kite connection between two ships had been made, messages could be transmitted by telephone far more rapidly than by any system of codes. Moreover if a telephone wire can be com-

neoted in this manner there would seem to be no reason why telegraphic communication cannot be made in a similar fashion. In such a case an operator on board the flagship, for instance, could carry on a conversation with his fellow operator aboard one of the fleet without difficulty. As a means of communication at night between two ships in hostile waters the kite telephone should prove especially valuable, as it would enable the two commanders to hold a conversation without having to have recourse to the Ardois system, which would necessarily reveal their exact location to the enemy. Difficulty would probably be experienced in getting a kite wire from one ship to another after dark, but were connections made during daylight the two ships could shift their position and be in communication all night without apprising the enemy of the fact.

The successful experiment recently made in England is only evidence of what electricians of the navy have held to be possible. It has been declared of late, especially since kites have been utilized so successfully for photographic purposes, that there was no reason why kite telephone communication should not be established between vessels not too far apart were the weather at all suitable. A practical experiment along this line was made a few days ago in this country by William A. Eddy which in the latter's opinion demonstrates that kites can be made use of for field telephoning in time of war.

Under the Searchlight.

Notes and Comments on Various Topics.

WITH reference to an item which appeared in our issue of June 15, entitled "Is This Another General Electric Scheme?" we are in receipt of the following communication:

Philadelphia June 16, 1898.

Editor ELECTRICITY.

DEAR SIR: In noticing the flotation of the General Electric Automobile Company of this city, in your current issue, under the caption "Is This Another General Electric Scheme?" you leave it to be inferred that your confidence in the new concern is not especially vigorous. Lest the enterprise suffer in your esteem because of its title, it is but proper that you be informed that it has no connection with the General Electric Company. It is a purely local enterprise, organized for the purpose of commercially developing the Hunter patents in their application to automobile vehicles. The people concerned are substantial business men. Yours truly,

DAILY PHILADELPHIA STOCKHOLDER.

J. H. MONTGOMERY, Asso. Editor.

THE Kansas City, Mo., *Journal* says that if the rate war continues between the Frisco Railroad and the electric line, which has already brought the cost of a ride between Joplin and Galena down to five cents, a free ticket with a coupon good for a drink at either end of the line needn't be looked upon as beyond the possibilities.

* * *

AN Austrian professor is said to have invented a new system of wireless telegraphy which does away with many of the defects in the Marconi system. The telegraphic signs are transmitted, so it is claimed, by means of electric light rays.

* * *

IN a certain church in Glasgow there has recently been installed a telephone connection between the pulpit and a pew in the back of the church, by means of which a lady, who has been unable owing to deafness to hear the minister, can now listen with ease to the discourse. The sound is conducted from the pulpit by means of two transmitters fitted on to ornamental hammered iron scroll-work brackets, in keeping with the other iron-work brackets of the church, and these are screwed on to the ledge of the pulpit on either side of the reading desk, and far enough apart not to hamper the movements of the officiating clergyman. The wires are led from the pulpit behind the wainscoting to the pew, where a battery switch is placed, so that the party using the

telephone can switch the current off when the minister is not speaking. We think that some arrangement might become popular in this country in the congregation of weak-voiced preachers, provided of course the switching apparatus works properly, thus enabling the party listening to occasionally cut off the discourse and take a nap.

* * *

THE manager of the Electrical Exposition in Philadelphia asked Mr. Edison to visit the show and give a short talk on some electrical subject, or if he found it inconvenient to do so, to send on a phonograph cylinder setting forth some of his latest ideas of electrical interest. Mr. Edison complied in his own way with the latter request, and in doing so, while omitting any reference to electricity, produced quite an electrical effect upon the management and the auditors by his contribution. It was as follows:

My dear Marks: You asked me to send you a phonographic cylinder for your lecture this evening and to say a few words to the audience. I do not think the audience would take any interest in dry scientific subjects, but perhaps they might be interested in a little story that a man sent me from a phonograph cylinder the other day from San Francisco.

In the year 1873 a man from Massachusetts came to California with a chronic liver complaint. He searched all over the coast for a mineral spring to cure the disease, and finally he found down in the San Joaquin Valley a spring the waters of which almost instantly cured him. He thereupon started a sanitarium, and people from all over the world came and were quickly cured.

Last year this man died, and so powerful had been the action of the waters that they had to take his liver out and kill it with a club. Yours truly,

EDISON.

MASSACHUSETTS is nothing if not patriotic. It was so during the Revolution and is so to-day. Its patriotism, however, occasionally assumes peculiar and original forms. We now hear of a certain town in the Bay State that has become so enthusiastic on the war question that the local electric railway company has been obliged to have built what might be termed a trolley car warship. This novel vehicle is supposed to resemble the cruiser "Brooklyn" (but why it was not patterned after the "Boston" is hard to say), and is said to be extremely well patronized.

* * *

A CHICAGO inventor is said to have succeeded in producing india-rubber from corn oil. The india-rubber so produced is said to be equal in quality to the genuine article. The only regrettable feature of the whole thing is that the process is still in an experimental stage. Should the rubber produced in this way, however, come up to what is expected, it would materially reduce the cost of many electrical instruments.

New York Electrical Society.

The following members of the New York Electrical Society who have changed their residence are requested to send their new address to the Secretary, 120 Liberty street, New York City: G. Arnold, A. C. Barrett, A. B. Bennett, Thos. Bennett, C. J. Bickley, Geo. Book, Jr., D. D. Book, B. F. Card, J. A. Cabot, Harry Cette, C. E. Chinook, J. S. Cobb, W. F. Collins, R. Crawford, Jno. Deane, Jr., E. Denning, H. A. Dingle, R. S. Dobbie, F. E. Dolbier, J. W. Doyle, J. Egan, Meno Fedden, T. A. Fowler, C. C. Gartland, W. A. Giles, C. P. Gott, C. F. Green, A. C. Greenburg, C. A. G. Groenback, T. F. Grover, M. W. Grovesteen, N. Hall, J. C. Harris, S. J. Harris, C. E. Hart, J. C. Henry, C. Hermon, A. G. Holcombe, W. E. Lamb, R. Leichman, J. H. Longstreet, A. McKinnon, J. W. McLogan, J. McMahon, M. B. Meddler, E. C. Miller, R. A. Mitchell, A. S. Miskin, H. B. Niles, L. J. O'Reilly, J. G. Palmer, C. W. Raymond, Fred Reed, E. S. Reid, H. F. Salamons, W. Schwein, G. R. Shepard, B. F. Sherman, A. Stamm, E. E. Stark, D. H. Starratt, A. W. Sterger, James Stewart, W. L. Tamblin, C. A. Thompson, J. D. Underhill, H. Van Sands, R. Varley, E. Voelckall, D. H. Washburn, A. V. Waldron, G. C. Webb, C. H. Wright.

ANALYSIS OF THE COST OF THE GENERATION AND DISTRIBUTION OF A UNIT OF ELECTRICITY.*

BY CALVIN W. RICE,
Brooklyn, N. Y.

The speaker has been asked at short notice to give this paper, which, considering the nature of the question, should have several months' labor for its preparation. Consequently no original work could be attempted.

I am fully aware of the responsibility of undertaking such a discussion, and therefore will confine the paper to a resumé of the most reliable data which can be secured from literature by recognized authorities during the last few years.

It is the intent of the paper to show what has been done, what is being done, and what is therefore possible, rather than to give theoretical tables. It is the intent also to show the advantage of watching each one of the various items which go to make up the total cost, and, by pointing out the proportions of each to the whole, to aid one in the discovery as to which particular items are disproportionately large in his plant.

Before taking up the consideration of the cost of operation of a plant we should first consider the plant itself.

TOTAL INVESTMENT PER KILOWATT.

In America the variation in the investment per kilowatt is \$200 to \$750 per kilowatt capacity installed. In a few cases the figure is below \$200, and in a few as high as \$1,000; but in the great majority of cases the cost is below \$400.

In this respect American practice is ahead of that of Great Britain and the Continent, where the majority of plants have a total investment of over \$500 per kilowatt installed.

Later in this paper are given figures on some railway plants in Chicago costing less than \$75 per kilowatt. I think these figures refer to stations alone, whereas the corresponding values for lighting plants include distributing systems also.

The importance of keeping down the investment per kilowatt need not be emphasized.

The principal items that go to make up the total investment are real estate, steam or water power plant, electric plant distributing system and minor details.

In the first item we naturally find a great variation in the different plants. In country towns it runs as low as \$25 per kilowatt, and in cities as high as \$150 and over. In other words, there are some plants where the investment in real estate alone is greater per kilowatt than the entire investment is in others.

The investment in steam plant varies from \$20 to \$60, with figures on the electric plant slightly greater.

It is needless to say that the location of the plant ought to be considered with reference to all influences, each considered separately and reduced to a common method of comparison, i. e., the dollars and cents value per year of each consideration.

For instance, in a large city which I visited a couple of weeks ago I observed a new station being erected not over 1,000 feet from a river, yet five or six 1,000-horse power non-condensing engines were being installed. It is reasonable to assume that the convenience of that site to the main street of the city had a greater dollars and cents value than the consideration of condensing plus the difference in value of the land, as the company had the option to sell the present power site to the Government and to buy a river site for less money.

In buying the steam and electric plant, however, it is essential to consider reliability above every other consideration. In emphasizing this

point, to make it the end sought while considering the merits of boilers, engines, water wheels or generators, it should be viewed in its broadest sense. It is of assistance in examining bids on electrical apparatus or engines to compare the prices per pound, and weight in pounds per kilowatt or horse power and in considering boilers, heating surface and pounds per horse power as well as price per pound.

The various methods of rating apparatus and of stating ability to stand overloads are very confusing to the purchaser, and comparison by pounds develops features not otherwise noticed but worth considering carefully.

Having decided whether or not it is economical to use simple compound or condensing engines, decision as to the boiler pressure will follow as a matter of necessity, and will in turn decide in part whether return tubular or water-tube boilers will be advisable. The price per horse power of boilers is now not widely different.

The advantage of direct connecting over belt or rope drive is now recognized, so very little need be said. The amount of saving has been very carefully sought by Mr. Crompton, and in 23 of the largest English works the results have been tabulated as follows:

COMPARISON OF FUEL USED. Converted Alternating Current System.

WORKS.	Cost of fuel per unit sold. Cents.	B. T. U. in fuel per unit.	Efficiency of distribution.	B. T. U. per unit generated.	Description of Plant.

Average of N to W.....		133	..	112	" "
Ideal Works.....	0.54	36 1/4	93	32.6	" "

This table shows that the cost of fuel averages 46 per cent. higher where the dynamos are rope-driven than where the dynamos are direct-driven by high-speed engines.

Great stress is nowadays put upon high efficiency, and while this is important, reliability should be the principal feature.

In the present day of good design there is at best little to be gained in absolute efficiency, but the cost of energy and the popularity of electric light and power will be very much affected according as it is reliable.

Good regulation in the station is more important than high efficiency. Good regulation in the station means ability to use high efficiency lamps.

The use of 50-watt instead of 58-watt lamps means a saving of 14 per cent. directly in the lamps and in the copper losses. Relatively this increase in efficiency is much greater than is possible in any of the various types of boilers, engines or generators. Therefore the governing of the engine from no load to full load, and the regulation of the generators with load thrown off and on, should be carefully determined.

The value of accessories in the reliability of the plant and the reduction of labor and attendance is important. These accessories are as follows:

I. Feed-water appliances: (a) injectors; (b) steam pumps; (c) electric pumps.

II. Boiler appliances (steam or electric): (a) forced

draught; (b) mechanical stokers; (c) super-heaters; (d) coal handling and storage; (e) ash conveyors.

III. Cranes: Mechanical or electrical.

IV. Auxiliary electrical apparatus: (a) boosters; (b) station motors.

It is not ever advisable to drive the exciters from a motor taking current from the main generators on account of fluctuations being multiplied.

But under certain conditions the feed pumps, coal and ash handlers, overhead cranes and stokers may be driven with success and economy by either alternating or direct current electric motors.

Electricity as delivered at the switchboard is generated with economy and can be used more advantageously than steam. The inefficiency of steam is illustrated in the following table, showing the indicated horse power and steam per indicated horsepower of some of the auxiliary apparatus of the U. S. S. Minneapolis.*

Name of Auxiliary.	I. H. P.	Steam per I. H. P.
Pump of starboard condenser.....	1.23	266
Circulating pump engine.....	19.	55
Starboard air pump.....	6.5	183
Center air pump.....	25.	78
Vertical duplex fire pump.....	1.	205
Horizontal duplex fire pump.....	0.8	319
Same pump.....	6.4	156
Vertical duplex bilge pump.....	2.5	171

Fireroom feed pump.....	8.8	91
Same pump.....	1.6	243
Forced draft blower engine.....	16.	77
Single cylinder horizontal flushing pump.....	1.4	194
An ice machine.....	6.	70

The use of an oil-distributing system reduces amount of oil consumed and the attendance required. The air-blast for cleaning around generators is a great assistance, saves time, labor and acts as an insurance against burn-out.

This apparatus can now be bought in a combined form so that the same air compressor and tanks furnish air for the oil circulation and for cleaning.

DISTRIBUTION SYSTEM.

From the station let us go to the cost of the distributing system, which is now becoming an enormous item of expense since underground conduits are required in many places. I give the following curves, showing the cost per foot of construction under Belgian block and asphalt, and with various materials of conduit. The cost of underground construction complete is about four times that of overhead construction.

In the choice of duct and insulation on con-

* Steam consumption of the auxiliary apparatus of the U. S. S. Minneapolis, p. 383, March 26, Elec. World, 1898.

* Paper read before the National Electric Light Association at its Twenty-first Convention, Chicago, Ill., June 7, 8 and 9, 1898.

ductors, again let me emphasize the importance of reliability. With such an enormous investment it is almost out of the question to consider material liable to break down.

In the tests which should be required of the cable two important features should be made prominent. First, the testing apparatus should be at least about 50-kilowatt capacity. The 7 and 8 kilowatt testing transformers which up to within a few years were considered sufficient were a delusion. When it is stated that a cable must stand a test pressure it should be required that that test pressure be maintained at least one hour, as the momentary test is not sufficient to develop faults. Make the insulation resistance requirements moderate, but insist on the test pressure from a large transformer being maintained one hour.

In the matter of joints employ only the most skilled labor.

PLANT MANAGEMENT.

Cost per unit in what follows refers to 1,000 watts maintained one hour, according to Mr. Crompton's arrangement.

The price charged per unit is made up of cost and profit.

The cost may be subdivided as to—

I, Generation and distribution; II, Maintenance, and III, Management.

It may again be divided into (a) material and (b) labor; (a) representing (1) fuel, (2) water and (3) supplies; (b) representing (4) wages and (5) superintendence.

II, Maintenance is made up of (6) material, (7) wages and (8) superintendence, and

III, Management, may be subdivided as to (9) directors, (10) salaries and (11) expenses.

Total cost or Price.	I. Generation and Distribution.	(a) Material.	(b) Labor.	II. Maintenance.	III. Management.	IV. Profit.
		(1) Fuel.	(2) Water.	(3) Supplies.	(4) Wages.	(5) Superintendence.
		(6) Material.	(7) Wages.	(8) Superintendence.	(9) Directors.	(10) Salaries.
		(11) Expenses.	(12) "on capital.			

As we compared total cost of plant per kilowatt and found it on the average to be under \$400, calculations as to cost of operation of plant per unit output per year gives that figure to be, on the average, under 50 cents. That is, on the average it requires 50 cents worth of plant to generate and distribute one kilowatt hour per year.

This immediately brings out an important point, namely load factor. This feature has been brought out with advantage by Mr. Hammond from data of the English companies. Such data is not obtainable yet in America, so I quote in full from Mr. Hammond's paper:

LOAD-FACTOR.

"Former writers have not failed to dwell upon the marked effect which the load-factor has upon the costs of production, and in my estimation of the influences which bear upon that problem I place load-factor directly after output. Without the latter the most favorable load-factor is useless, but, combined with a healthy output, a favorable load-factor greatly reduces costs.

"So convinced is Mr. Arthur Wright of the importance of load-factor that he offers to supply all his customers at 3 cents per unit for any consumption beyond an average of one hour per day of their maximum demand throughout the year.

"The advantages arising from a high load-factor are however universally acknowledged, and I therefore pass on to lay before you the data in connection with it that I have been able to collect.

"These data are not demanded by the Board of Trade, and I am much indebted to those works engineers who have responded to my request for information on this head.

"I use 'load-factor' in the sense of the ratio of the actual units generated to the product of the

maximum of the year and the total hours of the year; the 'load-factor,' therefore, of 1896, being obtained by multiplying the maximum load of 1896 by 8,784 (i.e., 366 days by 24 hours), and of 1897 by 8,760.

"Though it appears to be the custom at every works to record the maximum load, the 'units generated' are in the majority not arrived at by meter, but by calculation, and in some by a process which one of my correspondents describes as 'cooking.'

"Under these circumstances I have hesitated about dealing with the data, but, finally, being convinced of the absolute accuracy of a portion, and of the approximate accuracy of the bulk, I have decided to set it out (see table), leaving the members of the Institution to convince themselves in particular cases as to whether the 'units generated' have been arrived at in an accurate manner."

Table Showing (a) Load Factor and (b) Units Used in Distribution—Provincial Undertakings.*

WORKS.	Year.	Units sold to consumers, including public lighting.	Total units generated.	Maximum load of year. Kilowatts.	Load factor, % of units generated to output of maximum load in use constantly throughout the year.	Ratio of units used in distribution to units generated per cent.

*From paper by R. Hammond, before Institute of Electrical Engineers, March 24, 1898.

From these tables there is another point to be learned, namely, the percentage of units generated the distribution. I have no doubt but that a great saving may be made in our stations if attention is

brought to this feature. To go back to the total cost per unit, we find, comparing again the English stations, as I have been unable to obtain such data on American stations [see table "Record Costs—Total Costs," next column].

We find the cost of coal varies from \$3.50 to \$5 per ton, and yet the cost of fuel per unit has been kept down in a great many plants to one cent. So far as I am advised there is only one State in our Union which gives such data officially, namely, Massachusetts.

A very interesting report of one of the Continental plants is that of the polyphase station of the Budapest Allgemeine Electricitäts Gesellschaft.

* This station has been in operation since 1893. The electric light in Budapest is supplied by two large central stations, one working on the polyphase system and the other on the simple alternating system. The polyphase currents are transformed into continuous currents by rotaries to 230 volts on the three-wire system.

The station consists of six 300-kilowatt, two-phase generators driven by triple expansion engines. The coal is Ostrauer nut and makes 7.4 per cent. refuse. On an average during the winter months the efficiency of the entire system is 67 per cent. The results of the plant are given in the following table:

	1891.	1893.	1896.
Gross production.....	1,201,000 units	1,900,000	2,800,000
Highest load.....	15,000 16-c. p. l.	17,000	21,000
Lowest load.....	2,000 16-c. p. l.	3,000	9,000
Gross watt-hours per lb. of coal.....	432	575	571

Consumers pay 20 cents a unit for light and 16 cents for power.

† I give below the average cost of coal and contract price per arc lamp per year in about 100 stations in the United States. No distinction in price per 2,000 or 1,200 candle power is made in averaging on account of the great variation in price; a 2,000 candle power lamp in one place with high-cost coal sometimes selling for less than a 1,200 candle power with low-price coal:

State.	Hours per year.	Coal per ton.	Contract price per year.	C.P. per hr. for arc.

*January, 1897, Street Railway Journal, L. D. Tandy.

A, B, C and E are large stations, containing the most expensive machinery. No expense has been spared in their construction, and in consequence fixed charges are extremely high.

Station D is a representative city station of moderate cost and high efficiency.

Stations F, G and H are city stations of moderate cost. They are not of absolutely modern construc-

plants than any English lighting station, but it should be remembered that the figures on these railway stations refer probably to generation only.

If we take the pounds of coal per unit and divide 1,000 watt-hours by it, we will obtain 256.

At this point it is interesting to turn back to your 1896 meeting in New York and to the paper by Mr. Swetland, chairman of the Committee on Data.

NOTE.—This table should follow the tables on p. 374, headed "Output."

tion, but at the time of their erection were as perfect as money could make them.

Station I is a model station of small size, running an extremely variable load.

Station J is a large city station running under favorable conditions.

From the examination of 81 reports using coal as fuel the average efficiency is 108 watt-hours per pound of coal.

We are thus able to compare these two series of stations and find that the average efficiency of the lighting is less than half the railway companies'.

also that the average of these railway stations is above the highest efficiency of the 1896 report, but was equalled in 1895 in the report of one lighting station only.

It is interesting to compare these reports with the

It will be seen that in rated capacity the plants vary from 40-horse power to 2,500, and in value per rated horse-power from \$23 to \$89 in steam power plants, or as high as \$368 in waterworks pumping stations.

In fuel, soft coal or slack of soft coal largely predominates, and a considerable use of mixtures of the latter with dust from the yards and hard coal slack will also be noticed, which is largely due to efforts to reduce the smoke nuisance.

A carefully prepared paper by Mr. Horatio A. Foster on the cost of steam power, and read before the American Institute of Electrical Engineers a year ago, emphasizes the fact that there is very little reliable data on American plants. His results on 22 plants are given in the tables on this page.

The plants on which tests were made for cost of power were:

- Two electric lighting stations.
- One grain elevator.
- Three waterworks pumping stations.
- Two flouring mills.
- Six cotton mills.
- Four newspaper and printing offices.
- One department store.
- One furniture manufactory.
- One bakery.
- One, glazed and fancy paper manufacturing company.

While the type of boiler used leans largely to the plain, old-fashioned return tubular, with the exception of the cotton mills, the types of engines are almost as varied as the number of plants.

In conclusion I wish to say that if I may have the assistance of the members, by providing me with data, by next year I can prepare a more helpful paper, going more carefully into the question of

calorific value of the different coals used and to the different types of plants.

DISCUSSION.

Mr. Scovil—In the beginning of Mr. Rice's paper is the following paragraph: "In America the variation in the investment per kilowatt is \$200 to \$750 per kilowatt capacity installed. In a few cases the figure is below \$200, and in a few as high as \$1,000; but in the great majority of cases the cost is below \$400." I would like to ask what is meant by the word "investment"?

Mr. Rice—As I understand the data given in the literature which I have quoted, it covers the entire investment of developing water-works if it is a water-works plant, the steam plant, buildings, real estate, distributing system, whether underground or overhead, clear to the motor or insulation in the consumers' plant.

Mr. Scovil—Does it cover royalties?

Mr. Rice—As far as I know it does.

Mr. Ayer—There is a note in the paper where it speaks about the losses or unaccounted watts developed in the lighting station as compared with gas; that the losses are from different sources. I ask Mr. Barker his understanding of it. Is it not a fact that the gas losses are due to condensation quite as much as the watt losses are due to line losses; in other words, are there not in both cases loss in distribution?

Mr. Barker—The occasion for the losses in the gas distribution are largely leakage in the pipe. The matter of condensation loss, if gas is properly made, can be reduced to very low percentage, and the large percentages of loss in cases about which you hear occasionally are due to actual leakage. The causes are somewhat different in gas distribution from those in electric light distribution, although it may be that when electric light distribution is as thoroughly understood and as accurately applied, the losses in electric light distribution may be very largely reduced, as has been the case with gas distribution.

Mr. Dow—I should like to get a certificate of the accuracy of the statement regarding the Budapest system. It gives the gross watt hours per pound of coal as 575 and 571. It is specifically stated that it is gross watt hours and the station is described as a station where the loss would be quite high. Mr. Rice has no doubt given the statement most careful consideration.

Mr. Ferguson—The Budapest station pays more for coal than we do. They pay four or five dollars a ton, so that the figure 571 is possible. It costs them more for coal at Budapest than it does at our best American stations.

Mr. Dow—With all due respect to the Budapest statements, I do not think they are correct. The main engine alone might accomplish that result; it is possible to get them down to about 1.4, but to get the whole output down to such a figure it seems to be out of the question. There is a mistake of about 200 watts.

Mr. Creden—In connection with what Mr. Dow has said, I will say that the Chicago Edison Company generates a kilowatt on about $4\frac{1}{2}$ pounds of coal, equivalent to about 28 lbs., which gives an evaporation of about six lbs. on an average to a day's run. Coal as used in Budapest would safely give about ten lbs. on an average, which readily accounts for the large number of watts generated. The Chicago Edison Company generates about 250 watts per pound of coal. The coal we use will give an evaporation of six lbs., perhaps a trifle less, on a run of 24 hours. The coal at Budapest is of a better quality and will give an evaporation of ten lbs., which will account for the high figure specified. I think the figures presented by Mr. Rice are about right. They are possibly a trifle high, but not as high as Mr. Dow represents.

President Insull—I have here a chart which shows

the average cost of various operations in connection with our operating expenses, except the interest portion of the operating expenses. The largest amount of expenses is general expenses. The reason for that is that one-third of the expense is in getting new business, one-third administrative expenses and the balance insurance, taxes and similar items. Take the question of street repairing, that item will go down continually until you get your system in such shape that that item will not bear any particular relation to the amount of your output unless the output exceeds the capacity of your conductors. The biggest item of expense apart from general expense is, as Mr. Rice indicated, lamp renewals, when he referred to the question of regulation being more important than the question of economy.

The important point that the chart brings out is the interest cost. You might have all of your operating expenses presented to you outside of interest and then you could lose money—it would be possible to do such a thing if your selling price is not on the right basis. Here is a case of a 3.7 load factor. It is an office building and actual case, not an extreme case. I could show you cases where the load factor would be much poorer than that, but in that case the interest charge is 80 per cent. of the total operating charge. Here is the case of an ordinary fancy store (these cases are taken from the actual bills), and you see there that the interest charge is a little less. The importance of the interest charge in this case will be brought home to you when I tell you that the difference between six and five per cent. in the price you pay for your money and whether you sell your bonds at 90 per cent. or sell them at par makes a difference of 16 to 20 per cent. in the cost of operating expenses. That statement alone will show you that the public (generally) is more interested than we are in the question of protecting us in the enjoyment of our right to do business.

Now we come to the all-night restaurant where the load factor is 48 per cent.—the interest charge is only 26 per cent. of the total expenses. These are the two extreme cases I mentioned to you in my opening remarks. In this case (indicating) you could sell current to a man at about a quarter what you could sell it to this man and make more money out of that man than out of this man. You will find that the same relation goes all the way through with the different classes of business. Power business is not quite as good as all-night lighting business. The load factor is about 35 per cent. and the interest expense 32 per cent. With a drygoods store the interest is about 40 per cent. With a small lunch counter the interest is 45 per cent., and with a saloon the interest is 52 per cent.

It is generally supposed that the best business is the power business. I remember in the early days when the rates were established to foster the power business of the Edison Electric Illuminating Company of New York, the claim was made that you could afford to sell power at one-half the price if your current was going to be used for power when it was not going to be used for light. We have found that the power curve and the light curve cross each other for sixty days during the winter, and the claim which was made for the power business proved a fallacy.

In your lighting business—I am talking to people using large stations—you can get a class of business which will yield you a bigger return on your investment from lighting customers than from power customers at a low rate, because the interest cost, if you have a 50 per cent. load factor, is only 25 per cent. of the total cost; whereas with power customers the interest is about 35 per cent. This chart properly studied should enable a man running the Chicago Edison Company to make a price list that would fit all kinds of customers. If we can do that in our business, surely you people can do it in your business. You will find, too, that the adoption of a system of rates that will take care of these different condi-

tions will affect these items very materially. It will not affect lamp renewals, of course. It will certainly affect station repairs, general supervision, station labor, fuel and also general expenses. In other words, it will affect by far the greater proportion of your expenses outside of interest charges, besides very materially affecting your interest charges by putting your revenue on a basis so that it is in proportion to the interest you have to pay to take care of the customer whom you are supplying with current. You are putting your business on a basis so that you get a return on the investment which you have to provide for each separate customer. This subject came up for discussion last year at Niagara Falls. One gentleman, who I am sorry is not here to-day, took the ground that we had to sell the product at the same price to everybody. If you do you are selling your product at different prices to everybody, because in one case you can make money, and in another case you lose money. Take for instance this case. That office-building customer won't enable you to pay interest and depreciation on the investment. You may have to take him as a good business policy; but do not fool yourselves when you put on 5,000 lights in an office building that you are going to make any money on them. We do the largest office-building business in the country, and I am perfectly willing to say to you that I do not believe we make any money, but I would not like to say it to the stockholders. If the expenses of a station are followed out in this way, you can get a great deal more out of the method by which you sell than you can out of the method by which you produce.

Mr. Armstrong—What would you call your standard rate? What would be your base rate?

Mr. Insull—I never expect to sell that man below twenty cents a kilowatt hour unless the conditions of production change.

Mr. DeCamp—Mr. Armstrong means whether you establish a base rate for the least desirable customer and work down, or whether you take a base rate on the most desirable customer and work up?

Mr. Van Trump—How do you distinguish between your customers?

Mr. Insull—It is simply a question whether you are going to do it figuring on lamps connected, which is fallacious, or adopt some scheme which enables you to register the maximum load.

Mr. Hubeley—How can you regulate that plan on a meter basis—different rates for different services?

Mr. Insull—There are various ways of arriving at that.

Mr. Hubeley—I do not see how it could be done on a flat rate, on a contract basis. I do not see how you could do that without a great deal of computation.

Mr. Insull—Do you mean a meter flat rate or contract basis?

Mr. Hubeley—Contract basis; so much a month.

Mr. Insull—We would go into the hands of a receiver on that basis.

Mr. Hubeley—Do you use meters here under that plan?

Mr. Insull—Yes, sir.

Mr. Barker—You spoke of the different classes of business earning a certain percentage on the investment. How do you apportion the investment among the different classes of business?

Mr. Insull—On our maximum output per year. We take an investment of that kind, and divide the one by the other, and get the investment per unit at the maximum output. Then we get the maximum demand on us for current from the customer, and in that way we can figure his load factor. As we know what it costs for our investment per maximum unit of output, and as we know our customer's maximum demand—

Mr. Hubeley—How do you know that?

Mr. Insull—There are a number of ways of arriving at it. We use a Bristol recording wattmeter;

you can use some kind of indicator that will show it. There are a number of ways. We use the Wright demand meter.

Mr. Wendell—In towns of 25,000 people there are a number of small consumers whose maximum demand may not be five lights. They are very desirable customers. What would you do in their case?

Mr. Insull—If your smallest customer is a man who burns one light, and burns it five hours a day, he is likely to buy it at a rate of a little over one half a cent per lamp hour.

Mr. Wendell—How small a customer can you afford to take?

Mr. Insull—It depends upon the efficiency of the lamp. If you will give us a 25-watt lamp, we will take a customer whose demand is 25 watts.

Mr. Wendell—Can you afford to do that with the Wright demand meter? On what number of lamps do you use the meter?

Mr. Insull—Mr. Ferguson, what customers can we afford to take?

Mr. Ferguson—We take every and any customer on that basis, and we have a uniform schedule of prices for everybody, based on one cent per lamp per hour; that is the base rate. We charge the full rate of one cent per lamp per hour for one hour per day as the maximum demand, and for all watt hours beyond that hour we charge a half rate, 40 per cent. or 60 per cent. or anything you please.

In regard to the question of what customers you can afford to take, that would involve a great deal of calculation. The simplest way is to charge a minimum bill to each customer which will cover the smallest customer. If you charge a minimum bill for services furnished, that will cover interest and depreciation charges on the cost of the investment used.

Mr. Scovil—I would like to know whether the chart which you have shown, and the percentages you gave, do not include a great many motors that are used for electric power, such as elevators?

Mr. Creden—Yes, it does.

Mr. Scovil—I simply want to have it understood that Mr. Insull's deductions from his chart as to the desirability of power as a load factor on the station is not altogether to be accepted from the showing made by the chart, for the reason that that chart includes in it many motors used on electric elevators in which the power factor is very small; that motors used for manufacturing purposes only have a much higher power factor, and are entitled to a much better rate.

Mr. Insull—I do not say power is not desirable business.

Mr. Scovil—It is good lighting that is as good as ten-hour motor power ordinarily.

Mr. Insull—I do not wish you to think that we do not take power.

Mr. Coggeshall—You charge one rate for one hour a day and another rate for the rest of the day. How do you do it?

Mr. Insull—That is called the two-rate system. It is done by a meter with two dials or a double meter.

Mr. Wagner—I understand from your remarks that the Chicago Edison Company is going to use the Wright demand system of charging, which is a very thorough way of providing for all these different classes of service. I should like to know if there is any one else here who accomplishes nearly the same thing by any other method.

Mr. Dow—I have been into this thing up to my neck. I suppose that remark will interest a good many members here from small towns, say of 25,000 inhabitants. We have more than 25,000 people but we have not money enough to buy Wright demand meters for all our customers just yet. We are going to do so some day. However, we use demand meters on a number of customers. We use them when there is doubt of arriving at the demand by any other means. We do not believe it necessary to leave

them on continuously, but we put them on long enough to make certain that we have a fair average demand for the current twelve months, and in such cases we make the demand established by meter and base a contract on it with the customers for the current twelve months. We say to them that they shall pay for that amount for twelve months at the maximum rate, and everything beyond that at a minimum rate, and at the end of twelve months we will again meter in the same way, and reserve the right to put the meter on at any time to satisfy ourselves as to what the actual demand is. In some places we leave the meters on continuously. We would do so all the way through but for the one point of not having money enough to put them on everybody.

Mr. Ayer—I think it would be interesting to the members who did not attend the last Convention when the Wright demand system was described to have a brief description of it given here by Mr. Dow.

[Mr. Dow gave a description of the operation of the Wright demand meter. The principle, he said, is the same as that which governs the registering thermometer.]

Mr. Dow—Now to answer the question raised as to how any one has reached the same result by other means. In the matter of arc lighting practically nine-tenths of the business is with customers whose lamps connect, are all turned on at once. If a man has ten arc lights he is likely to use all at the same time, so that in the majority of cases the arc lamps will be an exact measure of the demand. With certain classes of motors the same thing applies, not with all classes by any means, because there is nothing that is more frequent than a motor running at a much less load than it is rated, or they seldom use continuously any length of time the maximum. The matter of elevator motors, to which Mr. Scovil referred, is in that line. There is a large amount of motor business where you can put on an ammeter and ascertain the largest demand. As we are situated now we have been trying to develop the motor business and inspect motors frequently, and we have not so many that a faithful man cannot visit them all in five weeks. We are not missing anything, but our method of checking depends on personal knowledge and can only be looked upon as a makeshift. It does not compare with the method of gauging the arc lights, but as a temporary device it fills the bill. Beyond that you have still another class of customers, small barber shops, saloons, cigar stores, news-stands and fruit stands, that use only a few lights and keep open long hours. They are good customers. Beyond that is the general use of incandescent lights where some meter must be used. It limits the necessity of the application of the demand meters to one part of the business, and that may be one-half or one-third of the whole business. If there is any place in the world where a demand meter is a good thing it is in a residence. In the absence of the meter system in residences we have instituted a method of assessment according to the number of rooms in a house and the number of persons likely to use the light.

Mr. Wagner—How do you arrive at the assessment you speak of?

Mr. Dow—We inspect each house and make a list of the rooms and the number of lights in each room, and we make a charge accordingly.

Mr. Wagner—You have to collect all the data for each customer?

Mr. Dow—With the residence customers only.

Mr. Wagner—We have 75,000 incandescent lamps in St. Louis.

Mr. Dow—We have 24,000.

Mr. Robinson—In formulating a scheme for the adoption of the Wright demand system I found a certain class of business that I did not know how to handle. It comes from lodges, churches, etc.

Mr. Dow—Mr. Wright maintains strongly that the

relation of the demand, maximum customer's demand, and the time at which the demand takes place is of no consequence; but I feel that it is, so I reclassified all these certain lines of business, which include the troublesome customers mentioned who think that they ought to have special rates. I have churches, lodges, schools, banks and fire engine houses on a special basis, in the latter case because we use some of the fire alarm telegraph poles. Our annual peak is due to the sixty days crossing of motor and lighting loads. The banks are off before the great bulk of business comes on. I established for them, on the same set of calculations, a rate which is equitable and known as the church, bank or lodge rate. It is got at in the same way.

Mr. Wagner—I think we might hear more about the details of the system of the Chicago Edison Company.

Mr. Ferguson—Mr. Dow made the statement that he could not afford to buy demand meters. He can do it after a while but cannot afford to do it now. After listening to what he said I think he is much mistaken. I think he is spending too much of his valuable time in attempting to understand the personal characteristics of his customers. I am sure that if he does that properly, if he ascertains the characteristics of his customers so well that he can approach the work done by the Wright demand meter, he must employ a large force of assistants, and when we consider that the cost of the demand meter is small in proportion to the total investment, and when we consider the immense amount of business that can be obtained by using the demand meters, I think he can well afford to buy them. We will suppose that in Chicago we have 5,000 customers and the cost of the instruments would be something like \$30,000 for all these customers. We do not spend all the entire sum in one year, it would take some time. Our business has improved largely by the use of the meter and we cannot get instruments fast enough. We have made contracts on the Wright demand basis and a month has passed and we have not the Wright meters in. If that is so, it seems to me that any central station man can well afford to borrow the money, even at a very high rate of interest, as Mr. Ayer has just suggested, and purchase the meters. The additional business that you will get by the use of such instruments will more than compensate in a few years for the total investment by having an instrument to measure the current properly. We have listened to papers in these Conventions showing the economy to be effected in generation and distribution and that sort of thing. It seems to me that there is more money to be made in the intelligent selling of your product than in attempting to introduce further economies in operation. With an instrument like the Wright demand meter you are put in a position where the instrument does for you what you will otherwise have to do by skilled labor at a very high cost. I say this from experience.

In further reference to this question of dealing individually with customers, especially in residences, upon which Mr. Dow dwelt particularly, the load factor varies greatly and you cannot classify residences; it is almost impossible to do so. We will have a rich man, for instance, like Mr. Armour, who has 200 lights in his house, at \$25 a month, and we have another man with 25 lights and his bill is \$20 a month. They would be entitled to a 25 per cent. discount on the basis of 25 cents per kilowatt hour for the first hour and 20 cents per kilowatt hour for the succeeding hours. The load factor would be over 20 per cent. Theaters use light at a high load factor; they run for short periods, and the load factor is small. Hotels are about 50 per cent., and large dry goods houses 50 per cent., and residences vary all over the line. We have not made any increase since starting in with the Wright demand system. We have not published the fact that we are selling electric light on that basis as yet. We have how-

ever instructed our men to take all new business on that basis. We sell arc lamps at a flat price per week from dusk to midnight. With the exception of that and the power business it is all done on the Wright demand basis. We put our arc light and incandescent light on the same meter. The reading of the demand meter is made at the same time as the reading of the wattmeter. The wattmeter is placed on the wall and the demand meter under it. The latter is graduated in kilowatt hours, the same as the wattmeter.

Mr. Weeks—There have been few discussions before this Association, Mr. President, of greater importance to central station interests than that to which we have just listened. In the cost of our product the relative value of the interest factor has been forcibly and clearly shown, and the necessity for revision of rates or discounts has been ably demonstrated. In my judgment the method employed by Mr. Insull, or a slight modification of it, will soon come into general use. In one respect, however, the practice as stated strikes me of questionable equity if not expediency, and I would like to ask what has been the effect upon your revenue of the lower rates for summer service?

Mr. Insull—We do not know yet. We only put it in operation during the last few weeks.

Mr. Weeks—It seems to me that it is somewhat inequitable to make a lower rate for transient summer service, such as that of the customer who operates a fan but a few weeks, or months at most, in the year, while his rate on account of the interest factor should be higher rather than lower than that for most other classes of service.

Mr. Insull—We have a large by-product that we want to sell, which usually lies idle in the summer, and we endeavor to dispose of it to these casual users.

Mr. Rice—There is only one more point that I wish to speak of that was omitted. The curves alluded to in my paper show the figures during about four years of the recorded plants of England. These figures show plants having outputs between five hundred thousand and four million units. It is interesting to observe that the largest plant shown, the Westminster plant, is only about one quarter as large as the Edison Company of Chicago. The cost here was eight cents per kilowatt hour in 1890, and in 1897 it had dropped to a little over four cents. There are smaller plants, perhaps 100 to 200 kilowatt capacity. Their cost in 1890 was about nine cents a kilowatt hour and in 1896 four cents, and some of the smaller plants, the Portsmouth plant for instance, having a maximum output of only 800,000 units, is down to three and a half cents, whereas with the largest plant in England, its best record is four and a quarter cents per kilowatt hour.

The Ohio Street Railway Association.

At the annual meeting of this association, held in Columbus recently, steps were taken toward extending the membership of the association by admitting the heads of the various departments into the organization. This will make a considerable increase in the membership; hitherto only the recognized heads of the roads could be accepted in the association. With the extended organization there will be meetings with papers that will deal with the advances being made in the roads and how these are attained. The next meeting of the association will be held in Springfield, June 14, 1899. The officers elected are: President, S. L. Nelson, Columbus; vice-president, James F. Flood of Steubenville; secretary and treasurer, Charles Currie of Lima; executive committee: the officers and W. A. Lynch, Canton; T. H. McLean, Toledo, and A. A. Anderson, Youngstown.

THE DISTRIBUTION OF ELECTRICAL ENERGY IN PARIS.

BY J. LAFFARGUE.

(Continued from page 328.)

The alternating-current distribution is carried out partly by concentric cables and partly by separate cables, laid either in pipes or in sulphated wooden mouldings in concrete subways. Besides supplying the different subscribers, the high-tension network supplies the public lighting of the Avenue de l'Opéra. The transformers, two in number, each of 15 kw., are installed in the upper portion of a kiosque at the corner of the Avenue de l'Opéra and the Rue des Petits Champs. The reception and delivery switchboards for the lamp circuits are placed beneath the transformers. The potential difference at the secondary terminals is 220 volts; the arc lamps are those of Kremenetzki, taking 14 amperes. There are 50 of them, connected five in series, and they are distributed in 10 circuits, of which five are always in use. All the lamp circuits are connected to the kiosque. The distribution is effected by concentric cables, lead-covered and armored, laid direct in the earth; these cables were manufactured by the Société Industrielle des Téléphones. The lamps are mounted on posts 17 ft. high, placed on the two footways of the avenue.

In the course of the year 1896 the municipal works of the Halles generated an output of 1,010,734 kilowatt-hours, of which 478,132 kilowatt-hours were expended in lighting the Halles, 76,147 in the interior of the works, 62,245 in charging the accumulators, and 394,209 in supplying subscribers and for public lighting. The consumption of coal was 8.7 lb. per kilowatt hour generated. The cost price of the kilowatt-hour at the works is 2.45d., non-inclusive of interest and sinking fund. The cost of the public lighting is 3.8d. per kilowatt-hour supplied to the lamp. The cost of a kilowatt hour supplied to subscribers is 3.04d. The selling price of the kilowatt-hour was 9.5d. for continuous current and 9.1d. for alternating current. The number of arc lamps supplied was 245 in the Halles Centrales, 101 on the public thoroughfare, and 196 on the premises of subscribers. The number of incandescent lamps was 743 in the Halles Centrales and 3,479 on the premises of subscribers.

Société du Secteur de la Place Clichy.—This society adopts the five-wire system of distribution by feeders with accumulators at the works and regulators with four dynamos located at the regulating stations within the city. The regulation is carried out also by the aid of boosters arranged in series in the circuit of the feeders at the works. The works comprise three portions, which are quite distinct. In front, and in a line with the Rue des Dames, are the buildings pertaining to the administration; behind these are the machine-room and the boiler-room. The latter contains 12 Noeyer boilers, each supplying 5,500 lbs. of steam per hour, at the pressure of 110 lbs. per square inch. The water used for the boilers passes through Dervaux filters. In the machine-room are located three horizontal Corlies steam-engines, with single cylinders worked non-condensing, yielding 500 HP. Also three vertical compound steam-engines, non-condensing, yielding also 500 HP. at 64 revolutions per minute. These six steam-engines each actuate a continuous-current dynamo having eight poles and an external collector of 340 kw. at 500 volts. These are the machines utilized for the distribution of the electric energy. Along one side are located three Armington horizontal engines with two cylinders, yielding 150 HP., and working at 240 revolutions per minute, each of which actuates by means of belting two bipolar shunt dynamos, yielding 62.5 kw. at 250 volts. Besides these there are two compound engines with variable expansion, yielding 100 HP. at 240 revolutions per

minute, each of which directly actuates a dynamo with external collector, yielding 62.5 kw. at 250 volts. These different machines are utilized in charging accumulators. The works also include two batteries of accumulators, consisting of 250 of the cells of the Société des Métaux, yielding 2,100 ampere-hours, and one battery of 260 Tudor elements, yielding 3,000 ampere-hours. The distribution is wholly effected by lead-covered and armored cables, placed directly in the earth in a layer of fine sand. The junctions of the cables, the tee-joints, and the connections for subscribers are all made in special boxes, hermetically closed, and on a level with the pavement. Some interesting trials have been made at the Clichy sector in the burning of anthracite for the purpose of avoiding smoke. These trials have been made comparatively with Saint-Charles of Charleroi coal burned in smoke-consuming Langer furnaces. The anthracite was burned on Richards firebars. The following gives respectively the consumption per kilowatt-hour.

St. Charles Coal.	Anthracite.
5.5 lbs.	5.1 lbs.
6.1 lbs.	5.5 lbs.
5.8 lbs.	4.65 lbs.

Special trials of St. Charles coal on Richards firebars gave a consumption of 5.8 and 5.9 kilos per kilowatt-hour. Taking anthracite at 27s. 3d. per ton, and St. Charles coal at 22s. 6d., the mean cost respectively would be 0.748d. and 0.71d. per kilowatt-hour. By the use of anthracite, absolute smoke consumption is assured. On July 30, 1897, the number of subscribers supplied was 2,864 taking the equivalent of 152,846 lamps of 10 candles, of which 136,471 were for lighting, 14,622 for motive power, 603 for heating appliances, and 1,150 for public lighting. The yearly return per lamp installed was 10s. The estimated return per lamp was 19s. 6d. for commercial lighting, 6s. 5d. for domestic lighting, 3s. 1d. for motive power, and 11d. for heating. The Clichy sector uses Aron meters; all the other sectors have adopted the Thomson-Houston meters.

Secteur des Champs Elysées.—The Society for the Champs Elysées Sector supplies a large and extended sector, as may be seen on the map; and has therefore adopted the use of alternating currents, with transformers on the premises of subscribers. The central station is installed at Levallois-Perret, on the banks of the Seine, at about 1.5 km. from Paris. It is composed of a large boiler-room, which comprises seven Galloway boilers, each producing 6,600 lbs. of steam per hour, at the pressure of 85 lbs. per square inch. These boilers are furnished with Green's economizers. Within the boiler-room there are two Faroot horizontal steam-engines, with single cylinders and condensers, of 600 HP., working at 60 revolutions per minute; also one similar machine, formed of two twin engines of 300 HP., and one similar engine of 800 HP. One of the three first engines directly actuates a Hillairt alternator, of 400 kw. at 3,000 volts, with a frequency of 40 periods per second, with revolving indicators, and the two others work two Hutin and LeBlanc alternators of the same power; with each machine there is an exciter of 25 kw. at 160 volts. The 800-HP. engine works a Hutin and LeBlanc alternator of 600 kw. at 3,000 volts, of the same frequency, and an exciting continuous-current dynamo of 25 kw. At the present moment a fifth Faroot engine, with a Hutin and LeBlanc alternator, is being installed. There is also to be found at these works a Willans 60 HP. engine, working a continuous-current dynamo of 25 kw., for the supply of electrical energy to a crane located on the banks of the Seine for discharging coal. The alternators are connected in parallel for the various purposes to which they are applied.

The distribution is carried out by Berthoud-Borel concentric cables, lead-covered and armored, laid directly in the earth. The total power actually available is 1,800 kw. At the commencement of

1897 the company possessed 1,723 subscribers, utilizing 127,842 incandescent lamps, 118 arc lamps and 50 motors, equivalent to 220 H.P. We particularly notice that electric motors are beginning to be utilized in the working of lifts. Even in the case of alternating currents there are already a large number of applications in this direction. A few important subscribers desirous of installing electric lighting have made application for the continuous current. We may especially mention a large building in the Avenue des Champs Elysées. The sector is about to establish a special sub-station for the supply of this building. The alternating current is to actuate a rotary transformer, which will supply the continuous current.

(To be continued.)

MIDSUMMER MEETING OF THE NORTHWESTERN ELECTRICAL ASSOCIATION.

On Board Steamer North West, Chicago to Duluth.

The meeting was called to order June 11 at 11 A. M. by the President, Mr. F. A. Copeland.

Mr. S. Everett Doane of Marlborough, Mass., then read a paper on "Incandescent Lamps" in which attention was called to the fact that the old theory that the evaporation of carbon and condensation in the bulb of the lamp were the cause of blackening had been exploded, and that the generally accepted theory at present, and which was undoubtedly correct, was that the blackening was truly a chemical effect. After the reading of this paper a vote of thanks was extended to Mr. Doane.

The question-box was then opened by the Secretary and the following question discussed: "What success has been realized in substituting an incandescent lamp in place of wire resistance in direct-current enclosed arc lamp?"

Mr. J. W. Mabbs, of Chicago, said: I have had a little experience in the line suggested. Some two or three years ago I conceived the idea that the resistance in an incandescent lamp was wasting a great deal of energy which ought to be utilized as light, and I had an idea that the resistance that is generally wasted in an incandescent arc lamp could be utilized, and along that line I tried quite a number of experiments by taking several incandescent lamps and putting them in multiple series with the incandescent arc. I had quite a little trouble to get the incandescent lamps to work satisfactorily, owing to their faulty construction, but after a little we got the thing down so that the lamps worked pretty well. The arc lamps worked much better than they did with the metal resistance, and the smaller lamps gave more or less light that we utilized for places where a little aberration in light would not be objectionable, and in that way put the energy formerly thrown away to good use in lighting spaces where a variable light would not be objectionable, and during the two or three years that we have used the incandescent lamps in connection with the arc lamps, in this way, we have been put to less trouble and expense for repairs than when we used the lamps with the metal resistance. By putting about 6 lamps in multiple series of 10 candle power, each one consuming about an ampere, we get very good results.

Mr. Harding—The better service that you obtain from your arcs I presume is due to your having less trouble in maintaining the lamp.

Mr. Mabbs—Yes, sir. I think the main benefit derived is in having the heat from the resistance kept away from the lamp. The insulation, etc., are injured by the resistance in the lamp, and by putting this resistance in incandescent lamps it removes the heat from the arc lamp, and in that way lengthens the life of the arc lamp.

Mr. Wurts—Does the breakage of one of the lamps render them all useless?

Mr. Mabbs—We use a wattage of about four watts

in these lamps, and in that way we figure that five lamps will carry the current necessary to run the arc lamp, and we keep close enough watch of them so that if one burns out we replace it immediately and in that way avoid the loss of the entire lot. If two burn out, however, generally the whole lot goes.

Mr. Wurts—How many have you been operating in that way?

Mr. Mabbs—About 8 or 10. The reason that we have not used more in that way is because the light derived from the incandescent lamps will fluctuate considerably—for instance, a ten candle power lamp ranging from six to twelve candle power, which would be quite objectionable where a continuous light is needed. But for lighting passages, and in fact for all lighting purposes where variation in candle power is unobjectionable, this method of lighting can be used. The method described, however, is impracticable where steady reading or writing is concerned.

Mr. Abadie—What is the maximum distance from the arc lamp at which you can place the incandescent lamps?

Mr. Mabbs—Fifty or sixty feet.

Mr. Kimball—Although I am not a member of your Association, I might say that in Hartford, Conn., they have been making extended experiments in this line and have adopted a special form of series lamp, and are giving it in the form of a bonus to all their customers. It is installed in stairways, entries and places of that description, and it has been very successful. I think they have it in operation now on about 50 lamps. They have been operating that number to decide whether the method is practicable, and if found so they will put it in operation over the whole of their system.

Mr. W. F. Baker, Gas Commissioner of Massachusetts, was next requested to address the Convention, which he did on the subject of "The Mutual Relations of Municipalities and Companies."

At the close of this address, which was greeted with applause, Mr. Hill said: As the steamer is late it will hardly be possible for us to go on shore and still keep our appointment at Sault Ste. Marie. A reception has been prepared for us there, and we have been invited to inspect the new smelting furnaces. We will not reach the "Soo" before 8 o'clock even if we do not stop at Mackinac Island.

Mr. Abadie moved that a committee of three be appointed to determine the matter. This motion was seconded and carried.

The Secretary then suggested telegraphing from Mackinac Island to the "Soo," which suggestion was approved.

Messrs. Meroein, Hill and Abadie were appointed a committee to attend to the matter, after which the meeting adjourned.

A stop of but fifteen minutes was made at Mackinac Island.

At 9 P.M. on the 13th inst. a paper on the subject of "Mechanical Draft" was read by Mr. Cross in the absence of the author of the paper, Mr. Walter B. Snow.

The discussion of this paper was participated in by Messrs. Doherty, Dow and Cross.

This was followed by a paper by Mr. Dow of Midland, Mich., on "Purification of Water."

Mr. A. J. Wurts, of Pittsburg, then spoke at some length on the subject of "Lightning Arresters," after which the meeting adjourned.

On June 14, at 10 A.M., the meeting was called to order by President Copeland in the City Hall at Duluth. Mr. Henry Truelson, Mayor of Duluth, then delivered a welcoming address which was received with applause and responded to in behalf of the Association by President Copeland. After these preliminaries had been gone through with, a paper entitled "Electrical Smelting of Ores," by Mr. W. T. Horry, was read in the absence of the author by Mr. Doherty.

The question-box was then opened and found to

contain the following query: "On an overhead three wire system of direct low tension distribution, does it afford additional protection against lightning to ground the neutral wire at various points throughout the system?"

The President requested Mr. Wurts to give his opinion on the matter.

Mr. Wurts—In my judgment the grounding of this middle wire might, and probably would, protect the generator. But I do not think that the grounding of a wire protects apparatus at any considerable distance from the point at which the wire is grounded. The self-induction of the wire, that is, the resistance of a perfectly straight wire to the passage of disruptive discharges, is so great that the discharge will not travel any considerable distance over the straight wire to get to a perfect ground—it will jump in preference to doing that. I have seen that in practice very often, and have demonstrated the fact in laboratory experiments. I have short-circuited or made a loop of wire—for instance, take a wire running from my position here to the corner of the room and back again, and place a spark gap half way between here and the corner, send disruptive discharges into the wire, and the current will pass across the spark gap rather than go through the wire and back again. That amounts to the same thing as grounded wire, and, as I have said, in preference to traveling the wire the current will jump a considerable spark gap.

Prof. Elisha Gray, by request, then addressed the Association at some length, referring especially to the progress made by electricity since he was a young man. His remarks were listened to with much interest.

Prof. Fujioka of Tokyo, Japan, next addressed the meeting, dwelling especially on the enjoyment of the Lake trip and referring among other things to the use of lightning arresters in Japan. Prof. Fujioka in concluding said: "We are using Morse instruments almost exclusively on telegraph lines in Japan, and we use Western Electric switchboards on all telephone exchanges and Edison and Brush machines in lighting. That shows that the so-called alliance of the United States, Great Britain and Japan is already accomplished as far as electricity is concerned."

This statement was received with rousing applause.

A vote of thanks was then extended to the officers of the North West, and to Mr. James R. Dee for his management of the entertainment at Hancock and Calumet. The mayors and citizens of Duluth and Superior likewise received a vote of thanks, as did Mr. Hill for his untiring efforts in contributing to the success of the trip.

The Convention then adjourned sine die.

The following names additional to those given in our last issue were taken from the steamer's list:

R. N. Adams, P. C. Kelliber, Joseph Ripley, Dr. Darling, Mr. Ferguson, Geo. R. Easterday, Chas. S. Osborne, all of Sault Ste. Marie.

J. Loomis, Cheboygan, Mich.

Willson Howell, Harrison, N. Y.

Mr. Pierce, of Negaunee.

Charles Wigh, Edith Wigh, Hancock.

Edna Lind, Will Caverly, S. E. Doane, W. W. Darley, Chicago.

ELECTRICIANS IN THE WAR.

E. L. Bemiss, superintendent of the Edison Electric Light Company, New Orleans, is co-operating with Col. Eugene Griffin in the organization of the volunteer engineer brigade. He has sent several applications to Colonel Griffin from electricians and others.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Western Electric Company have entered suit in the Circuit Court at Chicago praying for an injunction to restrain the Kellogg Switchboard & Supply Company from infringing on their patent rights relative to improvements in multiple switchboards for telephone exchanges.

At Boston on the 14th inst., in the appeal case of Louis Post et al., complainants, vs. the Beacon Vacuum Pump & Electrical Company et al., the court denied the appellants' petition and motions filed March 7, 1898, and revoked the judgment entered January 18, 1898. The decree of the court below is affirmed with a modification so amending it that the dismissal of the bill shall be without prejudice; appellees recover the costs of this court, and the case is remanded to the Circuit Court for further proceedings accordingly. It was further ordered that a mandate issue forthwith.

In Philadelphia on the 14th inst. Judge Dallas heard argument in the United States Circuit Court upon the plaintiff's motion for preliminary injunctions in the suits of William Pelzer of New York against the Horn & Brannen Manufacturing Company, the Acme Gas Fixture & Art Metal Company, R. W. Giese & Co. and W. J. Buok, Sons & Co., to have the defendants restrained from the making of an alleged infringement on the complainant's patented improvement in electrical fixtures. Decision was reserved. The proceedings are said to be of widespread interest to the trade.

The Tesla Electric Company of New York has brought suit in the Circuit Court at Cincinnati against the Dayton Fan and Motor Company of Dayton, and others, for the alleged infringement of a certain patented improvement in electro-magnetic motors, of which it is claimed Nicola Tesla was the first and original inventor. An injunction and an accounting are asked for.

Warren B. Reed, a citizen of Louisiana, and Brainard Rorison, a citizen of Michigan, have filed suit in New Orleans against the Edison Electric Light Company for alleged infringement of a certain invention patented by complainants. They aver that the General Electric Company of New York controls most of the stock of the Edison Electric Light Company of New Orleans; that said General Electric Company manufactures all kinds of electric appliances; that complainants have invented a meter which greatly economizes the consumption of electricity, and they have protected it by letters patent. They further aver that they showed the meter and its practical workings to the Edison Electric Light people, and soon the latter began to secretly manufacture and put in use a large number of such meters; that later the General Electric Company openly manufactured these meters and sold and put into use thousands and thousands of them, to the great damage of complainants' patent rights, and cutting them off from all profits on said meters thus sold and used. Complainants pray that the court decree that the three wire high efficiency type meter manufactured, sold and used by the General Electric Company are infringements on complainants' patent; that said company be prohibited from manufacturing any more of these meters, and that the matter be referred to a master in chancery to ascertain how many meters have been sold and what profits should have accrued to petitioners.

Richmond, Va.—The Southside Railway & Development Company has asked the Henrico board of supervisors for permission to construct an electric road in Henrico county to connect with the Traction Company's Broad street line in Richmond.

The General Electric Company owed on January 1, 1898, \$1,339,380 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

THE NEWS.

What Is Going On in the Electrical World.

LIGHTING PLANTS.

Bethlehem, Pa.—The town council of the borough of Hellertown has passed an ordinance permitting the Bethlehem Electric Light Company to erect poles and string wires within the corporate limits of that borough for the purpose of operating electric lights and furnishing heat and power by electricity.

Conshohocken, Pa.—The light committee of the town council of the borough of West Conshohocken will receive bids up to July 5 for furnishing electric lights for the borough for the term of five years, 25 candle power, 50 lights with the privilege of more, to burn all night and every night.

Columbus, O.—The Ambos Construction & Electrical Company, which has the contract for constructing the municipal electric light plant, has begun setting the poles. The equipment will require 387 lights and 1,700 poles.

Dalton, Ga.—The finance committee of the city council has been instructed to obtain estimates of the cost of an electric light plant.

Danville, Ill.—The city council has inserted into the annual appropriation ordinance an item of \$30,000 for an electric street lighting plant.

Gaylord, Minn.—At a special election held here on the 8th inst. it was voted to bond the village for the purpose of putting in an electric light plant to cost \$5,000.

Huron, O.—Proposals will be received by the council of this village, at the office of the village clerk, until noon on the 29th inst. for furnishing the necessary materials, machinery, etc., and performing the necessary labor to construct, erect and install the following: 1. Building for power station. 2. Steam plant, consisting of two 80-horse power boilers, two high speed engines, steam fitting, etc. 3. One 60-arc light dynamo, one 1,000 candle power alternating switchboard, pole line and equipment, etc., and everything necessary to make a complete lighting plant. Bids must be addressed to T. W. Derry, clerk, who will furnish specifications, printed forms for bids, etc.

Lansdale, Pa.—The borough council has passed an ordinance authorizing a loan of \$20,000 for the purpose of establishing an electric light plant. The bonds are to bear 3½ per cent. and to run thirty years, exempt from taxation. Bids will be asked for the erection of the plant.

Los Angeles, Cal.—The city council has ordered advertisements printed for bids for an electric lighting plant for the city, complete with the exception of the generating machinery. About 640 lights are called for. The Los Angeles Lighting Company owns the present system.

New Iberia, La.—The electric light plant at this place was totally destroyed by fire on the night of the 5th inst.

Paris, Tex.—The plant of the Paris Gas & Electric Light Company was sold on the 7th inst. to Judge D. H. Scott, who represented one-half of the bondholders as attorney and the other as trustee. The amount bid was \$30,000. The same management will continue and several improvements will be made and probably an electric railway added.

Sea Isle City, N. J.—Proposals will be received at the office of the borough clerk until July 7 for lighting the streets of the borough of Sea Isle City with 80 incandescent lights of 32 cp. for a period of ten years. There is a considerable amount of private lighting in the borough. For specifications apply to A. H. Sickler, Mayor, 516 Minor street, Philadelphia.

Terre Haute, Ind.—The court has issued an order permitting the assignee, John L. Walsh, to sell at private sale the plant of the old Electric Light & Power Company, a rival of Russell Harrison's bankrupt company.

STREET RAILROADS.

Beaumont, Tex.—The city council has repealed the electric street railroad franchise granted to L. P. Featherstone of Galveston.

Dayton, O.—The council has granted a street franchise to the Springfield & Dayton Electric Railway, and work will be pushed in order to have cars running between the two cities by the middle of September. The route selected is about 26 miles long.

Denver, Col.—The board of aldermen has passed the ordinance giving the Denver City Railroad Company permission to change its system from cable to electric power.

Fond du Lac, Wis.—At a recent council meeting L. T. Treleven, A. G. Bechaud and George W. Watson, all wealthy citizens of this city, made a request for a franchise for a street railway. The specification states that the line is to be in course of construction in less than a year. The council adopted a resolution to have the franchise published, in order that the parties interested may submit a bid for the franchise, which is to be sold by the city. A special meeting has been called for June 30 for action on the matter.

Kutztown, Pa.—Albert Schmick, president of the Allentown & Kutztown Traction Company, has secured all right of way for the electric road that is to connect this place and Allentown and work on the construction will begin immediately.

Milwaukee, Wis.—The city attorney is quoted as saying that any additional litigation in the four-cent fare case would only lead to useless expense. The District Court, it will be remembered, decided that the ordinance passed by the council requiring the Milwaukee Electric Railway & Light Company to reduce its car fare to four cents was unconstitutional.

Norwalk, O.—President De Witt of the Sandusky, Milan & Norwalk Electric Railway says that the Pullman Palace Car Company is now constructing for the Norwalk branch of the road the finest passenger car that was ever put on any street car track.

Portland, Me.—Work is being rapidly pushed on the Portland & Yarmouth electric rail road. The foundation for the power house at Falmouth has been laid and work has been begun on constructing a coal wharf.

Southbridge, Mass.—A movement is on foot to form a company made up of Webster and Southbridge capital to build an electric road connecting these two towns. This with the roads now being built would give Southbridge an electric road to Worcester.

St. Albans, Vt.—It is reported that the incorporators of the projected electric road to run from this city to the bay have received word from the Chicago capitalists interested in the enterprise that matters were being satisfactorily arranged and that the prospect for the immediate building of the road is very favorable.

St. Louis.—The Central Traction Company's bond, signed by the Mississippi Valley Trust Company, has been approved by the city council. The bond is for \$250,000 and was given as a guarantee that the provisions of the franchise granted the company by the councils will be faithfully carried out. The franchise is now before the courts, the contention being that under the Julian law it is invalid. The Supreme Court is expected to give a decision on the constitutionality of this law next month.

MANUFACTURING, ETC.

Boston, Mass.—It is stated that the Boston Elevated Railway Company has given a contract to the Walker Company for a generator of a rated capacity of 4,000 horse-power and capable of delivering over 5,000 horse-power for a few hours at a time. It is for use in connection with the surface lines of the company.

Minneapolis, Minn.—To W. H. Dunwoody belongs the distinction of possessing the first and at present only electrically-propelled yacht on Minnetonka lake. The current that drives the motor is obtained from storage batteries placed with the rest of the machinery beneath the floor.

Moon Run, Pa.—The Moon Run Coal Company is having two Morgan-Gardner mining machines installed in its mine. These machines are to be operated by electricity. A compressed-air plant is now in operation at the mine, with electrical haulage, but it is understood that the mine will shortly be operated entirely by electricity.

Newport News, Va.—The steamship Pisa, which sailed from this port for Hamburg, Germany, on the 15th inst., had on board ten large electric cars, manufactured in St. Louis. These are the first American manufactured electric cars to be shipped abroad, and are to be tried as an experiment in competition with German manufactured cars.

New York.—The Goubert Manufacturing Company, 14 and 16 Church street, will furnish, under contract, feed water heaters for the big power station of the Metropolitan Street Railway Company at 96th street and East River. This is said to be the largest single order for feed water heaters ever placed in this or any other country. The first installment consists of 30,000 hp. in six heaters rated at 5,000 hp. each.

COMPANY MATTERS.

Bloomington, Ill.—The \$202,500 realized from the sale of the Bloomington City Railway is to be disbursed as follows: Court costs, \$349.20; D. Funk, trustee, \$500; first mortgage bonds, including \$5,000 fees for Lillard & Williams, attorneys, \$112,215.34; John C. Barron, third mortgage bonds, \$2,523.17; Theodore Kitchen, third mortgage bonds, \$296.84; attorneys' fees for Rowell, Neville & Lindley and Fifer & Barry, third mortgage bonds, \$10,000; Lien holders, 76 third mortgage bonds, \$1,279.92; second mortgage bonds, \$70,335.53; A. E. De Mange, solicitor's fees, \$5,000.

Bridgeport, Conn.—The Canadian Bryant Electric Company has been organized here with a capital of \$5,000 to accommodate Canadian buyers of the products of the Bryant Electric Company. The latter company has already a factory in Montreal.

TRANSMISSION PLANTS.

Buffalo, N. Y.—The motive power of the great milling plant of the Urban Roller Mills is to be changed from steam to electricity generated at Niagara Falls. The electric machinery has been ordered.

New Orleans.—I. Sternfeld, an electrician of the City of Mexico, when here a few days ago, stated that his plan to utilize the water falls of the Monte Alto river

had succeeded and he had been East to purchase the electrical machinery, and had closed a deal with a large manufacturing concern amounting to about \$1,500,000. Mr. Sternfeld stated that "the contract calls for a 6,000 horse-power transmitter, and the current will be carried from the river into Mexico City, a distance of thirty-five miles. The pressure will be 22,000 volts, and it will be carried over three wires into the city. The incline of the Monte Alto river amounts to about 2,000 feet, and there are five of the falls where generators will be placed, four of which will be set in each fall, thus making twenty generators in all. The generators of the electrical current will be run by water power, and a system of signals will be in vogue so that each station will know exactly what the others are doing."

Phoenix, Ariz.—The Arizona Canal and Arizona Improvement companies have been organized and will probably consolidate and form a new company. One of the plans of the men composing the companies is the utilization of the water power, both at the falls on the Arizona canal and at other points, in generating electricity for transmission to Phoenix.

PERSONAL AND MISCELLANEA.

Joseph C. Field, an electrician of wide reputation, died at Chicago of heart disease on the 9th inst. He was seventy-one years old, and had been many years in the employ of the Western Electric Company, retiring from that concern about a year ago on account of ill health. His electrical inventions were numerous and several of them valuable. Mr. Field was born in Syracuse, N. Y., but had been a resident of Chicago for about thirty years. His wife died three years ago, and his only surviving children are Howard Field and Mrs. Cobb.

Dr. A. P. Southwick, the dentist who originated the idea of substituting electricity for hanging, died at his home in Buffalo, N. Y., on the 11th inst. He was locally known as the "Father of Electrocutation." He was born in Ashtabula, Ohio, in 1826. He was deeply interested in science all his life, and at one time managed a large oxy-hydrogen gas plant at Buffalo and invented and patented a process for purifying gas which was highly remunerative to him until the advent of electric lighting.

The electric Jacquard loom invented by Jan Szezanik is to be exhibited at the Paris Exposition for the first time. Before the eyes of the public it will weave silk pocket handkerchiefs. In three minutes the purchaser of such a handkerchief will be photographed by an apparatus in the loom itself, the design plate will be prepared by the same machine, and then it will make a silk handkerchief with the purchaser's likeness woven into it, so that in not more than half an hour from the time when the portrait was taken the buyer will be able to take away with him as a remembrance of the Exhibition a handkerchief with his inwoven portrait, and all for a few francs.

Third Assistant Secretary of State Thomas W. Cridler has been designated to continue the work begun by the late Moses P. Handy as special commissioner of the Paris Exposition. President McKinley in transmitting to Congress a report made on the Exposition by Mr. Cridler, renews his recommendation that a liberal appropriation be immediately granted.

COMMERCIAL PARAGRAPHS.

The Lundell Slow-Speed Electric Motors manufactured by the Sprague Electric Company, 20 Broad street, New York, have probably had as much or more to do with making shafting and belting obsolete than any other electric motor. In this country, in England, and upon the Continent, in Japan, Australia and the far East the Lundell Motor has won enviable standing, for exacting use has demonstrated its advantages. The characteristic feature of the Lundell Slow-Speed Motor is the single field coil which energizes all the magnetic poles, resulting in great simplicity of construction. The magnetic circuits are the shortest possible, and the leakage of the magnetic lines of force is reduced to a minimum, resulting in economy of the field ampere-turns. At the present time there are many thousands of high and medium speed types of the Lundell motor in use and about one thousand of the slow speed, which certainly speaks well for this make of motor.

The Goubert Manufacturing Company, 14 and 16 Church street, New York, has secured from the Metropolitan Street Railway Company of that city the contract for Feed Water Heaters for the mammoth power station being erected at 96th street and East River. The first installment consists of 30,000 hp. in six heaters, horizontal type and rated at 5,000 hp. each. They are to be placed between the low pressure cylinders and the condensers. It is said to be the largest single order for feed water heaters ever placed in this or any other country.

The Warren Electric & Specialty Company, Warren, O., advise us that they are receiving a large number of suggestions of names for their new lamp, and as each suggestion must be accompanied with an order they are correspondingly busy—some of a character to provoke mirth, and which will be published after the contest is closed and prizes awarded.

INCORPORATIONS.

The Natchez Light, Power & Transit Company, Natchez, Miss.—to erect and operate electric plants for lighting and power purposes and the operation of railways. Capital stock, \$100,000.

The Gordon Battery Company, Portland, Me.—to generate and deal in electricity. Capital stock, \$350,000. President, Arthur S. Pinkham; treasurer, Charles E. Lockwood.

The King Electric Company, St. Louis. Capital stock, \$10,000, all paid in. Incorporators: John C. King, Ida A. King and John A. King.

The Central Ohio Gas Company, Lima, O.—to operate in natural and artificial gas and in electricity. Capital stock, \$10,000. Incorporators: H. S. Wheeler, C. H. Gable, J. D. S. Neely, J. W. Easley and A. E. Schlethe.

The Kane's Falls Electric Company, Fort Ann, N. Y. Capital stock, \$25,000. Directors: Eugene L. Ashley and Elizabeth Ashley of Glens Falls, Elmer J. West of Caldwell.

The Providence & Taunton Street Railway Company—to build and operate an electric railway about 16 miles long, beginning where the Taunton line intersects the State line in Seekonk and run through that town, Rehoboth and Dighton to the city square in Taunton, Mass. Capital stock, \$160,000. Directors: J. A. King, clerk, F. E. Perkins, treasurer, Reuben Bovee, N. E. Walker, G. E. Francis, Asa Waterman and Peter A. Corr.

The Boston, Milton & Brockton Street Railroad, Boston, Mass.—to build and operate an electric railway running from the boundary line between Boston and Milton, through Milton, Quincy and Randolph to "West Corners." Capital stock, \$5,000,000. Directors: Bradford Hamilton, clerk, and G. J. Morse, S. A. Hilton, F. W. Archer, A. H. Crossman, F. C. Hinds, J. H. Packard, J. B. L. Bartlett.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 14, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

- 605,503. Electric Railway. Arthur J. Moxham, Lorain, O., assignor to the Johnson Company, same place. Filed Nov. 18, 1897.
- 605,620. Overhead Car or Like Receptacle. Alfred M. Acklin, Pittsburgh, Pa., assignor to Heyl & Patterson, same place. Filed Jan. 15, 1897.
- 605,664. Electric Railway. Charles H. Davis, New York City. Filed Nov. 2, 1897.
- 605,694. Combined Train Arresting and Signaling Mechanism for Electric Railways. Charles H. Davis, New York City. Filed Nov. 9, 1897.
- 605,716. Trolley-Wheel. Alexander F. Humphrey, Allegheny, Pa. Filed Dec. 9, 1897.
- 605,796. Trolley-Role. John N. Prisk, Johnstown, Pa. Filed Feb. 8, 1897.
- 605,814. Electric-Railway System. Henry A. Chase, Boston, Mass. Filed Feb. 7, 1897.
- 605,821. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa. Filed Dec. 14, 1897.
- 605,885. Brake for Trolley-Cars. Aloysius B. Klingler, Ridley Park, Pa. Filed Feb. 20, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

- 605,198. Incandescent Electric Lamp. Otto H. Michaelson, Charleston, W. Va. Filed July 17, 1897.
- 605,529. Desk-Lamp. William E. Ward, Montclair, N. J. Filed Jan. 2, 1897.
- 605,714. Electric-Arc Lamp. Daniel Higham, Boston, Mass., assignor to Howard H. Higham, Philadelphia, Pa. Filed Oct. 26, 1897.

ELECTRICAL MACHINERY AND APPARATUS.

- 605,525 and 605,526. System of Electrical Distribution. Charles P. Steinmetz, Schenectady, N. Y., assignor to the General Electric Company of New York. Filed Jan. 28, 1895, and June 17, 1897.
- 605,665. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Filed Aug. 6, 1897. Renewed May 18, 1898.
- 605,679. Mounting for Electric Motors. Emil B. W. Reichel and Friedrich W. V. Stein, Berlin, Germany, assignors to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Jan. 27, 1898.
- 605,765. Apparatus for Supplying or Measuring Currents of Electricity. William B. Watson and Thomas Humphreys, Rochdale, England; said Humphreys assignor to said Watson. Filed Dec. 28, 1897.

ELECTRIC ELEVATORS.

- 605,598. Electric Elevator. Hayward Cochran, Chicago, Ill. Filed April 19, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

- 605,575. Carbon Transmitter. Godfrey W. Goss, Kokomo, Ind. Filed April 20, 1897. Renewed Feb. 7, 1898.
- 605,580. Telephone Circuit and Apparatus. Milo G. Kellogg, Chicago, Ill., assignor to the Kellogg Switchboard & Supply Company, same place. Filed March 23, 1897.
- 605,594. Telephone Receiver. Peter C. Burns, Chicago, Ill. Filed Nov. 20, 1897.
- 605,670. Telephone-Switchboard System. Fred C. Hughes, Detroit, Mich. Filed July 3, 1897.
- 605,671. Cord-Weight for Telephone-Switchboards. Fred C. Hughes, Detroit, Mich. Filed Sept. 27, 1897.
- 605,832. Telephone-Transmitter. William E. Sundberg, Worcester, Mass., assignor to Lars M. Petterson and Carl J. Ekstedt, same place, as trustees for the Reliable Electric Manufacturing Company. Filed Sept. 28, 1897.

SIGNALS AND SIGNALING APPARATUS.

- 605,648. Selector Signaling System. Thomas O. Drake, Malta, Ohio. Filed Sept. 17, 1897.
- 605,798. Electric Railway Signal. Charles L. Renrew, East Windsor, Conn. Filed March 2, 1897.

MISCELLANEOUS.

- 605,548. Electric Recording Instrument. Charles L. Jaeger, Maywood, N. J. Filed Aug. 5, 1897.
- 605,661. Insulating Electrodes for Electric Gas-Lighting Burners. Adrian L. Bogart, Jamaica, N. Y., assignor to William B. M. Jordan, New York City. Filed May 5, 1897.
- 605,795. Automatic Electric Fire-Alarm. Herman A. Olson, Quincy, Mass. Filed June 17, 1897.

TELEPHONE AND TELEGRAPH.

A special committee of the council of Terre Haute, Ind., has reported in favor of granting a franchise to operate in that city to the People's Telephone Company.

The Eastern Wisconsin Telephone Company has been granted a franchise to enter Fond du Lac. Lines of this company are now operating in Sheboygan, Manitowish, Calumet and Fond du Lac counties.

At Columbia, Tenn., recently the board of mayor and aldermen reconsidered their action in regard to refusing a franchise to the American Telephone & Telegraph Company of Tennessee, and by a unanimous vote granted the franchise.

The Southwestern Telegraph & Telephone Company has been certified to the Secretary of State at Albany, N. Y., that it had increased its capital stock from \$4,000,000 to \$5,000,000. The liabilities of the company are \$131,000.

H. A. Helvin of Columbia, Tenn., and associates have been granted a franchise to operate a telephone exchange in Chattanooga, Tenn. The ordinance, however, is hedged about with rigid restrictions, and it is doubtful whether Mr. Helvin will consent to operate under its provisions. He is allowed ninety days to decide.

Frank L. Wood has been appointed receiver of the New York State Telephone Company of Syracuse. The receivership is the result of an action brought by Frank Sumney to set aside a bill of sale and transfer of the property to the Automatic Service Company of Buffalo.

The Erie Telegraph & Telephone Company held its annual meeting in New York on the 14th inst., and elected the following officers: President, Charles J. Glidden; secretary, George B. Perham; treasurer, Charles A. Grant; general manager, James P. McKinstry. The Southwestern Telegraph & Telephone Company elected the same officers.

The Baldwinsville, N. Y., Telephone Company has asked the court to grant a peremptory mandamus directing the Central New York Telephone & Telegraph Company to furnish it a service so that it can transmit messages to Syracuse which it has refused to do. It is claimed that the company is a common carrier and bound to furnish service to the entire public and that under the telephone law rival telephone corporations must be treated the same as individuals.

Judge Lacombe, in the United States Circuit Court at New York, has signed an order discontinuing the suit of the United States of America against La Compagnie Francaise des Cables Telegraphiques. This is done by mutual consent of and without cost to either party to the suit. The suit was brought to prevent the cable company from landing on American soil.

A resolution passed by the city council of Des Moines, Ia., orders the Iowa Telephone Company to cease setting poles, stringing wires, laying cables, or in any manner using the streets and alleys of Des Moines for the operation of telephones; also instructs the city solicitor to notify that company that if the ordinance is not complied with he will immediately take the matter into court. Council holds that the company has no right to use the streets, its franchise having expired over a year ago.

The law governing the operation of telephone lines under the War Revenue bill, now in force, is as follows: "It shall be the duty of every person, firm or corporation owning or operating any telephone line or lines to make within the first fifteen days of each month a sworn statement to the Collector of Internal Revenue in each of their respective districts, stating the number of messages or conversations transmitted over their respective lines during the preceding month for which a charge of 15 cents or more was imposed, and for each of such messages or conversations the said person, firm or corporation shall pay a tax of one cent; provided, that only one payment of said tax shall be required, notwithstanding the lines of one or more persons, firms or corporations shall be used for the transmission of each of said messages or conversations."

New Companies Incorporated.

The United Telephone Company, Swanwick, Ill. Capital stock, \$500. Incorporators: John I. Higgs, Philip Fearnson and Matt Robb.

The Mountain Home & West Plains Telephone Company, Little Rock, Ark. Capital stock, \$5,000. Incorporators: O. W. Brown, president; N. H. Dyer, B. E. Massey, B. O. Paul, W. C. Eastman and R. C. Love.

The Lawrence Telephone Company of Ashland, Ky., has filed articles with the Secretary of State increasing its capital stock from \$12,000 to \$24,000.

The New York & Long Island Telegraph Company has been certified to an increase of capital from \$5,000 to \$30,000.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by ELECTRICITY from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Company and City & Suburban Railway Company.
 Company controls Citizens' Railway, North Baltimore Passenger Railway, Baltimore
 & Curtis Bay Street Railway, Baltimore & Powhatan Railway, Pimlico & Pikeville Railway
 and Wallbrook, Gwynn Oak & Powhatan Railway and Park.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau system.
 h 80 % per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.;
 \$250,100 of stock owned by North Chicago Street Railroad Company.
 i Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and
 West Chicago Street Railroad Tunnel Company.
 j 85 % per annum paid on outstanding capital as rental by lessee—North Chicago Street
 Railroad Company; \$625,100 of stock owned by West Chicago Street Railroad Company.
 k Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,
 000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 l Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 8 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.
 f Leased to Houston, West Street & Pavonia Ferry—now Metropolitan Street Railway.
 g Leased to Metropolitan Street Railway at 8 % on stock until Oct. 1, 1897; thereafter 9 %
 h Leased to Metropolitan Street Ry. for 99 years from Jan. 1, 1896, at \$215,000 per annum.
 i Leased to Metropolitan Street Railway for 18 % on stock.
 j Leased to Met. St. Ry. for 99 years from April 20, 1892; 6 % first 5 years, 8 % thereafter
 k Leased to Metropolitan Street Railway for \$145,000 per annum.
 l Leased to Metropolitan Street Railway for 18 percent on capital stock.
 m Controlled by Third Avenue Railroad by purchase.
 n Dividends of 1 1/2 % yearly guaranteed by Consolidated Traction Company.
 o Controls by lease the Allegheny, Cent., Citizens, Duquesne, Fort Pitt and Pitts' Trac. Co.
 p Leased to Consolidated Traction Company for 8 % per annum on par value of stock
 q Leased to Fort Pitt Traction Company for 6 % on \$8,000,000 capital stock.
 r Leased to Consolidated Traction Company for 4 % on capital stock after October,
 s Leased to Consolidated Traction Company for 1 % on capital stock after October.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 11.80@12c. casting, 11½@11½c.

Lee, Higginson & Co., of Boston, offer the Bell Telephone 4 per cent. ten-year debentures at 102 and interest.

The Edison Electric Illuminating Company of Brooklyn has declared a quarterly dividend of 1½ per cent., payable July 15.

The American Bell Telephone Company has declared a quarterly dividend of 3 per cent. and an extra dividend of 1½ per cent., payable July 15.

The Baltimore City Passenger Railway Company has declared a semi-annual dividend of 5 per cent., payable July 1 to stock of record June 18.

The Boston Elevated Railway Company, lessee, has declared a semi-annual dividend of 4 per cent. (\$2 per share) on West End Street Railway stock, payable July 1 to stock of record June 15.

Judge Woolson, in the Federal Court at Des Moines, Ia., has approved the sale of the Ottumwa Electric Railway, Heat & Power Company's plant, which was recently sold to the bondholders' committee for \$190,000.

The engineers of the Department of Bridges, New York, have made a report to the Commissioner strongly urging a change in the electric specifications of the new Harlem River bridge at Third avenue, so as to bring them up to date.

It is officially announced that the Capital Traction Company of Washington, D. C., will on the 1st of July pay seventy-five cents on each share, which is at the rate of 3 per cent. on the par value of the stock and nearly 4 per cent. on the market value.

The Chicago City Railroad Company, according to press reports, has purchased the General Electric Railway for \$950,000, and will increase its capital stock from \$12,000,000 to \$14,000,000 in order to pay for that property and provide for improvements.

The Brooklyn Elevated Railroad ran its first passenger train across the Brooklyn Bridge on Saturday last. The regular schedule is not yet arranged. It is the intention eventually to withdraw the bridge trains and allow the elevated roads to operate the bridge railroad.

A report comes from Philadelphia that the Welsbach Light Company is to enter the electric light field and has perfected an electric incandescent burner which it is claimed is as far superior to the ordinary electric incandescent burner as the Welsbach gas burner was to the old time gas burner.

The Edison Electric Illuminating Company of New York reports for May: Gross earnings, \$246,794, an increase of \$58,004, and net \$106,789, an increase of \$24,094. From January 1 the gross earnings were \$1,326,567, an increase of \$270,661, and net \$605,772, an increase of \$97,263.

The committee on railroads of the Chicago city council has recommended for passage the ordinance granting a fifty-year franchise to the Wisconsin Inland Lakes & Chicago Railway Company, which offers as compensation for the use of certain streets in Chicago for the term of the franchise \$735,000.

At the annual meeting of the Chicago Edison Company held on the 14th inst. the old officers and the following directors were elected: Edward L. Brewster, F. S. Gorton, Samuel Insull, R. T. Lincoln, Joseph Leiter, J. J. Mitchell, Erskine M. Phelps, Byron L. Smith, A. A. Sprague, A. F. Seiberger, Lambert Tree. The number of directors was reduced from thirteen to eleven.

It is stated that the Edison Electric Illuminating Company of New York is about to send a number of engineers abroad for the purpose of reporting on the methods in use in Europe for the generation, distribution and sale of current. The commission, which leaves in a few days, is composed of J. W. Leib, Jr., general manager; J. Van Vleck, constructing engineer, and Arthur Williams, general inspector.

Adolph G. Greenberg, of New York, has allowed judgment to be taken against him for \$30,686 in favor of Austin B. Fletcher on a claim against Mr. Greenberg as indorser on eleven notes of the Atlantic Highland, Red Bank & Long Branch Electric Railroad Company, of which he was formerly president. The company went into the hands of a receiver on May 23, with liabilities reported at \$650,000 and assets at \$450,900. Mr. Greenberg has been served with the summons.

The State Board of Public Works of Ohio has adopted a resolution authorizing W. G. Wagenhals of Dayton to make a practical test of the use of electricity as a motive power for canal transportation. He is given the privilege of making a three-year test subject to the approval of the Governor. His operations are to be confined to the Miami & Erie Canal, and if he succeeds in demonstrating that he can make use of electricity to cheapen transportation as well as to accelerate it to the satisfaction of the board, he is to be given a three-year franchise over that particular canal.

The committee of preferred stockholders of the General Electric Company appointed two years ago have issued a circular to their constituents setting forth that they have been unable to procure the payment of dividends, that the assets are worth at least 72 per cent. of the par value of the common and preferred stocks, and that a proposal will be made that the par value of the common stock be reduced to \$60 a share. This proposal will be voted upon by the stockholders at an early day and proxies are solicited in favor of the proposition.

John A. Brill, on account of other business engagements, is understood to have found it impracticable to serve as a director of the General Electric Automobile Company of Philadelphia. The Philadelphia "Times" states that a gentleman connected with the company says that "the management had no other aim in bringing the stock out on the Philadelphia Stock Exchange than to divert public attention to a new industry which has before it a great future. The Hunter patents, owned by the company, are broad and comprehensive and legally unassailable. Under them it is proposed to at once engage in the manufacture of various types of electrical vehicles. The management is now chiefly concerned with the commercial development of the company, ignoring the stock market aspects of the stock."

The Boston "Advertiser" states that the trustees of the Street Railway & Illuminating Properties Company say that the reports about the street as to a coming dividend of a considerable amount in the stock are untrue. This is given as the present condition of the company: At the close of the last fiscal year the securities held by the company had a par value of \$5,157,955. Since then the outstanding preferred stock, aggregating 4,129 shares, has been retired at about \$110 and interest. The company has declared one dividend of \$3. Allowing \$135,000 for this requirement and \$454,190 for the redemption of the 4,129 shares of preferred stock, the proceeds of security sales this year have aggregated nearly \$600,000, not including the expenses of sales.

The annual meeting of the North American Company was held on the 15th inst. The annual report showed an income of \$50,102 and expenses and taxes of \$36,402, leaving a surplus of \$13,640. The company has no debts of any kind except an old open account of \$17,060. The assets of the concern on May 31 are stated as follows: Milwaukee Electric Railroad preferred, \$2,416,500; Milwaukee Electric Railroad common, \$3,078,000; Milwaukee Electric Railroad 5 per cent. bonds, \$55,000; Cincinnati Electric Light stock, \$382,700; Cincinnati Electric Light bonds, \$300,000; miscellaneous securities, \$25,009; accounts receivable, \$161,025; demand loans, \$337,543; cash, \$219,205. The company is stated to be in a position to reach out for new business that may commend itself to a conservative management.

ELECTRICITY.

Vol. XIV.

NEW YORK, JUNE 29, 1898.

No. 25.

ELECTRICITY

Published every Wednesday by the
ELECTRICITY NEWSPAPER COMPANY.

Publication Office, - - 136 Liberty St., New York.
Long Distance Telephone, 4081 Cortlandt.

SUBSCRIPTION RATES:

UNITED STATES,	\$2.50
IN CLUBS OF FIVE OR MORE,	2.00
FOREIGN COUNTRIES,	4.50
SINGLE COPIES,	10 cents

ADVERTISING RATES:

As **ELECTRICITY** reaches all classes interested in electrical work, its value as an advertising medium can be readily understood. Rates will be sent on application. Changes of advertisements should reach the office not later than the Saturday preceding the day of publication.

Entered at the New York Post Office as second-class mail matter.

EDITORIAL NOTES.

Another Startling Invention.

Herr Szczepanik, who recently invented the telestroscope, or as he calls it, the Feruseher, which was described in an issue of our paper some time ago, has again startled the scientific world with another electrical invention even more important from a practical standpoint than his alleged apparatus for seeing by electricity. This new invention, which, like all of Herr Szczepanik's productions, is more or less clothed in mystery as to the exact details of operation, is a device for greatly simplifying the present method of weaving. With the looms now generally in use a design to be woven must first be resolved into very small squares. In the larger pieces of textile goods the designer is obliged to fill up thousands of such little squares before it is possible to punch the stencils plates. This operation has sometimes taken months to accomplish. By the use of a suitably ruled screen, which is nothing more nor less than a large photographic plate on which the picture which the web is to show is produced, the former tedious process is done away with. A few minutes' exposure suffices to produce on the sensitive plate or paper an image showing the points of intersection needed. The developing, it is claimed, occupies a quarter of an hour, when the design is finished. The various colors the web is to have are shown by different signs or figures which are produced by means of corresponding stops in the objective. The next process is the punching of the Jacquard stencils. Ordinarily this has to be done by a special machine, each square being cut out separately. Herr Szczepanik does away with this tedious process and by means of carbon transfers the design onto a thin sheet of metal and thus obviates the necessity of making the Jacquard stencil on silver bromide paper. The procedure is then said to be practically the same as in zinc etching; the parts of the design exposed to the light are covered with gelatine, while in the non-exposed ones the metal remains bare. In this way good and bad electrical conductors are formed, all the points on the metal plate representing holes being good conductors and offering little resistance to the passage of the current. The plate is then placed in a specially designed machine which passes it automatically under a row of contacts which are connected with electromagnets that set in motion levers which punch the plate. By means of a similar contrivance attached directly to the loom the inventor sets in motion not only the punching levers, but also the threads in the loom, thus weaving direct from the original design plate by means of electricity.

As in the case of the telestroscope, Herr Szoze-

panik, it is said, purposes to exhibit an electric loom for the first time at the Paris Exhibition, where it will weave silk handkerchiefs with the purchaser's likeness woven into them in the short space of half an hour.

If Herr Szozeapanik continues to bring out new and startling inventions at the rate he has lately, between now and the time the Paris Exposition opens there should be quite an array of wonderful exhibits by the Galician schoolmaster.

* * *

The Automobile Exposition in Paris.

Automobiles as a method of locomotion appear to be growing in popularity, especially in Paris. Although a few electrically-propelled hansoms are to be seen driving

around the streets of New York, the residents of the French metropolis have enjoyed horseless vehicles in steadily increasing numbers for a much longer time, the interest centering in this form of vehicle prompting an automobile exhibition to be held. This international automobile exhibition, inaugurated in the Tuileries Gardens on Wednesday, June 15, is probably the first of the kind ever held. The exhibits consist not only of electrically-propelled vehicles of steam and of mineral-spirit motor-driven carriages, but in a hundred and one necessary articles, such as tires, lamps, different grades of oil, tools, etc., which make up the appendages.

This Paris exhibition is attracting considerable attention and many advantages should be derived from it. It admits of a comparison being made of what has been accomplished in the automobile line during the past few years, and stimulates public interest in this line of industry. Although the exhibition is designated international, there are but few vehicles that are not of French make. The Pope Manufacturing Company of Hartford, Conn., however, has one of its Columbia two-seated motor carriages on exhibition, which from all accounts compares favorably with the other exhibits. The Compagnie Générale des Voitures de Paris shows a number of its new electric cabs, which it is said are shortly to be placed at the convenience of the public. The motors used weigh about 1,500 pounds, and by a novel arrangement, coupé, victoria or small landau bodies are interchangeable, and either of these may be placed over the motor and attached. The advantages claimed for the electric carriage is that it is extremely simple in construction, there being little or nothing to get out of order, is under perfect control in crowded streets, and the small amount of current required to keep an electric carriage running makes it inexpensive as compared with the cost of hay and grain, stabling, harness, etc., required for horses. On the other hand, care has to be exercised to prevent the battery from

becoming discharged at a distance from a station. A point well worth noticing with reference to the Paris exhibition is apparently the small amount of attention given by the French manufacturers to the utilization of the automobile for delivery wagon purposes.

Judging from the present state of the automobile industry in this country, it should not be long before many of our large stores adopt this method of delivering parcels, as already one or more houses have placed orders for a number of such vehicles. As we stated in an editorial some months ago, a wide field would seem to be open to the automobiles in this line, as the conditions are favorable to their use in work of this character. Storage batteries can be procured of moderate weight capable of propelling a vehicle of this nature twenty-five miles, and moreover, in a city an automobile delivery wagon would not be apt to get at any great distance from a point where a set of charged batteries could be procured.

* * *

The Philadelphia Exhibition.

This unquestionably is an era of exhibitions. The Philadelphia Electrical Show, following that held in this city, is now in full swing and attracts nightly a large number of visitors. There would appear to be nothing strikingly new in the Quaker City Exhibition, or that was not to be seen in Madison Square Garden during the month of May. Moore's vacuum tubes, which illuminated so perfectly the Chapel in the Garden, are to be found in Philadelphia illuminating the hangings of an Oriental smoking-room, and have so far proven one of the principal features of attraction.

In front of the building there are a large number of arc lamps, aggregating, so it is claimed, 120,000 candle power. On the first floor there is a rotunda in which is situated an electric fountain around which, in a gallery, a band plays. There are many attractive company exhibits tastefully arranged and brilliantly illuminated. Lectures on electrical topics of interest are frequently given which are both entertaining and instructive. As this is the first Exhibition of the kind that has been held in Philadelphia since that given under the auspices of the Franklin Institute in 1884, it is naturally receiving considerable attention. It seems unfortunate however that the Philadelphia show follows so closely on the heels of that given in Madison Square Garden, as many persons who would have attended it had already witnessed in New York the exhibits that lend it its chief attractions.

Electrical Equipment of the Alabama.

Unquestionably the American Navy is electrically the best equipped in the world, and every new man-of-war completed marks an advance in naval electrical installation. Not only will more powerful electrical appliances be used on the United States ships recently launched than on those now in commission, but the electric current will be put to new uses.

The battle-ship Alabama, recently launched at the Cramps' shipyard, Philadelphia, will when completed probably be the best electrically equipped man-of-war afloat, if we except the Illinois and Wisconsin which will have identically the same equipment.

How well the Alabama will be provided for so far as electrical apparatus is concerned will be gathered from the fact that there will be eight generating sets, or four times as many as the unfortunate Maine was provided with. There will also be a total of 770 incandescent lamps, or 372 more than were thought necessary for lighting the Maine. Four searchlights will be provided as a protection against torpedo boats, with either parabolic or Mangin mirrors. Provision is also made for two sets of electrical night-signaling apparatus, with spare lanterns such as are

now generally in use on the vessels of our Navy, two diving lamps, four portable electric ventilating sets, and twelve one-twelfth horse-power electric desk or ceiling fans. The Alabama as well as the other two vessels will be supplied with but one main switch-board, from which twenty-five battle circuits and seven lighting circuits will lead. There will be 772 outlets, and a total of 789 lamps with a capacity of about 623 amperes. The thirty-two circuits require twenty feeders, which will be divided up into sections. The fixtures for the incandescent lamps will include sixty-five battle lanterns, over 130 bulkhead and forty-nine bunker lamps, four cargo reflectors, thirty-five magazine lanterns, the necessary running lights, and lights for the engine room telegraphs, helm telegraphs and indicators, and for the binnacles. In short it may safely be said that the electrical equipment of the Alabama will be in all things up to date.

After the experience gained by the United States fleet at the Philippines it would certainly seem advisable to add to the very thorough electrical equipment of the Alabama suitable submarine telegraphing instruments such as a mirror galvanometer and Morse apparatus. Were a suitable outfit of this nature provided, with a competent person to handle it, the electrical equipment of our new battle ships would be everything that could be desired.

Under the Searchlight.

Notes and Comments on Various Topics.

A CONUNDRUM and its answer attributed to a prominent participant in the recent N. E. L. A. Convention seem to have met with general approbation as conveying a recognized truth with axiomatic directness. The conundrum was, "When is an electrician not an electrician?" the answer being, "Nineteen times out of twenty." What this suggests is some term that can be properly applied to the nineteen who are misplaced. Who will provide a suitable name for these neophytes in the profession?

* * *

THE New York Sun says: "Some modern inventions are a boon to humanity and others are not. The phonographic clock which has just been launched upon the market in Germany belongs to the latter category. One must admit the alarm clock in the theory of modern life, but a phonographic alarm clock adds insult to injury. If one must be awakened, one must; but how can one turn over and take the final luxurious forty winks when the depressing programme of a busy day has been shouted into one's ears? Things that seemed natural and practicable the night before present an appalling front in the early morning; and the breakfast hour, announced in strident tones, is much more insistent than when suggested by an impersonal metallic clang. Some valuable possibilities the new invention does possess. The housewife needn't laboriously explain breakfast details to the servant at night, and find the next morning that all important points have been conscientiously forgotten. She sets the phonographic alarm for an early hour, talks directions into it, and the next morning the cook is awakened by a stern voice telling her exactly what is expected of her in regard to breakfast preparation. Paterfamilias, too, can work the combination. No more will he sit up until his pretty daughter's caller goes home and resort to time-honored hints to hasten the departure. He will not slam shutters and noisily lock doors and bid the other members of the family good night at the top of his voice and drop his shoes on the bedroom floor with a force that shakes the parlor chandeliers, and call down to the daughter that she must be careful about turning off the gas and locking the door. He will never be goaded by a sense of parental duty into walking into the parlor and making a scene and reducing the daughter to a point of tears. Oh, no; he will simply set

the phonographic alarm for the hour when he thinks young men should end their calls. Then he will go serenely to bed; and when the fatal hour strikes a specimen of the old gentleman's finest irony will be hurled at the offending guest. Exit young man. The maiden wrathfully weeps alone."

* * *

A BARE iron wire and an insulated copper wire wound helically on an iron core with water as the electrolyte constitute a novel primary battery of a Kentucky inventor from which great things are expected. It is claimed the form increases the output of current while yielding inductive effect that may be utilized in a secondary coil. The cell may serve as a self generating electromagnet, and is said to be adapted for telephone, telegraph and electric bell purposes and is especially valuable in electro-therapeutics.

* * *

IN Massachusetts legal sanction is given to the distinction making a street car line a "railway" while a steam line is a "railroad." General adoption of this rule is advisable.

The Trans-Mississippi Exposition.

A writer in *Bradstreet's* gives a description of the Exposition now in progress at Omaha, Neb., from which we extract the following:

"Visitors to the Exposition have been surprised at the magnitude and beauty of the grounds and buildings, and all agree that the Columbian Exposition at Chicago excelled it only in size and not in beauty. In round figures the Trans-Mississippi Exposition represents an expenditure of about \$1,200,000. The grounds cover two hundred acres, located within fifteen minutes' ride by electric cars from the heart of the city. The central feature of the Exposition is a large lagoon of artificial construction, several hundred feet wide and about one-half mile in length. Around this lagoon, at a distance of a hundred feet or more, are located most of the main buildings, all of classical design and harmonious as a whole. They are constructed of staff, as the buildings were at the Chicago Exposition, but unlike any other Exposition these buildings are connected by artistic colonnades, which afford shaded and sheltered walks by which visitors can pass from one building to the other. This feature of the Exposition alone distinguishes it from any other recently held, and gives to the grand court, in which the lagoon is located, a unique appearance.

"At night this grand court is illuminated by some fourteen thousand electric lights, a larger number than ever before installed for the illumination of any place. Those who have seen the grand court thus illuminated at night declare that it is a veritable fairy land, rivaling in beauty any scene in the world. At the end of the grand court, where stands the great building constructed by the United States, the lagoon broadens into a harbor, whose central feature is a beautiful electric fountain, and this harbor is outlined by colonnades, which extend in a circle from the Government Building on either side of the lagoon, one to the Agriculture Building and the other to the Fine Arts Building, suggesting very much the approach of St. Peter's in Rome, which effect is heightened by the Government Building, which carries out the idea by its style of architecture.

"Connected with the Exposition there has naturally developed during the year a plan to attract national conventions to Omaha, and the result is that during the Exposition some fifty or sixty conventions will be held in Omaha, and delegates from all parts of the United States will be entertained."

The General Electric Company will owe on July 1, 1898, \$1,488,200 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

GENERAL DISTRIBUTION FROM CENTRAL STATIONS BY DIRECT CURRENTS.*

BY LOUIS A. FERGUSON,
Chicago.

Mr. President and Gentlemen of the National Electric Light Association: The subject of central station distribution by direct currents is one which is so familiar to many of you that I hesitated when asked to write this paper, feeling that it would be difficult to present to you any new thoughts or experiences, so I trust you will pardon me if in the attempt to precipitate discussion and bring to the attention of the meeting the ideas and experiences of others, which is after all the object of my paper, I may trespass upon ground previously explored.

Nor do I wish to be construed as advocating blindly the general use of direct currents under all conditions for both transmission and distribution of electricity for lighting and power purposes in cities and towns, for records will, I think, clearly show that the writer was the first of the so called Edison central station men (who have represented the direct current idea in central station lighting) to advocate the introduction of the alternating current as a means of effecting important economies in the operating of the direct-current distribution systems, and also vastly extending their field of operation, which without the combination of alternating currents might have remained, despite their distinct advantages, unfortunately limited to a comparatively small and closely populated area.

The general design of the modern direct-current central station and its equipment has been fairly well established within the past five years, and while it was originally the custom to erect the generating stations as nearly as possible in the electrical center of the city or town, it is now generally conceded that direct current may be more economically distributed from a condensing station, situated even a mile distant from the electrical center, than from a non-condensing station located at the electrical center of the city, and it has been further demonstrated that the former practice of building many central generating stations in various centers of distribution in cities is to be supplanted by the use of one or two large condensing stations generating direct current for distribution throughout the business district if the station be within one mile of the electrical center of the district, and alternating current for transmission to sub-stations located at the electrical centers of districts more remote from the main generating station. In some cities water for condensing purposes may not be easily obtainable within a distance of one mile, and the location is then merely a question of total cost of land, building and transmission lines to the various distributing stations, proper consideration being given of course to the limitations of line voltage and insulation.

In order to show the workings of the first mentioned type of modern direct-current central station systems, I will explain in a general way the method of distribution employed in the system of the Chicago Edison Company, which I think fairly represents the latest development in direct-current distribution, and leave the explanations of the methods of direct-current distribution in other cities to the representatives of the companies operating them.

The system of distribution is a solid network of underground conductors on the three-wire system, extending from North avenue to 39th street, a distance of six miles north and south, and from Lake Michigan to Blue Island avenue, a distance of one and one-half miles east and west. The entire network is continuous from end to end, and is supplied at present from four central stations, all connected in parallel through the network and each feeding into it. The two large stations located at Harrison

street and Washington street on the Chicago River, and known as Stations No. 1 and No. 5 respectively, are condensing plants, while the stations on the north side and south side, located at North Clark and Oak streets and Wabash avenue and 27th street, known as Stations No. 4 and No. 2 respectively, are non-condensing.

The total current furnished to the network at the time of maximum load of the system in the winter of 1897 was 50,730 amperes, and is divided as follows:

Station No.	Amperes.	Per cent of total.
Station No. 1.....	35,000	70.2
Station No. 5.....	7,600	15.0
Station No. 2.....	3,400	6.7
Station No. 4.....	4,180	8.1
	50,730	100.00

The total low tension direct current kilowatt hours output for the stations for the fiscal year of 1897 was 15,255,466, divided as follows:

Station No.	Low tension Kilowatt hours.	Per cent. of total.	Maximum station voltage.	Yearly average station voltage.
Station No. 1.....	11,835,618	77.3	149.	126.2
Station No. 5.....	2,814,473	18.5	142.5	129.6
Station No. 2.....	808,158	5.3	135.0	119.0
Station No. 4.....	797,217	5.2	123.5	120.1
	15,255,466	100.0		

The pressure at the feeder ends throughout the system is maintained at 115 volts on each side of the three-wire system. Although the maximum station pressure is 149 volts, the average pressure of all stations for the year is 126.2 volts, giving an average loss of pressure of 11.2 volts or 8.8 per cent., which means an average yearly efficiency of distribution of

91.2 per cent. from the station switchboard to the customer's meter.

The center of distribution in the business district of the city is at Adams street, between Clark and LaSalle streets. Station No. 1, which, as has been shown, furnishes 74.3 per cent. of the total low tension output, is located on the Chicago River at Harrison street, 3,340 feet distant from the center of distribution at Adams street. Station No. 5, which furnishes 15 per cent. of the total low tension output, is located on the Chicago River at Washington street, and is 4,500 feet from Station No. 1 and 3,000 feet from the Adams street sub-station.

These two stations furnish all the low tension output for the district bounded by the river on the north, Harmon court (approximately) on the south, Lake Michigan on the east and the river on the west. They also furnish all the energy for the entire low tension system of the city during the hours from midnight until dusk the following afternoon, and a portion of the output of Districts No. 2 and No. 4 from dusk until midnight daily, and ultimately they will furnish all of the output of the territories mentioned and all of the energy required for alternating transmission lines into the outlying districts of the city and its suburbs.

The load curves "A," here shown, indicate the

amperes furnished in District No. 1 by Stations No. 1 and No. 5, the small lower curve representing that delivered by Station No. 5, and the lower large curve showing that delivered by Station No. 1, and the upper curve representing the total amperes delivered to District No. 1.

The distribution of current from these two stations to the underground network is as follows:

From Station No. 1 to the Adams street sub-station is laid an immense trunk line known as the Adams street trunk line, having a total cross-sectional area of 68,000,000 circular mils, 28,500,000 circular mils being ordinarily connected on the positive and negative sides and 9,000,000 circular mils in the neutral. The length of this trunk line is 3,840 feet, and is made up of fifteen special Edison tubes, each 3,000,000 circular mils area, laid directly in the ground, and fourteen 1,500,000 circular mils stranded rubber insulated, lead-covered and juted cables drawn into cement-lined iron ducts. The trunk line on leaving Station No. 1 goes down a shaft 60 feet, thence through a brick tunnel built especially for it in the river bed to the east side, where it rises again in another shaft 60 feet into the tunnel house, where a small switchboard is located. The portion of the trunk line in the shafts and tunnel, which is 430 feet in length, is made up entirely of cables; of these forty-five are 1,000,000 circular mils Siemens jute insulated and fourteen are 1,500,000 circular mils General Electric rubber insulated, leaded, asphalted and iron-armored submarine cables, each supported on iron racks. Where the cables hang vertically in the shaft, the cable is supported by the iron-armored sheathing clasped between iron plates on a heavy cast iron ring. The copper conductors thus hang in a sort of basket, the strain being distributed throughout the length of the cable. At the tunnel house the forty-five Siemens 1,000,000 circular mils cables connect with fifteen 3,000,000 circular mils single pole Edison feeder tubes, and, together with the fourteen 1,500,000 circular mils cables, are mounted on racks in a large subway, into which the duct line enters about 200 feet east of the tunnel house. At intervals of about 500 feet manholes are built in the Edison tube portion as well as in the conduit portion of the trunk line, thus affording a quick means of locating low insulation points as they develop. Each of the tubes and cables is provided with an amperemeter at Station No. 1, and with switches at both ends so that they may be completely disconnected from the system in case of trouble. Two of the 3,000,000 circular mils tubes are provided with throwover switches and arranged so that they may be quickly connected either to the positive or neutral or negative or neutral at will. All of the cables are provided with throwover switches at both ends, so that they may be operated either as positive or negative at will, thus providing for any possible contingency that may arise. At the Adams street sub-station the trunk line feeds into the main bus-bar in the distribution room, and from the switchboard forty-two feeders radiate to various points in the business district, ranging in size from 250,000 circular mils to 1,000,000 circular mils, and in length from 290 feet to 2,831 feet, the average size being 485,000 circular mils, and the average length of feeder 1,373 feet.

The maximum current in amperes carried over the trunk line and distributed from the Adams street sub-station last December was 34,400 amperes, the maximum loss of pressure on the trunk line being 12.4 per cent., and to the customer's meter 22.8 per cent., the distance to farthest feeder end being 6,171 feet. In addition to the current furnished to the trunk line, Station No. 1 also delivers from its main bus-bar current to the two 1,000,000 circular mils feeders which feed into two points in the southern portion of the business district. One of these feeders terminating at Washington avenue and Harrison street is 3,800 feet in length and carries with maxi-

* Paper read before the National Electric Light Association at its Twenty-first Convention, Chicago, Ill., June 7, 8 and 9, 1898.

sum station pressure 780 amperes on each side, the other terminating at Eldredge Court and State street is 4,800 feet in length and carries with maximum station pressure 620 amperes on each side. The supplying of District No. 1 by Station No. 5 is done in much the same manner as that just described by the two feeders from Station No. 1 into the southern portion of the district. From Station No. 5 eight feeders, varying in size from 400,000 circular mils to 1,000,000 circular mils, and in length from 2,175 feet to 4,445 feet, terminating at different points in the northern section of District No. 1, deliver a total of 7,600 amperes at maximum station pressure of 140 volts, the amount of current furnished during the run being only enough to maintain standard steam pressure at the feeder ends, the curve of station voltage following very closely that of Station No. 1.

Station No. 2, which is now really a rotary transformer sub-station, is 17,500 feet from Station No. 1, and 14,300 feet from Adams street sub-station. The load diagram "B" shows the amperes delivered to District No. 2, the cross-hatched portion representing the current furnished through the rotary transformers and the unshaded portion representing the current furnished by the dynamos in Station No. 2, the dynamos and rotary transformers operating in parallel on the three-wire system. The upper curve shows the total amperes delivered to District No. 2.

Station No. 4, which now operates only from dusk till midnight, and will later become a sub-station, is 11,500 feet from Station No. 1, 9,000 feet from Station No. 5, and 8,000 feet from Adams street sub-station. The load diagram "C" shows the amperes delivered to District No. 4. The portion of the curve from midnight until 3:30 P. M. on the winter day and until 6:30 P. M. on the summer day is furnished from District No. 1 through the interconnected underground network, the District No. 4 being during these hours merely an extension of District No. 1 and having no distinct supply delivered through its own switchboard. From dusk till midnight the generating plant in Station No. 4 is operated, and the current is delivered as shown by the next to the highest curve on the diagram, the low curve marked No. 5 representing the amperes furnished by Station No. 5 to District No. 4 over a direct-current tie line between the switchboards of the two stations. The tie line is made up from one feeder running out of Station No. 5, originally feeding into District No. 1 and now connecting by means of river cables with a feeder out of Station No. 4, which formerly fed into the district at a southern point. This tie line is also used on dark days to keep up the pressure in District No. 4 by connecting onto the main bus in Station No. 5 and allowing it to take a small current and deliver it to Station No. 4 switchboard, thus relieving the network between Districts No. 1 and No. 4 of some of the work. Between the hours of midnight and 8 o'clock in the morning there is only one low tension direct-current generating station operating (Station No. 1), supplying direct-current to District No. 1, and through the network to District No. 4.

District No. 2 is supplied from Station No. 1 by means of a converse rotary transformer connected to the 250 volts direct-current bus-bars, converting to three phase alternating current at about 160 volts. By means of step-up transformers this is raised to 4,500 volts, and at this pressure the energy is transmitted by three-phase underground transmission line to Station No. 2, where it is reduced by step-down transformers to about 80 volts and converted by means of rotary current transformers to direct current at about 115 volts.

For the permanent conversion of Station No. 2 into a sub-station a pair of special 200 kilowatt generators are being installed, directly coupled to the existing 600 HP. triple expansion engines in Station No. 1. Each generator is provided with a commu-

tator and a set of three collector rings, and is designed to deliver from the same armature direct currents and three phase alternating currents, the direct current sides of each pair of machines being connected in series to form a three wire unit, and the alternating current sides, after passing through transformers stepping up to 4,500 volts, being connected in multiple. The alternating current from these machines will be taken to supply the transmission line to Station No. 2, and the balance of the capacity of the machines will be delivered directly into the main direct current bus-bar of Station No. 1, thus keeping the unit operating at full load and

maximum efficiency during its run. The peak of the load in District No. 2 arrives later than the peak of District No. 1, so that the same investment in steam and electrical machinery may be employed to take care of a portion of the peak in both districts, these special generators constituting a reserve or surplus for the direct current equipment of Station No. 1.

Lest I might wander from the subject of the paper, I shall not now dwell further upon the question of transmission of energy by alternating currents, although it plays an exceedingly important part in the

distribution of electricity by the Chicago Edison Company.

Uniformity of pressure throughout an incandescent electric lighting system is absolutely essential to commercial success. To accomplish this different methods have been proposed at different times. It often happens that the original plan of distribution, laid out by the constructing engineer, does not meet the requirements, after several years' growth of the business, for in all cities lighting business may localize at certain special points, and so demand a remodelling of the existing system of conductors, or require some means of correcting for the inequalities

of pressure that are due to the unevenly distributed load.

In the Edison systems built prior to 1890 it was customary to introduce in series with each feeder a resistance box with capacity to carry the entire current of the feeder and of resistance much greater than that of the feeder itself. The resistance box is commonly known as a feeder equalizer. From the end of each feeder where it connected with the mains a set of pressure wires was run back to the station and there connected to pressure indicators. The method of regulating was to designate the feeder supplying the most important district in the system the standard feeder, and to keep its pressure constant, say 110 volts. Each pressure indicator of the other feeders was differentially wound, so as to receive the pressure of the standard feeder as well as the pressure of its own feeder. When there was any difference of pressure between the standard feeder and a given feeder, the latter's indicator needle would deflect to one side or the other according as the pressure on that feeder was higher or lower than the standard, and if the equal of the standard, the indicating needle would stand in the center. If, then, any indicator showed that its feeder was low in pressure, some resistance would be cut out of its feeder equalizer, and the resistance diminishing, the volts loss on the feeder would then become less, and thus the feeder could be brought to the same pressure as the standard. If the pressure of the feeder were high, the operation would be the reverse.

With this method of regulation, the entire output of the station must be at such pressure at the station switchboard as will permit the delivery of the correct pressure at the end of that feeder, the product of whose load and resistance is greatest in the system. There are some large stations in America operating to-day on this plan of regulation, notwithstanding that it is an expensive and troublesome one. Another method of regulating, which may be employed where the load is fairly well distributed, is by cutting out the feeders which are high and forcing the current to travel through the remaining feeders and the mains, thus increasing the fall of pressure to the end of the feeders which were formerly high.

The only economical and safe way to regulate in a city where the distances are not abnormally great, and where the load is fairly well distributed, is to so design the conducting system that it will be self-regulating, that is, so that it will require no change of the resistance of feeders or anything of the kind.

A good conducting system should have an ample number of feeders reasonably close together, and the connecting mains should be of generous cross sectional area.

A valuable adjunct to a station, where there are one or two straggling feeders of great length so located that they cannot be interconnected with the general system so that they may be benefited by such connection, is what is known among the Edison companies as the "booster." The "booster" is a direct-current dynamo wound for a large current and low voltage, and is used for raising the pressure of the station and of the feeders which are ordinarily low. The "booster" dynamo should be series wound and so designed that its voltage will be proportional to the current passing through it, the speed remaining constant. It is connected in series with the feeder whose pressure is to be raised, and is belted to or directly connected with a motor which drives it at the speed for which it is designed. Its action is as follows: The current passing out on the feeder also passes through the field and armature of the "booster" dynamo, and an electromotive force is thus added to that already existing on the feeder due to the dynamos of the general system. As the load on the feeder increases, the electromotive force of the "booster" dynamo increases proportionately, and adds to that of the feeder, thus overcoming the loss of pressure due to the increased cur-

rent in the feeder, which enables the feeder to deliver the proper pressure at its mains. The "booster" may also be employed to raise the pressure of a number of feeders which are connected to an auxiliary bus bar. In this case, the "booster" would be connected between the main bus and the auxiliary bus, and would carry all the current of the auxiliary bus, raising the pressure of it as its load increases, and decreasing as the load decreases, as described in the case of the single feeder.

In some central stations two or more potentials or pressures are used, certain dynamos working on a bus bar at one pressure and the other dynamos working on another bus bar at different pressures.

This method is only economical when the dynamos can be worked very near the maximum load, which is not often the case. In some cities the dynamos in central stations or machinery or storage batteries in sub-stations feed into one general system at different points, each station or sub-station operating at such pressure as will deliver the same voltage at the feeder end of the mains. This is, without doubt, the method to be recommended as giving the best efficiency and assuring reliability of service throughout the system.

With the method proposed in case of accident to any one station, either by fire or lack of water supply, the whole system will not be shut down, but each station will take its share of load which comes from the shutting down of the disabled station.

(To be continued.)

A South African Industrial and Art Exposition.

United States Consul-General Stowe writes the State Department from Cape Town, South Africa, that an invitation has been extended to American manufacturers and producers to exhibit productions at the Exhibition which is to be held at Grahamstown in Cape Colony, opening December 15, 1898, and closing January 21, 1899. This Exhibition will be the second of its kind held in South Africa. It is to be an industrial and art exhibition, and great care is being exercised in the endeavor to make it a success in every way. The promoters are all men of acknowledged standing in the community, several of them having been connected with the first South African Republic, Orange Free State and Natal, and the high commissioners of Rhodesia and Basutoland. Over £100,000 have been subscribed, and exhibits from all parts of the world have been asked. There are five classifications of exhibits, viz.: (a) Raw materials; (b) manufactures; (c) mining and machinery; (d) natural history and science; (e) arts.

This Exposition will be called the South African Industrial and Art Exhibition. Grahamstown is in the southeastern part of the colony.

Consul Stowe says that the Exhibition will be of incalculable benefit to manufacturers of agricultural implements and vehicles, electrical apparatus, machinery of all kinds, cottons, woollens, etc.

American goods are becoming widely and favorably known in the South African country, and this opportunity of still further popularizing them should not be neglected by American manufacturers.

Electric Lighting in Berlin and Paris.

The *Bulletin des Usines Electriques*, in an article discussing the question of extending the time of the concession for lighting Paris, gives a few interesting details about electric lighting in Berlin, to the effect that there are some 300,000 incandescent lamps of 16 CP. installed, besides several thousand arc lamps. The length of mains is about 186 miles, and the power developed is about 28,000 HP. There are some 1,600 motors taking 6,450 HP. The price for lighting is 15 cents per kilowatt-hour, that for power is 4 cents. Paris will require about 25,000 HP. for about 418,000 lamps of 10 candles and 7,448 arc lamps, with about 240 miles of mains. There will be 513 motors, requiring 1,940 HP., and the cost will be about 23 cents per kilowatt-hour.

GENERAL DISTRIBUTION FROM CENTRAL STATIONS BY ALTERNATING CURRENTS.*

BY HERBERT A. WAGNER,
St. Louis.

Ever since the installation of the first few pioneer alternating-current central stations, just ten years ago, we have heard it predicted with persistent reiteration that for the distribution of current for lighting from central stations direct current was a thing of the past, and that in a few years the alternating-current transformer system would hold the field without a competitor.

To many, this prediction may seem to have been fulfilled, considering the enormous number of alternating-current plants, compared with direct-current, that have been installed, and the remarkable impetus given to electrical industries by the development of alternating currents.

The great success achieved in the transmission of power by polyphase alternating currents in the last three years has but strengthened this general belief, and left fewer champions to adhere to the direct-current cause.

These great achievements, I say, have led the enthusiast to think all progress confined to alternating systems of distribution. Deeper investigation, however, shows that while in point of number the alternating-current stations, reaching into the thousands, completely overshadow those of direct-current, there are few really large stations, outside of water-power plants, that are to-day employing alternating currents for distribution, and that while enormous investments have been made in direct-current stations in our larger cities, comparatively small amounts have been invested in alternating-current work.

The alternating system was heralded as providing a means of distribution with a great reduction in first cost of plant, and for years the development of the system has been made with this the principal end in view. On the other hand, direct-current distribution in the form of the Edison three-wire system has been steadily and intelligently developed to the highest standard of economy of operation, simplicity and permanence. In the same city, alternating-current stations have not, as a rule, been successful in competition with three-wire stations; their service has not been as good, and their profits have been smaller.

I may startle many by stating frankly the discouraging fact, which has been barely whispered at times, that, judged by the standards of the magnificent Edison properties in many of our larger cities, few alternating-current central stations in the United States have been a success. Do not imagine that this damaging admission, however, is an indication of any loss of faith on the part of one who has been identified with alternating-current work since its debut, as it were. Far from it. The fault lies, not with the alternating current itself, but with its application. Its few apparently inherent deficiencies, such as the difficulties of operating motors and arc lamps, have been shown to have been only awaiting discovery and development, and were at our disposal almost as soon as these important divisions of central-station service were operated with success from the Edison three-wire system. These can, therefore, hardly be held responsible for the difference in the commercial results obtained with the two systems.

As I have said, the ends in view in the development of the two systems have been radically different. The one was to produce a given amount of light for the minimum of investment; the other was to provide a permanent investment that would render the maximum of profit. These standpoints in general mark the difference between the manufac-

* Paper read before the National Electric Light Association at its Twenty-first Convention, Chicago, Ill., June 7, 8 and 9, 1898.

turer and the user, and we find these two systems developed in this way—one almost entirely by the manufacturer, and the other by the combined efforts of the various users. The results are the natural effects of progression along these lines.

Few opportunities have we had of comparing the two systems from the same standpoint and under like conditions. The purpose of this paper is to show the alternating current applied from the same standpoint, compelled to fulfill the same conditions; and then to compare the results with the best produced with direct current.

To better contrast the different methods of distribution, we will review briefly those in general use before describing the most recent developments.

The early alternating-current stations were installed on the principle that the drop in lines with distribution at 1,000 volts was so small that it was practically negligible. Two wires were accordingly run out from the station, passing along those streets where light was to be furnished, and lights were connected *ad libitum* at any desired points between the station and the farthest end, without reference to such trifling considerations as difference in potential. Distribution was attempted in this way for years, and in many places is still in operation. Lines are even being constructed to-day without any notion of a system of feeders and mains, although an almost perfect system for the maintenance of uniform pressure was in operation in many Edison stations before the first alternating station was in existence. Fortunately for the operators of such models of simplicity, the current delivered has usually been so small in quantity that with the proverbial No. 6 wire, which seemed to possess virtues not affected by distances, the difference of pressure between neighboring customers rarely exceeded 10 per cent.

A few more enlightened experts—plants were always installed by experts in the early days—eventually conceived the novel idea that if the drop, a little of which they had discovered by that time, could be confined to a greater extent to those portions of the lines where there were no lights, some might be spared from the lighting districts. A few feeder lines were therefore stuck in here and there to boost up the pressure where it was lowest.

The regulation was all effected by means of the dynamo field rheostat, and the pressure indicated by a voltmeter on the secondary of a transformer whose primary was connected to the bus bars on the switchboard. A few lamps were also often operated by the same transformer to light the switchboard or other parts of the station. The station attendant was, of course, in absolute ignorance of the pressure at any point on the lines where lamps were used. The pressure was therefore usually run high enough to be on the safe side. The attendant was sometimes instructed to let his voltmeter needle follow gently the manoeuvres of his ammeter, as there was thought to be a more or less intimate connection between volts and amperes and the volts ought not to be allowed to get too far behind.

If any one ever breathed a suggestion of pressure wires, it was probably his last breath. At any rate, he was never heard of again. What! pressure wires with alternating current? Preposterous idea. Alternating and progression were considered almost synonymous terms. Antiquated ideas must be abandoned.

This faintly-whispered need might, however, be heard again, so, to meet the emergency, a compensating voltmeter was produced that could be adjusted for any drop in the lines. It was ingeniously arranged so that a small series transformer in the main line would send currents opposing those operating the voltmeter, thereby making the needle or index drop back approximately proportionately to the current in the line. This device was a great help, and caused the drop in lines to jump into prominence at once. It would be quite perfect if the drop in alter-

nating-current lines were proportional to the current, but it is not. The power factor of ordinary alternating-current systems is usually quite low at light loads, and except with very small wire, an ampere may therefore produce much more drop proportionately at light load than at heavy load.

One alternating-current station of which I have intimate knowledge has used pressure wires in connection with each feeder for years. There may be a few others, but they are rare exceptions even to-day.

The usual system of distribution provides a separate transformer for each customer. In many cases this implies the use of a very small transformer. It is impossible to make the efficiency of small transformers high. As each customer may at times use all of his lamps, he must have full transformer capacity for such an emergency. The ordinary ratio between maximum station loads and the number of lamps connected is in most cases under 50 per cent. where meters are employed. The transformers then being of a total capacity equal to the number of lamps connected average at best only 50 per cent. of their rated capacity at the maximum station load. In most stations the average load generated is much less than 25 per cent. of the maximum load, and therefore, with twice the transformer capacity of that represented by maximum station load, the average transformer load would not exceed 10 per cent. of the transformer capacity, all the year round.

The efficiency of the average modern transformer of usual size at 10 per cent. of its rated load is not over 65 per cent., and the average of transformers at present in use not more than 50 per cent. It is perfectly safe to say that there is not an alternating-current station to-day using individual transformers for each or neighboring customers that can show an average efficiency of distribution of over 60 per cent., and few that can show over 50 per cent.

In Europe, it is, to some extent, the practice to use transformer sub-stations with low-potential distribution from these points. Transformers are out in and out at these sub-stations by attendants according to the demand for current. It is doubtful if, after paying interest on the investment in property and housing for these transformer stations, together with the investment in instruments and switches required, and the attendants' wages, there is very much saving effected. Had we nothing better to turn to than these systems, the cost of distribution from large stations would be extreme compared with the direct-current, Edison three-wire system, and competition with the latter could not be a success.

Another very important consideration is the economy or efficiency of lamps used. To employ successfully the highest-economy lamps made, a very uniform pressure must be maintained. With the usual alternating-current system, and with an equally good disposition of feeders and mains, the variations of pressure will exceed those in a direct-current system by nearly 3 per cent., on account of the transformer drop, and to secure even this limit of variation, pressure wires must be used with each feeder.

It is not surprising to find, therefore, that almost all alternating-current stations are using lamps requiring 20 per cent. more current than those used by direct-current stations.

I cannot refrain from remarking here that to operate any station, alternating or direct current, without pressure wires, is to be worse than penny-wise and pound-foolish. In any alternating-current station employing overhead wires, the saving in lamp renewals would equal the cost of pressure wires in little over a month's time. I might also add that the total loss of lamps is not the most serious result of variations in pressure. Such variations cause a rapid decline in candle power, and low candle power means dissatisfaction of customers and the increased use of gas.

Now let us leave for the time the alternating-current station and its usual system of distribution,

and adjourn to a modern Edison station, to see if there can really be anything learned from so antiquated a source. On entering, we see at first large direct-connected generators running in multiple. We have also seen those in a few alternating-current stations, and perhaps of larger size. We next see a very compact and convenient switchboard. Neither is that altogether new. But let us ask to see the system of distribution; for that is what we most want to look into.

On the plans of this system of distribution a remarkable network of feeders and mains is laid before us, most carefully calculated for the maintenance of uniform pressure. Means for regulating more or less independently the pressure on each feeder are provided. From numerous points in the system, corresponding to the feeder terminals, pressure wires are brought to the station, and indicators show the pressure at all these points. Numerous devices and appliances are shown us which must have been the result of years of experience in the development of distribution methods. We look with admiration, and ask why, with this apparently far more perfect system in existence, have we been working so long to try to perfect a new system that cannot to-day, we are informed, produce such results. Why, indeed!

But let us look a little further. What are those massive beams? They do not seem to support anything. "Those are not beams. They are copper wires to carry the current out," we are told. "Wires? Why, they weigh tons!" "So they do, but they are necessary with this system." A very serious drawback, it would seem. Another question troubles us. Why do you occupy ground in a part of the city where property must be very valuable? Why do you not go off to one side where land is cheap? "Oh, we are forced to be near our center of business. If we were twice as far away we should have to use four times the amount of copper in those bars." This, indeed, seems a very great defect. But are there no other defects in your system? In answer, we are told that there are no others that are considered serious.

If this necessity for using such an enormous amount of copper is the weak point of a beautifully developed system, why do we not endeavor to overcome that particular point and adopt the rest, instead of starting out anew and alone to develop another system from beginning to end? This is the question that should have been considered years ago. Why did we not start where others left off, engraft our alternating current and draw energy and strength from the old roots, instead of trying to grow from the seed to find ourselves running to limbs and branches with very little trunk to speak of. We have tried to overreach our older brother, and now lack his sturdiness and stability.

It is not too late, however, to begin afresh. We are satisfied that at the present time the Edison three-wire system of distribution is the most efficient in use and the most nearly perfect in details. We know that the usual system employed with alternating current is not efficient, and does not admit of as close regulation, but it is vastly cheaper to install.

Comparing the cost of individual transformers and high-potential distributing mains with the three-wire system of mains at low potential, we do not find a great difference in first cost in favor of the alternating. We do find, however, that the Edison feeders for the same distance cost about thirty-one times as much as for alternating current at 1,100 volts, 125 times as much at 2,200 volts, or 500 times as much at 4,400 volts. It would then appear that if we could apply alternating current to the feeders at high potential and transform down for the mains, we might reach the lower first cost of the ordinary alternating-current system and possibly retain all the best features of the direct current. To accomplish the former, the transformers must be provided at a small proportion of the cost of the alternating-

current feeder, and to do the latter, they must not increase the average losses in the system. It is obvious that we could with alternating-current move our station to any reasonable distance from our center of distribution, and at comparatively small additional cost for feeders. The whole problem then seems to come down to transformer efficiency and means of regulation.

To consider the matter of regulation first. We see at a glance that we cannot use the direct-current method of regulation by supplementary 'bus bars, but we can use the booster method, and can, moreover, apply a static booster to each feeder to regulate within any desired limits and with as small gradations as necessary. In fact, the booster method of regulation was first applied to alternating-current distribution, and operates with much less average consumption of energy than either the supplementary 'bus or direct-current booster method. In this important consideration, we can therefore improve on and simplify direct-current methods.

The means of regulation having been in this way provided for the feeders, it remains to be considered what we shall do to eliminate the effects of transformer drop. As we have determined on a secondary low-potential, three-wire distributing system of mains, we can altogether dispense with high-potential mains and limit the high potential to the feeders. If we do this, we can conveniently have the transformers of the same unit capacity as the feeders, and arrange each with its primary connected to its independent feeder and its secondary feeding into the three-wire mains. We know that the effects of our feeder drop are eliminated if we regulate by pressure wires from the feeder ends. In the same way the effect of our transformer drop may be eliminated by bringing pressure wires from the secondary terminals. The feeder drop and transformer drop therefore become one, and are cared for in the same way. We can even secure better general regulation than with the direct-current system, as we have a better form of feeder regulator and have eliminated the effects of transformer drop.

Now, to return to the transformer itself and its efficiency. It is evident that with this system the transformer capacity need be no greater than that required for maximum station load, instead of more than twice that amount or nearly equal to that required for the total number of lamps connected. This at once doubles the average load on our transformers, and raises the average efficiency. It also incidentally reduces the first cost of transformers in still greater proportion. We also know, however, that transformer efficiency at light loads is dependent on the iron loss, and that this is interdependent with regulation or drop. If we can increase the drop, we can decrease the iron loss, and thereby greatly increase the average efficiency. Having provided against any interference with the regulation of the system by the transformer drop, we can afford to increase that to the heating limit of the copper. In this way, a 100-kilowatt transformer can be built with an average efficiency of over 98 per cent. The entire transformer loss can, moreover, be more than made up by the less loss in feeders which we would naturally have with alternating current.

We have thus eliminated the two features in which the ordinary alternating-current system of distribution has been inferior to the direct current, and have provided means for obtaining better regulation and higher efficiency at a very much less cost of installation than with the direct-current system.

This system was conceived several years ago, and it has since been my good fortune to have an opportunity to install a system of this kind on a large scale which is now in very satisfactory operation. It is laid out exactly as a three-wire Edison system would be, except that there are no sub-feeders. A network of mains is planned as if for use with direct current. The feeders are all designed for a 110-kilowatt maximum load at 1,100 volts, and at each

feeder end is placed a 110-kilowatt transformer feeding into the three-wire network in the same manner and at the same points as with the direct-current system. The transformers are located in

dictated by the voltmeters and also to divide the load between transformers in any way desired as indicated by the feeder ammeters. It is possible to shift the entire load from one transformer and feeder to

stations certain feeders often become so overloaded that it is found necessary for their safety to put resistance in series with them to force some of the current to other feeders. The possibility of overloading any individual feeder beyond its share is absolutely provided against in the system described. To make the arrangement of this system perfectly clear it is illustrated diagrammatically in Fig. 2.

In Fig. 1 are shown four curves of station distribution efficiency. No. 1 is that of a representative Edison three-wire, direct-current station. No. 2 is the new alternating-current system described. No. 3 is the usual alternating-current system employing separate transformers for each customer or for adjacent customers, the best modern transformers being used. No. 4 shows the same system, but with the average transformers found on the lines of most existing stations. These curves were plotted from the following data obtained from actual practice:

	No. 1.	No. 2.	No. 3.	No. 4.
	Percent.	Percent.	Percent.	Percent.
Feeder loss.....	24	8	10	10
Main loss.....	2	2	2	2
House wiring loss...	1	1	1	1
Transformer loss, iron.....	..	.23	6	12
Transformer loss, copper.....	..	2.7	1	.5
Total loss at maximum station load,	27	13.93	20	25.5
Efficiency at maximum station load.	78.7	87.9	83.8	79.6

The efficiencies of distribution at assumed average loads are shown to be as follows:

	No. 1.	No. 2.	No. 3.	No. 4.
	Percent.	Percent.	Percent.	Percent.
Load, 25.....	94.1	95.8	78.4	66.6
Load, 20.....	94.8	96.2	75.3	61.4
Load, 15.....	96.1	96.5	70.3	54.3
Load, 10.....	97.8	96.4	61.9	45.1

At maximum load it will be noticed that the efficiency of alternating current No. 2 is ten per cent. higher than No. 1, the direct current. This means that the same energy can be delivered with ten per cent. less capacity in generators, engines and boilers, or a difference of ten per cent. in the first cost of generating plant. It is pertinent to remark here that alternating-current generators also have a much greater margin for overload for short periods than direct-current generators. The efficiency at average load, or the all-day efficiency of the No. 2 alternating-current system, is also shown to be appreciably higher than the direct-current. In large central stations the average load is generally found in practice to vary from about fifteen to twenty per cent. of the maximum, and it will be noted that from twelve per cent. average load up, No. 2 curve for the special system of alternating-current distribution shows a higher efficiency than the direct-current.

It may be asked what effect the aging or fatigue of the transformer iron will have on these figures. I answer, none appreciable. Transformer manufacturers are willing to guarantee as low as one per cent. increase per year in iron loss. This means one per cent. of the actual amount of energy lost in the iron, so that, if this increase continued at the same rate, it would take one hundred years to double the iron loss. Experiments tend to show, however, that this effect rapidly approaches a maximum, and that, therefore, the increase goes on at a constantly decreasing rate. The entire effect may be eliminated, if desired, about once in five years by reannealing the transformer iron at a very small expense.

It has been the practice in some European stations to out transformers during periods of light load, but it will be seen that outting out transformers in the system described would only decrease the efficiency; in fact, the efficiency is higher at about the average load, and the system was designed through-out to accomplish this result.

The less we say about curves Nos. 3 and 4 the

FIG. 1. CURVES OF DISTRIBUTION EFFICIENCY.

manholes of suitable design. From the secondary terminals of each transformer, pressure wires are run back to the station. Each feeder has an independent regulator by which the pressure can be

an adjacent transformer in this way without sensibly affecting the pressure on the system, and an equal division of load between transformers can be readily maintained at all times if desired. This is a

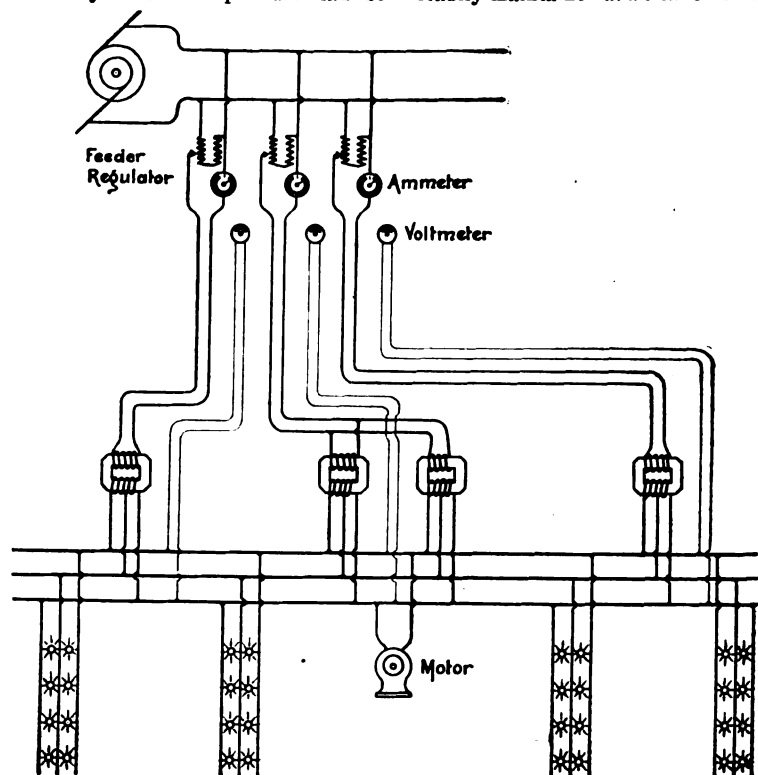

FIG. 2.- SINGLE PHASE A.C. SYSTEM

with High pressure Feeders and low pressure distribution.
Independent Feeder for each Transformer or Group.

raised or lowered. There are no primary mains, nor any connection whatever between the primary feeders. The regulators perform two functions. They are used to maintain the proper pressure as in-

very important consideration when very heavy loads or overloads are to be carried. The distribution of load on any large system is constantly changing as new customers are connected, and in large Edison

better, as at small loads the efficiency is shown to be appallingly low.

EXTENSIONS OF DIRECT-CURRENT SYSTEM BY ALTERNATING CURRENT.

Several large three-wire, direct-current Edison stations are beginning to employ alternating current to extend their lighting territory beyond that possible or profitable with low-tension current. This is a recognition of alternating current which would not have been considered for a moment a few years ago. They now propose to use alternating current to transmit their energy at high potential to a distant sub-station, where it will be transformed to a lower pressure and then again transformed by means of rotary transformers to direct current, which is in turn distributed over the three-wire Edison system as if generated in the ordinary way. This is a very beautiful and instructive application of alternating currents, and ingeniously designed machinery. It gives the manufacturers a chance to sell additional machinery, swells the company's real estate investment and gives work to the unemployed to operate the sub-stations.

The loss in the conversion to alternating current and back is about fifteen per cent. in addition to the loss in static transformers and lines. This distribution might be accomplished without the additional machinery, wire, real estate, labor and loss inefficiency. It is hardly to be expected, however, that those who have grown up under the protection or influence of direct current would use alternating current any further than absolutely necessary until they have grown more accustomed to the new mode of travel. After looking across the stream to coveted territory for many years, they are willing to use the new bridge and to ride across at about the highest speed provided, but when they get on the other side they are more than satisfied to foot it again the rest of the way.

A much higher efficiency of distribution, and better regulation, could be secured by using the alternating-current system as it is, without transformation to direct-current, and everything could be controlled from the main station without employing labor or apparatus at sub-stations. Why do they not use it so? They say that many things cannot be accomplished as well with alternating current. If that is a challenge, we will accept it and try conclusions with them. Let us then anticipate these various objections and see what they amount to.

FIRST, EFFICIENCY.

We have already seen how a properly designed system of distribution for alternating currents may be made to exceed the direct-current system in efficiency, taking the latter under its most favorable conditions. If we then add to the usual losses in the direct-current system the losses in double rotary transformation and in static transformers, the very great difference in favor of the alternating current is still more marked.

REGULATION.

It has been shown how very simple and reliable regulators can be provided for each alternating-current feeder, which will secure the closest possible regulation over any range desired, and this can be effected at a loss of less than one per cent. Such close regulation can only be secured with direct current by the use of a number of generators connected to auxiliary bus bars, or by connecting the feeder ends to adjustable resistance connected between the busses of two or more generators. The first cannot be realized in a rotary-transformer station, and the last is quite wasteful of energy. Regulators placed on the alternating-current feeders of the rotary transformers control alike the pressure on each rotary, and all the direct-current feeders supplied by the same, in exactly the same way as field regulation does on a direct-current generator. Such regulation can only be effectual with a number

of small rotaries not operated in multiple. The best regulation can, therefore, undoubtedly be secured with the alternating-current system.

OPERATION OF ARC LAMPS.

It seems now to be the universal opinion among Edison station men that the enclosed-arc long-burning lamp is destined to replace all the old forms of arc lamp. We will, therefore, consider this type of lamp only. Fully as well-burning lamps of this type are now made for alternating current. They are also about as free from noise as the direct-current lamps. Many will say, however, that it is impossible to get as much light from the alternating current as from direct current. That is true if we state that the same energy in the arc produces less light with alternating current than with direct current. It has been determined that the alternating-current arc produces about seventy per cent. of the light to be obtained from the same number of watts in the direct-current arc. The usual direct-current enclosed arc requires five amperes at 115 volts, or 575 watts. How much of this is used in the arc? Somewhat less than eighty volts, or under 400 watts; the balance of over 175 watts being wasted in resistance.

With alternating current, seventy per cent. of the amount of light would be obtained with this 400 watts, or about 570 watts would be required to produce the same light. The alternating-current arc is best operated at about seventy volts, but inductive resistance is used to bring the pressure down to this amount. This inductive resistance consumes about ten watts actual energy, making in all 580 watts, against 575 for the direct current for the same amount of light. This difference of five watts, or less than one per cent., is insignificant.

The standard alternating-current enclosed arc consumes about 420 watts at the lamp terminals, but I have had made to order a large number of 550-watt lamps which have replaced many series ten-ampere direct-current lamps. There are certain kinds of arc lighting to which the alternating current is particularly well adapted, of which I will speak later on.

(To be continued.)

THE DISTRIBUTION OF ELECTRICAL ENERGY IN PARIS.

BY J. LAFFARGUE.

(Concluded from page 378.)

Secteur de la Rive Gauche.—The company for the Sector de la Rive Gauche at Paris did not regularly commence to distribute electrical energy until January, 1896. Since that period the sector has considerably developed. This company distribute electrical energy over the whole of the left bank of the Seine. The works are situated outside Paris, at Issy, about 1 km. from it. The distribution is effected by alternating currents, with transformers installed in the premises of subscribers and at special sub-stations. The boiler-room comprises at the present time 10 boilers of the Crenot type, each capable of supplying 6,600 lbs. of steam per hour at the pressure of 170 lbs. per square inch. In the machine-room we find four horizontal compound Creusot steam engines of 700 HP. working at 125 revolutions per minute. A fifth similar engine is shortly to be installed. Each of these machines directly actuates a Ziperowski alternator of 400 KW. at 3,000 volts, with 40 inductor poles, and a frequency of 42 periods per minute. The continuous current exciting machines are two in number, of the six-pole Ganz form, yielding 70 KW. at 110 volts, with 200 revolutions per minute. These continuous current dynamos are worked directly by two horizontal compound single cylinder steam engines of 125 HP., working at 200

revolutions per minute. From the works start the feeders, laid in different directions.

The distribution is effected by Felten and Guillaume concentric cables insulated with paper and with jute, lead-enveloped and armored, laid directly in the earth. These cables were manufactured by the Société Industrielle des Téléphones. This sector is only beginning its work, but it has already a great number of prospective subscribers whose interior wiring is being proceeded with. On December 31, 1896, it numbered 44 cafés, utilizing 147 arc lamps and 2,636 incandescent lamps; 137 apartments, including 9,018 incandescent lamps; 126 shops and workshops, comprising 223 arc and 3,640 incandescent lamps; 19 establishments of various kinds, comprising 8,484 incandescent lamps, and 56 premises at the Halle aux Vins, comprising 516 incandescent lamps. In addition, there were 12 motors, of which six were for lifts and six for mechanical apparatus. On June 1, 1897, the total number of lamps supplied was 53,000. Amongst its principal subscribers the sector for the Rive Gauche includes the Sarbonne laboratories, which employ the continuous current. With this in view a special transformer station has been established. During the year 1896 the total amount of the electrical energy sold was 209,470 kilowatt hours for a sum of 232,261.65 francs. The mean selling price for the kilowatt hour was 10½d. The mean receipts per kilowatt installed was thus £14 13s., or 13s. 9d. per 10 candle lamp.

III.—POSITION OF THE PARIS DISTRIBUTING COMPANIES.

Such is the position in outline of the companies for the distribution of electrical energy in Paris. If we refer to the statistics worked out in 1896—for those of 1897 have not yet been published—we find the following results: The total power available at the works was 17,775 KW. from machinery and 1,610 from accumulators. For electric lighting 7,488 arc lamps and 417,468 incandescent lamps, corresponding to a total of 545,914 ten-candle lamps, representing an installed power of 21,840 KW. There were also to be numbered 300 electric motors, with a total power of 858 KW., for various purposes, and 220 motors, with 574 KW., for lifts; the total electrical power for force thus reached 1,432 KW. To this must be further added apparatus for electrical heating with a power of 6 KW. The total power utilized thus reached 23,276 KW. The mean prices charged for electrical energy at Paris are as follows:

	Price of KW. hour.	
	For	For
	light.	motive
	ing.	power.
	d.	d.
Municipal works at the Halles.....	10.0	5.76
Continental Edison Company.....	10.3	3.84
Société d'Éclairage et de Force.....	10.0	3.84
Compagnie Parisienne de l'Air Comprimé	10.9	4.8
Sector of the Place Clichy.....	10.7	4.8
Compagnie, Secteur des Champs Élysées.	12.2	5.76
Sector of the Rive Gauche.....	9.3	3.84

The present concessions will expire in 1906 and in 1907. The Municipal Council of Paris has latterly given much consideration to the conditions under which they may be prolonged. M. Charles Bos has made a special report on this subject. Without entering into all its details we will indicate some particular conditions: Electrical energy should be delivered at the price of 9.6d. per kilowatt hour for private lighting, and at the price of 4.8d. for public lighting. Electrical energy for motive power, heating and various uses should be paid at the rate of 3.84d. per kilowatt hour. The charging of accumulators for automobile vehicles should be effected also at prices varying from 2.86d. to 1.53d. and upwards per kilowatt hour according to consumption. These various conditions have not yet been accepted and concessions are not extended. But it is probable that a solution will shortly be arrived at, so as to allow all the arrangements being made to ensure an abundant distribution of electrical energy in the interior of Paris during the Exposition of 1900.

ON THE ABUSE OF POWER HOUSES.*

BY W. H. PREECE, C. E., F. R. S.

There is a great tendency in the present day to multiply power houses—or central stations, as they are more frequently called—unnecessarily. This arises from various causes: (1) from want of foresight in predicating the growth of electric industries; (2) economy in selecting the land we have, rather than pay money for land more suitable by position but which we have not; (3) the restriction of legislation in confining operations to a defined area; (4) the growth of other industries side by side, especially tramways and railways worked by electric traction.

These causes have led to the original power houses being designed too small and on space too confined; and to the subsequent construction of other power houses, further afield and more extended, and even to the necessity of going to positions outside of the original area secured by provisional order. But worse than this, different industries have been promoted by rival and opposing interests. Trade competition and patent rights have led to the construction of power houses side by side, until we see the absurdity of one installation being worked at night to supply energy for electric light and another installation generating energy during the day for traction purposes being built practically on the same site; whereas not only can the power be generated conveniently and economically by the same plant, but the two energies can mutually assist each other, so as to reduce considerably the work cost per unit generated. This is what the author means by the abuse of power houses. The man who causes two blades of grass to grow where one only grew before is called a benefactor, but the local authority which deliberately allows two power houses to be built where only one is needed is a disturber of the peace.

It is very well affirmed by experience that the greater the plant and the larger and more continuous the output the cheaper is the cost of generation per unit. It may be said roughly, that if a given plant—say, 10,000 kW.—working at its maximum load on the average three hours a day, produces electrical energy at one penny a unit, it will do so at three farthings per unit if it works six hours a day, one-half penny per unit if it works 12 hours per day and less than one farthing per unit if it works 24 hours the day; hence, concentration of power is distinctly financially desirable if it has the effect of lengthening the daily maximum output of the plant. One large station, conveniently built on the water-side, where coal can be delivered alongside, by rail or sea, at its cheapest; where water is abundant and available for condensing; where ashes, clinkers and dirt are easily barged away; where we have one control and one staff, is clearly the ideal power house for economy. And it puts a stop to any cause of nuisance. The cartage of coal and rubbish does not impede traffic. Vapor clouds do not offend the eye, and apparent rain, in the form of condensed drops of water, does not damage one's garment or need the raising of umbrellas; vibration, noise and smells cease to be causes of vexation and litigation; additional chimneys do not disfigure the view. The question of securing a site is very much simplified. Hence comfort and convenience attest the value of the concentration of power plant in one locality.

In these days of high electrical pressure, whether continuous or alternating, the position of the power house is not a matter of serious import. In the early days of the new electrical industry it was a question of economy of distribution to place the working plant in the center of the area to be served, but now it is of little consequence where it is placed within a limit of a few miles.

The whole tendency of recent legislation has

*Paper read before the Incorporated Association of Municipal and County Engineers at a district meeting held at Yarmouth, Eng., June 11, 1893.

been to favor local authorities and to facilitate their acquisition or induce their acceptance of those municipal duties which include the conduct of industries which affect the whole community, like the supply of water, of light and of general locomotion. The success of the electric light industry in the hands of local authorities is beyond dispute, and some of our large cities are now taking up vigorously and with great spirit the working of their tramways by electric traction. The ultimate success must be the same.

These corporations, with their provisional order and their electric light installations, have already the legal powers and the means to supply electrical energy. This is their right, and a valuable property it is to them. No one contests their right to do it, but there are corporations who have not yet acquired the working of the trams in their localities, but who have the right and the means to supply energy, and in these cases the right to supply energy to tramways is contested. If it were to succeed, and the tramway companies allowed in all cases to build and work their own power houses, we should see the absurdity of two buildings existing where only one was needed, of two causes of nuisance perpetuated where none need exist, where the public would suffer from higher fares and the undertakers voluntarily accept the responsibility of generating their energy at a needless cost. The supply of energy to work the tramways would enable the undertakers to reduce the price per unit to the electric light users by probably 1d., while they could at the same time supply the tramway company, if such exist, as cheaply as the company can make it themselves. Moreover, when the time arrives for the local authorities to take over the tramways they would not be saddled with two power houses.

Teaching Through the Phonograph.

At the Philadelphia Electrical Exposition, the views of a number of prominent men on the accomplishments and possibilities of electricity are given by means of the phonograph, and many hundreds of persons, young and old, have been delightfully entertained in listening to these utterances which were recorded upon the cylinder as they fell from the lips of the authors. The following by Mayor Warwick of Philadelphia is one of these phonographic addresses:

"Electricity is the spirit of the earth, the air, the sea and the sky. It is everywhere in nature; it makes the dull insensate wire vibrate with living words. Man is beginning to bridle it, to control it, and to apply it to the common uses of life. The irresistible forces of the ocean tide and the rush of the mighty cataract are being used as the creative motive power for its distribution throughout the world. It annihilates time and distance, and is uniting the nations.

"If the phonograph had been known to the ancients, the Greek and the Latin tongues would not be dead, but living, and the speeches of the orators of the past—Demosthenes, Cicero and Hortensius—would be repeated, word for word, even showing the inflection of the voice, the articulation, emphasis and pronunciation of the words. A couplet of Wordsworth in which he writes, 'And Babylon hath perished utterly without in her speech leaving one word to aid the following that would lament her,' would then be out of form and place. Ancient languages of States long since departed, the civilization of which is marked only by crumbling ruins, would to-day speak a language as distinct in meaning and in phrase as any modern language of the earth.

"In commerce, in art, and in the everyday uses it is doing its work. The telephone, the telegraph, the phonograph and the kinesiograph are comparatively modern inventions. No one can predict the future of this great force in the civilization of mankind. Galileo, Faraday, Franklin and Edison are

names that will always stand high in the record of fame and add to the glory of mankind."

MEETING OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The Fifteenth General Meeting of the American Institute of Electrical Engineers is now being held in Omaha, Neb. The meeting was called to order at 10 A. M. on Monday, June 27, and an inaugural address delivered by the President, Dr. A. E. Kennelly of Philadelphia. Daily sessions are being held at 10 A. M. at which the following papers will be read:

"The Dielectric Strength of Air." C. P. Steinmetz, of Schenectady, N. Y.

"Two-Wire Distributing Systems and Lamps at 220-240 Volts." John W. Howell, of Newark, N. J.

"A Capillary Electrometer for Electrical Measurements." Chas. F. Burgess, of Madison, Wis.

"Alternating Current Transformers from the Station Manager's Viewpoint." W. F. White, of Omaha, Neb.

"Some Phases of the Rapid Transit Problem." Albert H. Armstrong, of Schenectady, N. Y.

"Preliminary Report of Committee on Standardization." Dr. Francis B. Crocker, chairman.

"Power Transmission and Distribution for Railway Work." Ernst J. Berg, of Schenectady, N. Y.

"The Commutated Curve of a Composite-Wound Alternator." D. C. Jackson, of Madison, Wis.

"Some Tests with an Induction Generator." A. F. McKissick, of Auburn, Ala.

"The Evolution of the Line Signal." Arthur V. Abbott, of Chicago.

"Alternate Current Working for Laboratory and Testing Purposes." Harris J. Ryan, of Ithaca.

"High-Voltage Power Transmission." Charles F. Scott, of Pittsburgh, Pa.

"The Education of Electrical Apprentices and Journeymen." Arthur A. Hamersohlag, of New York City.

"Air Gap and Core Distribution—The Magnetic Flux and Its Effect upon Regulation and Efficiency of Dynamo Electric Machinery." W. E. Goldsborough, of Lafayette, Ind.

"The Graphical Treatment of Alternating Currents in Branching Circuits, with Special Reference to the Case of Variable Frequency." Dr. H. T. Eddy, of Minneapolis, Minn.

"The Imperial Electric Light, Heat and Power Plant of St. Louis." George A. Damon, of Chicago.

Canadian Electrical Association.

The Canadian Electrical Association held its annual meeting at the Windsor Hotel, Montreal, on June 23. The following papers were read:

"How to Overcome Some of the Difficulties Encountered by Central Station Men." A. A. Wright.

"The Quimby Screw Pump." W. T. Bonner.

"Experiences of an Inspector." Dr. J. K. Johnstone.

"The Electric Current in the Rainy River Gold Mines." F. A. Bowman.

"Electric Utilization of Water Powers." Louis De Witt Magie.

"Economies in the Boiler Room." James Milne.

"The Unconscious Ownership of an Important Key—A Plea for the Introduction of Goods Traffic on Our Suburban Tramways." W. T. Bonner.

The General Electric Company will owe on July 1, 1893, \$1,488,200 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

LEGAL NOTES.

The Electrical Railway Equipment Company, a Virginia corporation, has filed suit in Washington against the Metropolitan Railway Company and the Capital Traction Company, asking for an injunction and an accounting. The plaintiff sets forth in the bill that it is the owner of a certain patent of a current collector for electric railways, invented by Frederick A. Anderson, and variously transferred until it is now held by the plaintiff company. It charges that both of the railway companies named are using in the underground electric systems operated in Washington a current collector of exactly the same design and pattern as that upon which the complainant holds the patent.

Judge Townsend, in the United States Court at New Haven, Conn., on the 20th inst., dismissed the bill of the Perkins Electric Switch Manufacturing Company against the Gibbs Electric Manufacturing Company alleging infringement of the form of an electric switch known as a snap switch.

Justice Lambert has appointed Albert C. Emmerick receiver of the Buffalo, Kenmore & Tonawanda Electric Railway Company. The appointment was made on application by Rogers, Looke & Milburn, attorneys for the Fidelity Trust & Guaranty Company, which holds a \$55,000 mortgage on which the company has defaulted.

Judge Lacombe in the U. S. Circuit Court handed down a decision on the 25th inst., granting a preliminary injunction in the case of the Sprague Electric Railway & Motor Company against the Nassau Electric Railroad Company of Brooklyn, N. Y., restraining the latter from using a car motor which is claimed to be an infringement of a patent obtained by Frank J. Sprague in 1885 and described in the specifications as "the combination of a wheeled vehicle and an electric dynamic motor mounted upon and propelling the same, the field magnet of said motor being sleeved upon an axle of the vehicle at one end and supported by flexible connections from the body of the vehicle at the other end." The defendant is ordered by the decision to remove at least 250 of the infringing apparatus within thirty days, and at least 250 more within sixty days, and the balance within 120 days from date of decision.

The Connecticut Supreme Court of Errors, in the case of the New York, New Haven & Hartford Railroad Company against the Fair Haven & Westville Railway Company (electric) has decided in favor of the steam road, holding that the latter is entitled to damages for the crossing of its tracks at grade on Bridge street, New Haven, by the trolley. Since this suit was begun the Legislature has passed a law prohibiting the establishing of any more grade crossings of steam and electric roads.

The attorneys for the Richmond Railway & Electric Company and the vice-president of the company, George E. Fisher, on the 21st inst., at Baltimore, secured an order from Judge Harlan of the Court of Common Pleas removing to the United States Circuit Court two suits docketed by the Virginia Electric Company of Baltimore to recover \$500,000 upon an alleged violation of contract to develop water power in Virginia from the James River.

Howard A. Engle, Dillwyn P. Roberts and W. Howard Holden, on behalf of themselves and the Penn Insulated Wire Company, at Philadelphia on the 20th inst. filed an answer in the Common Pleas Court to the equity suit recently begun by Albert Foulds to have a receiver appointed for the company. The Penn Insulated Wire Company is a New Jersey corporation, with a capital stock of \$150,000, divided into shares of \$25 each, and is engaged in the manufacture of all kinds of insulated wire, cables, paper tapes and insulated compounds for electrical purposes. Mr. Foulds recovered a judgment against the company on October 16, 1896, and issued a writ of fieri facias, which was returned nulla bona, and no part of the judgment was ever paid. Mr. Foulds then brought his suit, alleging that the defendant company has no assets except stock subscriptions, and that by reason of their stock subscriptions each individual defendant became liable to pay to the

company \$15,625. He believes, however, that they have paid in less than 5 per cent. of the amount, and avers that the board of directors has failed to call in the balance due on said stock subscriptions. He asked that a receiver be appointed; that the individual defendants pay the receiver the amounts due by each of them, and that his claim be satisfied out of the moneys so paid in. In the answer filed as above the defendants say that all of the stockholders of the company are not made defendants; that the bill contemplates an entire winding up and settlement of the affairs of the company, and that the court has no jurisdiction to entertain a bill to that effect, and that an assessment or calls upon the holders of stock can only be made by the directors of the company or by virtue of a decree of the Court of Chancery of the State of New Jersey.

In the cases of the Edison Electric Light Company against the Minneapolis International Electric Company and the Thomson-Houston Electric Company against the Minneapolis International Electric Company, before Judge Loohren of the United States District Court at Minneapolis, it was decided that the defendants were in no way connected with the E. G. Bernard Company, which was enjoined from manufacturing apparatus infringing on the complainants' patents, and that the defendant's demurrer is sustained. The Minneapolis company is therefore free to continue the use of the apparatus in question.

CANADIAN NOTES.

It is said that the Grand Trunk Railway authorities have not yet come to any definite conclusion regarding the adoption of electricity for hauling trains through the Sarnia tunnel.

The new copper wire of the Canadian Pacific Telegraph Company, in course of construction from coast to coast, was completed between Montreal and Winnipeg last week. The new line gives the Canadian Pacific Company greatly increased facilities between the Atlantic coast and the city of Winnipeg, Man.

The report of Mr. James Milne, the electrical expert employed by the city of Toronto to make a report on the cost of an electric power supply for street lighting and commercial purposes for Toronto, is against the city erecting a commercial plant. The expert reports that the data received from users of both electric and steam power is not to be absolutely relied on for the purposes of careful calculations, owing to the different bases upon which the various returns have been prepared. The summary of steam users shows a consumption of 16,802 horse-power, from which may be deducted 10,000 horse-power for the Toronto Electric Railway Company, electric light and incandescent light companies' plants, leaving 6,802 horse-power for commercial purposes. Of this amount, he says, nearly 1,000 horse-power could be supplied by electric power or gas as cheaply as at present, but for the remaining 5,809 horse-power it is useless trying to persuade the manufacturers to change from their present methods.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING PLANTS.

Bellaire, O.—The citizens have voted to issue bonds for the purpose of establishing an electric light plant.

Chamberlain, S. D.—The strong flow of water struck in the Government artesian well at the Indian School has suggested to the superintendent the use of the water for power purposes in operating an electric light plant, in irrigation, etc.

Detroit, Mich.—The Peninsular Electric Light Company has been reorganized with a capital stock of \$150,000. The principal stockholders are David Whitney, Jr., George Peck, James E. Clough, Hoyt Post, S. J. Murphy and S. Dow Elwood. Other stockholders are J. L. Hudson, George Wiley, Robert McMillan and Alex. Dow. The first board of directors are Messrs. Peck, Whitney, Dow, Clough and Post.

Elkton, Mich.—An electric light plant is to be established here.

Escanaba, Mich.—In 1895 this city purchased the local lighting plant, the price being \$70,000, which was

to be paid in ten annual installments. This year's payment has not yet been made, although due on June 1, the mayor having refused to sign the order for the money, and the plant may now revert to the former owners under the conditions of the contract. If it does the city will lose the three payments already made on the plant.

Hagerstown, Md.—President Christian W. Lynch of the Hagerstown Electric Railway Company has submitted a proposition to the street commissioners to furnish 90 arc lights to the city for \$7,000 a year if given a ten-year contract. At present the city is paying \$6,000 for 80 arc lights.

Kansas City, Mo.—An ordinance granting to C. S. Sweetland and E. J. Ingraham the right to construct and operate an electric plant for the furnishing of light, heat and power to consumers in Kansas City has been introduced in the upper house of the council. The petitioners offer a large reduction on present rates, 2 per cent. of the gross earnings to go to the city, and the right to purchase the plant in twelve years by the city at a fair valuation. The term of the franchise asked for is thirty years.

Lebanon, O.—This town has voted to buy its electric light plant, now owned by a private citizen, for \$20,000.

Nanticoke, Pa.—The People's Electric Light, Heat & Power Company, which has just been chartered, will acquire the Nanticoke Electric and Nanticoke Gas Companies' properties and conduct the business of both with a view to more amicable and economical operation.

New Orleans.—The committee on lighting has determined to advertise for bids for lighting the town with electricity for ten years from the expiration of the present contract in 1902.

Petoskey, Mich.—At the recent election the voters decided to bond the town for \$16,000 to buy the Petoskey Edison Electric Light Works of H. O. Rose.

Perkasie, Pa.—The Philadelphians, Ettinger & Co., who were granted a franchise to operate an electric light plant by the borough council, have forfeited their right. Perkasie and Sellersville may unite in building a plant to light the two towns.

Salem, Pa.—The electric light plant of the Heat & Power Company of this city was sold at public sale on the 26th inst. It was purchased on behalf of the directors of the company by Thomas Sinnickson, Jr., the consideration being \$5,000.

Salt Lake, Utah.—The Utah Power Company is about to enter the lighting field in competition with the Union Light & Power Company.

San Francisco, Cal.—The petition of the Mutual Electric Light Company for an order vacating the contract for public lighting awarded to the San Francisco Gas & Electric Company, after argument before Judge Seawell was taken under advisement by the court.

Spartanburg, S. C.—By order of the Circuit Court, the plant of the Etna Light & Power Company of this city, which has been in the hands of receivers since last November, is to be sold the first Monday in August. The receivers, A. H. Leftwich and H. B. Carlisle, are authorized to make the sale.

West Bay City, Mich.—Bids will be received up to the evening of July 7 for an incandescent 45 kw. dynamo for the city lighting station. The bids also call for an exciter, rheostat, voltmeter, ampere meter and double pole switch.

STREET RAILWAYS.

Ashtabula, O.—The board of county commissioners of Lake county has granted to the Pennsylvania & Ohio Railroad Company a fifty-year franchise to build and operate an electric street car line to extend east from Painesville, via North Ridge, Middle Ridge and Narrows road, to the east line of Lake county. The company is required to furnish a \$20,000 bond to have the road built and in operation by July 1, 1900. Ashtabula county has already granted a franchise to the same company and the franchise granted in Lake county insures a continuous street line from Cleveland to Ashtabula.

Atlantic City, N. J.—An ordinance has been introduced in council giving the New Jersey Electrical Railroad Company the right to build an elevated roadbed into the city from the city limits. The company contemplates building a railroad from Camden to Atlantic City.

Brooklyn, N. Y.—President Frederick Uhlmann of the Brooklyn Elevated Railroad announces that the Fifth avenue branch of the road will be electrically equipped with the third-rail system this fall. As soon as this line is opened the work of electrically equipping the other lines of the company will be pushed, and in two years from the commencement of the work, according to the present programme of the managers, the entire road will be operated by electricity.

Burlington, Vt.—The "News" says there is a good prospect that the electric railway from Bethel to Rochester will be built.

Chicago.—The Chicago Electric Traction Company has been granted a twenty-year franchise to operate a trolley line in the town of Worth to the Calumet and Mount Olivet cemeteries.

Chattanooga, Tenn.—The Chattanooga Rapid Transit Company is experimenting with a Patton motor car

with a view to adopting that system if it proves satisfactory.

Cleveland, O.—The suburban electric railway companies have received notices from the express companies that after July 1 the latter would withdraw their messengers and handle no more express matter on suburban cars. The move is understood to be in the interest and at the dictation of the steam railroads, and the street railway people propose to form an association and handle the express matter themselves.

Du Bois, Pa.—Eastern capitalists are considering the feasibility of constructing an electric railway from Clarion to Du Bois, passing through Strattonville, Corsica, Brookville, Emericksville, Reynoldsville and Rathmel.

Fairmount, W. Va.—An effort is being made to secure sufficient local subscriptions to the stock of the proposed electric railway from Monongah to Fairview to warrant the promoters and capitalists interested in proceeding with the work.

Frederick, Md.—A deal has been made between the Myersville & Catoctin Electric Railway Company and the Frederick & Middletown Electric Railway Company whereby the latter will lease the former company's line when it is finished and operate it along with its own line.

Framingham, Mass.—The bill to incorporate the Marlboro, Southboro and Framingham Street Railway Company has passed both branches of the Legislature, and this being the case it should soon be possible to travel from Worcester to Boston by trolley.

Fort Scott, Kan.—The Davenport, Ia., owners of the street railway lines in this city, for a consideration of \$180,000, have deeded the entire plant to the Citizens' Railway Company, composed of Fort Scott men. The change in management has already taken place.

Hackensack, N. J.—The Bergen County Traction Company has completed the survey for the route from Leonia to Hackensack, and work on the construction will begin at once.

Mt. Holly, N. J.—The fight between the rival trolley companies in Burlington county is to be renewed at the next meeting of the board of freeholders. For some time past, the representatives of the two corporations—the New York & Philadelphia and Monmouth Companies—have been trying to pool their issues and effect either a consolidation or a division of the disputed territory, but a few days ago all negotiations were declared off, and it will now be a fight to a finish.

Neenah, Wis.—It is rumored that several of the city's monied men are having a street railway franchise prepared and will present it to council in a few days. There seems to be no doubt of the favorable action of council when the matter is brought before it.

Newport, R. I.—The electric railway between Newport and Fall River has been opened for public traffic. The Providence "Telegram" says the construction of the line is undoubtedly the best in New England; the tracks heavy and delightful to ride over; the cars almost like palace cars, with plenty of room, and the overhead work a model of wire system.

Norfolk, Va.—It is understood that a deal has been consummated by which three local trolley companies have been consolidated. The companies are the Norfolk Street Railway Company, the Norfolk & Ocean View Railroad Company and the Norfolk, Willoughby Spit and Old Point Railway Company. The deal was arranged by F. Lancaster Williams of Richmond.

Sandusky, O.—Clark Rude, receiver of the Sandusky Street Railway Company, advises that he will sell in Sandusky on the 9th of July, by order of the Court of Common Pleas, all the property, rights, privileges and franchises of that company, of which Rollin B. Hubbard and Jay O. Moss are trustees.

Washington, D. C.—Mr. Richardson has introduced a bill in the House providing that the Capital Railway Company of this city be authorized to change its name to Washington City Railway Company.

Westminster, Mass.—The Westminster & Fitchburg Street Railway Company has petitioned the selectmen for a re-location of franchise in this town, and the hearing will be held July 5.

Wichita, Kan.—At a recent meeting of the city council Mr. Reese, chairman of the street railway and franchise committee, reported that he had received a letter from an Eastern party who he felt certain would take hold of the street car line here and build a first-class road, fully equipped, providing he received a lighting franchise for a term of years. B. A. Ward, manager of the Wichita Gas, Electric Light & Power Company, has made a similar offer.

TRANSMISSION PLANTS.

Utica, N. Y.—The "Observer" states that the company which proposes to utilize the waters of West Canada Creek in generating electricity has been organized under the name of the Newport Electric Light & Power Company. Its operations at present will be limited to supplying the village of Newport with light and power, but a dam is to be built which will give about 4,000 horse-power, enabling the company to furnish electricity to several villages in the neighborhood, and for the operation of an electric road. Eventually power will be transmitted to Utica, a distance of about 13½ miles.

MANUFACTURING, ETC.

Baton Rouge, La.—A bill has been introduced in the House which provides that for conducting the business of supplying electric lights, or electric power, renting or hiring motors, fans, or other electric appliances or machines, each company shall pay an annual license of \$5 upon each \$1,000 of gross receipts from such business.

Bridgeport, Conn.—The Bryant Electric Company is erecting an engine room in rear of its factory which with its equipment will cost over \$12,000. The "News" says the company intends to have nothing but the most improved patterns in boilers, engines and dynamos and is sparing no money in its effort to procure the best obtainable.

Denver, Col.—The Colorado Gilsonite Company, who are developing the gilsonite deposits in Middle Park, have begun regular shipments from Empire, to which the crude material has to be hauled 54 miles from the mines. The company has made arrangements to ship 20 tons a day and already has contracts for the delivery of 4,500 tons to manufacturing establishments in the East. The principal use to which gilsonite is devoted is the manufacture of water-proof paint. It is used to paint the bottoms of iron ships, not only preventing the corrosion of the metal and reducing the friction of the water, but lessening the difficulties resulting from the fouling of the bottoms with barnacles and seaweed. It is also used for painting the faces of sea walls, preserving the stone from the action of the water, and for treating the timbers used for piling to prevent their destruction by the teredo, for coating fence wire, for insulating electric wire and for a number of other purposes.

New York.—The strike in the shops of the Bullock Electric Company at Cincinnati, which has been going on for several weeks, has extended to this city, where the International Association of Machinists has taken up the cause of the strikers and is obstructing the operations of the company. The Bullock Company has applied to the courts for relief.

Victor, N. Y.—The firm of F. M. Locke & Co., manufacturers of porcelain insulators and insulation pins, have determined to establish a factory here, sufficient inducement having been offered. Recent tests made of the earth about Victor showed that it was of the description necessary for the manufacture of the grade of porcelain required.

Washington, D. C.—The District Appropriation bill has been reported to the House, containing, among others, the following items: For the complete equipment of the central stations of the fire alarm system, including provision for thirty box circuits and ten alarm circuits, equipped with all modern appliances, to take the place of the present system, \$21,500; necessary cabinet work for mounting the same, \$3,000; storage battery system, to take the place of the gravity battery system now in use, \$3,500; replacing sixty old fire alarm boxes which have been worn out with sixty new modern boxes, \$8,000; placing in eighty boxes standard cut-outs, to prevent their being destroyed by lightning or other electrical disturbances, \$1,000; for twenty visual indicators, to be placed in the engine houses for recording visually alarms received, to prevent any errors in responding to fires, \$2,500; in all, \$37,500.—Hugo Donzelman, U. S. Consul at Prague, writes that "Bohemia, being the most productive State of the Austrian Empire, will gradually but surely advance in internal improvements. So far but little has been done, and the field is open; especially is this the case with electric roads, elevators and electric lights. There are in my district a number of electric street car lines projected, and I believe that with the proper effort United States contractors could successfully compete in this line; at least our firms could furnish the necessary machinery. The horse-car line now in Prague is to be changed into an electric line and to be extended. The city of Pilsen will also construct electric lines. I would suggest that our manufacturers take steps to investigate the possibility of getting their share of this business. I think that some one thoroughly conversant with this line should visit the various places, in order to be able to give figures and offer bids."

MINES.

O'Fallon, Ill.—The management of the Bennet mine is making preparations to install a system of electric haulage. Electric lights will also be added.

ELECTRICIANS IN THE WAR.

Joseph Steinmetz has been appointed First Lieutenant in the First Volunteer Engineer Regiment.

PERSONAL AND MISCELLANEA.

Charles S. Bidwell, until recently superintendent of the Warren (O.) electric lines, has accepted an important position with the company operating the railway from Asbury Park to Pleasure Bay, N. J.

Frank A. Phillips, an electrician of Brooklyn, N. Y., was drowned in the Hudson River, near New York City, on Saturday last. A sloop yacht in which he and others were sailing was capsized by a squall. All were rescued but Phillips.

Information has been received at Louisville, Ky., that Lieutenant William W. Harts, United States Army, who was injured by a premature explosion of a torpedo near Jacksonville, Fla., has been left deaf and blind from the shock. He is now in the Marine Hospital at

Jacksonville. J. J. O'Rourke, an electrician, and an assistant were killed by the explosion that caused Lieut. Harts' injuries.

D. O. Hull, electrician of the Port Clinton (O.) Light & Power Company, has secured a patent for "an alternating current regulator and alternating arc light system," which the local journals say has been pronounced a success by electrical experts. "This invention," says the Oak Harbor "Press," "makes it possible to run arc lights from an alternating incandescent dynamo independent of transformers and incandescent lights, reducing cost of construction and using and requiring only one dynamo, doing away with the service of an arc light machine."

The Chillicothe Street Railroad Company has discharged all its male conductors and placed women conductors on its cars. The women selected for this service are said to be all quite good-looking, as only those of "fine personal appearance" have any chance of getting the job. It is reported that the receipts of the road have increased since the change was made, owing to an influx of visitors from adjoining towns, principally from the ranks of the slighted sex.

RECENT COMPANY ELECTIONS.

Consolidated Car Heating Company, Albany, N. Y.—The old board of directors was re-elected with the exception of A. S. Hatch of New York who gives way for Hon. James W. Hinckley of New York.

Passaic & Newark Electric Traction Company, Passaic, N. J.—Directors: Bird W. Spencer, George W. Waite, Frank M. Stillman, William G. Shaller, William J. Davis, Percy Ingalls and John F. McArthur.

Siemens & Halske Electric Company of America, Chicago, Ill.—President, Charles E. Yerkes; secretary and treasurer, W. T. Block; assistant secretary and assistant treasurer, C. F. Marlow; general manager, B. W. Grist; directors: Charles T. Yerkes, Martin Maloney, John E. Bartlett, R. S. Grant, Charles E. Yerkes, E. A. Moore, B. W. Grist, Howland Colt, W. L. Elkins, Jr.

Metropolitan Street Railway Company, Kansas City, Mo.—President and treasurer, C. F. Morse; vice-president and general manager, W. H. Holmes; assistant general manager and general superintendent, C. F. Holmes; secretary, L. C. Krauthoff; assistant secretary and assistant treasurer, J. A. Hardee; directors: C. F. Morse, C. B. Armour, C. F. Adams, of Boston; W. H. Holmes, C. F. Holmes, Wallace Pratt, P. A. Valentine, of Chicago; L. E. James and Chester A. Snider, Kansas City.

Suffield & East Granby Street Railway Company, Suffield, Conn.—President, E. A. Fuller; secretary, George P. McLean; treasurer, Edmund Halladay.

Vermont Electric Company, Burlington, Vt.—President, A. E. Richardson; vice-president, Edward A. Pope; secretary and treasurer, A. C. Whiting; manager, Walter S. Vincent.

Wilmington & Brandywine Springs Electric Railway Company, Wilmington, Del.—President, Robert C. Justice; secretary and treasurer, Dr. L. H. Ball; general manager, Richard W. Crooks; directors: Joseph H. Coates, George W. Atmore and the officers.

COMMERCIAL PARAGRAPHS.

A New Belt Dressing.

There has been a growing demand among belt users for a more convenient form of belt dressing than the paste. The Joseph Dixon Crucible Company, Jersey City, N. J., are now placing on the market a solid belt dressing in round bars, about 8 inches long and 2 inches diameter. It makes a package convenient to the hand, and easy to apply even to fast running belts. The company does not claim that the solid dressing is as good a preservative of the life and elasticity of the leather as the Dixon paste, but it is quick to apply and quick to act, and that is what is wanted by the general run of belt users.

The Corrugated Copper Gaskets manufactured by the U. S. Mineral Wool Company, No. 6 Cortlandt street, New York, are rapidly coming into favor and displacing all other kinds heretofore in use. The advantages of this make of gasket are readily seen on examination. The gaskets consist of thin sheet copper stamped with concentric corrugations and may be used in place of rubber or other destructible materials in general packing. Three to six corrugations are all that are necessary, so that the space within the bolt holes usually determines the width of the gasket. In cases where the flanges are thin, and for this reason liable to bend when the bolts are tightened, it is advisable to extend the copper gasket to the full width of flange. This will, of course, require the cutting of bolt holes in the gasket. Connections made with these gaskets will not blow out after continued use, for each corrugation makes the entire circle of the flange, and so long as the contact is kept complete by compression the joint cannot leak. This gasket never blows out like rubber. It may be put in place while steam is leaking through valve, and it answers well on pipes in which steam is alternately on and off, for it is not impaired by the repeated expansion and contraction. These corrugated copper gaskets are said to be superior to all other devices for lip unions, flange unions, plain and ball joints, connecting steam, air, gas or water pipes; also for cylinder heads, steam chests, etc. The prices at which they are offered are very reasonable. A price list will be furnished by the company on application.

INCORPORATIONS.

The Orange & Passaic Valley Railway Company, Newark, N. J. Capital stock, \$1,000,000. Incorporators: Ohas. A. Sterling, of East Orange; William Scheerer and John A. Ely, of Orange; Albert B. Carlton, of Elizabeth, and Bird W. Spencer and Thomas M. Moore, of Passaic.

The Seattle Gas & Electric Company, Seattle, Wash. Capital stock, \$1,000,000.

The Oshkosh-Omro-Berlin Electric Railway Construction Company, Oshkosh, Wis.—to build an electric road to connect the places mentioned in the title. Capital stock, \$25,000. Incorporators: J. A. Jenkins, S. W. Hollister, John Hinebaugh, Nathan Payne, Jay Hume, W. J. Wagstaff, R. C. Russell, A. B. Ideson and Charles Barber.

The Columbia Traction, Light & Power Company, Columbia, S. C.—to buy and own the entire street railway system and electric lighting plant in Columbia. Capital stock, \$500,000. Incorporators: I. L. Withers and F. H. Weston, of Columbia; F. F. Williams and Willet Hazard, of Buffalo, N. Y.

The Rockford Electric Light & Power Company, Rockford, Ill. Capital stock, \$50,000. Incorporators: F. M. Ellis, W. E. Dewey and C. F. Warner.

The Bloomington & Normal Street Railway Company, Bloomington, Ill. Capital stock, \$250,000, one-half of which is represented by A. E. DeMange and the other half by John Graham.

The People's Electric Light, Heat & Power Company, Nanticoke, Luzerne County, Pa. Capital stock, \$75,000.

The Eberle Construction Company, New York City—to construct and equip railways to be operated by electricity and steam. Capital stock, \$4,000. Directors: David Longecker and Charles R. Eberle of Philadelphia, Edwin C. Stout, Alva Oatman and Thomas A. Matthews of New York City.

ELECTRICAL PATENT RECORD.

LETTERS PATENT ISSUED JUNE 21, 1898.

ELECTRIC RAILWAYS AND RAILWAY APPLIANCES.

603,970. Electromagnetic-Switch Railway. Addison Norman, Toronto, Canada. Filed July 3, 1897.

606,156. Device for Attaching Fenders to Cars. Christian Sauerbrey, Owego, N. Y., assignor of one-half to Theodore D. Gere, same place. Filed Oct. 4, 1897.

ELECTRIC LIGHTS AND APPLIANCES.

606,108. Electric-Arc Lamp. Frederic Wright, Newburg, N. Y. Filed Oct. 7, 1897.

606,127. Electrode for Arc-Lights. Charles S. Dolley, Philadelphia, Pa., assignor of one-half to Howard T. Goodwin, same place. Filed Nov. 21, 1896.

ELECTRICAL MACHINERY AND APPARATUS.

603,850. Electric Motor. Frederick E. Briner, St. Louis, Mo., assignor to the Emerson Electric Manufacturing Company, same place. Filed Aug. 21, 1897.

605,862. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Filed May 20, 1897.

635,915. Electric Clock-Controlled Switch Mechanism. Robert W. Rollins, Hartford, Conn. Filed Sept. 27, 1897.

605,919. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Filed June 24, 1897.

605,953. Controlling Mechanism for Electric Motors. George Gibbs, Warren S. Johnson and Henry Winkler, Milwaukee, Wis. Filed May 10, 1897.

603,007. Composing-Machine for Type-Casting and Setting-Machines. George A. Goodson, Minneapolis, Minn. Filed Sept. 27, 1897.

605,009. Electric Controller. Marshall W. Banks, Madison, Wis. Filed Dec. 17, 1897.

606,012. Electric-Current Controller. John J. Hogan, New Haven, Conn., assignor of one-fourth to Thomas W. Corbett, same place. Filed July 15, 1897.

606,015. System of Electrical Distribution and Regulation. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Feb. 10, 1898.

606,033. Means for Compensating for Temperature Resistance-Changes. Charles F. Scott, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company, same place. Filed Jan. 21, 1898.

603,036. Alternating-Current Electric Motor. Robert H. Hassler, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company of Pennsylvania. Filed Sept. 6, 1895.

606,076. Electric Alarm System. Albert Ovenden, Akron, Ohio. Filed Sept. 24, 1897.

606,167. Electric Brake. Ernst W. G. C. Hoffmann, Charlottenburg, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Dec. 29, 1897.

606,171. Shunt for Electric Circuits. Oliver B. Shallenberger, Rochester, Pa.; Mary W. Shallenberger, executrix of said Oliver B. Shallenberger, deceased. Filed April 22, 1897.

TELEPHONE AND TELEGRAPH APPARATUS.

605,913. Telephone-Transmitter. Forest A. Ray, Boston, Mass. Filed Aug. 18, 1897.

606,162. Telephone-Exchange System. William W. Dean, St. Louis, Mo., assignor to the Bell Telephone Company of Missouri, same place. Filed Feb. 6, 1897.

SIGNALS AND SIGNALING APPARATUS.

605,941. Electric Block-Signal System for Railways. Louis C. Werner, Broad Brook, Conn. Filed July 22, 1897.

013. Signal-Alarm. Frederick Bossert, Detroit, Mich., assignor of one-half to John E. F. Uthes, same place. Filed Dec. 6, 1897.

MISCELLANEOUS.

605,845. Electrolytic Production of Amalgams, etc. Emile Andreoli and Gabriel Andreoli, London, England. Filed Sept. 7, 1895.

605,842. Electrically-Heated Charge for Cartridges or Shells. Lindon W. Bates, Chicago, Ill. Filed June 30, 1896. Renewed Nov. 18, 1897.

605,928. Device for Metal Straightening and Cutting-Off Machines. Franklin B. Shuster, New Haven, Conn. Filed May 21, 1897.

606,143. Alarm-Clock. Frederick D. Hoehl, Pittsburg, Pa. Filed July 19, 1892.

TELEPHONE AND TELEGRAPH.

Association of Railway Telegraph Superintendents.

This Association met in Omaha, Neb., on the 15th inst., and elected the following officers for the ensuing year: President, W. W. Ryder, of the Chicago, Burlington & Quincy, Chicago; vice-president, L. B. Foley, of the Delaware, Lackawanna & Western, New York; secretary and treasurer, P. W. Drew, of the Wisconsin Central, Milwaukee. After the election of officers and the reading of committee reports, several interesting papers were read and discussed. The first was a paper on "Unnecessary Telegraphing on Railway Lines," by C. S. Rhoades of Indianapolis. K. Mackenzie of the Baltimore & Ohio next presented a paper on "Construction and Maintenance of Telegraph Lines Along Railways." E. A. Chenery of St. Louis read a paper on "Installation of Telephone Plants at Large Terminals," and the last topic, "Remarks on the Feasibility of Combining Telephone and Telegraph Circuits by Using the Same Wires," was introduced by C. Selden of the Baltimore & Ohio Railroad. On the 16th the meeting adjourned sine die after discussing a report made on the advantage of the use of low resistance relays on heavy railway wires, and the appointment of the following committees:

On Topics for Discussion at the Next Annual Meeting—J. S. Evans, Cleveland; H. C. Sprague, Kansas City; E. A. Chenery, St. Louis.

On Arrangements—W. F. Williams, Portsmouth, Va.; C. A. Dorton, Washington, D. C.; W. C. Walstrum, Roanoke, Va.

An informal reception was tendered to the Association on the evening of the 15th by J. J. Dickey at his residence. About 100 guests were present, and the company had the pleasure of listening to a concert in progress in a palm garden at Milwaukee, a number of long distance telephone receivers having been placed in the drawing-room for that purpose. The following is a list of the persons from abroad attending the meeting of the Association: C. F. Annett, wife and daughter, S. A. Mason, H. M. Sperry, W. W. Ryder and wife, Mrs. C. H. Bristol, Eugene W. Vogel, Chicago; Miss F. B. Terhune, Salt Lake; Mrs. M. B. Leonard, Richmond, Va.; J. B. Taltavall, New York; W. T. Williams and wife, Portsmouth, O.; Charles Selden and wife, Miss Imogene Selden, Baltimore; P. W. Drew and wife, Milwaukee; J. S. Evans and wife, Cleveland; Ed. Warner, Mrs. E. R. Warner, Jackson, Mich.

The next annual meeting will be held at Wilmington, N. C., July 19, 1899.

The New Orleans *Picayune* states that there is every indication that the new telephone company will begin work at an early day in that city. William P. Curtis, vice-president and general manager of the new company, has recently returned from Detroit, whither he had gone to hold a conference with the Detroit Telephone Company, whose system it is proposed to establish in New Orleans, and spoke to a *Picayune* representative hopefully of the prospects. He thought that when the proposition is actively canvassed in the city the minimum limit of subscribers will be speedily reached. Nearly 2,000 have already signed, and as the charges are only half of the Bell Company's rates, an early and large addition to the list is anticipated. Mr. Curtis is reported in the *Picayune* as saying: "The Bell Company have been flooding this town with all sorts of circulars, calling attention to the fact that they were the only people on earth, and that all other telephone companies were green-goods people and bunco-steerers, and warning every one to keep padlocks on their pockets when any other company but theirs came to town. You notice that this last circular, with one of which I have been favored, devotes its particular attention to the company which is coming here, and says all sorts of disparaging things about it. Well, all I can say from my recent trip to Detroit is this, even if the Bell people are the only ones on earth and entitled to an iron-clad monopoly of the telephone business, the new company is going to make them know that they are here, if they do them as they have done them in Detroit. The people who are putting in the new system here have a system in operation in that city, and they have about two 'phones to every one 'phone owned and operated by the Bell people. I sincerely believe that this town is ripe to get out of the clutches of the monopoly."

The Board of Fire Commissioners of Detroit, Mich., have instructed their secretary to correspond with telephone manufacturers with a view to getting estimates for the construction of an independent telephone line for the department. The appropriation of \$5,500 by the Board of Estimate for this purpose is thought to be sufficient to equip the department with 60 telephones of the improved make.

The Oregon Telephone Company, which has for some time been making preparations for closing up the gap in its long-distance service between Portland, Ore., and San Francisco, has now large gangs of men at work pushing the construction vigorously from each end. The completion of the line between Portland and San Francisco will

connect the long-distance systems of the Northwest and California, and make one system covering the whole Pacific coast, and forming one of the most extensive and complete long-distance telephone systems in the world. It will bring Portland in direct communication by telephone with every town of importance from Vancouver, B. C., on the north, to San Diego, Cal., on the south, and via Spokane and Boise City as far as Salt Lake City on the east.

The Franklin County Telephone & Telegraph Company was organized at Chambersburg, Pa., on the 21st inst., with a capital of \$40,000. A long distance telephone line will be built in town and over the county to compete with the Pennsylvania Company line now in operation. Enough subscribers are insured to make it a success. The following officers were elected: President, D. K. Appenzeller; secretary, H. B. McNulty; treasurer, Dr. David MacLay; advisory board: Hon. T. M. Mahon, D. L. Grove, Isaac Leasher, W. L. Minick, John C. Gerbig, Dr. J. O. Skinner; directors: Dr. R. W. Ramsey, A. N. Pomeroy, Alexander Stewart, H. E. Hultsizer, T. J. Kennedy, R. S. Smiley, A. S. Stover, W. C. Hull, John Zullinger, C. O. Gelwicks, Christian Brechbill. A charter has been applied for.

It is stated that the Bell company is getting the best of the fight at Three Rivers, Mich. The home company, it seems, got all the business people to agree not to use Bell phones, but the Bell people have secured such a large residence list that the merchants, in answer to demands, began to replace their old 'phones in their business places. The home company has put up a good fight, but as the field is limited, only one company can exist in the place and pay a profit on investment.

The telephone system is being largely extended in Japan, a survey having been completed for a proposed line between Tokyo and Osaka, upon which the work will soon be commenced. It is gratifying to know that a large number of orders for overland telephone cables have been placed with American firms.

The Magnetic Club of New York, composed of representatives of telegraphic lines, held their twenty eighth annual summer outing and dinner at College Point on the 22d inst. The day was thoroughly enjoyed by a large number of members, many coming from distant cities to meet with their fellows.

A Wilmington, N. C., paper states that the Southern Bell Telephone & Telegraph Company will advance its rates in that city on the 1st of July. Office 'phones after that date will cost \$30 a year, instead of \$20 as formerly, and residence 'phones will be increased from \$15 to \$18.

The American Long Distance Telephone Company has secured right of way through the principal counties and cities and will build a line from St. Louis to Evansville, Ill., making a complete circuit with Chicago and New York.

Col. C. E. McCluer, late superintendent of the Bell Telephone Company, Richmond, Va., has been appointed general manager of the Richmond Telephone Company. The appointment takes effect July 1.

New Companies Incorporated.

The Eureka & Mound City Telephone Company, Eureka, S. D. Capital stock, \$2,000. Incorporators: F. W. Boettcher, Walter C. Poehler, Eureka; Louis H. Clyborne; Chauncey E. Eckhart, Mound City; Alvin H. Poehler, Minneapolis, Minn.

The Ogle County Telephone Company, Rochelle, Ill., certified to an increase of capital stock from \$5,000 to \$10,000.

The Belvidere Telephone Company, Belvidere, Ill., has certified to an increase of capital stock from \$10,000 to \$25,000.

The Kendallville & Cresco Farmers' Telephone Company, Kendallville, Ia. Capital stock, \$360. Incorporators: C. C. Brown, Thomas Heines and M. H. Culbert.

The Lawrence Telephone Company, Ashland, Ky., has increased its capital stock from \$12,000 to \$24,000.

The South Missouri Telephone Company, Pierce City, Mo. Capital stock, \$20,000. Incorporators: R. J. Armstrong, G. E. Armstrong, Albert Newman and others.

The Illinois Telephone and Telegraph Company, Chicago. Capital stock, \$250,000. Incorporators: Ralph N. Bowman, Samuel N. McLaughlin and Thomas J. Holmes.

The Atchison Telephone Company, Atchison, Kan. Capital stock, \$20,000. Directors: E. H. Berry, O. D. Walker, George Storck, J. T. Hersey and S. A. Frazier.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 11½@12c.; casting, 11½@11½c.

The Consolidated Car Heating Company, Albany, N. Y., has declared the regular semi-annual dividend of 1½ per cent., payable August 15.

Work is being pushed on the Rockaway Beach branch of the Brooklyn elevated road and the line is expected to be in operation by July 15.

At a meeting of the directors of the Consolidated Railway Company in Baltimore on the 23d inst. a semi-annual dividend of 2 per cent., payable July 15, was declared.

The Philadelphia & West Chester Traction Company will meet on August 23 to vote on a proposition increasing its indebtedness from \$60,000 to \$400,000 by the creation of a mortgage.

The directors of the Metropolitan Street Railway, New York, have declared a dividend of 1½ per cent. on the stock of that company, payable July 15. Books closed June 27.

The directors of the Westinghouse Electric & Manufacturing Company have declared a quarterly dividend of 1½ per cent. upon the preferred stock of the company, payable July 1 to stockholders of record. Transfer books will reopen July 2.

The Edison Electric Illuminating Company of Brooklyn, N. Y., reports for May: Gross earnings, \$87,901, increase over same month in 1897, \$1,817; net, \$29,467, increase \$1,673; five months, gross, \$373,270, increase \$18,907; net, \$172,551, increase \$6,207.

The "Financial Chronicle" says: "The report that the Chicago City Railway Company will issue \$2,000,000 of new stock to defray the cost of the \$950,000 General Electric Railway and other expenditures, is officially denied, but there is a disposition to look upon the denials as more or less 'technical.'"

The injunction proceedings brought in the United States Circuit Court at Chicago by Charles A. Bates, to prevent the General Electric Railway Company and Lucius Clark and others from disposing of 20,000 shares of stock in the company which Bates claimed were his property have been dismissed by Judge Grosscup.

The Boston "Journal" states that "a majority of the General Electric Company's preferred stockholders are reported to have assented to the committee's plan for the remedying of the capital impairment." It does not state what the committee's plan is. The "Globe" states that exclusive of 100 stockholders the stock is divided into very small lots.

The "Daily Philadelphia Stockholder" has evidently felt some of the quickening effects of the war. It has lately appeared in an entirely new dress and made improvements in its various departments that place it on a par with the best daily financial newspapers published in this country. We congratulate our contemporary on these tokens of appreciation and prosperity.

The directors of the Metropolitan Street Railway Company, New York, have decided upon an increase of the capital stock of the company to \$40,000,000 by an additional issue of \$10,000,000. Of the proceeds of the new stock \$6,000,000 will be used in the retirement of outstanding debentures and the balance will be expended in the change of motive power on the Sixth and Eighth avenue lines by the substitution of the underground electric trolley for horse power.

"By clever detective work," says the Philadelphia "Times," "what is said to be an organized band among conductors to defraud the Consolidated Traction Company of Pittsburgh has been unearthed. A large number are supposed to be implicated in the conspiracy and numerous arrests are expected. Conductors William J. Flower and William M. Lasdusky have already been arrested, and the latter made a confession implicating a number of his associates. The scheme to defraud, it is said, was worked at transfer stations in this way: A car coming to the station with twenty passengers would have probably five transfers. The conductor would slip his confederate ten transfer slips, which would be turned into the company as cash. The proceeds of the day's stealings were divided later. The company officials claim that thousands of dollars have been taken from them in this way, and they believe similar schemes are being worked in other cities."

A special to the New York "Commercial," dated Philadelphia, June 24, states as follows: "Charles H. Schermerhorn, when asked to-day about his purpose in incorporating the Overland Telegraph Company, said that it was the intention of the incorporators to introduce a new system of telegraphy which would revolutionize the business. He also stated that he was not prepared yet to disclose to the public the secrets of the new system. Mr. Schermerhorn, who seems to be the leading spirit of the new company, is secretary of the Niagara Mining & Smelting Company. Gilbert Palen, another incorporator, is a physician who is interested financially in some of Mr. Schermerhorn's enterprises. Samuel B. Schrach is a dealer in undertakers' supplies, and J. A. Longstreet is a salesman."

An order approving a new or modified contract made between Bridge Commissioner John L. Shea and Frederick Uhlmann, receiver of the Brooklyn Elevated Railroad Company, and which turns over the tracks of the bridge railroad to the use of the elevated company, to be operated under the supervision of the Bridge Commissioner, was signed by Justice Maddox in the Supreme Court in Brooklyn on Monday last. All the parties to the action consented to this course. But one fare is to be charged for passage over the bridge and to any point in Brooklyn. If there should be a loss in the operation of the local railroad it shall be assumed by the "L" companies. The "L" roads must furnish their own motive power, as well as that of the local railroad, and defray all expenses, including repairs. If there is a profit, the city is to receive 5 per cent. of all profits amounting to \$10,000 or upward in a graded scale, reaching 25 per cent. on \$150,000 or over. For the additional use of the railroad track an annual rental of \$20,306.28 is to be paid. Ten cents per car is to be paid by the company for each round trip. This revenue shall not fall below \$250 a day.

In the Supreme Court on the 22d inst. Justice Bischoff vacated the temporary injunction obtained by James J. Phelan, a shareholder in the Municipal Electric Light Company of Brooklyn, N. Y., restraining the Edison Electric Illuminating Company of Brooklyn from carrying out the agreement made with the majority of the stockholders of the Municipal Company to purchase the shares of these stockholders. After the decision was handed down the Municipal Electric Light Company issued a circular giving the terms of the sale of its stock to the Edison Electric Illuminating Company. The Edison Company is to give the Municipal Company stockholders either cash or new consolidated mortgage bonds, 200 per cent. of the par value of their stock. In addition, the Edison Company is to deposit \$250,000 of the new bonds to be used in defraying all the debts and obligations of the Municipal Company. When such debts are paid, whatever amount is left over is to be divided among the stockholders of the Municipal Company. The circular estimates that this amount will be about 10 per cent. on the stock. The Municipal stockholders are also to receive the July dividend of 2½ per cent. on their stock. The new consolidated mortgage bonds of the Edison Company will be secured by a first lien on the stock of the Municipal Company to be purchased, and by a general mortgage on the property of the Edison Company, subject to the present first mortgage, which can be paid up in 1900 at 110. When that is done the consolidated mortgage will be a first lien upon all the company's property. The Municipal Company stockholders are requested to deposit their stock with the Manufacturers' Trust Company. In case the deal is not completed by August 1 stockholders will be entitled to the return of their stock, together with a pro rata share of the \$15,000 deposited by the Edison Company, after deducting the expenses incurred by the stockholders' committee.

EDITORIAL NOTES.

The United States Export Trade.

The export trade of the United States is undergoing a transformation which promises to influence the whole economic future of the country. As is well known, this country has reached the foremost rank among the industrial nations. For a number of years its position as the greatest producer of manufactures has been undisputed, but absorbed with its own internal development, and satisfied for the time being with the enormous home market of some 70,000,000 of people, it has until recently devoted but little concerted effort to the sale of its manufactures and machinery outside of its borders. Recently, however, the fact has become more and more apparent that the output of the United States manufacturers, developed by the remarkable inventive genius and industrial skill of our people with a rapidity which has excited attention throughout the great centers of manufacturing activity in Europe, has reached a point of large excess above the demands of home consumption. Under these circumstances it is not surprising that our manufacturers are looking to other countries for their markets, and especially is this the case among manufacturers of machinery and electrical apparatus. The conditions of export trade are therefore now being studied by every manufacturer who is confronted by the problem of finding new outlets for his products. Many lines of manufacture, and especially American electrical apparatus, have already been introduced into European countries of long-established pre-eminence, and are finding ready sale in competition with their own home products. This apparent phenomenon is readily explained, the reasons being the comparative cheapness of United States manufactures notwithstanding the higher rates for labor, and owing to the superior producing capacity of the American workman with the aid of improved labor-saving machinery. As the above results have been achieved with comparatively little effort, it is only fair to assume that with intelligent and systematized action on the part of the manufacturers and exporters in this country, aided as far as practicable by our diplomatic and consular representatives abroad, the United States has unfolded to it in regions as yet unopened to the full activity of commerce, possibilities of commercial expansion limited only by the use made of them. It is gratifying to observe that the business community of the United States seems already to have learned the significance of our industrial opportunity. The fact is demonstrated by the great increase in the volume of correspondence with the State Department in Washington of business houses, organizations and individuals

throughout the country, making inquiry as to possible markets for a variety of products. The State Department is devoting all its energies to the effort to satisfy the growing demand for information. For the next fiscal year, so we are informed, Congress has made provision for enabling the State Department to supplement the mail reports of consuls with cablegrams, notifying it immediately of any important commercial or industrial events.

In the South American countries especially, during the last few years, a demand has arisen for electrical machinery, and this has mostly been supplied by goods of American manufacture. But not only in South America are these openings to be sought. The far East, and particularly China, presents equal opportunities, which however are being fought hard for by European countries. China has a population of 400,000,000, and its foreign commerce amounts at present to about \$200,000,000 annually. Of this in 1896 Great Britain obtained about two-thirds, Japan one-eleventh and the United States one-twelfth. Our manufactured goods are already very popular in China, and it should soon become a vast field for enterprise. A New York Chamber of Commerce report already calls attention to an increase in our export trade to China of from \$9,117,059 in 1893 to \$17,978,065 in 1897, there being however but \$5,833 worth of electrical apparatus exported to that country from the United States during the last fiscal year. From the above figures it will readily be seen that although China purchases yearly a fair amount of American productions, electrical apparatus is as yet in little demand. With the new and more modern methods which are gradually being introduced into that thickly populated country, the demand for electrical machinery will assuredly go on steadily increasing until ultimately an extensive and profitable market will be created.

* * *

The Como International Exhibition of Electricity.

At Como, the birthplace of Alexander Volta, it is proposed to hold an International Exhibition of Electricity from May 15 to October 15, 1899, on the occasion of the centenary of the electric pile. It was thought that this would prove a most appropriate way of honoring the memory of the departed scientist and would at the same time afford an excellent opportunity of reviewing the history of a century in the vast field of electricity. A congress of electricians ready to present the most recent advances of the science and its applications will be its principal feature.

The exhibits will be divided into thirteen classes, which include a class of honor, consisting of Volta's discovery illustrated by his apparatus, bibliography, manuscripts, autographs, portraits, medals and per-

sonal objects. The other exhibits will comprise documents, publications and manuscripts, models and apparatus for didactic use, batteries and accumulators, steam boilers and engines, dynamos of every description, electric conductors, including aerial, subterranean and submarine, incandescent and arc lamps, the application of electricity to motive power, electricity in telegraphy and telephony, electro-metallurgy, including electric applications in mining and military operations, electricity in therapeutics, and various other applications of the electric current. No efforts are being spared by those having charge of the proposed Exhibition to make it a success, and undoubtedly the invitation to exhibit will be met with a hearty response by the manufacturers of electrical apparatus in many countries. The occasion would certainly seem important enough to warrant the hearty support of electricians from all over the world, marking as it does the anniversary of an invention which was the first step in the practical application of the electric current. All announcements of intention to exhibit should reach the committee having the matter in charge not later than October 31.

* * *

Roentgen Rays A short time ago in England in **Warfare.** a lecture was delivered before the Royal United Service Institution by Surgeon-Major Beavor, entitled "Working of the Roentgen Ray in Warfare," which in view of our extensive military operations in Cuba is particularly interesting and timely. The lecture was based on the result of experiences gained with the X-ray apparatus during a recent frontier expedition in India. The lecturer stated at the outset that his object was to give the results of the employment of the Roentgen rays in military surgery and to mention certain modifications in the construction of the appliances for generating the X-ray which had suggested themselves to him after working among the wounded on the field of battle and its adjacent hospitals. During the course of the lecture many cases of interest from the campaign were shown by means of magic-lantern slides thrown upon a screen. These consisted of bullet wounds sustained by officers and men, injuring bones, joints and internal organs, which baffled the skill of surgeons to ascertain their exact extent and which but for the application of the X-rays, so it was claimed, must have resulted in amputation and probable loss of life. The pictures shown included all manner of wounds. The most remarkable results obtained by the use of Roentgen rays were probably in the cases of a bullet imbedded in the backbone of one man, in the hip of another and in the heel of a third. In each of the cases referred to the bullets were successfully removed by aid of the rays, the men subsequently rejoining their respective regiments at the front. Great stress was laid by the speaker on the desirability of having all the apparatus for military work as simple in construction as possible, thus readily enabling the defects of wear and tear to be renovated.

As regards the most desirable means of transporting the apparatus, it was pointed out that it was not only possible but easy to have an X-ray outfit working at the front; that the cases exhibited were indisputable proof that even in savage warfare the X-ray could be brought thoroughly under control and in many cases alleviate an immense amount of human suffering. A most important point referred to by the lecturer was, that after trying every kind of transport in India—mules, camels, wheeled vehicles, etc.—he came to the conclusion that by far the safest and most satisfactory was human transport. As the portable apparatus did not exceed 80 to 100 pounds in weight, it was found that two men were all that were required, with a reserve of two more with reserve equipments. A bamboo pole or steel pipe some six feet in length was what he found the best

thing from which to suspend the boxes. This method of transport is said to have proven eminently satisfactory in spite of the extremely uneven nature of the country.

The campaign which the United States is at present carrying on in Cuba is also through a country extremely difficult to penetrate, but if a military X-ray outfit could be so successfully transported and proved such a boon in India, there would seem to be no reason why our armies should not also be provided with apparatus of this nature. A short time ago there was some talk of so doing, but whether any decided steps have as yet been taken in the matter we are unable to say. If nothing has as yet been done, the question of providing X-ray outfits should be taken up at once by the proper authorities with a view to giving our wounded soldiers the benefit of this means of alleviating their sufferings.

Under the Searchlight.

Notes and Comments on Various Topics.

THE New York *News Bureau* of the 1st inst. says: "The directors of the General Electric Company held a meeting to-day and took action on the proposition to reduce the common and preferred stock of the company 40 per cent. to correct the impairment of the capital. The officers refuse to make any statement at the present time, but it is understood that a special meeting of the stockholders will be held on or about August 11, to ratify the action of the directors. The notice filed with the Secretary of the Stock Exchange that the books of the company will be closed from July 11 to August 11 gives no reason for the closing, but it is understood to be in order to allow stockholders to qualify for the meeting of ratification."

* * *

IN Turin the other day, according to *Il Osservatore Romano*, a photograph by electric light was taken of the Holy Shroud, which gave an admirable reproduction of the body of Christ. The Holy Shroud was recently exposed to veneration, and King Humbert, who is its hereditary guardian, at first hesitated to give authority to have it photographed lest the photographs should be speculated in. However, His Majesty at length gave the necessary permission to Signor Secundo Pia, a lawyer and member of the Committee on Sacred Art, who had offered to photograph the Holy Shroud at his own expense. Signor Pia prepared his plates according to a special method, rendering them sensitive to the yellowish tint of the Holy Shroud by means of powerful electric reflectors. "Formerly," says the *Osservatore*, "the appearance of the Holy Shroud gave an idea of the contour rather than the facial lineaments and body of Christ. On the other hand the photographs, on being developed, showed a perfect representation of the face, hands and limbs of Christ, the general effect being that of a photograph of Christ and not of his shroud."

* * *

THE Fourth was electrically celebrated in New York and vicinity by a fierce thunderstorm accompanied by drenching showers. Off to the southeast of the city the sky was frequently gashed by great fissures of light that extended from the zenith to the horizon and almost blinded the spectator by its intense brilliance. It was an imposing electrical display and showed what enormous stores of the subtle fluid are held aloft in reserve for future utilization when man shall have learned how to bring them under control.

* * *

A NEW electric clock has recently made its appearance which it is claimed overcomes all difficulties which have existed in timepieces of this descrip-

tion in the past. The movement is said to be extremely simple, consisting of an electromagnet and its armature so arranged as to give occasional impulses to the pendulum whenever an automatic switch closes the battery circuit. These impulses occur at irregular intervals, their frequency varying with the variations in the strength of the current. As the battery weakens, impulses were more frequent, and herein lies the secret of the successful adaptation of electricity to timekeeping. In a recent trial by the United States Government of one of these clocks, at the end of sixty days the timepiece had varied less than sixty seconds.

* * *

IN a thunderstorm on June 28 a bolt of lightning struck the switchboard at Fort Washington which controls the mines in the Potomac River, exploding three mines and seriously damaging the system of electrical connections. This is probably the first occurrence of the kind on record, and emphasizes the need of having suitable lightning protectors on buildings and switchboards controlling submarine mines. In this instance, although several vessels had just passed over the mines that were exploded, no serious damage resulted.

* * *

THE New York *Sun* is responsible for the following instructive anecdote:

The observant Jerseyman and a friend of his were standing out of doors chatting the other evening when they were startled by a sharp flash of lightning in the western sky.

"We're going to have a shower," said the Jerseyman. They listened for an answering peal of thunder, but as none was heard the friend said:

"I guess not; that is only heat lightning."

"There is never any lightning without rain," said the Jerseyman. "My father made that discovery when he was a telegraph operator. That was in the early years of telegraphy, nearly fifty years ago. In those days there was no such thing known as reading by sound and all the operators used recording instruments. The crudeness of the instruments in those days made it very difficult to operate the lines except under the best circumstances, and utterly impossible, even with careful adjustment, when there were electrical storms."

"My father began experimenting to overcome this difficulty, and at last he made a self-adjusting relay magnet which would not only work on any line, long or short, without any manual adjustment, but it would also work just as well when the line wire was overcharged by aerial electricity, and the working of the key merely made slight differences in the amount of current on the line. At these times he could receive messages from any one on the line, although they could not get messages from him, as they had only the ordinary relay magnets."

"His ability to take messages under such circumstances soon became known all along the line. His office was at Perth Amboy, N. J. One day it occurred to him to inquire into this question of heat lightning, and, seeing a storm away off in the west, he telegraphed along the line asking all the offices where the storm was. He got answers from all the offices up to that which was cut off by the presence of the storm, and then requested each office between to tell him when the storm arrived there. So as the storm moved he got a history of it."

"This he repeated many times, and by means of questioning along the line afterwards also made sure that there was always rain falling where the lightning was central every time the flashes were visible to him, although no rain might fall at Perth Amboy for days or weeks."

* * *

OUR contemporary the London *Electrical Engineer*, with its usual dyspeptic fondness for deorying everything that is not of English origin, says: "The Americans cannot resist the Barnum influence in their exhibitions. So at the electrical exhibition in New York an electric wedding has been used as a means of advertisement. The unfortunate bride and bridegroom were married for the good of the show (we trust for their own good also) in the Moore Chapel. The vacuum tubes designed by Mr. Macfarlane Moore provided the light; the organ was driven electrically, and phonographs sang the hymns. Electric carriages were, of course, provided for the couple in question. An electric execution should be the next attraction, with a Spanish spy as the victim."

GENERAL DISTRIBUTION FROM CENTRAL STATIONS BY DIRECT CURRENTS.*

BY LOUIS A. FERGUSON,
Chicago.

(Concluded from page 389.)

Municipal legislation in all large cities requires, and very justly so, that the wires for the distribution of electricity for lighting and power purposes should be laid underground. The Edison companies throughout the country use a standard system of underground, the mains and feeders consisting of japanned iron pipe in which are three solid copper wires or rods insulated from each other and from the iron pipe by an asphaltum compound. These pipes or "tubes," as they are commonly called, are 20 feet in length, the copper conductors projecting three inches on each end, making the total length of each pipe 26½ feet.

The copper conductors are connected together by means of a flexible coupling, composed of a standard copper cable about eight inches in length, having copper terminals on either end, and which are provided with a circular opening of such diameter as will permit the reception of the copper conductor of the tube. The copper terminal is heated by the flame from a blow lamp, and the copper conductor is soldered into the terminal.

After the three couplings are connected an iron ball clamp is bolted on to the tube near the end, and a cast-iron oval-shaped coupling box is laid over the copper joint and fastened together by bolts and nuts. The coupling box is then filled with hot insulating compound, and after this has settled by cooling the box is again filled and the opening covered by plugs.

At each street intersection these tubes enter a junction box. The junction box is a cylindrical cast-iron box in the center of which is a cast-iron upright standard carrying three rings of flat copper bar. To one of these rings all of the positive conductors are connected, to another ring all the negative conductors, and to the remaining ring all of the neutral conductors are connected in a similar manner.

Many of the junction boxes are fed by a feeder direct from the central station, the feeder, when Edison tubes are used, being laid in the same manner as the mains before described. The feeders in a three-wire system consist of three conductors, as in the case of mains, with the exception that one conductor which is used as a neutral has usually one-third the area in cross section of either of the two other conductors. Feeder tubes are made in various sizes, from 250,000 cm. up to 3,000,000 cm. Each feeder tube also contains three small insulated copper wires, which are connected in each coupling box to the corresponding wires in the next tube, thus making a continuous circuit from the feeder end in the junction box at street intersection back to the station. At the generating station these wires connect with a pair of voltmeters, and at the end of the feeder they are connected through fusible strips to the copper rings in the junction box, thus giving in the station the pressure or difference of potential at the feeder end. By means of the junction boxes the system becomes one grand network of conductors connected in multiple and fed at many points by feeders from the central station, similar to that of a well designed gas or water system in a large city. By means of this network of mains the electrical pressure is equalized throughout the system and the current is distributed properly among the feeders. Every mechanical and electrical detail of the system is very carefully worked out and absolutely interchangeable, and it is without question, when cables are used for the feeders, the most complete, the most easily operated and most permanent underground system yet devised for the distribution of

electricity for large cities using a direct-current system of 500 volts and under. With this system the customers are almost absolutely certain to have continuous service, as they are fed from two points under ordinary conditions, and should the main in their block burn out it is nearly always possible for the company to feed the customers from one or another junction box. The method of coupling affords a perfect house to house system of distribution, and renders the placing of services a very easy and simple matter. The system is very easily laid down, and its maintenance compares favorably with other methods of distribution.

The maintenance of good pressure regulation at the customer's meter is very much more easily effected with an interconnected direct-current distribution such as has been described than with the ordinary alternating-current central station system, such as has been exploited in this country.

Owing to the parallel operating of direct-current dynamos and distribution systems the fluctuations in the pressure, due to change over from one machine to another, so prevalent in the ordinary American alternating-current central station, and so annoying to customers, are eliminated, and a carefully operated direct-current central station should show a pressure chart with an average deviation from the mean of less than one volt.

It is possible of course and often the careless prac-

Chart No. 1 represents the pressure for 24 hours on the direct-current distribution system in the business district of Chicago. The average deviation from the main pressure is less than one volt.

tice in direct-current stations to have had fluctuation of pressure at the times of change over, and also irregularities at other periods, but there is absolutely no excuse for their existence in a well operated and well planned direct-current system.

The parallel operating of the generators greatly simplifies the maintaining of uniform pressure regulation at the lamps, since when several units are connected to the common bus-bar the regulation for the entire system may be effected by careful attention to one unit, whereas in alternating current stations where the generators do not operate in parallel it is necessary, in order to even approach the uniformity of pressure regulation which exists in direct-current systems operating in parallel, to regulate the pressure accurately on each unit, which is seldom done in practice. Besides the better regulation possible with parallel operating of the dynamos, a further distinct advantage is derived from the economy effected by proper division of load among the units in the stations, this being particularly marked when the distribution systems are also interconnected. Each unit, irrespective of size, may be usefully and efficiently employed at the period of maximum load, and the amount of idle or uneconomically employed investment is reduced to a minimum.

To illustrate the comparative accuracy of regulation obtainable in an interconnected direct-current system, and in the ordinary type of independent

circuit alternating-current system, let us refer to the pressure charts shown herewith.

If the engineer designing a system employing alternate current in the distribution expects to obtain first-class pressure regulation he must follow those lines laid down by the engineers who have de-

Chart H represents the pressure on one of the circuits of a single-phase, house to house transformer, alternating system in Chicago.

veloped the modern direct-current distribution system. The distribution system of mains should be interconnected, forming one grand network of conductors with large transformers, located at points where feeders would terminate if it were a low tension direct-current system, and to these transformers should be brought the primary feeders from the central station, provided with boosting transformers or induction regulators. Pressure wires from the secondaries of the transformers should be brought back to the station so that the pressure on the ends of the mains may be known and properly controlled. Such a system will be described to you in detail by Mr. Wagner, and I am sure he will agree with me when I say that the single phase, house to house transformer, separate circuit alternating-current system, such as has been generally exploited in this country, has nothing to recommend it to the central station manager, either from a purely engineering or financial standpoint, although it has fulfilled its mission as a pioneer in the introduction of electric lighting in scattered districts.

One of the advantages to be derived from the use of direct-current distribution as distinct from alter-

Chart M represents the pressure regulation of an alternating-current system on a long avenue, where are used primary feeders with four 15 kw. transformers, the secondaries in multiple on the three-wire system.

nating-current distribution is the employment of storage batteries. They may be adopted for use in various ways, in sub-stations in outlying districts where the load factor of the district is very small, in the central stations themselves to deliver the entire output during period of minimum load, at the cen-

* Paper read before the National Electric Light Association at its Twenty-first Convention, Chicago, Ill., June 7, 8 and 9, 1898.

ters of distribution for discharging during the peak, as auxiliaries in rotary transformer sub-stations for discharge use at the time of the maximum load in the main central station. In addition to any one of the various ways which the battery may be employed it always acts as a reserve, guaranteeing the consumer good service, in much the same manner as a bank surplus is a guarantee to the depositors in cases of financial emergency.

Storage batteries when installed in central stations or centers of distribution are usually connected to the main bus and allowed to float on the system, taking a charging current from the bus or discharging into the bus according to the load on the system, the generating units being worked at such load as will insure the best efficiency of the entire system.

Batteries are economically valuable in connection with the distribution of direct current in systems whose load curve has an average peak width of not more than two hours, since the investment required for storage batteries to carry the peak having an average width of less than two hours is less than the investment required in steam and electrical machinery to do the same work. The storage battery also has the same value that exists in the case of moving machinery as a reserve in meeting sudden increases of load, providing such increase of load does not continue for a sufficient period to wholly discharge the battery and insufficient time remain for recharging before the ordinary load peak of the system appears at the regularly appointed time. Such a condition is rarely, and I might say almost never, met with, although in rare instances we may approach this condition.

The steam and electrical machinery is rated by the horse power or kilowatt, and the duration of the load peak does not influence the value of the investment since the machinery may be operated for the full twenty-four hours at its maximum capacity. The storage battery, however, is rated by the horse-power hour or kilowatt hour, and the investment is nearly directly proportional to the number of hours during which it discharges the maximum capacity, so that if we required the battery to be prepared to carry the full peak prolonged for seven or eight hours every day the investment in battery would be enormous as compared with steam and electrical machinery to furnish the same kilowatt hours' output. Illustrative of such contingency, let me refer you to the load diagram marked "D," representing the load in the business district of Chicago, December 20, 1897. This is a very extraordinary curve, illustrating the limitation of the storage battery and the possibility of its being rendered ineffective had the early morning peak extended to the arrival of the regular afternoon peak without affording sufficient time for recharging the battery.

The storage battery has a very distinct value, which is seldom recognized and employed to its full advantage, when located at the central distributing point of a system with feeders radiating to various points in the network. The battery may be provided with two or more end cell switches, so arranged that they may be connected in multiple and feed into the main distributing feeder bus, or they may connect also to one or more auxiliary bus-bars with a different number of cells in series feeding into each bus, thus providing two or more potentials at the center of distribution. It will be found when only one pressure is maintained at the center of distribution during the time of maximum load of a large district that the pressure at the ends of the short feeders will be somewhat higher than the standard and they will be overloaded, and at the end of long feeders the pressure will be lower and the feeders underloaded, although the pressure variation at other times may be negligible. Under such conditions the storage battery becomes exceedingly valuable, for by arranging it to operate at two or more potentials the long feeders may be connected

during the time of maximum load to the auxiliary bus or buses and additional current forced over them, utilizing their full capacity and maintaining a uniform feeder end pressure by means of an investment in end cells very light as compared with the investment in additional feeders and mains required to accomplish the same result.

The direct-current distribution system is very much better adapted to electric elevator work than the alternating-current distribution, and as far as I am able to learn there has not yet been developed a commercially successful direct coupled electric elevator capable of running at varying speeds and operated by alternating currents.

The direct connected electric elevator is a piece of apparatus which is of the greatest value to the central station companies, since it is practically the key to the isolated plant situation, and with its aid we are enabled in a large percentage of instances to show to the owners of large mercantile establishments and buildings a decided saving in the purchasing from the central station company of electricity for lighting, elevator and general power service as compared with the cost of operating an isolated plant using hydraulic elevators. The immense advantage

to the central station companies in being able to supply commercially successful electric elevator service economically may be realized when we consider that there is connected to the systems of the Edison companies in New York, Boston, Brooklyn and Chicago 15,000 horse-power capacity in direct connected elevators, representing a gross income of approximately \$375,000 annually. At the present time alternating current distributing systems confine us to the use of continuous running motors belted or geared to the elevator pump or winding equipment; but such an arrangement is not fitted for first-class passenger service and is very uneconomical, and similar equipments using direct-current motors were in use ten years ago and have long since become obsolete and have been entirely superseded by the direct coupled electric elevator which operates for approximately one-half the cost.

The use of low tension constant potential arc lamps connected in multiple to the distribution system has made rapid strides during the past three years, and in New York, Brooklyn, Boston, Chicago and other cities is fast superseding the use of series arc lamps wherever the low tension mains operate; and the day is not far distant when series arc lamps will be employed only in the outlying districts where there is not sufficient business to warrant the extension of the low tension distribution system. The competition effected by the Welsbach gas burner

has done much to develop the constant potential arc lamp, and it is safe to say that with incandescent lighting alone the central station companies are rendered helpless against the improved gas burners; but a successful competitor has been found in the use of the three and one-half ampere direct-current enclosed arc lamp, and as proof of this we have only to compare the results of the central station companies in the large cities, where these small arc lamps have been employed with the conditions existing in the small towns, where alternating-current systems of distribution furnish incandescent lighting only. In the latter places the Welsbach light is found to be in general use, and is affecting very seriously the earnings of these small central stations owing to the lack of an alternating-current arc lamp which would answer the purpose of the small ampere arc lamp used in connection with direct-current systems. Although very much has been done within the last year in the development of the large alternating-current arc lamp, it is still far from being

in the state of perfection, and cannot be said to compare practically or economically with the constant potential direct-current enclosed arc lamp.

The use of motor cycles and electric cabs employing storage batteries is becoming more popular every day, and in London and Paris they are used very largely, in Paris an Automobile Club having been formed by people owning motor cycles. The central station companies using direct current will undoubtedly find a profitable outlet for their product as the motor cycle becomes more popular, and by locating charging stations for the motor cycles along the central station mains the use of the motor cycle will become more extended.

When we consider the many practical advantages inherent to the direct-current system of distribution which add so greatly to the commercial success of a central station company, it would seem that the original investment required to establish the plant and system should not be the only question affecting the selection of the system to be adopted.

It is universally conceded by all competent and unprejudiced engineers that the alternating-current system of distribution in a closely settled district, which shall approach in commercial value the direct-current distribution system, shall be one which has

for its basis an interconnected system of secondary mains, with transformers of large capacity, and high pressure feeders from the central station to these transformers, and generators in the station operated in parallel, as previously described. Therefore the cost of the distribution network in the case of the alternating-current system will not be less than that of the direct-current network, and the cost of transformers, high pressure feeders and alternating-current dynamos should be compared with the cost of low tension feeders and low tension dynamos of the same capacity, these forming the only points of comparison. The investment in each case depends merely upon the advantageous location of the central station in each individual city.

I have shown in the early portion of the paper that in a large distribution system such as exists in Chicago seventy-five per cent. of the total energy supplied to the system is so nearly adjacent to the desirable location of the central station that a direct-current distribution system should form the basis of the general system of the company.

It seems to the writer that the useful field of operation for alternating-current distribution systems is not in large cities but rather in the scattered suburban residence districts and small towns where commercial lighting, elevator service and general power distribution form an insignificant portion of the demand and where the first cost of the direct-current installation would so far exceed that of the alternating-current system of distribution with primary mains and large transformers for blocks of lighting as to make the interest charges so great that the property would be rendered unremunerative.

The successful central station company of the future will be, as outlined in my paper read before the Association of Edison Illuminating Companies at its last convention, the one combining intelligently the use of alternating and direct currents, employing direct current in the distribution systems in the thickly settled business and residence districts of a city and alternating current for the distribution systems in the scattered residence districts and surrounding suburbs. The energy will be generated at one or two large condensing stations located where water and fuel may be obtained at the minimum cost and the energy transmitted to the various sub-stations located at the electrical centers of the distribution systems. The choice of low pressure direct current or high pressure alternating current for the transmission to the sub-stations will depend upon their relative distance from the generating stations, rotary transformers or other forms of current rectifiers being employed in the sub-stations which supply the direct-current distribution networks when alternating currents are used for the transmission.

Electrical Opportunities in Peru.

The following is an extract from a recent letter by Frank G. Carpenter in the *Washington Star*: "Some of the best things now offered here in a business way are of the electrical order. Lima is a city of 100,000 people, and it has a tramway upon which the cars are drawn by horses. The line of tracks reaches all parts of the city, and the cars, although they are irregularly run and poorly managed, are almost always full. I am told that the roads are now paying, although I could see that the conductors are cheating the company right along and that they do nothing to increase their custom. If this system could be replaced by an electric line it would probably pay well, and might be as big a bonanza as the Mexico City street railways, which sold for \$7,000,000. At present there are two or three American parties who are figuring on the proposition of buying the horse car lines and extending the system from here to Callao and Chorillo, the seaside resort of Lima."

GENERAL DISTRIBUTION FROM CENTRAL STATIONS BY ALTERNATING CURRENTS.*

BY HERBERT A. WAGNER,
St. Louis.

(Concluded from page 392.)

MOTORS.

The greatest argument used against alternating current used to be that it would not run a motor. It has long ago proved that it can, and that without a commutator. This subject now brings us to multiphase systems. There are two of these systems in general use, the two-phase and the three-phase. Other systems are but modifications of these and will be mentioned as such. Motors can be operated with equal facility and efficiency on either system, and have many distinct advantages over direct-current motors.

For long-distance power transmission the three-phase system shows an economy in copper; but for lighting, or for lighting and power combined, it is not at all well suited. I might say that where lighting is a distinct feature, and first-class service is to be rendered from a large station, the three-phase system cannot be used successfully. On even the best generators, the windings are so entirely inter-

tion, as six wires would then be required, forming six circuits that must be kept balanced.

The two-phase system is subject to the same objections unless the two phases are used separately for lighting, in which case we have the complication equivalent to twice the number of generators and feeders.

For good regulation and simplicity, the single-phase system cannot be equaled by any multiphase system.

The so-called monocyclic system is a modified two-phase system in which current is distributed for lighting on a single-phase circuit only, and a third wire carries current in quadrature to the first, which in connection with the first is transformed to a three-phase relation wherever it is desired to operate motors. The regulation of this system can be made almost as good for lighting as the single-phase, and can be as simply effected. The third wire adds complication, but no balancing is required, as all the lighting is done from single phase on two wires. If low-tension, three wire distribution is attempted with this system, a fourth wire must be used for power distribution.

A system practically the counterpart of the monocyclic, is the three-wire, two-phase system, in which

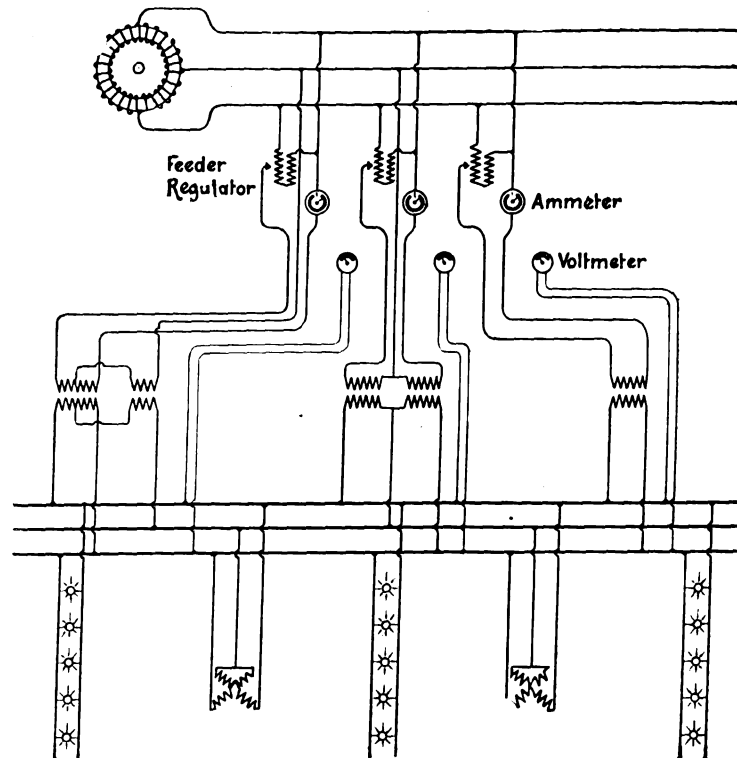

FIG. 3. THREE WIRE TWO PHASE SYSTEM.

with single phase lighting. - High pressure
Feeders & low pressure distribution.

dependent that a change of load on one phase will affect the pressure on the other two; but a defect even worse is the impossibility of regulating the phases independently for drop in the feeders if the load happens to vary differently on any two. Any regulator placed in circuit with one phase will effect about the same change of pressure in the adjacent phase within the usual limits of regulation. Regulation is then a question of the best possible averages, and at best is but guesswork. With the feeder and transformer drops found economical in practice, it would be practically impossible to keep the pressure sufficiently constant for high-efficiency lamps. The complication of wiring is also very serious, especially if the Edison three-wire system is used for distribu-

tion, as six wires would then be required, forming six circuits that must be kept balanced. The lighting is all done on one single-phase, and a third wire is used in conjunction with the other two for power. It is handled in exactly the same manner as the monocyclic system, the only practical difference being in the relative potential of the quarter-phase circuit. In the monocyclic, the quarter-phase element of the generator winding is one-quarter the potential of the main winding, giving between the power line and the main lines a pressure of fifty-five per cent. of that between the main lines themselves. In the special form of three-wire, two-phase, the quarter-phase element of the generator winding is equivalent to one-half of the main winding, which causes a pressure between power line and main lines seventy-one per cent. of that between the main lines. For power distribution, this system requires slightly less wire than the monocyclic. Fig. 3 shows diagrammatically the arrangement of this system used

* Paper read before the National Electric Light Association at its Twenty-first Convention, Chicago, Ill., June 7, 8 and 9, 1898.

in connection with the special method of distribution already described. The diagram shows a system of two-wire mains for lighting to which might be applied, of course, the Edison three-wire system. The motors used would most naturally be of the two-phase type although three-phase motors may be used with equal facility by the method of transformer connections devised by Mr. Scott.

It can be readily seen that while these systems are much better adapted to general station distribution than the two-phase or three phase, they still lack the simplicity of the single-phase, and both require more wire. Fortunately, we can now obtain single-phase motors which equal the multiphase and direct-current motors in efficiency and almost all desirable points. They start readily with load and may be operated with variable speed; in fact, they equal the direct-current shunt motor in all points, excelling it in efficiency and simplicity.

We can meet the direct current advocates on the power question, therefore, on at least an equal footing, save only one application met in central station practice; namely, the operation of high-speed elevators. The alternating current motor, multiphase or single-phase, cannot be controlled for this work as readily as a compound series direct-current motor. It has taken several years, however, to perfect the mechanism for the control of direct-current elevator motors. Give us the same time, and we will do it with alternating current. This field for power has only of late been opened to direct-current stations, and it is yet a question for debate as to whether it is a paying one.

SPECIAL APPLICATIONS OF CURRENT.

There are many special applications of current met with in practice, most of them bringing a small return, such as electro plating, electro cauterizing, charging small storage batteries, electric heating and cooking, etc. The first three require low-potential currents, and are economically effected only by motor generators or rotary transformers. It is evident that this transformation can be accomplished as readily with alternating current as with direct current. Electric heating and cooking are as yet luxuries, and cannot be depended on for much revenue. They can be done with equal facility by alternating current.

STORAGE BATTERIES.

Here we come to the direct-current advocate's last and greatest stronghold. To this he retreats with great confidence of safety. We may ask first whether storage batteries have yet been proved to be a valuable adjunct to the central station, cost and maintenance considered. It is true they are being tried by several large stations, and we watch eagerly for the results. They equalize the station load to a greater or less degree, and cut down the generator capacity for the peak. Are they, however, cheaper than generators, engines and boilers of the same capacity? Are the losses in transformation less than the cost of a few more attendants? Is their maintenance less expensive than that of generating apparatus? These questions can not yet be answered in the affirmative. But if the battery man's most sanguine hopes be realized, what then? If rotary transformers are good enough for the direct current man to use to change the direct current to alternating current, transmit a good proportion of his load to a distance and transform again to direct current, why should not the alternating current man use them to charge his batteries and then to transform their output back to his pet form of current? Loss in transformation, do we hear some one say? Not any more than with our contemporaries' long-distance transmission system, and, in this instance, they are small and unimportant, we are told. There is at least one station in the country where storage batteries are being used in this way, and I believe with success, as storage batteries go.

Have our direct current friends anything more to bring forward? Or have we forced their last posi-

tion? Well, we will declare a truce, and acknowledge that they fight bravely. We have learned as much from them as they can learn from us. If we had been as quick to acknowledge their beautifully designed distributing details and applications as they have been to appreciate a few of the advantages of our current, we might have been nearer together, or even hand in hand, long ago. As it is, we are both working to the same end, and our paths must join sooner or later as they converge.

Before closing, I wish to recapitulate a little, and draw your attention more forcibly to the flexibility of the alternating-current system. We all know of the many applications to which this current is now put, and what we have described here is, most of it, not new to many of us. The use of the rotary transformer has been widely talked of and described for the last two years. The facility of operating lines at any potential desired, through the means of step-up and down transformers, is no longer an experi-

The great desideratum in central-station practice is to be able to employ one system for everything. All current or all classes of service should be supplied from but one type of generator, be this direct current or alternating current. In this way only can the maximum output be accomplished from a given investment in machinery and apparatus, and greatest economy in operation secured. This has been accomplished in many stations where a limited range of service is to be provided. Arc lighting has, of all, been the most troublesome to provide for. How shall we operate our arc lamps from our incandescent lighting system, has been the anxious inquiry. The constant-potential arc lamp has answered this question for commercial lighting, but city street lighting cannot be so easily provided for. The Edison companies have done a limited amount of this from their three-wire system, but this can be done to advantage only in districts where mains have been provided for commercial lighting. For

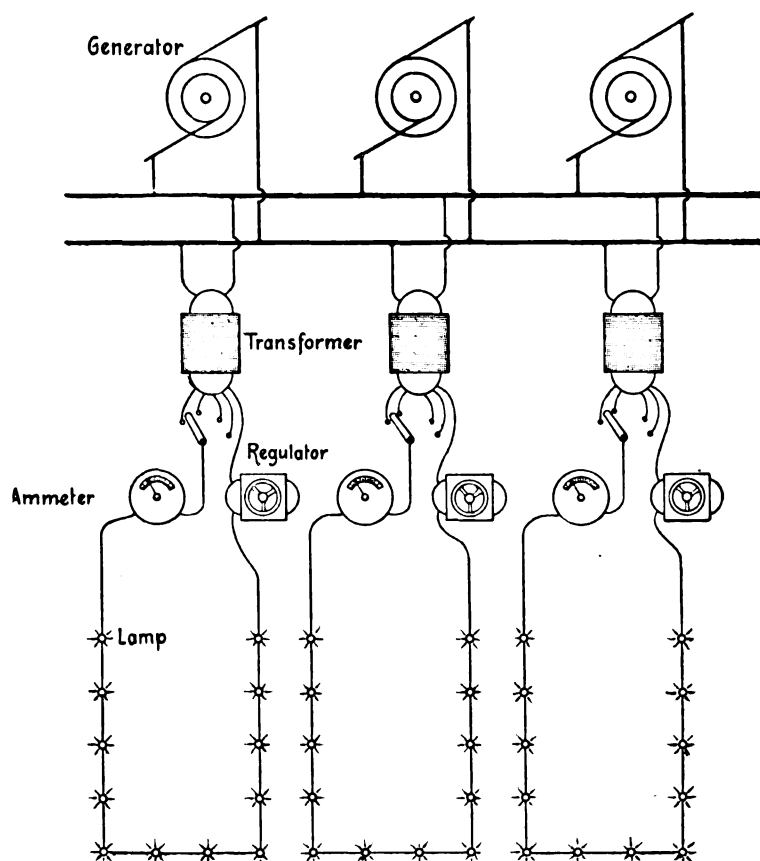

FIG. 4. A.C. SERIES ARC-LIGHT SYSTEM.

ment. Multiphase motors are familiar to all, while single-phase motors have been much talked of and written about, and failures have, time and again, followed boasted success. Many of us, however, have within the last year seen them quietly at work, thoroughly tamed and domesticated. One large station is using them extensively, and is so thoroughly convinced of their success that it has discarded all notion of using multiphase distribution, although it is using generators that can be operated two-phase if desired. Direct-current motors are being rapidly replaced by these single-phase motors to secure uniformity of system.

Arc lamps have been familiar to us on alternating-current circuits for some time, and the alternating current, enclosed, long-burning arcs are now numbered by the thousands. Street lighting is still, however, in most places done on the direct current series system, and even the largest machines yet built for this purpose are very small in comparison with our large direct-connected generators.

extended arc lighting, the small series machine with its belts and clutch pulleys still holds the fort.

I am able to state, however, that one large company has recently solved the problem to its entire satisfaction. This company furnishes 2,600 street lamps to the city, lighting some 300 miles of street. These were operated by a small army of series arc machines. They were installed by a company that was acquired by purchase by the one first mentioned. As this company has long since adopted alternating current for its entire distribution, it was extremely desirable to be able to operate these city lamps from its large direct-connected alternators, thereby saving in fuel, attendance, floor space and reserve investment.

After a few months' trial of an experimental circuit with alternating current, it was found perfectly feasible to operate the same direct-current lamps, slightly remodeled, on the same circuits of sixty or eighty lamps in series. A system of this kind was, therefore, adopted and the company now has 2,300

of these lamps in regular operation by alternating current in this way. The circuits are each provided at the station with a regular step up transformer of a maximum capacity of 4,000 volts and ten amperes, and the feeders to these transformers are treated on the switchboard in the same way as the feeders for incandescent lighting. It is quite usual for one generator to carry 2,000 of these lamps. The lighting is satisfactory to the city, and the lamps give better service than when operated by direct current. There has been a marked saving in fuel and attendance. The indicated horse-power per arc lamp is considerably less than with the direct-current arc lamps operated in the usual manner. Fig. 4 shows this system in diagram.

I know of no other place where this is being done, and it stands as a very pronounced example of the flexibility and adaptability of alternating currents.

There have been a great many problems in the operation of large alternating-current stations that have been discouragingly difficult of solution. The handling of high potentials on switchboards, the operation of generators in multiple, with facility, and scores of more or less important difficulties, have, one by one, been surmounted, the burden of the work usually falling on a few of the pioneer stations.

In summing up, we find the following marked features in which the alternating current, properly installed, has been shown to have pronounced superiority over the direct current:

Highest possible efficiency of distribution and operation.

Best regulation.

Largest territory desired readily supplied from one station.

Comparatively small cost of feeders, effecting enormous saving in investment.

Least cost of real estate.

Cost of installing and operating sub-stations entirely voided.

The only system in which all classes of service can be supplied from one type of generator.

Greatest flexibility.

In closing I wish to thank my friends and co-laborers of the direct-current faith, from several of whom I have had the pleasure of learning much that has proved of great value to me.

ALTERNATING CURRENTS AND DIRECT CURRENTS IN LIGHTING, ETC.

Discussion at the N. E. L. A. Convention at Chicago on Papers Read by Messrs. Wagner and Ferguson on the Above Subjects.

[The papers on which this discussion is founded were begun in ELECTRICITY for June 29 and are concluded in the present issue.]

Mr. Thayer—I would like to ask Mr. Wagner two things. One is in regard to the design of these extremely large transformers. Does he regard it advisable to obtain extremely close regulation; that is to say, a regulation within 1 per cent., or is it better to have a slightly poorer regulation and more iron work? Also, how he does away with the difficulty of the excessive drop in the large conductors carrying the secondary currents proceeding from the large transformers?

Mr. Wagner—In regard to the first question, I mentioned in the paper that by making the transformer practically an integral part of the feeder we eliminate all the effects of the transformer dropping, just as we do our feeder dropping by regulating the pressure wires from the feeder terminal, which become the secondary terminals of the transformer, so that we can sacrifice the regulation of the transformer to secure a very low iron loss; but I want to state further that a poorly regulated transformer is very much better for use in a system where transformers are connected in multiple, provided the pressure for each transformer can be regulated independently. The transformers of very close regulation, 1 per cent. or under, are connected in multiple with two or three hundred feet of mains or more in between. Unless the resistance of the mains is extremely low the transformer will not handle the

load unless it is uniformly distributed along the main. In such a case the transformer nearest the load will take practically all the load, so that for good distribution of load between the transformers poor regulation is desirable, provided that regulation does not affect in general the regulation of the system, and it is so modified it will not do that by making the potential of each transformer to be regulated independently by feeder regulators at the station, manually operated. The changes of loads are slow enough so that one mechanic can take care of them.

Mr. Van Trump—I wish to ask what is the objection to cutting the feeder transformer off the line automatically and saving the underload losses during underload?

Mr. Wagner—The object is to make the underload losses so small that it will not be necessary to do that. That would complicate the operation of the system very considerably both in the matter of attendance and the use of switches and automatic devices, which are not as a rule to be depended on. In the system described here the highest efficiency is at the average load, so that if a transformer was cut out and its feeder was cut out it would decrease the average efficiency rather than raise it, as it would increase the load on the other feeders, increase the copper losses in the other feeders and other transformers, and that increase in copper loss would be greater than the iron losses which you sustain temporarily. The object is to design a system to be most efficient at the average load. With a transformer that can be accomplished successfully.

Mr. Robinson of Baltimore—What is the wattless current loss?

Mr. Wagner—The wattless current is inappreciable. The volt amperes and the watts correspond to nearly in any alternating station at full load that the increase is almost inappreciable, even in the most poorly designed station. The power factor is very high at maximum loads, and with a system of this kind the power factor should be practically 100 per cent. at all times, except for alternating motors, which lower it slightly. The part of the load that comes on the peak is principally incandescent lighting. The motor load is almost constant and the arc lighting load is much more nearly constant than the incandescent load. The wattless current is small compared with the other currents in any event, and it is found in large alternating-current generators that they can be operated with a considerable increase of current in the armature without materially increasing the temperature of the machine for short periods, as the greatest losses in the generator do not originate in the copper of the armature and that can be very greatly overloaded without affecting the maximum value of the machine.

Mr. Dow—I desire to discuss Mr. Wagner's paper to some extent from the point of information furnished in the paper itself. He states the feeder loss in case No. 1 of the table giving the data on which his curves were plotted is 24 per cent. That is an exceptionally high feeder loss. It is not radically different from the feeder loss in Mr. Ferguson's paper, 22.8 per cent., but that includes the tie line losses over an Edison three-wire station located much further from the maximum load than is customary. I think that taking the average of Edison stations, and this is assumed to be a representative three-wire direct-current station, the feeder loss is more nearly 12 to 14 per cent. I am familiar with one station where the feeder loss is under 12 per cent., others 15 per cent. As to the 24 per cent. loss I cannot think of any station, except possibly the Chicago station with their tie line included, where the feeder loss would approximate that. A slight modification in the feeder losses will completely change the pressure of the two currents, Nos. 1 and 2. It will place No. 1 above No. 2 throughout its entire length as shown in his Fig. 1. I think that 24 per cent. loss in general will bring the cost of the feeder itself, particularly the cable feeder which is now standard, to not much more than the cost of feeder transformers, which Mr. Wagner proposes to employ. The transformer with a cable feeder capable of carrying 100 kilowatts can be bought for something like 90 cents a running foot; that is of course cheap construction, but it is a good figure to compare with the cost of a transformer which is proposed to be used in place of and to avoid the great expense of that feeder. A transformer for 100 kilowatts will cost \$1,000 to \$1,200, and the initial advantage of the thousand dollars in favor of the direct current system will pay for a great deal of copper, and the permanency of the one investment as compared with the other is much in favor of the direct current.

Taking again the figures alluded to, the loss in mains is assumed to be 2 per cent. in both cases. Now I rather take exception to that with the conditions of load which will prevail in such a station as the representative Edison station, viz., with a large

motor load and very respectable arc lamp load. Under those conditions the fact which Mr. Wagner has noted in his paper, that the drop in the alternating current main or feeder is not proportional to the current, which he sets forth as follows: "It would be quite perfect if the drop in alternating-current lines were proportional to the current, but it is not," will certainly affect the quality of the investment between mains for direct current and alternating current. To get the 2 per cent. regulation in the mains will certainly under the conditions of the representative Edison station involve considerably more investment if the supply is to be by alternating current.

The question as to arc lamps as discussed by Mr. Ferguson, and the statements made in his paper, can be applied directly to answering Mr. Wagner as to the quality of the two systems in these respects; and I wish to accentuate strongly Mr. Ferguson's statement that the electric elevator, which Mr. Wagner says is just now a difficult and unsettled problem for the alternating-current station, is of primary importance to central station interests. If you are not able to give good elevator service you will have to submit to the establishment of many isolated plants. It is a strange sequence that if a man has to keep an engineer on his premises, a steam boiler and a steam pump for the purpose of running a hydraulic elevator, he will add a dynamo and an engine to supply his own light. On the other hand, if you can furnish him good elevator service at a reasonable rate the necessity for the engineer and for the high pressure steam is eliminated; and in that very point lies the possibility of blocking the establishment of isolated plants. In my case to lose the elevator service would not be a serious matter as far as the elevator bill is concerned, but the incidental loss due to a good deal of valuable lighting would be very serious indeed.

I should say that Mr. Wagner has shown what a great many others knew, that the alternating current service can be wonderfully improved above its customary standard that it can be brought up closer to the standard heretofore set by the direct-current stations; but that it is still, except in most exceptional stations, an inferior service for the condition which Mr. Wagner has defined as those of the representative Edison three-wire central station. In the case of a densely populated district demanding the greater portion of the total supply the direct current is unquestionably the best; a less densely populated section might be supplied by the alternating system, or it can be supplied, as Mr. Ferguson has suggested, by an alternating distribution and direct current.

Mr. Wilmerding—Referring to the question of the drop in the feeder on the No. 1 curve in Mr. Wagner's paper, I would ask Mr. Ferguson if his statements in which he says that the drop on the trunk line was 12.4 per cent., and to the customer's meter 2.8 per cent., does not include all the losses; that is, include all the losses that might be made in the feeders themselves?

Mr. Ferguson—That includes simply the volt drop and does not include the losses at the meter. That is the loss at the time of maximum load, and is not the average loss. That is given as 8.8 whereas the maximum loss is 22.8, and that includes the total losses from the station to the customer's meter, including all the trunk line losses and the main. In line with the partial answer to that question, and to help out Mr. Dow in what he was saying, I can furnish a curve that illustrates the point he brought out. I have a curve that represents a typical central station, such as has been referred to by Mr. Wagner in the general remarks in his paper, and represents what Mr. Dow refers to.

Prof. Goldsborough—In being permitted to make a few remarks on the papers presented, I should like to say in connection with Mr. Wagner's paper in reference to the sub station transformer, it seems to me that there is an opportunity to improve the low-load efficiency of a plant. I notice from the curve that he has the load falling off and down below the direct current curve, for that is less than 8 per cent. That loss must be due to the inefficiency of the transformer, because the only difference between the two systems is in the transformer, the copper being the same, and the iron loss is the important factor. He said that the iron loss is so small, as his figure indicated, that it is not an appreciable quantity. It seems to me, however, that a system of sub-stations could be devised and a number of transformers placed together, and a set of feeders could run from the central station to the sub station, and some of the transformers could be cut out, that there would be a gain there, and a certain number of the feeders would be used in common with a certain number of transformers. In that arrangement you would have less core losses, and consequently you would have improved efficiency at the

lower load. That improvement I think would be noticeable from about 25 per cent. of the load on down to a very low load, and might be a considerable quantity, for the reason that as the load goes off the power factor of the large transformer comes into play. If you could cut out some of the large transformers, and have a few of them fully loaded instead of many of them partially loaded, you will improve the power factor of the whole distributing system, and thereby gain a great deal, because as you reduce the power factor you reduce the volume of current to supply a given amount of current. As to the means of cutting out and cutting in these transformers, that would be a matter of considerable expense and you would have to employ a man for that special purpose. Such a system can be devised. It might be a system of relays by means of a small wire; you could send out a line from the central station to the sub-station and operate it by a relay electro-magnetic device which will throw in or throw out the switches for the transformers on the transformer primary.

I was much pleased to hear Mr. Wagner express himself so strongly in favor of the single-phase alternating current. The single-phase alternating current possesses the same features of simplicity that are possessed by the direct current, to my mind. In connection with the arc light it was said a few moments ago by some one that the alternating arc lamp has found a rival in the Welshbach burner. It is said that we do not supply the arc light as cheaply as the light can be supplied by means of the mantle. I think that is not altogether so, for the reason that the gas light is becoming unpopular in the East. It is not at all suitable for interior lighting and won't do at all for entertainments, as it makes everything ghastly whereas the arc lamp gives a steady light.

Mr. Scovil—In Mr. Wagner's paper occurs this statement: "I might say where lighting is a distinct feature, and first-class service is to be rendered from a large station, the three-phase system cannot be used successfully." If there is any technical gentleman who takes an opposite view on that question I hope he will give us the benefit of his experience and judgment.

Mr. Rice—I wish to say in discussion of the two papers, that it seems to me the feature is brought out that we are comparing two systems, one of which is brought to a high state of development and one of which is just beginning to be developed. I think Mr. Ferguson's example of the alternating plant is very unfortunate, in that it does not represent an alternating plant of the latest design. It is now past discussion that alternators may be thrown in parallel the same as continuous-current generators. The use of motors is another feature which is coming into prominence. The alternating-current motors have not been developed and applied the same as continuous-current motors, simply because they have not lived long enough. In time I expect to see alternating-current motors distributed as widely and as universally as continuous-current motors.

Mr. Pillsbury, St. Louis—I wish to say a few words in regard to the alternating-current motor, having been identified for several years with the development more especially of single-phase machines. The question has been raised as to their power factor by one gentleman, as to their practical success by another, and as to their adaptability for the direct driving of elevators by several. Single-phase alternating-current motors are now made equal, if not superior, to direct-current motors for general power distribution. The power factor in a well designed machine may be considerably above 90 per cent., from 50 to 150 per cent. of its rated capacity, and above 80 per cent. while the motor is developing 20 per cent. of its rated output. For general power distribution these are superior to direct-current motors in point of care and attendance required, average efficiency, absence of wear, etc. To the direct driving of elevators they have not as yet been applied, but there is no reason why they cannot be adapted to this work as soon as a sufficient demand shall have arisen. The only problem met with in their application to this class of service is that of starting. There are two methods of doing this, one by splitting the phase and another by introducing a commutator. Either of these is entirely successful.

Mr. Insull—Gentlemen, I operate a company which is in no sense wedded to one system or another. Within the last week I have shut down a three-wire Edison system. I would like within the next week to shut down an alternating system. With us it is simply a question of the most money we can possibly make out of a given investment. I think if you will study Mr. Ferguson's paper you will find that he has gone into this question not merely from a theoretical point of view, but his observations are based on the actual results obtained in a year's operations of a large property. This property has been in existence some ten years. If you

study Mr. Wagner's paper you will find that he presents to you for use in our large cities—as his paper is based upon operations in a large city principally—a new scheme that has not stood the test of time, and that cannot be set up in comparison with the low tension system until a company under Mr. Wagner's plan has developed their business to a point where you can make a comparison of investment with investment, expenses with expenses and return with return. I know that most of you gentlemen here are alternating men, and that you look upon me as a low tension man. But I would remind you that exactly what Mr. Wagner has stated this morning with relation to the advantage of an alternating distributing system as against the present three-wire system was stated, for different reasons of course, with relation to the alternating house to house system that you are now using as against the three-wire system some ten or twelve years ago. Now what has been the test of time? The manufacturer used to tell us ten years ago that alternating current generation, house to house converter distribution, meant a very much lower investment cost to the parties providing the money. Exactly the contrary has been proved to be the case in any large center of population where there is much business. It has also been proved that in the smaller centers the losses are so great that some such scheme as Mr. Wagner propounds is absolutely necessary if you are going to sell electricity in competition with other forms of artificial illumination. I do not know that I am competent, in fact I do not care to go into the slight differences that are shown by Mr. Wagner's percentages on one hand and Mr. Ferguson's absolute figures on the other hand, and the slight difference of economy which Mr. Wagner claimed. What I would like to know from Mr. Wagner is whether he has a statement of his generated output for a year, and his delivered output for a year, and what is the difference between the two, and how closely they compare with the percentages as stated in his paper. I would like to know at the same time how he has obtained a record of his generated output. I tell you, gentlemen, that the Chicago Edison Company cannot swear to any absolutely correct output at the present time, and the differences of efficiency claimed by Mr. Wagner might possibly disappear in the personal errors that might enter into the calculations. There is one thing you must remember about the low tension distribution system. I assisted in laying the first conductors for a multiple-arc central station system in New York, and the only change that has ever occurred in the distribution system is the change from the two-wire to the three-wire system. If the Chicago Edison Company could profit by the adoption of Mr. Wagner's scheme (and I doubt whether Mr. Wagner would claim that), the only changes we would have to make would be in our feeder system, and those changes would depend on whether our insulation would stand the high voltage. Our distribution is a permanency; it has not changed from year to year to my certain knowledge since 1884. We have not been trying first one translating device, then a new system of distribution, and then another translating device, all of which pile up big interest cost. We have been working on the same lines; and I would like to ask Mr. Wagner if the city of St. Louis, in which he has done such remarkably good work with the alternating current, had started first of all in the central portion of the city with an Edison three-wire system whether he would have any reason to change it to-day.

Mr. Wagner made some facetious remarks about those "beams of copper." Those beams of copper earn a return for my stockholders. As to whether you shall have beams of a certain size is simply a question of interest cost, fuel cost, and other incidental costs under varying conditions. With fuel very low an Edison man would naturally decrease the size of his beams. With fuel very high he would naturally increase the size of his beams. It is a question of balancing the interest cost against the other portions of the cost, and the size is simply an incident in the matter. Mr. Wagner referred to the use of storage batteries. I may say that I agree with him to some extent. He says in his paper that you may ask as to whether storage batteries have not been proved to be a valuable adjunct to the central stations, cost and maintenance considered. I would ask him whether his proposed system of alternating distribution has yet been proved to be a more valuable adjunct to the central station as compared with the three wire low tension system. So far as the Chicago Edison Company is concerned and its use of the storage battery, as the battery only went into use yesterday we are not in a position to say much about it at the present time. We are to some extent trying an experiment; but I can say this, that one of the primary reasons in our deciding to use a storage battery was the difference in the investment

costs between the battery and the construction of a trunk line that would have had to take its place. That is an important factor, as I said before. Interest cost comes in in all these matters. It is a question of conditions.

Now as to Mr. Wagner's closing claims. The first is—highest possible efficiency of distribution and operation. I judge from that that Mr. Wagner means the cost of distribution and operation will be lower in the alternating-current system than in the case of a three-wire system. My claim is that that has to be proven. The next claim is: largest territory desired readily supplied from one station. There comes the question of investment. It is simply a question of conditions. The greatest claim is flexibility. If you can find anything more flexible than a system operated during the whole of the 24 hours, first from one station, then from two, then from three, carrying at the same time during the 24 hours current 13,000 feet from the point of generation with a loss almost impossible to figure out—if you can find anything more flexible than that, we will be delighted to adopt it.

Another claim is: the only system in which all classes of service can be supplied from one type of generator. I take issue and challenge him to show a plant in operation where that condition exists, except in the case of the low tension direct three-wire system. I have not seen it. I think it was Mr. Bowker, vice-president of the Edison Illuminating Company of New York, when we first started to discuss this question of the use of alternating current in connection with the low tension Edison station, pointed out the absolute permanency of the main investment in low tension work—that is, the distribution system; and although Mr. Wagner may be correct in the claims he makes as to percentages of efficiency—on that subject I am not competent to offer an opinion—I would warn you to go very carefully, certainly in large cities, about adopting a scheme over one that has received the test of time. So far as widely distributed areas are concerned there is no doubt that the alternating current is of great advantage to us, but in big centers of distribution I think that the experience of electrical engineers the world over has shown that the one system to use, one by which we can make money and which will enable us to keep our positions, is the use of the low tension Edison system.

Mr. Ayer—The discussion resulting from papers like these, so far as it has gone, largely relates to the practice in large cities. The membership in the Association, however, is not made up of representatives of large cities entirely, and the discussion of the papers should take a trend that would benefit the greatest number, and it seems to me there is ample food in these two papers to give us some lessons that will apply to all. One thing that I think is pretty generally understood by the operators of central stations in the last few years, is the necessity of getting rid of the house to house transformer, which means going to the three-wire distribution. We are all working for that end. It seems to me now from this discussion that it is the thing to come to; in other words, that method of distribution is best that produces permanency of investment and leads up to some one settled method for detail of our plan. The motor business is coming to be quite a factor as you appreciate. The alternating current motor, while not developed to its highest efficiency and not so well known, may have great possibilities, but it is not going to exceed the possibilities of the direct-current motor. The question of the flexibility of the current, while it is not so much a question to-day as it was five or ten years ago, is still very important. The point has been raised about hydraulic elevators in medium size cities cutting off desirable sources of revenue. Printing presses are very troublesome to the alternating-current motor man. There are other special uses and demands, but we know this in regard to the relative value of these investments—you have to make some experimental investments to-day in the alternating-current motor—you have the question of insulation to contend with, and in all high tension devices as you get up in pressure you decrease the life of the devices and the investment is of a less permanent nature. The character of the services that you could get from the one or the other is varied. It is certain that you can get good regulation with the direct current. It is easier to regulate the low pressure system than the high, but the question is to get the thing that will bring you the greatest amount of business at all times, and that is a question which is a pertinent one. The low tension system certainly does that. While we have the statements that a perfectly satisfactory single-phase motor is in the market we know they are not in general use. Many of the members have experimented with them. There is no question that they will come and be satisfactory, but they are not comparable to the direct-current motor

to-day. Isolated plants will invariably put in in the future as in the past the direct current and you will lose sight of the possibility of a large amount of business if you extend your alternating system rather than to extend the system with direct current. The arc lighting problem to me is one that is readily solved with the direct system, and for outlying districts and municipal lighting there is no question in the mind of any one who has ever attempted to compare the alternating current with the direct current for street lighting from series or multiple arc lamps, that the very nature of the current makes it a certainty. You get the strongest rays where they are useful; no reflectors are necessary to carry it down. We know the enormous investment we would have to put into apparatus incident to developing the alternating-current system. All translating devices are easily destroyed and they are expensive to replace.

I had thought to touch in detail on some of these statements relative to the comparison of the two methods, but it does not seem necessary. Where alternating current only is practicable and there are conditions where a central station should use it, it goes without saying that the method outlined, or substantially that, is one which should be taken up wherever the conditions warrant it; but I want to express my conviction very firmly that the old system is the best one.

The discussion was continued by Messrs. Fakes, Davis, Stetson, Van Trump, Ferguson, De Camp, Insull, Hubeley, Thayer, Chandler, Smith, Walbank and Carnes, and was principally in reference to details not entered into in the papers of Messrs. Wagner and Ferguson.

FIFTEENTH GENERAL MEETING OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The Fifteenth General Meeting of the American Institute of Electrical Engineers began its opening session at Omaha, Neb., at 10 A. M. Monday, June 27. Through the courtesy of Mr. Rosewater, of the Omaha Bee, a large, cool assembly room on the top floor of the Bee building was placed at the disposal of the Institute throughout the Convention. The opening session was called to order by the president, Dr. A. E. Kennelly, who announced that, the mayor of the city being absent, the president of the City Council, the Hon. W. W. Bingham, had been deputed to receive the visitors.

Mr. Bingham extended a cordial greeting, and assured the Engineers that during their stay our few would not ring till 3 A. M., so that plenty of time would be afforded to do the Midway properly. He closed by presenting the Convention with a golden key to the city. President Wattles of the Exposition was then introduced and welcomed the Society to the Exposition and extended the courtesies of the grounds to them. Mr. Wattles expressed his appreciation of what his electrical engineers had done for his big show and insisted that the lighting effect of the Grand Court at the Trans-Mississippi Exposition would take second place to nothing, not even the Chicago Exposition. Mr. Edward Rosewater was next presented and spoke in a reminiscent strain of his early experience in telegraphy.

President Kennelly next delivered his inaugural address, on "The Present Status of Electricity." This was followed by a paper entitled "The Dielectric Strength of Air," by Charles P. Steinmetz. The secretary next read a paper in the absence of its author, Mr. Howell, on "Two-wire Distributing Systems and Lamps of 220-240 Volts." This gave rise to an interesting discussion in which many members participated, and was one of the most instructive features of the session. "A Capillary Electrometer for Electrical Measurements" was the last paper to be read by its author, Charles F. Burgess, and was favorably received.

On Tuesday morning, after the meeting had been called to order, a paper by George A. Damon on "A Modern Electric Central Station" was read and was followed by a discussion in which Messrs. Arnold, Steinmetz and Humphrey participated.

The "Preliminary Report of the Committee on Standardization" was next presented by Dr. Crocker, the chairman of the committee. The general discussion of the report followed, which occupied the remainder of the morning session.

At the Wednesday session a paper by Albert H. Armstrong on "Some Phases of the Rapid Transit Problem" was read, which was followed by a paper on "Transmission and Distribution of Power for Railway Service," by Ernst J. Berg. Both papers were quite fully discussed. A paper on telephonic disturbances in Minneapolis was then read by Prof. G. D. Shepardson of the University of Minnesota.

During the afternoon of Monday, the opening day, the Convention visited the Omaha and Grant Smelting and Refining Company's works, also the Union Pacific Railway Company's shops. The smelter is the largest in the world and the trip through it proved quite interesting and profitable. Master Mechanic Manning of the Union Pacific personally conducted the men through his shops.

Col. J. J. Dickey, of the local committee, at the Monday morning session announced that the Knights of Ak-Sar-Ben would hold an honorary initiation in the evening for the A. I. E. E.'s. All who desired to take the oath of allegiance to King Samson IV were to meet at the "Den" at 8 P. M. Fifty men were at that morning meeting and fifty men knocked humbly at the gate of the King's palace in the evening. Sixteen entered the lists to gain special favor in the eyes of the King, and the rest stood by and enjoyed the efforts of the favor-seeking sixteen. Since the new subjects were electricians, it was thought no more than proper to turn the "juice" on a little stronger than usual in the machines fitted up to shoot lightning through candidates.

The afternoon and evening of the second day were spent in a complimentary trip to the Exposition. When night fell the lighting of the main court was admired, and then the trip down the Midway began. The crowd escaped from the delirium of the "Streets of All Nations," crossed the way and remembered the Maine long enough to see it blown up, and then found their way to the "German Village." The hospitable manager and his beer were too much, and there the crowd stayed till the lights went out.

An excursion to South Omaha was the programme for Wednesday afternoon. A visit to the establishments of the Swift and of the Armour companies gave the visitors some idea of the extensive packing interests of the Magic City. In the evening, through the kindness of the several managers, the Convention enjoyed a trolley party through Council Bluffs, South Omaha and Omaha.

Before adjourning, the Convention extended its unanimous thanks to Prof. Owens for his untiring efforts in the local committee on arrangements. The following resolutions were also unanimously adopted:

Whereas, The American Institute of Electrical Engineers at its first general meeting west of the Mississippi has been received with cordial hospitality and every endeavor has been made to contribute to the convenience and pleasure of its members:

Therefore, the Institute formally expresses its hearty appreciation of the many favors and courtesies which have been extended by its generous hosts in exhibiting the remarkable industries of Omaha, in presenting the beautiful "White City," which represents the progress and enterprise of the Trans-Mississippi West, and in many ways doing honor and contributing to the welfare of the Institute. In especial measure thanks are due to the city of Omaha, through its Acting Mayor Bingham; Mr. Rosewater for courtesies extended; Mr. Wattles in behalf of the Exposition, and also Mr. Kirkendall of the Department of Buildings and Grounds, for special attentions; the Omaha & Grant Smelting & Refining Company, the Union Pacific Railroad Company and Master Mechanic Manning, the Omaha Street Railroad Company, the Omaha and Council Bluffs Railroad & Bridge Company, Swift & Co. of South Omaha, Armour & Co. of South Omaha, the Knights of Ak-Sar-Ben, and the members of the untiring local committee.

The following is a list of names of those in attendance:

Abbott, Arthur Vaughn, Chicago.
Armstrong, A. H., Schenectady.
Arnold, Bion J., Chicago.
Bart, F. B., Chicago.
Berg, Ernst J., Schenectady.
Bingham, W. W., Omaha.
Burgess, Charles F., Madison.
Creighton, Hon. J. A., Omaha.
Crocker, Francis B., New York.
Damon, George A., Chicago.
Dickey, J. J., Omaha.
Dimmock, W. S., Omaha.
Drake, Luther, Omaha.
Eddy, Dr. H. T., Minneapolis.
Ekstrom, Alex., Schenectady.
Frankenfeld, Budd, State College, Pa.
Fuller, C. O., Omaha.
Goldsborough, W. E., Lafayette, Ind.
Hammeroblag, A. A., New York.
Harris, G. H., Birmingham, Ala.
Hubbard, Freeman, Minneapolis.
Horton, C. B., Omaha.
Howell, John W., Newark.
Humphrey, H. H., St. Louis.
Jackson, D. C., Madison, Wis.
Kammeyer, C. E., Chicago.
Keller, E. E., Pittsburgh.
Kennelly, Dr. A. E., Philadelphia.
Kerr, H. H., Chicago.
Korty, L. H., Omaha.
Lane, H. Van, Omaha.
Lindsay, W. E., St. Louis.
Lovett, Israel, Omaha.
McKissick, A. F., Auburn, Ala.
Morgan, Jacques L., Kansas City, Mo.
Murphy, Frank, Omaha.
Nash, F. A., Omaha.
O'Hara, J. B., Chicago.
Owens, Prof. R. B., Lincoln, Neb.
Pope, Ralph W., New York.
Reichmann, F., Austin, Tex.
Rogers, A. S., Omaha.
Rosewater, E., Omaha.
Rosewater, Andrew, Omaha.
Rustin, H., Omaha.
Scott, C. F., Pittsburgh.
Shaw, H. B., Columbia, Mo.
Shepardson, George D., Minneapolis.
Shurig, Edward F., Omaha.
Steinmetz, Charles P., Schenectady.
Stieringer, Luther, New York.
Umsted, W. W., Omaha.
Wattles, G. W., Omaha.
White, William F., Omaha.
Woolbridge, J. E., New York.
Yost, C. E., Omaha.

MEETING OF THE CANADIAN ELECTRICAL ASSOCIATION.

The Canadian Electrical Association held its annual meeting at the Windsor Hotel, Montreal, on June 28, the attendance being unusually large.

The Association was welcomed to the city by His Worship Mayor Prefontaine, who was introduced by Mr. Sadler, after which Mr. John Yule of Guelph, the president of the Association, delivered the customary presidential address. The first paper to be read was "How to Overcome Some of the Difficulties Encountered by Central Station Men," by A. A. Wright of Renfrew, Ont. Mr. Wright's paper contained many valuable suggestions on this subject from the standpoint of one having to deal with customers living in a town of moderate size. The paper was distributed. The meeting adjourned at noon to resume again at 2 o'clock. Another large attendance greeted the second session and much enthusiasm was displayed in the proceedings.

A paper on "Electric Utilization of Water Powers," prepared by L. D. W. Magie, was read by W. H. Browne, and read so well that it was humorously suggested that Mr. Browne should accept the position of official reader for the Convention.

Mr. Magie's paper dealt with the desideratum to be attained in making use of water power as a power for generating electricity at a profit; and as the relative merits of steam and water were incidentally involved in the argument, considerable discussion afterwards arose on this point.

After Mr. Reeser, E. E. Wright, Mr. Wickens and

others had spoken briefly, the suggestion to defer Mr. Magie's paper for discussion to next year was adopted, and it was received with a cordial vote of thanks.

A rather remarkable paper was that read by W. T. Bonner, entitled "A Plea for the Introduction of Goods Traffic on our Suburban Tramways."

Mr. Bonner drew attention to what he conceived to be an important field for development in tramway enterprise, after which he proceeded to expose the scheme of his paper. This, in a word, was that suburban tramways should acquire facilities for carrying farm produce in the wagons as freight on the roads, thus reducing the cost of carriage and saving the farmer the long and tiresome journey by horse and wagon to get to market.

After quite a lengthy discussion on this subject, on motion a vote of thanks was tendered to Mr. Bonner for his paper, and the meeting adjourned until June 29 at 10 o'clock.

After the meeting had been called to order on June 29, C. H. Mortimer submitted his annual report, and considerable routine business was gone through with, it being decided among other things to hold the Convention next year at Hamilton. James Milne's paper on "Economies in the Boiler Room" was read at this session by Mr. Weeks. W. T. Bonner read a paper on "The Quimby Screw Pump," which it was claimed offered a wider range for the utilization of electric power than any other apparatus presented for some time past, and in a field also where costs of installation and operation are both important factors.

The other remaining papers were taken as read, and the Convention adjourned.

E. M. F. of the Arc With Aluminum Electrodes.

It is known that an electrolytic cell having carbon and aluminum electrodes opposes the passage of current in the aluminum-carbon direction with an EMF. of 22 volts, while current passes in the other direction with only the opposition due to the resistance of the liquid and the polarization EMF. Herr V. von Lanz describes in *Wiedemann's Annalen* his researches upon the arc with aluminum electrodes.

This arc is established under an EMF. of 19 volts. Between electrodes of aluminum and carbon the current passes more easily from aluminum to carbon, an effect contrary to that noticed in the electrolytic cell. This arc may be used therefore for the rectification of alternating currents, but the efficiency of such a rectification would not be higher than about 6 per cent.

LEGAL NOTES.

A recent decision of a New York court is of importance to street railway companies. The case was one of a collision between a street vehicle and a trolley car, and grew out of an action for damages on the part of the owner of the vehicle. It appears that the vehicle was traversing a street crossing the street railway track, and that while so doing it was struck by a car and badly damaged. The defence set up the plea that the car had the right of way, and that it was the duty of the driver of the vehicle to recognize this fact and stop his horse to let the car go by. The court held that this defence was erroneous; that a street railway company in acquiring the privilege to lay rails along the streets for its traffic was not given any exclusive privilege, and that it was the duty of a motorman at all times to be as careful and as watchful in avoiding collisions with horse drawn vehicles as the drivers of such vehicles should be in avoiding collisions with the cars. In other words, that street cars have no special privileges other than the right to require that vehicles shall not impede their progress along the streets they traverse.

A bill in equity has been filed in the United States Circuit Court at Philadelphia by the Edison Electric Light Company against the Lancaster Elec-

tric Light, Heat & Power Company, and Isaac C. Walker and Henry G. Keppler, trading as Walker & Keppler of Philadelphia, asking to have the defendants restrained from the making of an alleged infringement on the plaintiff's patent upon an improved system of electrical distribution.

Justice Scripture in special term at Syracuse, N. Y., on the 25th ult., after hearing argument on a motion made by Attorney Bronner, of Little Falls, dissolving the Dolgeville Electric Light Company and appointing a receiver therefor, named James D. Feeter of Little Falls as receiver. The electric light company is one of the concerns involved in the failure of Alfred Dolge & Sons.

Judge Valiant has denied the writ of mandamus asked for by George H. Little of St. Louis to compel the officers of the St. Louis Electric Railway Company to permit him to see the books of the company. The company was organized some years ago to build an electric road between St. Louis and Chicago. The road was not built.

The Volunteer Engineers.

Company F, First Regiment U. S. Volunteer Engineers, was mustered in at Camp Townsend, Peekskill, on the afternoon of the 4th. Among those designated electrical engineers or electricians on the muster roll are: Sergeants—Francis M. Blacklock, Niagara Falls; George C. Ewing, Newton, Mass. Corporals—George B. Gordon, New York; William J. Schweiger, New York. Musician—Warren S. Fisher, Ridley Park, Pa.

THE NEWS.

What is Going On in the Electrical World.

LIGHTING PLANTS.

Bunker Hill, Ill.—The electric light ordinance has passed the council by a unanimous vote. Bonds will be issued to the amount of \$6,900 and the proceeds applied to the erection of the plant.

Decatur, Mich.—The committee appointed to investigate as to cost and advisability of putting in an electric light plant have reported favorably to the project, and recommend that a plant to cost about \$6,000 be obtained. The system will be for both arc and incandescent lighting.

Fargo, N. D.—A franchise has been granted to Alexander Hughes and Elmond A. Hughes of Bismarck to operate an electric light and power plant in Fargo. The term of the franchise is twenty years.

New Richmond, O.—P. Arlund & Co. have been granted a franchise permitting them to erect an electric light plant in this town of sufficient capacity to supply 33 arc or 150 incandescent lights for street lighting.

Oshkosh, Wis.—An ordinance is being published granting to F. H. Libbey and associates the right to establish a plant in Oshkosh for furnishing light, power and heat by means of electricity. The franchise is to be in force for 25 years from July 1.

Terre Haute, Ind.—The old electric light plant has been sold by Receiver Walsh to A. J. Crawford for \$40,000, he being the only bidder.

STREET RAILWAYS.

Albany, N. Y.—An application has been filed with the State Railroad Commissioners for authority to build an electric road in Cheektowaga and to the town of Java in Wyoming county. The application is made by the Buffalo Valley Railroad, but it is believed to be merely an extension of the Buffalo Traction Company's lines. The Commission will give a hearing on the application on the 13th inst.

Baton Rouge, La.—The car shed of the Home Electric Company was burned down on the 24th ult., resulting in the destruction of several cars, the office furniture and the repair shop. The loss is estimated at \$15,000, with only \$2,000 insurance.

Cleveland, O.—The Cleveland & Eastern Railroad Company has begun its line to Burton, 28 miles distant, and expect to complete it this year. Later the road will be extended to the Pennsylvania State line. The officers and directors of the company as organized are: President, H. P. McIntosh; vice-president, H. A. Sher-

win; secretary and treasurer, E. G. Tillotson; directors: H. P. McIntosh, H. A. Sherwin, E. A. Hartman, H. Clark Ford, W. H. Lamprecht, Howard White, W. N. Gates and E. G. Tillotson.

Fernandina, Fla.—J. E. Starke, of Jacksonville, has submitted a proposition to the city council, looking toward the building of an electric street car line to Amelia Beach, a local resort. The matter was submitted to a special committee of the council.

Kansas City, Mo.—A number of local capitalists are about to incorporate as the Kansas City Electrical Street Railway Company and will build and operate a line on the south side of the city.

Lawrence, Mass.—The substitution of an electric traction service for steam at the Arlington mill here has given great satisfaction as a measure of economy in the shifting of loaded and empty cars on the tracks connected with the establishment.

Mamaroneck, N. Y.—The Tarrytown, White Plains & Mamaroneck Railroad, the first line to connect Long Island Sound with the Hudson River, is completed, and the first car was run by electricity over the new branch from White Plains to Mamaroneck on Thursday evening. The route is about eighteen miles long, and includes a short branch to the Bloomingdale Asylum. The company has the right to charge 20 cents fare over its entire line, or 10 cents between White Plains and Mamaroneck.

Milwaukee, Wis.—The Milwaukee Street Railway Company's line to Waukesha and Waukesha Beach is completed and in operation.

Milford, Conn.—The Milford Street Railway Company's line between Milford and Woodmont has been opened for traffic. This gives a continuous trolley line between New Haven and Stamford, a distance of over fifty miles.

Pine Bluff, Ark.—The promoters of the electric street railway have secured a site for a power house and will erect the necessary buildings at once. Work on the road will begin as soon as the rails which have been ordered arrive.

Saginaw, Mich.—An ordinance of council is published in the "News" granting a 25-year franchise for a street railway in this city to C. Sidney Shepard, S. D. Loring, and Charles Eddy, who are allowed one month from June 20 to reject or accept it.

St. Paul, Minn.—The North St. Paul, White Bear & Suburban Railway has passed into the hands of the St. Paul City Railway Company and is now being operated by that corporation.

Staten Island, N. Y.—The Staten Island Midland Railroad, which controls about one-half of the electric railroads on Staten Island and has almost exclusive control of the streets on the south shore toward the interior, has abolished the system of transfers provided for in its franchise, and hereafter every one wishing to change from one branch of the road to another must pay a second full fare.

Waterville, Me.—A company has been organized to build and equip an electric road from Fairfield to Benton Falls. The members of the company are John T. Richards, Chas. D. Brown, Elisha Morgan, Edwin W. Heath and H. M. Mansfield. The primary object of the road is to carry freight between the two points.

West Bay City, Mich.—The Interurban electric road has settled with D. F. Campbell, of Bay City, for \$10,000 in payment for the lives of his wife and three children who were killed in the bridge accident on the road July 7, 1897.

MANUFACTURING, ETC.

Berlin, Ger.—A company has been formed here under the title of the Electric Power Company of Santiago de Chili, with a capital of 24,000,000 marks, of which Werner, Beit & Co., of Berlin, take as much as 12,000,000 marks, while the balance is taken in equal proportion by the Societe Generale d'Electricite. Part of the capital will be offered for subscription in England. Extensive electrical undertakings in Chili are soon to be started by the company.

Cleveland, O.—A meeting of the representatives of the suburban electric roads entering this city was held here on the 29th ult. for the purpose of arranging plans for a new express company to be operated by those lines. An organization for this purpose will probably be the result.

Detroit, Mich.—The Fire Commission has awarded the contracts for the new fire and police telephone system. The contract for cable was given to the Standard Underground Cable Company and for telephone apparatus to the Holzer-Cabot Electric Company of Brookline, Mass.

TRANSMISSION PLANTS.

Johnstown, N. Y.—The Cayadutta Electric Generating Company, composed of Supervisor A. Z. Wemple and Dr. W. H. Post of Fultonville and J. S. Wilson of Fonda, has purchased the dam and water privileges, known as the Clapper dam, on Cayadutta creek, near Sammonsville, and will use the water power to operate an electric plant. The company intends to put in a 100 horse power generator that will have a capacity of furnishing 800 incandescent and 50 arc lights, a sufficient number to furnish Fonda and Fultonville with all the light they are likely to need for some time.

Los Angeles, Cal.—The San Gabriel Electric Company's line has been completed and the works are in operation, furnishing power to customers at a distance of 23 miles from its source, the San Gabriel Canyon. The company has at its command 4,300 horse-power.

Lowville, N. Y.—Lafayette Wetmore of Martinaburgh has bought a water power at Belfort, and intends to harness the power and convey electricity to Lowville for lighting and manufacturing purposes. Belfort is fourteen miles northeast of Lowville, and the power in question, which is on Beaver river, it is estimated will develop about 2,000 horse-power.

Massena Springs, N. Y.—A contract has been placed by the St. Lawrence Power Company for the excavation of its canal. The generating plant which it is proposed to erect will entail an expense of about \$3,000,000. The water power available is some 200,000 HP. and the electric generator equipment will in time be 150,000 HP. The power will be electrically transmitted to several towns and cities.

COMPANY MATTERS.

Newark, N. J.—A mortgage for \$200,000 was recorded in the office of the Register of Essex County on the 1st inst. It was given by the Crocker-Wheeler Electric Company of East Orange to the Knickerbocker Trust Company of New York.

PERSONAL AND MISCELLANEA.

James Smith of Orange, N. J., has been appointed manager of the Elizabeth branch of the North Jersey Street Railway Company, to take the place of George F. Chapman, promoted to be general superintendent.

A few nights ago, at Northboro, Mass., Superintendent B. L. Dickinson of the Worcester & Marlboro Street Railway was aroused from his peaceful slumbers and presented with a handsome gold Waltham watch, gold chain and charm by the employees of the company, as a token of their esteem.

We are advised from Washington that Mr. Frederick Emory's term as Director of the Bureau of American Republics has been extended to October 1 of the present year. Mr. Emory will, as heretofore, by direction of the Secretary of State, continue to serve as Chief of the Bureau of Foreign Commerce, Department of State, in the work of editing the commercial reports of the diplomatic and consular officers. He was designated as Acting Director of the Bureau of the American Republics upon the death of the late Director, Mr. Joseph P. Smith, on the 5th of February last, and was made

was the manager of the Franklin Institute. In 1887 he was engineer of the Edison Electric Light Company. In 1889 he was made chief engineer of the Edison General Electric Lighting Company, and in 1891 he was made president of the same company. In 1896 he was president of the American Electrical Exhibition Company. He is now the director of the Philadelphia Electrical Exhibition, which has proven so interesting both as an exhibition and a means of instruction to thousands of our public. Prof. Marks is strong in the belief that the usefulness of horses for business and pleasure purposes in large cities and towns is rapidly coming to an end, because electricity will do the work of the equines far better, cheaper, more cleanly and more healthfully than they do it. The General Electric Automobile Company is to be congratulated in having a servant of his prominence and energy at its head."

Walter K. Freeman, convicted in the New York Court of General Sessions of assaulting a young girl, has been released from prison after having served three years of his ten years' sentence. He was discharged because of a stipulation made by the District Attorney that he would press the complaint no further if the Court of Appeals sustained the decision of the Supreme Court directing a new trial. The Court of Appeals having done this, the prisoner on Wednesday last was declared a free man.

Lion tamers nowadays frequently use electricity in taming their beasts. When a wild lion or tiger is to be tamed, electric wires are first rigged up in the cage between the tamer and the animal. After a time the tamer turns his back, and the lion invariably makes a leap at him, but, encountering the charged wires, receives a paralyzing shock sufficient to terrorize it forever.

COMMERCIAL PARAGRAPHS.

The motor herewith illustrated, and known as No. 1 Motor, and which operates a 4½-inch fan by means of a battery, was invented by Mr. James H. Mason, 151 East 23d street, New York. Mr. Mason, who is a well-known inventor, manufactures various designs of portable fan outfits under patents owned by himself. In every case special care has been given to the design, which is scientifically correct, and in every case the construction is perfect. Mr. Mason is prepared to furnish portable battery fan outfits with fans 4½ or 8 inches in diameter, ranging in price from \$2.50 to \$10. For country residences or isolated dwellings

No. 1 Motor—Cut one-half height.

Director, with special powers, by action of the Executive Committee on the 28th of February last to serve until June 30, 1893.

Superintendent Robert H. Dalzell of the Bullock Electrical Company, Cincinnati, tendered his resignation a few days ago because of some disagreement between him and Vice President Neave. After doing so he went to his lodging rooms and took morphine to steady his nerves, but, it is supposed, drank an overdose. He was found shortly after lying unconscious upon his bed by an attendant who called in medical aid. After working with his patient for several hours the doctor pronounced him out of danger.

Prof. William D. Marks, who has just been elected president of the new General Electric Automobile Company, is, says the Philadelphia "North American," not only one of the most expert electricians in the country, but is also a scholar of great attainments in other branches of science. Prof. Marks, like most of the great electricians of the world, is American born, bred and reared. He came before the public prominently in 1876, when he was made Professor of Dynamical Engineering of the University of Pennsylvania. In 1878 he took up the study of electricity in accordance with the suggestion of his intimate friend, Thomas A. Edison, and it has ever since been with him not only a source of profit, but also a labor of love. He is to-day recognized as one of the greatest of authorities in all that pertains to electrical matters. Prof. Marks is a man of great executive ability, and has held many positions of trust and responsibility in this city, which for over twenty years has been his home. In 1884 he

where no steady supply of electricity can be obtained from city mains for operating a fan during the summer months, the portable fan outfit sold by Mr. Mason would seem to be just what is needed, as the first cost is extremely low and the cost of operation but one cent an hour. The fact that Mr. Mason has received many orders for fans of this description, one order alone being for 500, would certainly go to prove that an outfit of this description, where no acids are obliged to be handled, is just what is needed during the hot season and is easily within the reach of all.

The Holophane Glass Company of No. 1 Broadway, New York, is manufacturing a line of glass globes that far surpasses any make of globes now on the market. The Holophane compound prism glass places all high-power sources of light such as the electric arc, incandescent gas, incandescent electric and acetylene under absolute control, enabling the light to be so distributed and diffused as to give the highest possible illuminating efficiency in each particular case. The methods by which the Holophane glass is produced make it absolutely different from any other form of corrugated or ribbed glass in existence. Its general appearance when not illuminated does not differ materially from the ordinary ribbed and prism glass now on the market; there is one infallible method however by which Holophane glass can be instantly recognized, namely, that when put over a light the whole surface shines. The value of a globe, as is well known, can only be determined by getting underneath so as to look up at it. With

the ordinary globes most of the downward rays are cut off, whereas in the case of a Holophane there is an increased brilliancy. This well known concern has recently gotten out an exceedingly attractive and fully illustrated pamphlet of some 60 pages descriptive of the Holophane which should certainly be in the hands of all those interested in securing good illumination.

RECENT COMPANY ELECTIONS.

Providence & Taunton Street Railway Company, Taunton, Mass.—President, Col. J. J. Whipple of Brockton; treasurer, P. L. Walton of Taunton; clerk, George A. Rutman of Taunton; directors: W. A. Tucker and E. P. Shaw, Jr., of Taunton, F. K. Peck of Providence, A. B. Williams of Taunton, and the officers.

Penn Electric Light Company, Philadelphia.—Directors: A. J. DeCamp, Henry Olay, Samuel R. Huey, James McManis, W. L. Elkins, Martin Maloney, George S. Graham, David H. Lane and James E. Hays.

General Electric Automobile Company, Philadelphia.—President, William D. Marks, formerly president of the Edison Electric Light Company; directors: W. W. Foukard, president of the Trades League and senior member of the firm of Hood, Foukard & Co.; O. C. Hobby-hell, treasurer of the Fidelity Mutual Life Assurance Company; H. S. Hale, president of Hale & Kilburn Manufacturing Company; E. F. Morse, president of Morse, Williams & Co. Elevator Works; J. H. Lorimer, president of W. H. Lorimer Sons Co.; F. R. Maturin, Secretary of Corporation Trust Company of New Jersey; R. M. Hunter, electrician and inventor. The Fidelity Insurance, Trust & Safe Deposit Company of Philadelphia are the subscription and financial agents.

Deering Electric Light Company, Deering, Me.—President, W. W. Mitchell; treasurer and manager, George W. Brown; directors: W. W. Mitchell, D. W. Hoegg, Myron E. Moore, Frank W. Stockman, J. L. Watson, George W. Brown, Joseph B. Walton, Caleb E. Marsh.

INCORPORATIONS.

The People's Electric Light, Heat & Power Company, Nanticoke, Pa. Capital stock, \$71,000. Incorporators: M. W. Morris, Pittston; C. E. Stegman, J. A. Bullard, Sol. Hirsch, S. Wormser, E. W. Mulligan, W. G. Weaver and J. W. Morris, of Wilkes-Barre, Pa.

The Toledo Heating & Lighting Company, Toledo, O.—to furnish electricity for lighting, heating and power and hot water and steam for heating and power purposes. Capital stock, \$125,000. Incorporators: H. L. Yanger, H. E. Marvin, Irving R. Hiett, T. W. Oulids, R. R. Lee and George H. Beckwith.

The International Electric Company, Cleveland, O.—to manufacture and deal in electrical appliances. Capital stock, \$10,000. Incorporators: A. W. Mayers, E. H. Shaw, W. R. Studebaker, W. S. Hale and Charles Seaton.

The St. Louis & Belleville Electric Railway Company of East St. Louis has certified to an increase of capital from \$50,000 to \$350,000.

The Ottumwa Electric & Steam Company, Ottumwa, Ia.—to operate street railways in the city of Ottumwa and vicinity. Capital stock, \$200,000. Incorporators: Samuel Mahon, Calvin Manman, J. W. Garues, J. B. Sax, William Doggett and J. H. Merrill.

The Mutual Electric Company, Chicago, Ill. Capital stock \$25,000. Incorporators: E. H. Oheuey, F. S. Richmond and H. O. Hall.

The Portchester Electric Lighting Company, Portchester, N. Y.—to manufacture electricity and use it for producing light, heat and power. Capital stock, \$50,000. Directors: William L. Ward and Addison Johnson, of Portchester, and William E. Ward of Itey.

The North Jersey Light and Power Company, Montclair, N. J.—to distribute electricity for power and light purposes. Capital stock, \$15,000, of which \$1,000 is paid in. Incorporators: William T. Francisco, Albert C. Williams and Harry M. Warren, all of Montclair.

The Ephrata Electric Company, Ephrata, Pa. Capital stock, \$15,000. Directors: F. E. Halcy, Philadelphia; A. W. Mentzer (treasurer), H. G. Mentzer and John W. Von Nerda, Ephrata; S. N. Bailey, Dillsburg, Pa.

The Gross Electric Experimental Company, Gillespie, Ill. Capital stock, \$12,500. Incorporators: William M. Gross, John Sellers, William M. Williams.

The Eagle Electric Works, Peoria, Ill., has increased its capital stock from \$5,000 to \$15,000.

The Mingo Light Company, Mingo Junction, O.—to maintain an electric light plant in Mingo Junction. Capital stock, \$1,000. Incorporators: Benjamin L. Hirschfeld, Joseph May, William May, Louis W. May and Thomas M. Loup.

The Lima Honyoe Electric Light Company of Honyoe Falls, N. Y. Capital stock, \$25,000. Directors: H. H. Sittel, R. L. Freyer, J. C. Conway, P. P. Miller, H. W. Bux, A. L. Williams, A. M. Huldin, H. C. Gilbert and Clarence McGregor, Buffalo.

The Standard Electric Vapor Motor Company, New York. Capital stock, \$50,000. Directors: S. W. Warner, B. L. Warner and W. M. Warner, of Yonkers.

The Manhattan Institute of Electro-Therapeutics, New York. Capital stock, \$25,000. Directors: Henry H. Goldberg and Ralph Goldberg, New York, and F. M. Buckley, Brooklyn, N. Y.

The General Electric Company owed on July 1, 1893, \$1,488,200 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

A SPECIAL PRIZE OFFER.

TELEPHONE AND TELEGRAPH.

Theses Competition for Students.

We take pleasure in announcing to the students who are taking the electrical engineering course in the various Universities of this country that we have decided to award prizes for the most meritorious theses sent us by students graduating this year, as follows: First prize, \$25; second prize, \$15; the next three best theses to receive honorable mention with a year's paid subscription to *ELECTRICITY*.

The conditions of the competition will be as follows: Competing theses shall be sent in anonymously indorsed on the outside "For *ELECTRICITY*'s Thesis Competition." Each thesis should be either accompanied or followed by a sealed envelope containing the anonymous or assumed name under which the thesis was sent in as well as the correct name and address of the author and the name of the University or College he represents. These envelopes will not be opened until all the theses submitted have been carefully examined and those deserving of prizes selected. Each of these envelopes should also contain a note from the Professor of Electrical Engineering of whatever University the student is attending, stating that the candidate is eligible to enter the competition.

The merit of the various theses submitted will be judged by the editorial staff of *ELECTRICITY*, assisted by any outside experts it may be deemed advisable to call in.

The theses will be graded according to their apparent permanent value for the advancement of practice or theory in electrical engineering. No thesis which has previously been published in full or in substance will be eligible for the competition, and whenever in a thesis it is found necessary to quote an authority credit must be given.

The two theses awarded first and second prizes will appear in the columns of *ELECTRICITY* duly credited to their respective authors, as also those receiving honorable mention. The right is reserved to reject all these submitted in case none is found worthy of a prize.

All theses awarded either a prize or honorable mention are to become the property of *ELECTRICITY*, although all drawings will be immediately returned after publication as well as those theses receiving neither prize nor honorable mention.

We make this announcement at the present time so as to give the students who desire to enter this competition ample time to prepare creditable papers. No definite time is specified as to when all papers should be in, but if possible we would like to have them all on hand by August 1.

If the conditions of the competition as set forth above are not perfectly clear, we will be pleased to answer any inquiries relating to this matter.

The General Electric Company owed on July 1, 1898, \$1,488,200 accumulated dividends on its preferred stock. These dividends have not been paid since July, 1893. The rate of interest is 7 per cent. per annum. Neither have any dividends been paid on its common stock since August, 1893.

The Independent Telephone Convention.

The Independent Telephone Association held its second annual meeting at Chicago on June 30, July 1 and 2. The attendance was quite large and the proceedings were conducted with a view to practical results in the contest which the independent companies are waging against the strongly entrenched Bell monopoly. The sessions of the Association are for very good reasons held with closed doors, and our information in regard to the transactions is limited to the fact that it was determined that the fight against the Bell Company is to be kept up and extended into fields not heretofore entered by the independent companies.

Several months ago, as we learn from the Burlington *Hankey*, the citizens residing in Massena and Cumberland, in the southern part of Cass county, Iowa, were quite anxious to have telephone communication with Atlantic, the court town, and to this end negotiated with the Iowa Union Telephone Company (Bell) for some time to have them extend their line in that direction. Quite a sum of money was pledged by subscription, and after waiting for some months the citizens took hold of the matter and established a line of their own, which has been in operation for about sixty days. Since then the Iowa Company announced their intention of building a line, and had commenced setting poles to Massena, but when they attempted to erect poles in the city limits they were informed that the city council would not permit them. As the matter stands now, the Iowa Company has decidedly the worst of it, having set twenty-four miles of poles and being able only to get into Cumberland, and it is said they will have trouble there in a short time.

A few days ago an extraordinary long circuit was made up over the Postal Telegraph system from Little Rock, Ark., to Vancouver, British Columbia, the total distance being 5,000 miles. This stretch of wire went by way of Birmingham, Ala., and had automatic repeaters at the following points: Richmond, Va., New York City, Montreal, Fort Williams, Ontario, Swift Current, Northwest Territory, thence to the Pacific coast. Mr. T. L. Gouldings, chief of Vancouver, exchanged greetings with a number of Little Rock citizens who were present by invitation of the local manager.

Western Union officials say the tax on telegraph messages of one cent will be levied on all messages. The senders must pay for the stamps, affix them to the messages and cancel the same with their names and the date of cancellation. The company, having no facilities for handling stamps, will only carry a limited supply, during the early period of the enforcement of the law, for the accommodation of its patrons.

The new telephone company at Indianapolis has filed with the board of works two bonds—one for \$10,000 and the other for \$25,000. The former is to guarantee the city against any damage from the operation or construction of the plant and the latter to insure faithful performance of the contract. Both bonds were required by the contract between the city and company. The American Surety Company is surety on both bonds.

At Lincoln, Neb., a few days ago the Supreme Court handed down an opinion in which the action brought by John O. Yeiser of Omaha to compel the Nebraska Telephone Company to put an instrument in his office at the monthly rental of \$2.50 was dismissed, and the authority of the court to grant the relief on the proceeding denied. The court holds that fixing of telephone rates is a matter for the Legislature and not for the courts.

The sub-committee of the Philadelphia councils' electrical committee have agreed to report the Drawbaugh Telephone bill with a favorable recommendation. The bill is practically the same as the one introduced by the company in 1897, which was so amended that it was not accepted by the company. It provides for a maximum charge of \$75 per annum for business houses, \$50 for private houses, and the payment to the city of 3 per cent. of the gross receipts; also the filing of a bond of \$50,000 for faithful compliance with the ordinance.

The New York Telephone Company has officially announced that the charge for a telephone message from any pay station in the Borough of Manhattan to any other telephone station connected with an exchange of the company in the same borough will be 10 cents instead of 15 cents as heretofore; a reduction of five cents has also been made on messages from any of its stations in the Borough of Manhattan to its stations in the Borough of the Bronx, the charge heretofore being 25 cents.

The annual meeting of the directors of the Telephone Manufacturing Company of Sumter, S. C., was held at the office of the company in Sumter a few days ago, with all of the directors, both resident and from other places,

present. The report of the manager showed that the year's business was very satisfactory indeed and was sufficiently encouraging to warrant the immediate enlargement of the factory so that the output will be more than doubled.

Stanley F. Stout counsel of the Western Telephone Construction Company, died at Chicago on the 18th ult. In his will he directed that his body be cremated and his ashes be thrown into the lake. For five years he had devoted almost his entire time to the patent interests of the Western Telephone Construction Company, not losing a single case entrusted to him.

The People's Telephone Company, better known as the Havens Company, has been granted a franchise in Terre Haute, Ind., by the city council. The Bell company people made strenuous efforts to prevent the new company from getting a franchise and kept up the fight for two or three years.

The Boston *News-Bureau* states that the New England Telephone & Telegraph Company announces that the new 1 cent stamp tax on telephone messages for which a charge of 15 cents or more is charged will be paid by the company without additional cost to subscriber.

The Citizens' Telephone Company has succeeded in getting a franchise in Medina, N. Y., and will build an exchange, 75 subscribers having been obtained. The local Bell company is endeavoring to head off the new company and has lowered its rates.

The Southern New England Telephone Company at New Haven, Conn., announces that it will change its rates for night service from 10 cents to 25 cents, the income from the extra charge to be devoted to the payment of the war tax. As a compensation, the time will be doubled.

A stock company is being organized by several prominent citizens of Fredericksburg, Va., for the establishment of a telephone line between Fredericksburg and Spotsylvania Courthouse. About one-half of the stock has been already subscribed and the remainder is in sight.

The People's Telephone Company has secured a franchise for Windsor, Sandwich and Walkerville, Can., for 20 years. Its rates will be \$21 for business places and \$8 for residences and with Detroit connections \$35 and \$22. The company will pay the city \$225 a year.

The authorities of New Rochelle, N. Y., have contracted with the New York Telephone Company for a police system of telephones, to be put in operation as soon as possible. Eleven instruments will be used, with a switchboard in police headquarters.

There has lately been a good deal of friction between the Lexington, Ky., council, and the East Tennessee Telephone Company, and the council is now in the mood to grant an acceptable franchise to a responsible independent company.

Superintendent Baker of the Southwestern Telegraph & Telephone Company at Austin, Tex., announces that the war taxes on telephone messages will be paid by the company itself and not collected from persons using its lines.

An ordinance has been introduced in the borough council of Homestead, Pa., granting a franchise to an independent company recently organized. The new company promises telephone service at \$12 a year.

The new State Telephone Company has been granted a franchise in Jackson, Mich. The company will at once commence to erect what it says will be one of the finest 1,000 instrument exchanges in existence.

The West Point Telephone Company has opened its exchange at West Point, Neb., for business. It has 51 instruments installed in the business houses and offices of the city.

The Des Moines, Ia., Mutual Telephone Company has put in an application for the telephone service of the State House. The Bell 'phones are still used in the building.

The New York & New Jersey Telephone Company has applied to the trustees of South Orange for permission to erect a plant in that village.

The Gordon Telephone Company has been granted a franchise for the establishment of a telephone system in Charlestown, W. Va.

New Companies Incorporated.

The Beverly & Marlinton Telephone Company, Hutonsville, W. Va. Capital stock, \$5,000. Incorporators: Perry Bosworth, J. L. Bosworth, A. B. Bosworth, T. O. Russell and O. A. Barlow.

ELECTRICAL SECURITIES.

The subjoined quotations of Electrical Securities dealt in at the leading commercial centers are compiled from special reports received by **ELECTRICITY** from a variety of sources. The utmost care is exercised in their collection and preparation, and every effort is made to secure accurate and reliable information. The management of this journal will esteem it a favor to have brought to their attention any inaccuracies readers may discover in these columns.

* Unlisted. † Ex div.
 a Consolidation of Baltimore Traction Company and City & Suburban Railway Company.
 Company consists of: Baltimore Traction Company, North Baltimore Passenger Railway, Baltimore & Curtis Bay Street Railway, Baltimore & Pothan Railway, Pimlico & Pikeville Railway and Wallbrook, Gwynn Oak & Pothan Railway and Park.
 b Leased to Boston Elevated Railroad Company.
 c Owned by Brooklyn Rapid Transit Company.
 d Leased to Brooklyn Heights Railroad Co., which guarantees 10 % on capital stock.
 e Stock owned by Brooklyn Rapid Transit Company; road operated by Brooklyn Hts. Co.
 f Stock owned by Kings County Traction Company; road leased to Nassau Electric RR.
 g Owned by Atlantic Ave. RR. and leased to Nassau Electric RR.
 h \$200 per share on outstanding capital paid as rental by lessee—West Chicago St. RR. Co.
 i \$200,000 of stock owned by North Chicago Street Railroad Company.
 j Controls by lease Chicago West Division Railway, Chicago Passenger Railway, and West Chicago Street Railroad Tunnel Company.
 k \$25 % per annum paid on outstanding capital as rental by lessee—North Chicago Street Railroad Company.
 l Majority of stock owned by Chicago West Division Railway Company; 5 % on \$1,000,000 stock guaranteed by West Chicago Street Railroad Company, lessee.
 m Cincinnati St. Ry. Co. has purchased the Mt. A. & Eden Park road, assuming its bonds.

* Unlisted. † Full paid. ‡ Outstanding. † Ex div.
 a Leased to New Orleans Traction Company at 6 % on stock.
 b Leased to New Orleans Traction Company at 8 % on stock.
 c Leased to Central Crostown Railroad at 8 % on stock and interest on bonds.
 d Operating the former Met. Trac. system, that corporation having become extinct.
 e Leased to 23d Street Ry. for 99 years; lease assigned to Metropolitan Street Ry.

NOTES FOR INVESTORS.

Late quotations for copper are: Electrolytic, 11½@11½c.; Lake, 11½@12c.; casting, 11½@11½c.

The Baltimore Consolidated Railway Company has purchased the uncompleted trolley line between Baltimore and Ellicott City from the Columbia & Maryland Electric Railway Company.

Bridge Commissioner Shea has notified the trolley companies using the Brooklyn Bridge that they must agree to the new schedule of car tolls at once. If the companies object the matter will be put in the hands of the Corporation Counsel.

The application of the Nassau Electric Railroad Company of Brooklyn, N. Y., for permission to increase the capital stock of the company from \$6,000,000 to \$15,000,000, was submitted to the State Railroad Commission by Gen. B. F. Tracy, representing the company, on the 29th ult. There was no opposition. The Commission took the papers in the case and promised to render a decision at an early date.

Halgarten & Co., New York, announce that they have consented to accept deposit of the 5 per cent. second mortgage bonds of the Staten Island Rapid Transit Railroad Company, guaranteed by the Baltimore & Ohio Railroad Company, under the mortgage of November 21, 1885, and to act for the bondholders in devising and promoting a reorganization of the property covered by the mortgage and preserving the bondholders' interest.

Redmond, Kerr & Co., New York, in their financial report issued on the 2d inst. say: "The usual conditions attending the close of the half-year and preceding the July 4th period have prevailed this week in Wall Street. There has been no important war news to change the course of events, and business has been chiefly of a routine character. At present there is a disposition in financial circles to hold active operations in abeyance until the occupation of Manila and Santiago by the American forces is an established fact."

A Boston financial paper states that "the directors of the Electrolytic Salts Company have declared a dividend of 3 per cent. to stockholders of record of June 22, payable July 15. Since February 4, 940.43 ounces of gold have been received and 1,834.51 ounces of silver. Over 5,000,000 tons of seawater have been treated by the accumulators to produce the above result. Three hundred men are now at work constructing what is known as plant No. 2."

A mortgage for \$1,500,000, executed by the New York & North Shore Railroad Company, was filed in the office of the clerk of Queens County at Jamaica, L. I., last week. The mortgage names the New York Security & Trust Company as trustee to secure the payment of 1,500 thirty-year gold bonds of the denomination of \$1,000 each. The New York & North Shore Railroad Company is a new corporation, organized by the managers of the New York & Queens County Trolley Company, which owns the trolley lines in Long Island City.

The N. Y. "News Bureau" says: "We understand that the differences between the preferred and common stockholders of the General Electric Company have been settled privately. It is proposed to reduce both classes of stock 40 per cent. in par value and to pay all the back dividends on the preferred stock in cash. The common stock, after the reduction in par value, will be placed on a 6 per cent. dividend paying basis. The company, it is claimed, has the cash on hand to pay the deferred dividends on the preferred and to begin quarterly payments on the common."

The directors of the Metropolitan Street Railway, New York, announced on Friday that it had been decided to distribute to the stockholders the accumulated surplus, now amounting to \$26,793,000. A cash dividend of \$20 will be paid to stockholders of record on August 15, in addition to the regular 2 per cent. quarterly dividend. This will call for \$7,200,000 cash. In October the company will increase its capital stock to \$54,000,000, each shareholder receiving one share of the new stock for each two shares held by him. The shareholders thus receive extra dividends of 70 per cent., 20 per cent. in cash and 50 per cent. in stock.

The stockholders of the Potomac Electric Power Company, Washington, D. C., at a meeting on Wednesday last adopted a resolution increasing the capital stock to \$1,000,000, of which \$250,000 shall be 6 per cent. voting, non-cumulative preferred stock, divided into 2,500 shares of \$100 each, and \$750,000 shall be common stock, divided into 7,500 shares of the par value of \$100 each. The present capital stock is \$500,000, fully paid, and the total liabilities and debts amount to \$380,000. The company also placed on file a deed of trust to the United States Mortgage & Trust Company, to secure the payment of \$750,000 in \$1,000 bonds, payable June 1, 1948, with interest at 5 per cent., payable semi-annually. The deed covers all the company's property, rights and franchises.

"A deal of great importance to our trolley lines is reported to be under way," says the N. Y. "News Bureau." "It is to the effect that the Philadelphia syndicate, which includes William C. Whitney, W. L. Elkins, P. A. B. Widener and Thomas Dolan, and which has made such successful ventures in establishing or reorganizing trolley companies, notably the Metropolitan Street Railroad Company, is now seeking to secure control of the Brooklyn Rapid Transit Company. It is known that these capitalists are in the market for valuable surface lines and franchises, and are thoroughly conversant with the present and prospective future values of that class of properties. It is believed that they have been careful students of the situation in Brooklyn and are now and have for some time been steady buyers of the company's stock. The report is to the further effect that the action of the syndicate is with the consent of the interests represented by former Governor Flower and that the latter is an active participant in the scheme."

The new tax law in regard to street railways recently passed by the Massachusetts Legislature goes into effect in October. It differs radically from the present law in regard to taxing the property of street railways. Under the present law the real estate and machinery of a street railway company are taxed direct by the city or town in which they are located. The Commissioner of Corporations reports the difference between the town tax and the amount of the tax on the capital stock, and the State collects the tax upon this difference. The money obtained in this manner is distributed among the towns and cities of the commonwealth in proportion to the amount of stock in the corporation held by its taxpayers. Under the new law the State will collect the excess tax, but it will be distributed according to the mileage of street railway in a town or city. Each railway will be considered separately in the distribution. If the tax on a street railway be \$5,000, and there be two miles of track in one city and three in another, the first city will receive \$2,000 and the other \$3,000. There is also to be an excise tax based on the amount of gross receipts per mile of track. The tax is regulated by a graduated scale according to the amount of earnings. The per cent. per amount of earnings is as follows: For less than \$4,000, 1 per cent.; for more than \$4,000 and less than \$7,000, 2 per cent.; for more than \$7,000 and less than \$14,000, 2½ per cent.; for more than \$14,000 and less than \$21,000, 3 per cent.; for more than \$21,000 and less than \$28,000, 3½ per cent.; for more than \$28,000, 4 per cent. In return for the "excise tax," as it has been called, the railroads are released from the care of streets, paving and the removal of snow, excepting in the tracks, and from all restrictions in franchises granted for extensions. When a change of grade or relocation of street is made the railroad must pay a part of the expense, not to exceed one-fourth of the total, including the cost of the relocation of the tracks. The board of aldermen shall determine what proportion the railroad shall pay, but appeal may be made to the Superior Court, as in the case of other betterments. To meet this expense the railroad may increase the amount of stock with the consent of the Railroad Commissioners, and stock may also be issued to pay for extensions.

"Hold-em"

Holds down your shirt.

Holds up your Drawers.

A tab at the lower end of the bosom is a useless method—tapes on the drawers are always broken—both were invented to exasperate the wearer. "Hold-em" makes this useless tab useful; buttons stay on the drawers; the shirt bosom don't wrinkle—the shirt stays down and the drawers stay up. Worn on first or second button of drawers. Souls with corporations use the top button—thin people use the next. Comfort and contour dictate. For 15 cents, stamps or silver, we send a "Hold-em" post paid.

Worn as above.

Exact size. Is handsomely and neatly made of colored silk elastic and nickel trimmings.

SHAIN COMPANY,

136 Liberty Street, New York.

It is invaluable for the full dress shirt.

TRADE MARK
"Chloride Accumulator"

REGISTERED SEPTEMBER 11, 1904.

The Western Union Telegraph Company
is installing in its Memphis office
436 Chloride Accumulators
displacing
5,250 gravity cells.

Atlanta, Washington, New Orleans and eighteen smaller offices are already equipped with Chloride Accumulators, which have effected a great reduction in cost of maintenance and an improvement in the wire service.

THE ELECTRIC STORAGE BATTERY COMPANY,
Drexel Building, Philadelphia, Pa.

SITUATIONS WANTED.**Free Advertising.**

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column Without Charge. Each advertiser is invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and the employer together to their mutual benefit, and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 35 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to insure attention.

Address all communications to Free Advertising Editor, "Electricity," New York.

31 WANTED.—Position by an electrician; age 25, married; over seven years' practical experience in light and power work, installing generators and motors, also all systems of arc and incandescent wiring and line work. Address A. K., care ELECTRICITY.

32 WANTED.—Position as manager or superintendent; interurban electric railway preferred; am a competent electrical, mechanical and steam engineer and can take charge of a lighting as well as railway plant; have had several years' experience constructing and operating electric lines, and know how to handle men for the best interests of all concerned; correspondence solicited. Address L. C. H., care ELECTRICITY.

33 WANTED.—By a stationary engineer with six years' experience position as assistant with some plant; can do lamp repairing and line work in electric station. Address G. S. D., care ELECTRICITY.

34 WANTED.—Position by a mechanical engineer; can do practical work anywhere in the machine shop; well posted on electricity; a first class draughtsman. Address T. C. K., care ELECTRICITY.

35 WANTED.—A works manager offers his services to economic manufacturers of insulated wires; can furnish his own private solid core rubber stocks for any grade of work; mixtures for weatherproof and finishes; designs for all kinds of insulating machines; scientific inexpensive methods of finding costs of manufacture; more than ten years' experience over a wide field; correspondence only with principals. Address "ECONOMICS," care ELECTRICITY.

36 WANTED.—Position as foreman by a man 35 years old; thoroughly familiar with special tools and piece work and well posted on the cost of manufacture of street railway motors and their appliances; will be open for engagement Jan. 1, 1898; can furnish best of references. Address A. J., care ELECTRICITY.

37 WANTED.—Electrician, who is a journalist and telegrapher, desires any good position where ability, energy and temperance are required; best of references. Address ABLE, care ELECTRICITY.

38 WANTED.—Position as chief engineer of a light or power plant; 5 years' experience in the construction and maintenance of alternating and direct current, high speed and Corliss central stations; technically educated; expert lineman and wireman. Address M. H. F., care ELECTRICITY.

39 WANTED.—Position as salesman or manager of any electrical business for American firm in Mex'co; have lived among the Mexicans for years and understand their customs and language; have a thorough scientific education obtained by three years' special study in an accredited school of electrical engineering; references given. Address SPANISH, care ELECTRICITY.

40 WANTED.—Position to make myself generally useful with an electrical engineering party in charge of construction anywhere; have had five years' experience in setting up and maintaining private telephone lines and interior wiring. Address H. W. G., JR., care ELECTRICITY.

Bargains in Electrical Machinery.

Two hundred Dynamos, direct current, alternating and arc; 200 Motors, from 1 to 300 H. P., any voltage; 100 Steam Engines, vertical, horizontal and marine type, high, moderate and slow speed, with or without boilers. Wanted a full description of what you want to buy or sell. WRIGHT, 939 Monadnock Block, Chicago.

ELECTRICITY NEWSPAPER CO..

136 LIBERTY ST., NEW YORK.

"Hold-em"

Holds down your shirt.

Holds up your Drawers.

A tab at the lower end of the bosom is a useless method—tapes on the drawers are always broken—both were invented to exasperate the wearer. "Hold-em" makes this useless tab useful; buttons stay on the drawers; the shirt bosom don't wrinkle—the shirt stays down and the drawers 'stay up. Worn on first or second button of drawers. Souls with corporations use the top button—thin people use the next. Comfort and contour dictate. For 15 cents, stamps or silver, we send a "Hold-em" post paid.

Worn as above.

Exact size.
Is handsomely
and neatly made
of colored silk
elastic and nickel
trimmings.

SHAIN COMPANY,

136 Liberty Street, New York.

It is invaluable for the full dress shirt.

TRADE MARK

"Chloride Accumulator"

REGISTERED SEPTEMBER 11, 1904.

The Western Union Telegraph Company
 is installing in its Memphis office
436 Chloride Accumulators
 displacing
5,250 gravity cells.

Atlanta, Washington, New Orleans and eighteen smaller offices are already equipped with Chloride Accumulators, which have effected a great reduction in cost of maintenance and an improvement in the wire service.

Graham Rolled Steel Truck.

If you will look carefully at out you will understand better just how much superior our Brakes are over all others.

Perfection of SIMPLICITY, LIGHTNESS AND STRENGTH. Equipped with Graham's Equalized Brakes, hung on the axle boxes, enabling the motorman to stop the car easier when full than when empty. See cut of truck. The entire frame of truck is supported on Graham's Spring Suspension. The only truck that will not teter or jump. The frame is rolled steel (10 lbs. to the foot), has only twenty $\frac{5}{8}$ inch bolts (no rivets of any kind), all the castings are steel. Frame is braced like a bridge, relieving car body of all strain. Weighs only 8,200 lbs. The easiest on rail joints. The lightest on repairs. The cheapest on fuel. If you are not satisfied with what you have write us.

Graham's Steel Floor Framings

are attracting the attention of all up-to-date railway men. We substitute our Rolled Steel Sill for the wooden sill. It is LIGHTER, STRONGER AND CHEAPER. We bolt the pedestals of the axle boxes to this sill, lowering car floor 8 inches. We can tell you more about this if you will write for circulars.

SITUATIONS WANTED.**Free Advertising.**

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column Without Charge. Each advertiser is invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and the employer together to their mutual benefit, and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 55 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to insure attention. Address all communications to Free Advertising Editor, "Electricity," New York.

31 WANTED.—Position by an electrician; age 25, married; over seven years' practical experience in light and power work, installing generators and motors, also all systems of arc and incandescent wiring and line work. Address A. K., care ELECTRICITY.

32 WANTED.—Position as manager or superintendent; interurban electric railway preferred; am a competent electrical, mechanical and steam engineer and can take charge of a lighting as well as railway plant; have had several years' experience constructing and operating electric lines, and know how to handle men for the best interests of all concerned; correspondence solicited. Address L. C. H., care ELECTRICITY.

33 WANTED.—By a stationary engineer with six years' experience position as assistant with some plant; can do lamp repairing and line work in electric station. Address G. S. D., care ELECTRICITY.

34 WANTED.—Position by a mechanical engineer; can do practical work anywhere in the machine shop; well posted on electricity; a first class draughtsman. Address T. O. K., care ELECTRICITY.

35 WANTED.—A works manager offers his services to economic manufacturers of insulated wires; can furnish his own private solid core rubber stocks for any grade of work; mixtures for weatherproof and finishes; designs for all kinds of insulating machines; scientific inexpensive methods of finding costs of manufacture; more than ten years' experience over a wide field; correspondence only with principals. Address "ECONOMICS," care ELECTRICITY.

36 WANTED.—Position as foreman by a man 35 years old; thoroughly familiar with special tools and piece work and well posted on the cost of manufacture of street railway motors and their appliances; will be open for engagement Jan. 1, 1896; can furnish best of references. Address A. J., care ELECTRICITY.

37 WANTED.—Electrician, who is a journalist and telegrapher, desires any good position where ability, energy and temperance are required; best of references. Address ABLE, care ELECTRICITY.

38 WANTED.—Position as chief engineer of a light or power plant; 5 years' experience in the construction and maintenance of alternating and direct current, high speed and Corliss central stations; technically educated; expert lineman and wireman. Address M. H. F., care ELECTRICITY.

39 WANTED.—Position as manager of any electrical business in Mexico; can speak Spanish and has a thorough scientific education obtained by four years' special study in a well known school of electrical engineering; references furnished. Address SPANISH, care ELECTRICITY.

40 WANTED.—Position to make myself generally useful with an electrical engineering party in charge of construction anywhere; have had five years' experience in setting up and maintaining private telephone lines and interior wiring. Address H. W. G., JR., care ELECTRICITY.

41 WANTED.—A college graduate in electrical engineering, with good shop experience, also central station installation and operation, wishes to change present position; best of references and good reason for change given; correspondence solicited. Address LEHIGH, care ELECTRICITY.

Two Good Books that You may Prove Useful to You**Speeches and Speech Making**

BY JUDGE J. W. DONOVAN.

This book upon its appearance obtained an immediate and wide-spread popularity. And that is natural, for it is of practical interest and value to every man who has or hopes for any prominence in his community. It contains nearly 300 pages, giving practical hints and helps, both as to preparing and delivering speeches, examples of speeches, for the many different occasions on which we are all apt to be called upon for speeches, when we have not time to prepare and must depend upon the preparation of times past. This book will aid one to prepare for such occasions. The sooner a man begins to prepare the better, for he cannot become a good public speaker at a bound, but public speakers are made as well as born.

Handsomely bound in Cloth, \$1.50 delivered.

Model Banquet Speeches,

BY FAMOUS BANQUET SPEAKERS.

Here we offer you the finest collection of after-dinner speeches ever gathered together in one book, for they are not a collection of the utterances of one man, but are the best efforts of many men famous at the banquet table, such as Thomas A. Hendricks, Senator Vilas, James G. Jenkins, Geo. W. Wacker, Thomas F. Bayard, Gen. J. C. Black, Rev. Wm. E. Park, Dr. Hirsch, John B. Green, Henry Wollman, Joseph C. Hendrix, Judge Grosscup, Senator Foraker, Chauncey M. Depew; and many others "of infinite jest, of most excellent fancy and flashes of merriment that were wont to set the tables on a roar." The speeches here given cover an infinite variety of subjects and occasions—banquets, business men's banquets, political banquets, occasional celebrations, and all kinds and conditions of society gatherings. The after-dinner speaker, or one who would be such, wants this book.

Handsomely bound in Cloth, \$1.50 delivered.

SITUATIONS WANTED.**Free Advertising.**

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column Without Charge. Each advertiser is invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and the employer together to their mutual benefit, and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 55 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to insure attention. Address all communications to Free Advertising Editor, "Electricity," New York.

38 WANTED.—Position as chief engineer of a light or power plant; 5 years' experience in the construction and maintenance of alternating and direct current, high speed and Corliss central stations; technically educated; expert lineman and wireman. Address M. H. F., care ELECTRICITY.

39 WANTED.—Position as manager of any electrical business in Mexico; can speak Spanish and has a thorough scientific education obtained by four years' special study in a well known school of electrical engineering; references furnished. Address SPANISH, care ELECTRICITY.

40 WANTED.—Position to make myself generally useful with an electrical engineering party in charge of construction anywhere; have had five years' experience in setting up and maintaining private telephone lines and interior wiring. Address H. W. G., JR., care ELECTRICITY.

41 WANTED.—A college graduate in electrical engineering, with good shop experience, also central station installation and operation, wishes to change present position; best of references and good reason for change given; correspondence solicited. Address LEHIGH, care ELECTRICITY.

42 WANTED.—Position as foreman or inspector of telephone or electric light plant; have had 12 years' experience; can do practical work anywhere; strictly temperate; best of references. Address W. C., care ELECTRICITY.

43 WANTED.—Position by a young man (22) with two years' training at a technical school and considerable practical experience; preferably one with a consulting engineer or electric lighting company. Address H., care ELECTRICITY.

44 WANTED.—Position by a central station manager; expert in all practical details; ten years' experience in finances; will operate plant for part salary, balance based on results; large plants as references. Address STOCKHOLDER, care ELECTRICITY.

45 WANTED.—Position where I can learn electrical engineering; no technical knowledge and very little experience; will go anywhere. Address W. G. M., Lock Box 28, Ninety Six, S. C.

46 WANTED.—Position as superintendent of plant by an electrical; seven years' practical experience in light and power, both alternating and direct current; excellent reference. Address G. K., care ELECTRICITY.

47 WANTED.—Position by an engineer who has had about ten years' experience in lighting and street railway plants; also understands ice machines; at present employed; best of reference; married; will go to any section of the country. Address D. C. W., care ELECTRICITY.

48 WANTED.—Position as superintendent or assistant superintendent of an electric lighting plant; have had 9 years' practical experience in electric lighting in all its branches; am a machinist by trade; can furnish the very best of references. Address L. E., care ELECTRICITY.

49 WANTED.—Position by electrician as superintendent or manager of a telephone exchange; 10 years' experience; best of references; married; strictly temperate. Address H. M., 617 Front st., Fort Madison, Ia.

Two Good Books that may Prove Useful to You**Speeches and Speech Making**

BY JUDGE J. W. DONOVAN.

This book upon its appearance obtained an immediate and wide-spread popularity. And that is natural, for it is of practical interest and value to every man who has or hopes for any prominence in his community. It contains nearly 300 pages, giving practical hints and helps both as to preparing and delivering speeches; examples of speeches for the many different occasions on which we are all apt to be called upon for speeches, when we have not time to prepare and must depend upon the preparation of times past. This book will aid one to prepare for such occasions. The sooner a man begins to prepare the better, for he cannot become a good public speaker at a bound, but public speakers are made as well as born.

Handsomely bound in Cloth. \$1.50 delivered.

Model Banquet Speeches,

BY FAMOUS BANQUET SPEAKERS.

Here we offer you the finest collection of after-dinner speeches ever gathered together in one book, for they are not a collection of the utterances of one man, but are the best efforts of many men famous at the banquet board, such as Thomas A. Hendricks, Senator Vilas, James G. Jenkins, Geo. W. Wakefield, Thomas F. Bayard, Gen. J. C. Black, Rev. Wm. E. Park, Dr. Hirsch, John B. Green, Henry Wollman, Joseph C. Hendrix, Judge Grosscup, Senator Foraker, Chauncey M. Depew, and many others "of infinite jest, of most excellent fancy and flashes of merriment that were wont to set the tables on a roar." The speeches here given cover an infinite variety of subjects and occasions—bar banquets, business men's banquets, political banquets, occasional celebrations, and all kinds and conditions of society gatherings. The after-dinner speaker, or one who would be such, wants this book.

Handsomely bound in Cloth. \$1.50 delivered.

SITUATIONS WANTED.**Free Advertising.**

Inquiries from those seeking employment as Electrical Engineers, Superintendents, Foremen, Salesmen, Dynamo-tenders, Constructing and Designing Engineers, Electro-metallurgists, or in other positions requiring technical experience or intimate acquaintance with the electrical trade, will be inserted in this column without charge. Each advertiser is invited to repeat his advertisement in case the first one produces no results.

It is the desire of the management of this paper to bring the unemployed and the employer together to their mutual benefit; and to this end they invite the former to make use of this column without charge. No advertisement exceeding five lines (about 85 words) will be inserted, but advertisers may write fully of their qualifications and these letters will be kept on file for future reference in filling vacancies which may occur.

Applicants should write clearly and distinctly and enclose postage to insure attention.

Address all communications to Free Advertising Editor, "Electricity," New York.

46 WANTED.—Position as superintendent of plant by an electrician; seven years' practical experience in light and power, both alternating and direct current; excellent reference. Address G. K., care ELECTRICITY.

MISCELLANEOUS.

SARATOGA, THOUSAND ISLANDS, ADIRONDACK MOUNTAINS.

The greatest of American health and pleasure resorts are directly reached by the through parlor and sleeping cars of the New York Central. The service by this great line is elegant and luxurious in every particular, strictly maintaining the apt title bestowed upon it of "America's Greatest Railroad."

For a book or folder descriptive of the above resorts, together with the time and rates of fare, send a 2-cent stamp to George H. Daniels, General Passenger Agent, Grand Central Station, New York

DO YOU know the Constitution of the United States?

Every citizen of the republic should be familiar with the Constitution and all the charters of our national policy. You can find them collected in

Our National Charters,

a pamphlet giving the Constitution and Amendments, The Declaration of Independence, the Articles of Confederation, Washington's Farewell Address, the Dictatorship Conferred on Washington, the Ordinance of 1787, the Monroe Doctrine, and the Emancipation Proclamation. As a matter of patriotic pride, if for no other reason, every American should be familiar with these documents. Price 50 cents.

Shall I Study Law?

BY ONE WHO HAS TRIED.

This book was written for men who are thinking of taking up the law as a special study, either for practice, for general culture, or for business purposes, and discusses the matter fully, giving reasons for and against it, together with much practical instruction, enabling men to know what to do in answer to this question.

Paper bound, 69 pages. Price 50c.

Blair's Ink Making Security Fountain Pens.

Producing their own ink by merely filling the holder with water, which turns into a deep black, purple or scarlet copying ink, enabling the owner to produce the right ink at any time or place. The ink-making quality will last one year and can be renewed at a trifling cost, saving the price of the pen in a few months.

They cannot leak.
No weak internal mechanism.
Regular shape 14 carat Gold Pens.
Upper feed bars on long point pens.
Under feed-bars on short point. They cost no more, even considerably less, than the old makes.
More than 12,000 sold in six weeks.

To give our readers this Absolutely Perfect Fountain Pen at a moderate price, we have made an arrangement with Blair's Fountain Pen Company of New York to furnish our subscribers their "Security Fountain Pens" at the following low

PRICES:

No. 1 Gold Pen, fine point, at \$1.75.
No. 2 Gold Pen, fine or stub point, \$2.
No. 3 Gold Pen, fine or stub point, \$2.50.
No. 4 Gold Pen, fine or stub point, \$3.
Handsomely Chased and Gold Mounted, 75 cents extra.

To insure getting these pens at prices named, orders for them should be sent direct to this office with the price of the pen desired. Should you wish to have them insured against loss in the mails, send eight cents extra. Address
